ANNESLEY (Arthur), earl of Angleſey, and lord privy ſeal in the reign of King Charles II. was the ſon of Sir Francis Anneſley, bart. lord Mount Norris, and viſcount Valentia, in Ireland; and was born at Dublin on the 10th of July, 1614. He was for ſome time at the univerſity of Oxford, and afterwards ſtudied the law at Lincoln's Inn. He had a conſiderable ſhare in the public tranſactions of the laſt century; for in the beginning of the civil war he ſat in the parliament held at Oxford, but afterwards became reconciled to the oppoſite party, and was ſent commiſſioner to Ulſter, to oppoſe the deſigns of the rebel Owen Roe O'Neal. He engaged in ſeveral other affairs with great ſucceſs. He was preſident of the council of ſtate after the death of Oliver, and was principally concerned in bringing about the Reſtoration, ſoon after which, King Charles II. raiſed him to the dignity of a baron, by the title of lord Anneſley, of Newport Pagnall, Bucks; and a ſhort time after, he was made earl of Angleſey. During that reign he was employed in ſome very important affairs, was made treaſurer of the navy, and afterwards lord privy-ſeal. In October 1680, his lordſhip was charged by one Dangerfield, in an information delivered upon oath, at the bar of the Houſe of Commons, with endeavouring to ſtifle evidence in relation to the Popiſh plot, and to promote the belief of a Preſbyterian one. The uneaſineſs he received from this attack did not prevent his ſpeaking his opinion freely of thoſe matters in the Houſe of Lords, particularly in regard to the Popiſh plot. About the ſame time he anſwered the Lord Caſtlehaven's Memoirs, in which that nobleman endeavoured to paint the Iriſh rebellion in the lighteſt colours; and a ſharp diſpute was raiſed, which ended in the ſeals being taken from him. He was a perſon of great abilities, had uncommon learning, and was well acquainted with the conſtitution and laws of England. He wrote, beſides his Animadverſions on Caſtlehaven's Memoirs, 1. The Privileges of the Houſe of Lords and Commons ſtated. 2. A Diſcourſe on the Houſe of Lords. 3. Memoirs. 4. The Hiſtory of the Troubles in Ireland, from the Rebellion in 1641, till the Reſtoration. 5. Truth unveiled, in behalf of the Church of England;—and ſome other works. He died in April 1686, in the 73d year of his age; and was ſucceeded by his ſon James.

ANNIHILATION (*Encycl.*). The Perſian bramins hold, that, after a certain period of time, conſiſting of 71 joogs, God not only annihilates the whole univerſe, but every thing elſe, angels, ſouls, ſpirits, and all, by which he returns to the ſame ſtate he was in before the creation; but that, having breathed a while, he goes to work again, and a new creation ariſes, to ſubſiſt 71 joogs more, and then to be annihilated in its turn. Thus they hold there have been almoſt an infinite number of worlds: but how many joogs are elapſed ſince the laſt creation, they cannot certainly tell; only in an almanac written in the Sanſcrit language in 1670, the whole is ſaid to be then 3,892,771 years old from the laſt creation.

The Siameſe heaven is exactly the hell of ſome Socinians, and other Chriſtian writers; who, ſhocked with the horrible proſpect of eternal torments, have taken refuge in the ſyſtem of annihilation. This ſyſtem ſeems countenanced by ſcripture; for that the words *death*, *deſtruction*, and *periſhing*, whereby the puniſhment of the wicked is moſt frequently expreſſed in ſcripture, do moſt properly import annihilation and an utter end of being. To this Tillotſon anſwers, that theſe words, as well as thoſe correſponding to them in other languages, are often uſed, both in ſcripture and in other writings, to ſignify a ſtate of great miſery and ſuffering, without the utter extinction of the miſerable. Thus God is often ſaid in ſcripture to bring *deſtruction* on a nation, when he ſends judgments upon them, but without exterminating or making an end of them. So in other languages, it is frequent, by *periſhing*, to expreſs a perſon's being made miſerable; as in that known paſſage in Tiberius's letter to the Roman ſenate: *Ita me dii, deæque omnes, pejus perdant, quam hodie perire me ſentio.* As to the word *death*, a ſtate of miſery which is as bad or worſe than death may properly enough be called by that name; and thus the puniſhment of wicked men after the day of judgment is in the book of Revelations frequently called the *ſecond death.*

Some Chriſtian writers allow a long time of the moſt terrible torments of ſinners; and after that, ſuppoſe that there ſhall be an utter end of their being. Of this opinion Irenæus appears to have been; who, according to M. du Pin, taught that the ſouls, at leaſt of the wicked, would not ſubſiſt eternally; but that, after having undergone their torments for a certain period, they would at laſt ceaſe to be at all. But Tillemont, Petit, Didier, and others, endeavour to defend Irenæus from this imputation, as being too favourable to the wicked.

It has been much diſputed among divines, whether, at the conſummation of all things, this *earth* is to be annihilated, or only purified, and fitted for the habitation of ſome new order of beings. Gerard in his Common Places, and Hakewil in his Apology, contend earneſtly for a total abolition or annihilation. Ray, Calmet, and others, think the ſyſtem of renovation or reſtitution, more probable, and more conſonant to ſcripture, reaſon, and antiquity. The fathers who have treated on the queſtion are divided; ſome holding that the univerſe ſhall not be annihilated, but only its external face changed; others aſſerting, that the ſubſtance of it ſhall be deſtroyed.

How widely have the ſentiments of mankind differed as to the poſſibility and impoſſibility of annihilation! According to ſome, nothing ſo difficult; it requires the infinite power of the Creator to effect it: ſome go further, and ſeem to put it out of the power of God himſelf. According to others, nothing ſo eaſy: Exiſtence is a ſtate of violence; all things are continually endeavouring to return to their primitive nothing; it requires no power at all; it will do itſelf; nay, what is more, it requires an infinite power to prevent it.

Many authors conſider preſervation as a continual reproduction of a thing, which, ſubſiſting no longer of itſelf, would every moment return into nothing. Gaſſendi on the contrary aſſerts, that the world may indeed be annihilated by the ſame power which firſt created it, but that to continue it there is no occaſion for any power of preſervation.

Some divines, of which number the learned Biſhop King ſeems to be, hold annihilation for the greateſt of all evils, worſe than even the utmoſt torments of hell-flames: while others, with ſome of the eaſtern philoſophers, acknowledge annihilation for the ultimate pitch of happineſs human nature is capable of; that ſovereign good, that abſolute beatitude, ſo long vainly ſought for by the philoſophers, is found here. No wonder it has been ſo long concealed; for who would have thought of looking for the *ſummum bonum*, where others have placed the ſum of miſery?

The ſaid prelate propoſes it as a queſtion, Whether ſuffering eternal torments be a greater evil than not exiſting? He thinks it highly probable, that the damned will be ſuch fools, that, feeling their own miſery in the moſt exquiſite degree, they will rather applaud their own conduct, and chooſe to be, and to be what they are, rather than not to be at all; fond of their condition, however wretched, like people enraged, they will perſiſt in their former ſentiments without opening their eyes

to their folly, and perſevere by way of indignation and revenge. Mr. Bayle refutes him on this head; but might, one would think, have ſaved himſelf the trouble.

The Talapoins hold it the ſupreme degree of happineſs to have the ſoul totally annihilated, and freed from the burden and ſlavery of tranſmigrations. They ſpeak of three Talapoins, who, after a great number of tranſmigrations, became gods; and when arrived at this ſtate, procured this further reward of higheſt perfection man can arrive at, *neurepan*, or annihilation; which at length is granted to thoſe who are perfectly pure and good, after their ſouls have wandered many thouſand years through various bodies.

ANO-CAPRI, the largeſt town in the iſland of Capri, belonging to the kingdom of Naples.

ANOLYMPIADES (*Encycl.*). The Eleans claimed the ſole right of managing the Olympic games, in which they ſometimes met with competitors. The hundred and fourth Olympiad was celebrated by order of the Arcadians, by whom the Eleans were at that time reduced very low: this, as well as thoſe managed by the inhabitants of Piſa, they called ανολυμπιαδας, that is, "unlawful Olympiads;" and left them out of their annals, wherein the names of their victors and other occurrences were regiſtered.

ANOSSI (*Encycl.*). This province is watered by many rivers, moſt of which run into the *Franchere*, *Ramevatte*, or *Immour*, the ſpring of which is in a mountain called *Manghage*, and diſcharges itſelf into the ſea in Lat. 25. 18. S. The mouth of this river is often ſtopped, and the courſe to the ſea interrupted, unleſs kept open by the overflowings of great rains and high tides. The water runs ſalt one league above the mouth, particularly in a free communication with the ſea. A lake, called *Ambou*, is formed at the mouth, half a league wide, with depth ſufficient for any ſhip if the mouth of the river was kept open. Next in bigneſs to the Franchere is the Manghaſia, which ſprings from a mountain called *Siliva*, and empties itſelf into the ſea, where large ſhips may ride at anchor. Crocodiles breed in theſe and all the other rivers of the iſland.

Between the two rivers above mentioned lies Cape St. Romain, half a mile diſtant from the mouth of the Franchere, and which runs from the north-weſt ſix or ſeven leagues into the ſea. When the Cape is paſſed, the coaſt forms a great bay, in the ſhape of a croſs, which extends to the mouth of a river called *Dian Panouge*, or *Pitorah*. In the middle of this bay the land runs out, and almoſt forms a peninſula called *Tholangare*. Fort Dauphin lies to the north of this peninſula, and Port Dauphin over againſt it. This province has ſeveral other peninſulas and ſmall iſlands belonging to it. The country is beautiful; abounds in fruit-trees; is fertile in paſtures for cattle; and, if carefully cultivated, would produce all the neceſſaries of life. It is ſurrounded by high mountains, which are covered with woods and ſhrubs; but, about four miles diſtant from Fort Dauphin, the adjacent hills are quite deſtitute of verdure. The French often dug in this neighbourhood, expecting to meet with mines of gold and ſilver, particularly in one mountain where ſeveral ſprings flow near each other, and empty themſelves into a neighbouring river. In this river they found ſeveral ſtones and heaps intermixed with yellow clay, with a great quantity of black and white ſpangles ſhining like ſilver, which they carefully pounded and waſhed, but without effect. About ſixty yards above theſe ſprings the graſs and every ſort of vegetable appears half dried and yellow, from a metalline ſulphur which gives that aſpect; but the top of the mountain is covered with a freſh and beautiful verdure. It is ſaid that the Portugueſe found gold at the foot of the mountain on the north-ſide, but that the place they had dug was filled up by the chiefs of the country after the Portugueſe had been driven out.

The province of Anoſſi is inhabited by three different ſorts of whites, and four ſorts of negroes. The whites are diſtinguiſhed by the names of *Rohandrians*, *Anacandrians*, and *Ondzatſi*. The whites are diſtinguiſhed from the negroes by the general name of *Zaferamini*, or *Rahimini*; and the Rohandrians are diſtinguiſhed above the other whites. When they proceed to an election of a ſovereign, whom they call *Ompiandrian*, or *Dian Bahouache*, he is choſen from the Rohandrian race. Next to him the others hold the rank of princes, and are honoured as ſuch by all the reſt of the ſubjects. The Anacandrians are deſcendants of the chiefs, but who have degenerated, and are accounted the baſtards of princes, or thoſe who are deſcended from a Rohandrian and any inferior white or black woman. Theſe are likewiſe called by the name of *Ontempaſſemaca*, or people from the ſandy parts of Mecca, from whence, they ſay, came the Rohandrians. Both the Rohandrians and Anacandrians wear long hair, which hangs down in curls; and enjoy the privilege of killing beaſts. The Ondzatſi, or loweſt claſs of whites, are deſcended from the baſtards of the Anacandrians. Theſe are all fiſhermen, and are allowed to kill no land animals except chickens.

The four claſſes of negroes are named *Voadziri*, *Lohavohits*, *Ontſoa*, and *Ondeves*. The Voadziri, the moſt powerful and the richeſt, are maſters of ſeveral villages, and deſcended from the original lords of the country. They enjoy the privilege of killing beaſts, when at a diſtance from the whites, and no Rohandrian or Anacandrian in the village. The Lohavohits are deſcendants from the Voadziri, and alſo lords; but with this difference, that the one commands a whole diſtrict, and the juriſdiction of the others extends only to their own village and family. They are alſo permitted to kill thoſe beaſts they intend to eat, when at a diſtance from the whites. The Ontſoa are next to the Lohavohits, and are their near relations. The Ondeves are the loweſt of all, being originally ſlaves by father and mother. The Voadziri, Lohavohits, and Ontſoa, enjoy the privilege of ſubmitting themſelves, on the death of their lord or king, to any chief they pleaſe. In return for ſuch homage the new lord makes them a preſent, in conſequence of which he becomes heir to all their poſſeſſions. Hence the lower claſſes both of whites and blacks, when death approaches, are under the greateſt concern and anguiſh of mind, well knowing that their lords will not fail to deprive their children of every thing they poſſeſs. Ondeves have not the ſame liberty with the others: but, in times of famine, the chiefs are obliged to ſupply them with neceſſaries; which if they fail to do, they have the liberty of ſubmitting themſelves to new maſters. The inhabitants of this province have no temples, and very little appearance of religion; only they keep up a cuſtom of immolating beaſts upon particular occaſions, as in ſickneſs, planting yams or rice, on aſſemblies, &c. They offer the firſt-born beaſt to the devil and to God, naming the devil firſt, in this manner, *Dianbilis Aminhanhabare*, or "Lord Devil and God."—There are ſeveral towns on the river Franchere; and near this river the Portugueſe had a fort built upon a ſteep rock, and ſeveral buildings below, with incloſures, which furniſhed all ſorts of neceſſaries for their ſubſiſtence; but they were all maſſacred by the natives.

This province ſeems originally to have been inhabited by negroes. The whites or Zaferamini ſettled in it about 200 years ago, and conquered the negroes. But they themſelves were conquered by the French, though under the government of a king whom they honoured as a god. In 1642, Captain Rivault obtained a permiſſion to eſtabliſh a colony in this part of the iſland; and accordingly took poſſeſſion of it

in the name of the king of France, in the month of September, that ſame year. The French landed 200 men well armed and provided with ſtore of ammunition and other neceſſaries for building a fort, which they immediately ſet about; but no ſooner did the natives obſerve their intention, than they uſed their utmoſt art to prevent their deſign from taking effect. This created a war, in which the French were victors; and, the natives becoming in time much better reconciled to them, they intermarried, and lived up and down in ſeveral towns at ſome diſtance from one another, not above five or ſix in a place. This tranquillity laſted for ſome years; but at laſt the natives, growing jealous, reſolved to free themſelves from a foreign yoke, and accordingly formed a conſpiracy to cut off all the French in one day; which they ſoon after effected, not leaving a ſingle perſon alive. In 1644 the above-mentioned Fort Dauphin was erected, in lat. 25. 6. S. Many buildings were erected, behind the fort, adjoining to the governor's houſe, with great incloſures that produced every ſort of fruit and kitchen herb. In 1656 this fort was accidentally deſtroyed by fire; but was ſoon after repaired, and ſtill continues, notwithſtanding the cataſtrophe above mentioned, and its garriſon carries on frequent wars with the natives.

ANSELM, archbiſhop of Canterbury, in the reigns of William Rufus and Henry I. He was born in the year 1033, at Aoſt, a town in Savoy at the foot of the Alps. He became a monk in the abbey of Bec in Normandy; of which he was afterwards choſen prior, and then abbot. In the year 1092, he was invited over to England by Hugh earl of Cheſter; and in the year following was prevailed on, as we are told, with great difficulty, to accept the archbiſhopric of Canterbury. He enjoined celebacy on the clergy; for which he was baniſhed by King Rufus, but recalled by Henry at his coming to the crown. He refuſed to conſecrate ſuch biſhops as were inveſted by the king, according to Pope Urban's decree; flatly denying it to be the king's prerogative: for this he was outed again; till, the pope and king agreeing, he was recalled in 1107. In ſhort, from the day of his conſecration to that of his death, he was continually employed in fighting the prerogative of the church againſt that of the crown; and for that purpoſe ſpent much of his time in travelling backwards and forwards between England and Rome, for the advice and direction of his holineſs. At the council of Bari, in the kingdom of Naples, the pope being puzzled by the arguments of the Greeks againſt the Holy Ghoſt's proceeding from the Father, he called upon Anſelm, who was preſent, and he diſcuſſed their objections with great applauſe. Prieſts call him a reſolute ſaint; to other people he appears to have been an obſtinate and inſolent prieſt. He wrought many miracles, if we believe the author of his life, both before and after his death, which happened at Canterbury, in the 76th year of his age, *anno* 1109. He was canoniſed in the reign of Henry VII. Anſelm, though we may diſregard him as a ſaint, deſerves to be remembered as one of the principal revivers of literature, after three centuries of profound ignorance.

His works have been printed in different years, and at different places, *viz.* Nuremb. 1491. Paris, 1544 and 1549. Venice, 1549. Cologn, 1573 and 1612. Lyons, 1630. But the beſt is that of Father Gerberon, printed at Paris, 1675. It is divided into three parts; the firſt contains dogmatical tracts; and is entitled *Monologia*; the ſecond contains practical and devotional tracts; the third part conſiſts of letters in four books.

ANSIBARII, or ANSIVARII (*Encycl.*). All we know of the hiſtory of this ancient people is, that in the reign of the Emperor Nero they were driven from their poſſeſſions by the Chauci. Being then in a forlorn condition, they took poſſeſſion of ſome uninhabited lands, which had been uſed as paſture for the horſes of the Roman ſoldiers. They were led by one Boioculus, a man of great valour, and of known fidelity to the Romans. He remonſtrated to the Romans, who objected to their taking poſſeſſion of theſe lands, That the territory in diſpute was large; and requeſted, that it might be allowed to an unhappy people, driven from their own habitations: that, at the ſame time, wide tracts might be retained for the horſes and cattle of the ſoldiers to graze in: that it was inconſiſtent with humanity to famiſh men in order to feed beaſts &c.: and at laſt, lifting up his eyes to heaven, he aſked the celeſtial luminaries how they could behold a deſolate ſoil, and if they would not more juſtly let looſe the ſea to ſwallow up uſurpers, who had engroſſed the whole earth? To this the Roman commander, Avitus, replied, the weakeſt muſt ſubmit to the ſtrongeſt; and that ſince the gods, to whom they had appealed, had left the ſovereign judgment to the Romans, they were reſolved to ſuffer no other judges than themſelves. To Boioculus himſelf, however, he privately offered lands as a reward for his long attachment to the Romans: but this offer the brave German rejected, as a price for betraying his people; adding, "A place to live in we may want, but a place to die in we cannot." The Anſibarii now invited the neighbouring nations to join them againſt the Romans; but they, dreading the power of that nation, refuſed to give them any aſſiſtance: upon which they applied to the neighbouring nations, begging leave to ſettle in their territories; but being every-where driven out as enemies and intruders, theſe unhappy people were reduced to wander up and down till every one of them periſhed.

ANSIKO (*Encycl.*), a kingdom of Africa. The king of Anſiko, or the great Macoco, commands thirteen kingdoms, and is eſteemed the moſt powerful monarch in Africa. The inhabitants of Angola have a tradition, that this is the proper country of the Giagas, who came originally from Sierra Leona, and over-ran like a torrent the whole coaſt as far as Benguela; that, being weakened by numerous battles, and unable to force the defiles in order to return to Sierra Leona, they arrived on the borders of Monomotapa, where being defeated, they were forced to remain in the provinces of Anſiko. Be this as it will; the Anſikans yielded not in the leaſt to the Giagas in fierceneſs and barbarity. They are ſo accuſtomed to the eating of human fleſh, that it is aſſerted they have markets where it is publicly ſold, and that there are no other graves for the dead than the bellies of the living. They try the courage of their priſoners of war by ſhooting at them as at marks, directing their arrows above or around their heads; and whoever diſcovers the leaſt ſign of fear, is immediately devoured without remedy. Thoſe who appear intrepid and reſolute, have their noſes and ears bored, and two fore-teeth of the upper jaw drawn. They are then improved in barbarity, by accuſtoming them to the moſt horrid cruelties.

The Anſikans are neat, well-proportioned, and ſtrong, wandering about from place to place, without either ſowing or reaping. They are dreaded for their extreme brutality, and never traded with by the Europeans. Their language is barbarous, and difficult to be learned, even by the inhabitants of Congo. The moſt diſtinguiſhed among them wear red and black caps of Portugueſe velvet; the lower ranks go naked from the waiſt upwards; and, to preſerve their health, anoint their bodies with a compoſition of pounded white ſandal-wood, and palm-oil. Their arms are battle-axes, and ſmall but very ſtrong bows adorned with ſerpents ſkins. Their ſtrings are made of ſupple and tender ſhoots of trees, that will not break, and their arrows of hard and light wood. Theſe people, who kill birds flying, ſhoot with ſuch ſurpriſing ſwiftneſs, that they can diſcharge 28 arrows from the bow before the firſt falls to the

ground. With equal dexterity they manage their battle-axes; one end of which is ſharpened and cuts like a wedge, and the other flattened like a mallet, with an handle ſet between, about half the length of the iron, rounded at the end like an apple, and covered with the ſkin of a ſerpent.—The current money in this country is the zimbis or ſhell, which is fiſhed for, and paſſes among ſeveral African nations.—They worſhip the ſun as their chief deity; whom they repreſent by the figure of a man, and the moon by that of a woman. They have alſo an infinite number of inferior deities, each individual having a particular idol whom he addreſſes on certain occaſions.

ANSPACH (the marquiſate of), is a ſmall territory of Franconia in Germany, bounded on the north by the biſhoprics of Wartſburg and Bamberg, which laſt likewiſe lies to the weſt; the earldoms of Holach and Oeting, with the biſhopric of Aichſtet, lie on the ſouth; and the palatinate of Bavaria and the territory of Nuremberg on the eaſt. The country is fruitful, and interſperſed with woods, which renders it agreeable for hunting. Beſides the city of Anſpach, which is the capital, the chief towns are Kregſin, Swaſbach, Kreilſheim, Rot, and Waſſer-Truding.

ANSTIS (John), an able herald, was born at St. Neot's in Cornwall, Sept. 28, 1669, being ſon of John Anſtis, of that place, by Mary, daughter and coheir of George Smith. He was admitted at Exeter College, Oxford, 1685, and three years after at the Middle Temple; repreſented the borough of St. Germans, 1702, 1703, 1704, in parliament, where he diſtinguiſhed himſelf againſt the bill for occaſional conformity, for which he got ranked in the liſt of the tackers, printed about that time. He was appointed deputy-general of the auditors of the impreſt, 1703, which office he never executed; one of the principal commiſſioners of prizes, 2 Anne; Garter king of arms, 13 Anne; in which place he died, March 4, 1743-4, and was buried the 23d following, in a vault in the pariſh church of Dulo in Cornwall. He publiſhed, in 1706, "A Letter concerning the Honour of Earl Marſhal," 8vo. in 1720, "The Form of the Inſtallation of the Garter," 8vo. in 1724. "The Regiſter of the moſt noble Order of the Garter, uſually called the Black Book, with a Specimen of the Lives of the Knights," 2 vols. folio; and, in 1715, "Obſervations introductory to an hiſtorical Eſſay on the Knighthood of the Bath," 4to. intended as an introduction to the hiſtory of that order, for which the ſociety of antiquaries had begun to collect materials. His "Aſpilogia, a Diſcourſe on Seals in England," with beautiful draughts, almoſt fit for publication, of which Mr. Drake read an abſtract to the ſociety in 1735-6; and two folio volumes of drawings of ſepulchral monuments, ſtone circles, croſſes, and caſtles, in the three kingdoms; were purchaſed, with a MS. "Hiſtory of Launceſton," and many other curious papers (particularly a good collection of epitaphs and other inſcriptions in England, and many in Wales, all fac-ſimiles), at the ſale of Mr. Anſtis's library of MSS. 1768, by Thomas Aſtle, eſq. F.R. and A.SS. Beſides theſe, he left in MS. two large folio volumes on the office, &c. of Garter King at Arms, and on Heralds in general; memoirs of the Talbot, Carew, Granville, and Courtney families; the Antiquities of Cornwall; "Collections relating to the Pariſh of Colliton in Devonſhire," containing matters relative to the tithes of that church (of which his ſon, George Anſtis, was vicar), in a diſpute before the court of Exchequer in 1740, depoſited in Dr. Ducarel's library; and alſo large collections relative to All Soul's College, Oxford, by whom they were bought. Sixty-four pages of his Latin anſwer to "The Caſe of Founders' Kinſmen," were printed in 4to. with many coats of arms. His "Curia Militaris, or a Treatiſe on the Court of Chivalry, in three books," was printed in 1702, 8vo. His eldeſt ſon, John Anſtis, eſq. who had been educated as a gentleman-commoner at Corpus Chriſti College, Oxford, was, at the revival of the order of the Bath in 1725, joined to his father in the office of Garter; and had the additional office of genealogiſt and regiſter of the Bath. At the opening of Dr. Radcliffe's library, 1749, he was, with ſeveral other members of that univerſity created LL.D. He died a bachelor, Dec. 5, 1754.

ANTEDILUVIANS (*Encycl.*). The only thing we know as to the religious rites of the Antediluvians is, that they offered ſacrifices, and that very early, both of the fruits of the earth, and of animals; but whether the blood and fleſh of the animals, or only their milk and wool, were offered, is a diſputed point.—Some have endeavoured to prove, that all the patriarchs from Adam had ſtated places, and annual and weekly times, ſet apart for divine worſhip, and alſo a ſeparate maintenance for the prieſt: all which particulars may be true, though they cannot be made out from ſcripture. But what is more extraordinary, they pretend to tell us the very day of the week on which the antediluvian ſabbath was kept; and that it was the ſame with the Chriſtian ſabbath, or Sunday.

Of the arts and ſciences of theſe people we have not much more to ſay. They ſeem rather to have ſpent their time in luxury and wantonneſs, to which the abundant fertility of the firſt earth invited them, than in diſcoveries or improvements, which probably they ſtood much leſs in need of than their ſucceſſors. The art of working metals was found out by the laſt generation of Cain's line; and muſic, which they might be ſuppoſed to practiſe for their pleaſure, was not brought to any perfection, if invented, before the ſame generation. Some authors have ſuppoſed aſtronomy to have been cultivated by the antediluvians, though this is probably owing to a miſtake of Joſephus: but it is to be preſumed, the progreſs they made therein, or in any other ſcience, was not extraordinary; it being even very doubtful whether letters were ſo much as known before the flood; whatever is pretended by ſome men, who have conceived ſo high an opinion of Adam's knowledge, that they ſuppoſe it to have been almoſt univerſal: nor can any thing be inferred from the books attributed to that patriarch, or to Seth, and Enoch, which are forgeries too groſs to deſerve any conſideration.

As to their politics and civil conſtitutions, we have not ſo much as any circumſtances whereon to build conjectures. It is probable, the patriarchal form of government, which certainly was the firſt, was ſet aſide when tyranny and oppreſſion began to take place, and much ſooner among the race of Cain than of Seth. It ſeems alſo, that their communities were but few, and conſiſted of vaſtly larger numbers of people than any formed ſince the flood: or rather, it is a queſtion, whether, after the union of the two great families of Seth and Cain, there were any diſtinction of civil ſocieties, or diverſity of regular governments, at all. It is more likely, that all mankind then made but one great nation, though living in a kind of anarchy, divided into ſeveral diſorderly aſſociations; which, as it was almoſt the natural conſequence of their having, in all probability, but one common language, ſo it was a circumſtance which greatly attributed to that general corruption, which otherwiſe perhaps could not have ſo univerſally overſpread the antediluvian world. And for this reaſon chiefly, as it ſeems, ſo ſoon as the poſterity of Noah were ſufficiently increaſed, a plurality of tongues was miraculouſly introduced, in order to divide them into diſtinct ſocieties, and thereby prevent any ſuch total depravation for the future.

As an illuſtration of the remarks contained in our original article, we here introduce a table, made upon the principles there ſtated by Mr. Whiſton. It ſhews at leaſt what number of people might have been in the antediluvian world.

Number of mankind.	Year of the world.	Year of doubling.	Series.

As to any hiſtory of the tranſactions before the flood, beſides the general account already given, we are left entirely in the dark by the ſacred hiſtorian. The Jews and eaſtern nations, however, have made ample amends for the ſilence of Moſes, by the abundance of fables they have invented. The only part of their traditions which can be connected in any thing like hiſtory is what follows.

After the death of Adam, Seth with his family ſeparated themſelves from the profligate race of Cain, and choſe for their habitation the mountain where Adam was buried, the Cainites remaining below in the plain where Abel was killed; and, according to our hiſtorians, this mountain was ſo high, that the inhabitants could hear the angels ſinging the praiſes of God, and even join them in that ſervice. Here they lived in great purity and ſanctity of manners. Their conſtant employment was praiſing God, from which they had few or no avocations; for their only food was the fruits of the trees which grew on the mountain, ſo that they had no occaſion to undergo any ſervile labours, nor the trouble of ſowing and gathering in their harveſt. They were utter ſtrangers to envy, injuſtice, or deceit. Their only oath was, "By the blood of Abel;" and they every day went up to the top of the mountain to worſhip God, and to viſit the body of Adam, as a mean of procuring the Divine bleſſing. Here, by contemplation of the heavenly bodies, they laid the foundations of the ſcience of aſtronomy; and, leſt their invention ſhould be forgotten, or loſt before they were publicly known, underſtanding, from a prediction of Adam's, that there would be a general deſtruction of all things, once by fire, and once by water, they built two pillars, one of brick, and the other of ſtone, that if the brick one happened to be overthrown by the flood, or otherwiſe deſtroyed, that of ſtone might remain. This laſt, Joſephus ſays, was to be ſeen in his time in the land of Siriad (thought to be in Upper Egypt)

The deſcendants of Seth continued in the practice of virtue till the fortieth year of Jared, when an hundred of them, hearing the noiſe of the muſic, and the riotous mirth of the Cainites, agreed to go down to them from the holy mountain. On their arrival in the plain, they were immediately captivated by the beauty of the women, who were naked, and defiled themſelves with them; and this is what is meant by the intermarriage of the ſons of God with the daughters of men, mentioned by Moſes. The example of theſe apoſtate ſons of Seth was ſoon followed by others; and from time to time, great numbers continued to deſcend from the mountain, who, in like manner, took wives from the abandoned race of Cain. From theſe marriages ſprung the giants (who, however, according to Moſes, exiſted before); and, theſe were as remarkable for their impiety as for their ſtrength of body, tyrannizing in a cruel manner, and polluting the earth with wickedneſs of every kind. This defection became at laſt ſo univerſal, that none were left in the holy mountain, except Noah, his wife, three ſons, and their wives.

Beroſus, a Chaldæan hiſtorian, who flouriſhed in the time of Alexander the Great, enumerates ten kings who reigned in Chaldea before the flood: of whom the firſt, called *Alorus*, is ſuppoſed to be Adam, and Xiſuthrus, the laſt, to be Noah. —This Alorus declared that he held his kingdom by divine right, and that God himſelf had appointed him to be the paſtor of the people. According to our hiſtorian, in the firſt year of the world, there appeared out of the Red Sea, at a place near the confines of Babylonia, a certain *irrational* animal called *Oannes*. He had his whole body like that of a fiſh; but beneath his fiſh's head grew another of a different ſort (probably a human one). He had alſo feet like a man, which proceeded from his fiſh's tail, and a human voice; the picture of him being preſerved ever after. This animal converſed with mankind in the day-time, without eating any thing: he delivered to them the knowledge of letters, ſciences, and various arts: he taught them to dwell together in cities, to erect temples, to introduce laws, and inſtructed them in geometry: he likewiſe ſhewed them how to gather ſeeds and fruits, and imparted to them whatever was neceſſary and convenient for a civilized life: but after this time there was nothing excellent invented. When the ſun ſet, Oannes retired into the ſea, and continued there all night. He not only delivered his inſtructions by word of mouth, but, as our author aſſures us, wrote of the origin of things, and of political economy. This, or a ſimilar animal, is alſo mentioned by other authors.

Of Alaſporus, the ſecond king, nothing remarkable is related. His ſucceſſor, Amelon, or Amillarus, was of a city called *Pantabibla*. In his time another animal reſembling the former appeared, 260 years after the beginning of this monarchy. Amelon was ſucceeded by Metalarus, and he by Daonus, all of whom were of the ſame city. In his time, four animals, of a double form, half man and half fiſh, made their appearance. Their names were *Euedocus*, *Eneugamus*, *Encubulus*, and *Anementus*. Under the next prince, who was

likewiſe of Pantabibla, appeared another animal of the ſame kind, whoſe name was *Odacon*. All theſe explained more particularly what had been conciſely delivered by Oannes.

In the reign of the tenth king, Xiſuthrus, happened the great deluge, of which our author gives the following account: Cronus, or Saturn, appeared to Xiſuthrus in a dream, and warned him, that on the fifteenth of the month Dæſius mankind would be deſtroyed by a flood; and therefore commanded him to write down the original, intermediate ſtate, and end of all things, and bury the writings under ground in Sippara, the city of the ſun; that he ſhould alſo build a ſhip, and go into it with his relations and deareſt friends, having firſt furniſhed it with proviſions, and taken into it fowls and four-footed beaſts; and that, when he had provided every thing, and was aſked whither he was ſailing, he ſhould anſwer, *To the gods, to pray for the happineſs of mankind.* Xiſuthrus did not diſobey, built a veſſel, whoſe length was five furlongs, and breadth two furlongs. He put on board all he was directed, and went into it with his wife, children, and friends. The flood being come, and ſoon ceaſing, Xiſuthrus let out certain birds, which finding no food, nor place to reſt upon, returned again to the ſhip. Xiſuthrus, after ſome days, let out the birds again; but they came back again to the ſhip, having their feet daubed with mud: but when they were let out a third time, they came no more to the ſhip, whereby Xiſuthrus underſtood that the earth appeared again; and thereupon he made an opening between the planks of the ſhip, and ſeeing that it reſted on a certain mountain, he came out with his wife, and his daughter, and his pilot; and having worſhipped the earth, and raiſed an altar, and ſacrificed to the gods, he and thoſe who went out with him diſappeared. They who were left behind in the ſhip, finding Xiſuthrus, and the perſons that accompanied him, did not return, went out themſelves to ſeek him, calling him aloud by his name: but Xiſuthrus was no more ſeen by them; only a voice came out of the air, which enjoined them, as their duty was, to be religious; and informed them, that, on account of his own piety, he was gone to dwell with the gods; and that his wife, and daughter, and pilot, were partakers of the ſame honour. It alſo directed them to return to Babylon, and that, as the fates had ordained, they ſhould take the writings from Sippara, and communicate them to mankind; and told them, that the place where they were was the country of Armenia. When they heard this, they offered ſacrifice to the gods, and unanimouſly went to Babylon; and when they came thither, they dug up the writings at Sippara, built many cities, raiſed temples, and rebuilt Babylon again.

The Egyptians, who would give place to no nation in point of antiquity, have alſo a ſeries of kings, who, as is pretended, reigned in Egypt before the flood; and, to be even with the Chaldeans, began their account the ſame year that theirs does according to Beroſus.

There was an ancient chronicle extant among the Egyptians, not many centuries ago, which contained 30 dynaſties of princes who ruled in that country, by a ſeries of 113 generations, through an immenſe ſpace of 36,525 years, during which Egypt was ſucceſſively governed by three different races; of whom the firſt were the Auritæ, the ſecond the Miſtræi, and the third the Egyptians.

But this extravagant number of years, Manetho (to whoſe remains we muſt chiefly have recourſe for the ancient Egyptian hiſtory) has not adopted; however, in other reſpects he is ſuppoſed to have been led into errors in chronology by this old chronicle, which yet ſeems to have been a compoſition ſince Manetho's time.

The account given by Beroſus is manifeſtly taken from the writings of Moſes; but we have another account of the firſt ages of mankind, in which no mention is made of the flood at all. This is contained in ſome fragments of a Phœnician author called *Sanchoniatho*, who is by ſome ſaid to have been contemporary with Gideon, by others to have lived in the days of King David; while ſome boldly aſſert there never was ſuch a perſon, and that the whole is a fiction of Peilo-Biblius, in oppoſition to the books Joſephus wrote againſt Apion. To gratify the reader's curioſity, however, we have ſubjoined an account of the firſt ten generations mentioned by him, which are ſuppoſed by the compilers of the univerſal hiſtory to correſpond to the generations mentioned by Moſes before the flood.

Sanchoniatho having delivered his coſmogony, or generation of the other parts of the world, begins his hiſtory of mankind with the production of the firſt pair of mortals, whom Philo, his tranſlator, calls *Protogonus* and *Æon*, the latter of whom found out the food which was gathered from trees.

Their iſſue were called *Genus* and *Genea*, and dwelt in Phœnicia; but when the great drought came, they ſtretched forth their hands to heaven towards the ſun; for him they thought the only God and Lord of heaven, calling him *Beelſamen*, which in Phœnician is, *Lord of heaven*; and in Greek, *Zeus*.

Afterwards from Genus, the ſon of Protogonus and Æon, other mortal iſſue was begotten, whoſe names were *Phos*, *Pur*, and *Phlox*; that is, *Light*, *Fire*, and *Flame*. Theſe found out the way of generating fire, by the rubbing of pieces of wood againſt each other, and taught men the uſe thereof. Theſe begat ſons of vaſt bulk and height, whoſe names were given to the mountains on which they ſeized: ſo from them were named mount *Caſſius*, and *Libanus*, *Antilibanus*, and *Brathys*.

Of theſe laſt were begotten Memrumus, and Hypſuranius, but they were ſo named by their mothers, the women of thoſe times, who without ſhame lay with any man they could light upon. Hypſuranius inhabited Tyre, and he invented the making of huts of reeds and ruſhes, and the papyrus. He alſo fell into enmity with his brother Uſous, who firſt invented a covering for his body out of the ſkins of the wild beaſts which he could catch. And when violent tempeſts of winds and rains came, the boughs in Tyre, being rubbed againſt each other, took fire, and burnt the wood there. And Uſous, having taken a tree, and broken off its boughs, firſt was ſo bold as to venture upon it into the ſea. He alſo conſecrated two rude ſtones, or pillars, to fire and wind, and he worſhipped them, and poured out to them the blood of ſuch wild beaſts as had been caught in hunting. But when theſe were dead, thoſe that remained conſecrated to them ſtumps of wood and pillars, worſhipping them, and kept anniverſary feaſts upon them.

Many years after this generation, came Agrens and Halicus, the inventors of the arts of hunting and fiſhing, from whom huntſmen and fiſhermen are named.

Of theſe were begotten two brothers, the inventors of iron and of the forging thereof: one of theſe, called *Chryſor*, the ſame with Hepheſtus, or Vulcan, exerciſed himſelf in words and charms and divinations; found out the hook, bait, and fiſhing line, and boats ſlightly built, and was the firſt of all men that ſailed. Wherefore he alſo was worſhipped after his death for a god; and they called him *Zeus Michius*, or Jupiter the engineer; and ſome ſay, his brothers invented the way of making walls of brick.

Afterwards from this generation came two brothers; one of

whom was called *Technites*, or the artiſt; the other *Genus Autochthon* [the home-born man of the earth]. Theſe found out to mingle ſtubble, or ſmall twigs, with the brick earth, and to dry them in the ſun, and ſo made tyling.

By theſe were begotten others: of which one was called *Agrus* [field]; and the other *Agrouerus*, or *Agrotes* [huſbandman], who had a ſtatue much worſhipped, and a temple carried about by one or more yoke of oxen, in Phœnicia, and among thoſe of Byblus he is eminently called the *greateſt of the gods*. Theſe found out how to make courts about men's houſes, and fences, and caves or cellars. Huſbandmen, and ſuch as uſe dogs in hunting, derive from theſe; and they are alſo called *Aletæ* and *Titans*.

Of theſe were begotten Amynus and Magus, who ſhewed men to conſtitute villages and flocks.

In theſe men's age there was one Eliun, which imports in Greek *Hypſiſtus* [the moſt high], and his wife was named *Beruth*, who dwelt about Byblus: and by him was begotten one Epigeus, or Autochthon, whom they afterwards called *Uranus* [heaven]; ſo that from him that element which is over us, by reaſon of its excellent beauty, is called *heaven:* and he had a ſiſter of the ſame parents, called *Ge* [the earth]; and, by reaſon of her beauty, the earth had her name given to it.

Hypſiſtus, the father of theſe, dying in fight with wild beaſts, was conſecrated, and his children offered ſacrifices and libations to him.—But Uranus taking the kingdom of his father, married his ſiſter Ge, and had by her four ſons; Ilus, who is called *Cronus* [or Saturn]; Betylus; Dagon, who is Siton or the god of corn; and Atlas: but by other wives Uranus had much iſſue.

ANTES, in architecture, are ſmall pilaſtres placed at the corners of buildings.

ANTHESTERIA (*Encycl.*). This feaſt, celebrated by the Athenians in honour of Bacchus, laſted three days, the 11th, 12th, and 13th of the month; each of which had a name ſuited to the proper office of the day. The firſt day of the feaſt was called πιθοιγια, *i. e.* opening of the veſſels; becauſe on this day they tapped the veſſels, and taſted the wine. The ſecond day they called χοες, *congii*, the name of a meaſure containing the weight of ten pounds; on this they drank the wine prepared the day before. The third day they called χυτροι, *kettles:* on this day they boiled all ſorts of pulſe in kettles; which however they were not allowed to taſte, as being offered to Mercury.

ANTHONY, or ANTONY (Dr. Francis), a very learned phyſician and chemiſt in the latter end of the ſixteenth and beginning of the ſeventeenth centuries. His father was an eminent goldſmith in the city of London, and had an employment of conſiderable value in the jewel office under the reign of Queen Elizabeth. This ſon of his was born April 16, 1550; and having been carefully inſtructed in the firſt rudiments of learning while at home, was, about the year 1569, ſent to the univerſity of Cambridge, where he ſtudied with great diligence and ſucceſs, and ſome time in the year 1574 took the degree of maſter of arts. It appears from his own writings, that he applied himſelf, for many years that he ſtudied in that univerſity, to the theory and practice of chemiſtry, with ſedulous induſtry, and made no ſmall progreſs. When he left Cambridge and came up to London, he began to publiſh to the world the effects of his chemical ſtudies, and in the year 1598 ſent abroad his firſt treatiſe, concerning the excellency of a noſtrum drawn from gold, which he called *aurum potabile*, and which led to much literary controverſy; but not having taken the neceſſary precautions of addreſſing himſelf to the College of Phyſicians, for their licence, he fell under their diſpleaſure, and in the year 1600 had various ſtruggles with them, and was impriſoned for non-payment of the fines impoſed on him. Dr. Goodal tells us, that this learned ſociety thought him weak and ignorant in phyſic, yet it ſeems there were other learned bodies of another opinion; ſince after all theſe cenſures, and being toſſed about from priſon to priſon, he became doctor of phyſic in our own univerſities. What chiefly contributed to maintain his reputation, and thereby reflected credit on his medicine, was his unblemiſhed character in private life. He died on the 26th of May, 1623, in the 74th year of his age. Dr. Anthony was twice married, and by his laſt wife, whoſe name was Elizabeth, he had two ſons, John and Charles, both phyſicians. The former ſold his father's *aurum potabile*, and lived by it very handſomely; the latter ſettled in the town of Bedford, where he attained the character of a learned, honeſt, and induſtrious man in his profeſſion.

ANTHONY (St.), was born in Egypt in 251, and inherited a large fortune, which he diſtributed among his neighbours and the poor, retired into ſolitude, founded a religious order, built many monaſteries, and died anno 356. Many ridiculous ſtories are told of his conflicts with the devil, and of his miracles: there are ſeven epiſtles extant, attributed to him.

ANTICS, in architecture (probably a corruption of *Antiques*), figures of men and animals placed as ornaments to buildings.

ANTI-CHRIST (*Encycl.*). Father Malvenda, a Jeſuit, publiſhed a large work entitled *Antichriſto*, in which this ſubject is amply diſcuſſed. It conſiſts of thirteen books. In the firſt, he relates all the opinions of the fathers with regard to Antichriſt. In the ſecond he ſpeaks of the times when he ſhall appear; and ſhews, that all the fathers who ſuppoſed Antichriſt to be near at hand, judged the world was near its period. In the third, he diſcourſes of his origin and nation; and ſhews that he is to be a Jew, of the tribe of Dan: this he founds on the authority of the fathers; on the paſſage in Geneſis xlix. 17. *Dan ſhall be a ſerpent by the way*, &c.; on that of Jeremy viii. 16. where it is ſaid, *The armies of Dan ſhall devour the earth*; and on Rev. vii. where St. John, enumerating all the tribes of Iſrael, makes no mention of that of Dan. In the fourth and fifth books, he treats of the ſigns of Antichriſt. In the ſixth, of his reign and wars. In the ſeventh, of his vices. In the eighth, of his doctrine and miracles. In the ninth, of his perſecutions: and in the reſt, of the coming of Enoch and Elias, the converſion of the Jews, the reign of Jeſus Chriſt, and the death of Antichriſt, after he has reigned three years and an half. See alſo *Lowman on the Revelation*.

ANTICIRRHA (Strabo); ANTICYRA (Pauſanias, Stephanus, Livy); a town in Phocis, on the Corinthian bay, oppoſite to Cirrha, lying to the weſt, on the ſame bay. Another *Anticirrha*, or *Anticyra*, on the Sinus Maliacus, and near mount Oeta, where grew the beſt hellebore (Strabo, Stephanus); but which Pauſanias aſcribes to the *Anticyra* of Phocis: Hence the adage, *Naviget Anticyram* (Horace), uſed of a perſon of an unſound mind. The gentilitius name is *Anticyreus* (Pauſanias).

ANTICUS, a term uſed by the old anatomiſts, importing, that the part with which it is joined ſtands before ſome others: Thus, we meet with *ſerratus anticus, peronæus anticus*.

ANTIGONUS (*Encycl.*), one of Alexander's commanders, conquered Eumenes, and expelled Seleucus out of Syria; who flying to Ptolemy Lagus in Egypt, a bloody war commenced betwixt him, Caſſander, and Antigonus, wherein, by the help of his ſon Demetrius, Antigonus prevailed, and built the city Antigonia, anno Romæ 448. Afterward Caſſander, Seleucus, and Lyſimachus, uniting againſt him, routed him,

n league with King Pyrrhus, and ſlew him near Epirus, 301 ears before Chriſt.

ANTICONUS, king of the Jews, was the ſon of Ariſtobu-us. He entered into an alliance with the king of the Par-hians, and beſieged Jeruſalem. He cut off his uncle Hirca-us's ears, to incapacitate him for the high-prieſthood; and ut Joſephus, Herod's brother, to death. At length, Herod ook him and ſent him to M. Anthony; who, to gratify He-od, cut off his head, and thereby extinguiſhed the Aſmo-neans, who had reigned 126 years. This happened 36 years efore Chriſt.

ANTIHECTICUM POTERII, the name of a medicine for-merly much celebrated, but now laid aſide.

ANTIMETER, or REFLECTING SECTOR, an inſtrument nvented by Mr. Garnard, calculated for meaſuring ſmall angles with greater accuracy than by the ſextant or other inſtruments commonly uſed.

The frame of it is ſimilar to that of Hadley's quadrant, having two radii, a limb, and braces; but with this difference, that the further radius is produced upwards of four inches beyond the centre of motion of the index; and the great ſpe-culum, or what is called the index glaſs in Hadley's quadrant, being placed there is called the *upper centre*. In this inſtrument there is no proviſion for the back obſervation. The horizon glaſs is like that in Hadley's quadrant; there are two ſight-vanes, to ſuit two different ſituations of the large ſpeculum or object-glaſs: theſe vanes are adapted to receive a ſmall teleſcope. On the centre of the index, where the index-glaſs of Hadley's quadrant is fixed, is a braſs or bell-metal ſemicircle, two inches in diameter, and one-eighth of an inch thick: this ſemicircle is ſcrewed faſt to the index, in ſuch a manner that the axis of the index is a tangent to it. On the upper centre are two circular braſs plates, which re-volve concentrically, either together or ſeparately. The under plate has a lever, or part perpendicular to the plane of the inſtrument, projecting downwards, a little beyond the lower centre: this lever is acted upon by the ſemicircular plate at the lower centre, to which it is always kept cloſe by a ſpring on the other ſide. In the upper of the above-mentioned cir-cular plates are two circular perforations or ſlits, through one of which a ſcrew takes into the head of the inſtrument, and through the other a ſcrew takes into the lower moveable plate. The large ſpeculum is faſtened to the upper plate; and by the above-mentioned ſcrews the poſition of this glaſs may be al-tered. A circular plate is fixed to the lower centre by three pillars: in its centre is a nut to admit a ſcrew, by which the plate carrying the large ſpeculum may be faſtened here occa-ſionally.

The ſcale on the limb is divided into 45 equal parts or degrees, and not into half-degrees as is the caſe in Hadley's quadrant, by reaſon of the double reflection. Theſe diviſions are numbered in a retrograde order; zero being at the extremity of the further radius. Although the limb contains 45 degrees, yet the greateſt angle which can be meaſured, the large ſpeculum remaining fixed to the circular plate, is 10° 18′ 21″·8; the diſtance between the two centres being four inches, and the radius of the ſemicircle one inch. Agreeably to theſe dimenſions, the inventor has given a table exhibiting the value of each primary diviſion on the limb; he hath alſo given a more ample table, adapted to a diſtance between the centres of three times the radius of the ſemicircle, which he ſays, hath been found the moſt convenient in practice. If an angle greater than 10° 18′ is wanted, it may be meaſured by the method of *anticipation*, as the inventor calls it, which is as follows: Let the ſcrew which faſtens the two circular plates on the upper centre be made faſt, and looſen the ſcrew which faſtens the upper circular plate to the inſtrument: now adjuſt the glaſſes by the uſual method: bring forward the in-dex to any given diviſion on the limb, and make it faſt; alſo faſten the ſcrew which was before looſe, and looſen the other ſcrew; then bring the index to zero, and proceed as before.

From the inventor we have the following directions for ad-juſting and uſing the antimeter.

"The firſt thing to be attended to is, to ſet the horizon-glaſs perpendicular to the plane of the inſtrument, which is performed as follows: Hold the inſtrument with its plane per-pendicular to the horizon, and look over backwards into the glaſs and beyond it. If the limb of the inſtrument appears in a right line with its reflection, the glaſs is upright; but if it does not appear ſo, looſen or tighten the little ſcrew on the foot of the glaſs until it be adjuſted: then with the inſtrument, as in taking an altitude, look through the ſight-vane or tele-ſcope at ſome diſtant object, with the index fixed in any in-tended ſituation; the two ſcrews at the upper centre being looſe, turn the glaſs about till the ſame object appears nearly in the ſame part of the horizon-glaſs: next hold it in a ho-rizontal poſition, and adjuſt the object-glaſs or large ſpeculum with the ſcrews which are behind and before, on the foot of it, till the object and its reflection are ſeen in the ſame ho-rizontal line. Laſtly, with the inſtrument upright, turn the tangent-ſcrew belonging to the horizon-glaſs at the back of the inſtrument, until there be a perfect coincidence of the object and its reflection that way, and the adjuſtments are complete."

ANTINOUS, the favourite of Adrian, was born at Bithy-nus in Bithynia. His beauty engaged the heart of Adrian in ſuch a manner, that there never was a more boundleſs and ex-travagant paſſion than that of this emperor toward this youth. After his death, the emperor ordered divine honours to be paid him.

ANTIO, a promontory of Italy, in St. Peter's Patrimony, near which is a harbour, lately made. It takes its name from the ancient city of Antium, the ruins of which extend over a large track of land.

ANTIOCA, or ANTIOCH, an iſland in the Mediterranean, near Sardinia, taken from his Sardinian majeſty, by the French, in February 1793, but evacuated ſoon after.

ANTIOCH (*Encycl.*). This city ſtood on the river Orontes, about twenty miles from the place where it empties itſelf into the Mediterranean; being equally diſtant from Con-ſtantinople and Alexandria in Egypt, that is, about 700 miles from each. Seleucus Nicator called it *Antioch*, from his fa-ther's name, according to ſome; or from that of his ſon, ac-cording to others. He built ſixteen other cities bearing the ſame name; of which one, ſituated in Piſidia, is probably that where the name of *Chriſtians* was firſt given to the fol-lowers of Jeſus Chriſt. But that ſituated on the Orontes, by far eclipſed, not only all the others of this name, but all the cities built by Seleucus. Antigonus, not long before, had founded a city in that neighbourhood, which from his own name he had called *Antigonia*, and deſigned it for the capital of his empire; but it was razed to the ground by Seleucus, who employed the materials in building his metropolis, and alſo tranſplanted the inhabitants thither.

The city of Antioch was afterwards known by the name of *Tetrapolis*, being divided as it were into four cities, each of them being ſurrounded with its proper wall, beſides a com-mon one which incloſed them all. The firſt of theſe cities was built by Seleucus Nicator, as already mentioned; the ſecond by thoſe who flocked thither on its being made the capital of the Syro-Macedonian empire; the third by Seleucus Callini-cus; and the fourth by Antiochus Epiphanes.—About four

er five miles diſtant, ſtood a place called *Daphne*, which was nevertheleſs reckoned a ſuburb of Antioch. Here Seleucus planted a grove, and in the middle of it built a temple which he conſecrated to Apollo and Diana, making the whole an aſylum. To this place the inhabitants of Antioch reſorted for their pleaſures and diverſions: whereby it became at laſt ſo infamous, that, "to live after the manner of Daphne," was uſed as a proverb to expreſs the moſt voluptuous and diſſolute way of living. Here Lucius Verus, the colleague of M. Aurelius, choſe to take up his reſidence, inſtead of marching againſt the Parthians; while his general Caſſius forbad by proclamation any of his ſoldiers to enter or even go near the place. In ſhort, ſo remarkable was Daphne of old, that the metropolis itſelf was diſtinguiſhed by it, and called *Antioch near Daphne*.

Though Antioch continued to be, as Pliny calls it, the queen of the Eaſt, for near 1600 years; yet ſcarce any city mentioned in hiſtory hath undergone ſuch calamities, both from the attacks of its enemies, and its being naturally ſubjected to earthquakes—The firſt diſaſter, mentioned in hiſtory, which befel the Antiochians, happened about 145 years before Chriſt. Being at that time very much diſaffected to the perſon and government of Demetrius their king, they were continually raiſing tumults and ſeditions; inſomuch that he found himſelf at laſt obliged to ſolicit aſſiſtance from the Jews; and was furniſhed by Jonathan, one of the Maccabees, with 3000 men: by which reinforcement believing himſelf ſufficiently ſtrong to reduce the mutineers by force, he ordered them immediately to deliver up their arms. This unexpected order cauſed a great uproar in the city. The inhabitants ran to arms, and inveſted the king's palace, to the number of 120,000, with a deſign to put him to death. All the Jews haſtened to his relief, fell upon the rebels, killed 100,000 of them, and ſet fire to the city. On the deſtruction of the Syrian empire by the Romans, Antioch ſubmitted to them as well as the other cities of that kingdom, and continued for a long time under their dominion. About the year 115, in the reign of the emperor Trajan, it was almoſt entirely ruined by one of the moſt dreadful earthquakes mentioned in hiſtory. Trajan himſelf happened to be there at that time, being returned from an expedition againſt the Parthians; ſo that the city was then full of troops, and ſtrangers come from all quarters either out of curioſity or upon buſineſs and embaſſies: the calamity was by this means felt almoſt in every province of the Roman empire. The earthquake was preceded by violent claps of thunder, unuſual winds, and a dreadful noiſe under ground. The ſhock was ſo terrible, that great numbers of houſes were overturned, and others toſſed to and fro like a ſhip at ſea. Thoſe who happened to be in their houſes were for the moſt part buried under their ruins: thoſe who were walking in the ſtreets, or in the ſquares, were, by the violence of the ſhock, daſhed againſt each other, and moſt of them either killed or dangerouſly wounded.—This earthquake continued, with ſmall intermiſſion, for many days and nights; ſo that vaſt numbers periſhed. The moſt violent ſhock, according to the Acts of St. Ignatius, was on a Sunday, December 23. By this Trajan was much hurt, but eſcaped through a window. Dio Caſſius pretends, that he was taken out of the window by one who exceeded the human ſize in tallneſs. The ſame hiſtorian adds, that mount Liſon, which ſtood at a ſmall diſtance from the city, bowed with its head and threatened to fall down upon it; that other mountains fell; that new rivers appeared; and others, that had flowed before, forſook their courſe and vaniſhed. When the earthquake ceaſed, a woman was heard crying under the ruins; which being immediately removed, ſhe was found, with a living child in her arms. Search was made for others; but none was found alive, except one child, which continued ſucking its dead mother.

No doubt, Trajan, who was an eye-witneſs of this terrible calamity, would contribute largely towards the re-eſtabliſhment of Antioch in its ancient ſplendor. Its good fortune, however, did not continue long; for in 155, it was almoſt entirely burnt by accidental fire; when it was again reſtored by Antoninus Pius. In 176 or 177, the inhabitants having ſided with Caſſius, the above-mentioned Roman general, who had revolted from M. Aurelius, that emperor publiſhed a ſevere edict againſt them, deprived them of all their privileges, ſuppreſſed their public aſſemblies, and took from them the ſhows and ſpectacles to which they were greatly addicted: but his anger being ſoon appeaſed, he reſtored them to their former condition, and even condeſcended to viſit their city. In 194, having ſided with Niger againſt Severus, the latter deprived them of all their privileges, and ſubjected Antioch as a mere village to Laodicea; but, however, pardoned them the next year, at the entreaties of his eldeſt ſon, then a child.

When the power of the Roman empire began to decline, Antioch became the bone of contention between them and the eaſtern nations; and, accordingly, on the breaking-out of a Perſian war, it was almoſt always ſure to ſuffer. In 242 it was taken and plundered by Sapor; and, though he was defeated by Gordian, it underwent the ſame misfortune in the time of Valerian, about eighteen years after; and after the defeat and captivity of Valerian, being taken by the Perſian monarch a third time, he not only plundered it, but levelled all the public buildings with the ground. The Perſians, however, being ſoon driven out, this unfortunate city continued free from any remarkable calamity till about the time of the diviſion of the Roman empire by Conſtantine in 331. It was then afflicted with ſo grievous a famine, that a buſhel of wheat was ſold for 400 pieces of ſilver. During this grievous diſtreſs, Conſtantine ſent to the biſhop 30,000 buſhels of corn; beſides an incredible quantity of all kinds of proviſions, to be diſtributed among the eccleſiaſtics, widows, orphans, &c. In the year 347, Conſtantine II. cauſed a harbour to be made at Seleucia, for the conveniency of Antioch. This was effected at an immenſe expence, the mouth of the Orontes, where the port was made, being full of ſands and rocks. When the emperor Julian ſet out on his expedition againſt the Perſians, he made a long ſtay at Antioch; during which time, many of the Roman provinces were afflicted with a famine, but which raged more violently at Antioch than in other places. The eccleſiaſtic writers of thoſe times ſay, that this famine followed Julian from place to place; and as he continued longer at Antioch than any other city, it raged more violently there than any-where elſe. To remedy this evil, Julian fixed the prices of corn, by which means the famine was greatly increaſed, the merchants conveying their corn privately to other places, ſo that the metropolis was reduced to a moſt deplorable ſituation. In 381, in the reign of Theodoſius the Great, Antioch was again viſited by a famine, accompanied by a grievous plague. The latter ſoon ceaſed: but the famine ſtill continuing, the biſhop, Libanius, applied to Icarius, count of the Eaſt, requeſting him by ſome means or other to relieve the poor, who had flocked from all parts to the metropolis, and were daily periſhing in great numbers; but to this Icarius gave no other anſwer, than that they were abhorred and juſtly puniſhed by the gods. This inhuman anſwer raiſed great diſturbances; which, however, were terminated without bloodſhed. In 387, Theodoſius finding his exchequer quite drained, and being obliged to be at an extraordinary expence in celebrating the fifth year of the reign of his ſon Arcadius, and the tenth of his own, an extraordinary tax was laid upon

all the people in the empire. Moſt of the cities ſubmitted willingly to this: but the people of Antioch, complaining of it as an unreaſonable oppreſſion, crowded to the houſe of Flavianus their biſhop, as ſoon as the edict was publiſhed, to implore his protection. Being unable to find him, they returned to the forum; and would have torn the governor in pieces, had not the officers who attended him kept back with great difficulty the enraged multitude, till he made his eſcape. Upon this, they broke ſome of the emperor's ſtatues, and dragged others through the city, uttering the moſt injurious and abuſive expreſſions againſt him and his whole family. They were, however, diſperſed by a body of archers, who, by wounding only two of the rabble, ſtruck terror into all the reſt. The governor proceeded againſt the offenders with the utmoſt cruelty; expoſing ſome to wild beaſts in the theatre, and burning others alive. He did not ſpare even the children, who had inſulted the emperor's ſtatues; and cauſed ſeveral perſons to be executed, who had been only ſpectators of the diſorder. In the mean time a report was ſpread, that a body of troops was at hand, with orders to plunder the city, and put all to the ſword, without diſtinction of ſex or age; upon which the citizens abandoned their dwellings in the utmoſt terror and confuſion, retiring to the neighbouring mountains with their wives and families. As the report proved groundleſs, ſome of them returned; but the greater part, dreading the cruelty of the governor, and the diſpleaſure of the emperor, continued in their retreats. To thoſe who returned, St. Chryſoſtom preached ſome Homilies, which have reached our times, and are greatly admired; and which are ſaid by St. Chryſoſtom himſelf, as well as ſome contemporary writers, to have had a conſiderable effect in reforming the lives of this licentious and diſſolute people. On hearing the news of this tumult, Theodoſius was ſo much enraged, that he commanded the city to be deſtroyed, and its inhabitants to be put to the ſword without diſtinction; but this order was revoked before it could be put into execution, and he contented himſelf with a puniſhment ſimilar to that inflicted by Severus above mentioned. He appointed judges to puniſh the offenders; who proceeded with ſuch ſeverity, and condemned ſuch numbers, that the city was thrown into the utmoſt conſternation. On this occaſion, St. Chryſoſtom and the hermits, who were very numerous in the neighbourhood, exerted all their eloquence in behalf of the unhappy people, and obtained a reſpite for thoſe who had been condemned. They next proceeded to draw up a memorial to the emperor in favour of the citizens in general; and being joined by Flavianus, at laſt obtained a general pardon, and had the city reſtored to all its former privileges.

In the year 458 Antioch was almoſt entirely ruined by an earthquake, which happened on the 14th of September; ſcarce a ſingle houſe being left ſtanding in the moſt beautiful quarter of the city. The like misfortune it experienced in 525, during the reign of the Emperor Juſtin; and fifteen years after, being taken by Coſrhoes king of Perſia, that inſulting and haughty monarch gave it up to his ſoldiers, who put all they met to the ſword. The king himſelf ſeized on all the gold and ſilver veſſels belonging to the great church; and cauſed all the valuable ſtatues, pictures, &c. to be taken down and conveyed to Perſia, while his ſoldiers carried off every thing elſe. The city being thus completely plundered, Coſrhoes ordered his men to ſet fire to it; which was accordingly done ſo effectually, that none of the buildings even without the walls eſcaped. Such of the inhabitants as eſcaped ſlaughter were carried into Perſia, and ſold as ſlaves.

Notwithſtanding ſo many and ſo great calamities, the city of Antioch ſoon recovered its wonted ſplendor; but in a ſhort time underwent its uſual fate, being almoſt entirely deſtroyed by an earthquake in 587, by which 30,000 perſons loſt their lives. In 634 it fell into the hands of the Saracens, who kept poſſeſſion of it till the year 858, when it was ſurpriſed by one Burtzas, and again annexed to the Roman empire. The Romans continued maſters of it for ſome time, till the civil diſſenſions in the empire gave the Turks an opportunity of ſeizing upon it as well as the whole kingdom of Syria. From them it was again taken by the Cruſaders in 1098. In 1262 it was taken by Bibaris ſultan of Egypt, who put a final period to its glory. It is now only a ſmall and contemptible village, known by the name of *Antbakia*; and the name of the river Orontes is changed for that of *Aſi*. The walls of each quarter, as well as thoſe which ſurrounded the whole, are ſtill remaining; but as the houſes are entirely deſtroyed, theſe quarters look like ſo many incloſed fields. Its former grandeur, however, appears in the many magnificent ruins that ſtill remain.

ANTIOCHUS THE GREAT, king of Syria, ſucceeded his brother Seleucus Ceraunus, 223 years before Chriſt. He was defeated in a bloody battle, by Ptolemy Philopater, near Raphia, 217 years before Chriſt. Some time after, he took Sardes; attacked the Medes and Parthians; conquered Judea, Phœnicia, and Cœloſyria; and formed the deſign of reducing Smyrna, Lampſacus, and other cities of Aſiatic Greece. Theſe cities implored the aſſiſtance of the Romans; who ſent ambaſſadors to oblige him to reſtore to Ptolemy Philadelphus the countries he had taken from him, and to ſuffer the free cities of Greece to enjoy the bleſſings of peace. Antiochus being enraged, at the ſolicitation of Hannibal declared war againſt the Romans; but was defeated by Acilius Glabrio, and loſt a great battle againſt Scipio Aſiaticus, near Magneſia: in ſhort, the Romans granted him a peace on very diſgraceful conditions. At laſt, finding his exchequer low, and going to recruit it with the plunder of the temple of Belus, he was killed by the rabble, who came to ſave the ſacred treaſure, about 187 years before Chriſt; and was ſucceeded by Seleucus Philopater.

ANTIOCHUS EPIPHANES, or *the Illuſtrious*, uſurped the throne of Syria from his nephew Demetrius, 175 years before Chriſt, and attempted to take Egypt from his nephew Ptolemy Philometer; but was repulſed. He depoſed Onias, the high-prieſt of the Jews; and beſieged and took Jeruſalem, 170 years before Chriſt, when he prophaned the temple of God, offered ſacrifices in it to Jupiter Olympius, carried away the ſacred veſſels, and committed the moſt horrid acts of cruelty. At his return to Antioch, 167 years before Chriſt, he put to death the ſeven brothers, the Maccabees, with old Eleazar. However, Matthias and Judas Maccabeus defeated his armies; and he himſelf was routed by the Elymeans, and obliged to return to Babylon, where he was ſeized with a dreadful diſeaſe, and died in the greateſt inward agonies, 164 years before the Chriſtian æra. He was ſucceeded by his ſon—

ANTIOCHUS EUPATOR, king of Syria, 164 years before Chriſt. By the advice of Lyſias his ſon-in-law, he entered Judea, with an army of 80,000 foot, and eighty elephants; but was defeated by Judas Maccabeus. He was killed by Demetrius his couſin-german, 162 years before the Chriſtian æra.

ANTIOPE (*Encycl.*), in fabulous hiſtory. Another Antiope was queen of the Amazons; and, with the aſſiſtance of the Scythians, invaded the Athenians; but was vanquiſhed by Theſeus.

ANTIPAROS (*Encycl.*). This iſland, according to Heraclides Ponticus as quoted by Stephanus, was firſt peopled by a Phœnician colony from Sidon.—According to Mr. Tournefort's account, it is about ſixteen miles in circumference, produces a little wine and cotton, with as much corn as is ne-

ceſſary for the maintenanee of ſixty or ſeventy families, who live together in a village at the end of the iſland, and are moſtly Malteſe and French corſairs.

This iſland is remarkable for a ſubterraneous cavern or grotto, accounted one of the greateſt natural curioſities in the world. It was diſcovered in the laſt century by one Magni an Italian traveller. The following account of it appears in the old Britiſh magazine, in a letter ſigned *Charles Saunders*, dated Feb. 24th, 1746-7. He ſays, "Its entrance lies in the ſide of a rock, about two miles from the ſea-ſhore; and is a ſpacious and very large arch, formed of rough and craggy rocks, overhung with brambles and a great many climbing plants, that give it a gloomineſs which is very awful and agreeable. Our ſurgeon, myſelf, and four paſſengers, attended by ſix guides with lighted torches, entered this cavern about eight o'clock in the morning, in the middle of Auguſt laſt. We had not gone twenty yards in this cavity, when we loſt all ſight of day-light: but our guides going before us with lights, we entered into a low narrow kind of alley, ſurrounded every way with ſtone all glittering like diamonds by the light of our torches; the whole being covered and lined throughout with ſmall cryſtals, which gave a thouſand various colours by their different reflections. This alley grows lower and narrower as one goes on, till at length one can ſcarce get along it. At the end of this paſſage, we were each of us preſented with a rope to tie about our middles; which when we had done, our guides led us to the brink of a moſt horrible precipice. The deſcent into this was quite ſteep, and the place all dark and gloomy. We could ſee nothing, in ſhort, but ſome of our guides with torches in a miſerable dark place, at a vaſt diſtance below us. The dreadful depth of this place, and the horror of the deſcent through a miſerable darkneſs into it, made me look back to the lane of diamonds, if I may ſo eall it, through which we had juſt paſſed; and I could not but think I was leaving heaven to deſcend into the infernal regions. The hope of ſomething fine at my journey's end, tempted me, however, to let myſelf down. After about two minutes dangling in this poſture, not without much pain as well as terror, I found myſelf ſafe, however, at the bottom; and our friends all ſoon followed the example. When we had congratulated here with one another on our ſafe deſcent; I was inquiring where the grotto, as they called it, was. Our guides, ſhaking their heads, told us, we had a great way to that yet; and led us forward about thirty yards under a roof of ragged rocks, in a ſcene of terrible darkneſs, and at a vaſt depth from the ſurface of the earth, to the brink of another precipice much deeper and more terrible than the former. Two of the guides went down here with their torches firſt; and by their light we could ſee, that this paſſage was not ſo perpendicular indeed as the other, but lay in a very ſteep ſlant, with a very ſlippery rock for the bottom; vaſt pieces of rough rugged rocks jutting out in many places on the right hand, in the deſcent, and forcing the guides ſometimes to climb over, ſometimes to creep under them, and ſometimes go round them; and on the left, a thouſand dark caverns, like ſo many monſtrous wells, ready, if a foot ſhould ſlip, to ſwallow them up for ever. We ſtood on the edge to ſee theſe people with their lights deſcend before us; and were amazed and terrified to ſee them continue deſcending till they ſeemed at a monſtrous and moſt frightful depth. When they were at the bottom, however, they halloed to us: and we, trembling and quaking, began to deſcend after them. We had not gone thirty feet down, when we came to a place where the rock was perfectly perpendicular; and a vaſt cavern ſeemed to open its mouth to ſwallow us up on one ſide, while a wall of rugged rock threatened to tear us to pieces on the other. I was quite diſheartened at this terrible proſpect, and declared I would go back: but ſtill our guides aſſured us there was no danger; and the reſt of the company reſolving to ſee the bottom now they were come ſo far, I would not leave them: ſo on we went to a corner where there was placed an old ſlippery and rotten ladder, which hung down cloſe to the rock; and down this, one after another, we at length all deſcended. When we had got to the bottom of this we found ourſelves at the entrance of another paſſage, which was terrible enough indeed; but in this there was not wanting ſomething of beauty. This was a wide and gradual deſcent; at the entrance of which one of our guides ſeated himſelf on his breech, and began to ſlide down, telling us we muſt do the ſame. We could diſcover, by the light of his torch, that this paſſage was one of the nobleſt vaults in the world. It is about nine feet high, ſeven wide, and has for its bottom a fine green gloſſy marble. The walls and arch of the roof of this, being as ſmooth and even in moſt places as if wrought by art, and made of a fine gliſtering red and white granite, ſupported here and there with columns of a deep blood-red ſhining porphyry, made, with the reflection of the lights, an appearance not to be conceived. This paſſage is at leaſt forty yards long; and of ſo ſteep a deſcent, that one has enough to do, when ſeated on one's breech, not to deſcend too quickly. Our guides that remained with us, could here keep on each ſide of us: and what with the prodigious grandeur and beauty of the place, our eaſy travelling through it, and the diverſion of our now and then running over one another whether we would or not; this was much the pleaſanteſt part of our journey. When we had entered this paſſage, I imagined we ſhould at the bottom join the two guides we had firſt ſent down; but alas! when we were got there, we found ourſelves only at the mouth of another precipice, down which we deſcended by a ſecond ladder not much better than the former. I could have admired this place alſo, would my terror have ſuffered me; but the dread of falling, kept all my thoughts employed during my deſcent. I could not but obſerve, however, as my companions were coming down after me, that the wall, if I may ſo call it, which the ladder hung by, was one maſs of blood-red marble, covered with white ſprigs of rock cryſtal as long as my finger, and making, with the glow of the purple from behind, one continued immenſe ſheet of amythyſts. From the foot of this ladder we ſlided on our bellies through another ſhallow vault of poliſhed green and white marble, about twenty feet; and at the bottom of this joined our guides. Here we all got together once again; and drank ſome rum, to give us courage before we proceeded any farther. After this ſhort refreſhment, we proceeded by a ſtrait, but ſomewhat ſlanting paſſage, of a rough, hard, and ſomewhat coarſe ſtone, full of a thouſand ſtrange figures of ſnakes rolled round, and looking as if alive; but in reality as cold and hard as the reſt of the ſtone, and nothing but ſome of the ſtone itſelf in that ſhape. We walked pretty eaſily along this deſcent for near 200 yards; where we ſaw two pillars ſeemingly made to ſupport the roof from falling in: but in reality it was no ſuch thing; for they were very brittle, and made of a fine glittering yellow marble. When we had paſſed theſe about twenty yards, we found ourſelves at the brink of another very terrible precipice: but this our guides aſſured was the laſt; and there being a very good ladder to get down by, we readily ventured. At the bottom of this ſteep wall, as I may call it, we found ourſelves for ſome way upon plain even ground; but, after about forty yards walking, were preſented by our guides with ropes again; which we faſtened about our middles, though not to be ſwung down by, but only for fear of accidents, as there are lakes and deep waters all the way from hence on the left hand. With this caution, however, we entered the laſt alley; and horrible work it was indeed to get through it. All was perfectly

horrid and diſmal here. The ſides and roof of the paſſage were all of black ſtone; and the rocks in our way were in ſome places ſo ſteep, that we were forced to lie along on our backs, and ſlide down; and ſo rough, that they cut our clothes, and bruiſed us miſerably in paſſing. Over our heads, there were nothing but ragged black rocks, ſome of them looking as if they were every moment ready to fall in upon us: and, on our left hands, the light of our guides' torches ſhewed us continually the ſurface of dirty and miſerable looking lakes of water. If I had heartily repented of my expedition often before, here I aſſure you I was all in a cold ſweat, and fairly gave myſelf over for loſt; heartily curſing all the travellers that had written of this place, that they had deſcribed it ſo as to tempt people to ſee it, and never told us of the horrors that lay in the way. In the midſt of all theſe reflections, and in the moſt diſmal part of all the cavern, on a ſudden we had loſt four of our ſix guides. What was my terror on this event! The place was a thouſand times darker and more terrible for want of their torches; and I expected no other, but every moment to follow them into ſome of theſe lakes, into which I doubted not but they were fallen. The remaining two guides ſaid all they could, indeed, to cheer us up; and told us we ſhould ſee the other four again ſoon, and that we were near the end of our journey. I don't know what effect this might have upon the reſt of my companions; but I aſſure you I believed no part of the ſpeech but the laſt, which I expected every moment to find fulfilled in ſome pond or precipice. Our paſſage was by this time become very narrow, and we were obliged to crawl on all-fours over rugged rocks; when in an inſtant, and in the midſt of theſe melancholy apprehenſions, I heard a little hiſſing noiſe, and ſaw myſelf in utter, and not to be deſcribed, darkneſs. Our guides called indeed cheerfully to us, and told us that they had accidentally dropped their torches into a puddle of water, but we ſhould ſoon come to the reſt of them, and they would light them again; and told us there was no danger, and we had nothing to do but to crawl forward. I cannot ſay but I was amazed at the courage of theſe people; who were in a place where, I thought, four of them had already periſhed, and from whence we could none of us ever eſcape; and determined to lie down and die where I was. Words cannot deſcribe the horror, or the extreme darkneſs, of the place. One of our guides, however, perceiving that I did not advance, came up to me, and clapping his hand firmly over my eyes, dragged me a few paces forward. While I was in this ſtrange condition, expecting every moment death in a thouſand ſhapes, and trembling to think what the guide meant by this rough proceeding, he lifted me at once over a great ſtone, ſet me down on my feet, and took his hand from before my eyes. What words can deſcribe at that inſtant my aſtoniſhment and tranſport! Inſtead of darkneſs and deſpair, all was ſplendor and magnificence before me; our guides all appeared about us; the place was illuminated by fifty torches, and the guides all welcomed me into the grotto of Antiparos. The four that were firſt miſſing, I now found, had only given us the ſlip, to get the torches lighted up before we came; and the other two had put out their lights on purpoſe, to make us enter out of utter darkneſs into this pavilion of ſplendor and glory. I am now come to the proper buſineſs of this letter; which was, to deſcribe this grotto. But I muſt confeſs to you that words cannot do it. The amazing beauties of the place, the eye that ſees them only can conceive. The beſt accounts I can give you, however, pray accept of.

The people told us, the depth of this place was 485 yards. The grotto, in which we then were, is a cavern of 120 yards wide, and 113 long, and ſeems about ſixty yards high in moſt places. Theſe meaſures differ ſomething from the accounts travellers in general give us; but you may depend upon them as exact, for I took them with my own hand. Imagine then with yourſelf, an immenſe arch like this, almoſt all over lined with fine and bright cryſtallized white marble, and illuminated with fifty-ſix torches; and you will then have ſome faint idea of the place I had the pleaſure to ſpend three hours in. This, however, is but a faint deſcription of its beauties. The roof, which is a fine vaulted arch, is hung all over with icicles of white ſhining marble, ſome of them ten feet long, and as thick as one's middle at the root: and among theſe there hang 1000 feſtoons of leaves and flowers of the ſame ſubſtance; but ſo very glittering, that there is no bearing to look up at them. The ſides of the arch are planted with ſeeming trees of the ſame white marble, riſing in rows one above another, and often incloſing the points of the icicles. From theſe trees there alſo hung feſtoons, tied as it were from one to another in vaſt quantities; and in ſome places among them there ſeem rivers of marble winding through them in a thouſand meanders. All theſe things are only made, in a long courſe of years, from the dropping of water, but really look like trees and brooks turned to marble. The floor we trod upon was rough and uneven, with cryſtals of all colours growing irregularly out of it, red, blue, green, and ſome of a pale yellow. Theſe were all ſhaped like pieces of ſalt-petre; but ſo hard, that they cut our ſhoes: among theſe, here and there, are placed icicles of the ſame ſhining white marble with thoſe above, and ſeeming to have fallen down from the roof and fixed there; only the thick end of theſe is to the floor. To all theſe our guides had tied torches, two or three to a pillar, and kept continually beating them to make them burn bright. You may gueſs what a glare of ſplendor and beauty muſt be the effect of this illumination, among ſuch rocks and columns of marble. All round the lower part of the ſides of the arch are a thouſand white maſſes of marble, in the ſhape of oak-trees. Mr. Tournefort compares them to cauliflowers, but I ſhould as ſoon compare them to toad-ſtools. In ſhort, they are large enough to incloſe, in many places, a piece of ground big enough for a bed-chamber. One of theſe chambers has a fair white curtain, whiter than ſatin, of the ſame marble, ſtretched all over the front of it. In this we all cut our names, and the date of the year, as a great many people have done before us. In a courſe of years afterwards, the ſtone bliſters out like this white marble over the letters. Mr. Tournefort thinks the rock grows like oaks or apple-trees for this reaſon; but I remember I ſaw ſome of the fineſt cockle and muſcle ſhells in the rock thereabout that ever I ſaw in my life. I wonder whether he thinks they grow there too. Beſides, if this rock grows ſo faſt, the cavern ought to be all grown up this time; and yet, according to his meaſures and mine, it ſeems on the other hand to be grown larger ſince. Indeed, all that I can gather from his account of this glorious place is, that he had drank a bottle or two too much before he went down into it."

ANTIPATER, the diſciple of Ariſtotle, and one of Alexander the Great's generals, was a man of great abilities, and a lover of the ſciences; but was accuſed of poiſoning Alexander. He ſubdued the revolted Thracians, relieved Megalopolis, and overthrew the Spartans there. He died 321 years before the Chriſtian æra.

ANTIPATER, an Idumean of illuſtrious birth, and poſſeſſed of great riches and abilities, taking advantage of the confuſion into which the two brothers Hyrcanus and Ariſtobulus plunged Judea by their conteſt for the office of high-prieſt, took ſuch meaſures as to gain Hyrcanus that office, and under his government to obtain the abſolute direction of all affairs;

while his great abilities and application to buſineſs made him ſo conſiderable, that he was honoured as much as if he had been inveſted with the royal authority in form: but he was at laſt poiſoned by a Jew, named Malachus, forty-three years before the Chriſtian æra. He left among his other children, the famous Herod king of the Jews.

Antipater (Cælius), a Roman hiſtorian, who wrote a hiſtory of the Punic war, much valued by Cicero. The emperor Adrian preferred him to Salluſt.

Antipater of Sydon, a Stoic philoſopher, and likewiſe a poet, commended by Cicero and Seneca: he flouriſhed about the 171ſt Olympiad. We have ſeveral of his epigrams in the *Anthologia*.

ANTIPATHY (*Encycl.*), in phyſiology, is, properly ſpeaking, a natural horror and deteſtation, an inſuperable hatred, an involuntary averſion, which a ſenſitive being feels for ſome other object, whatever it is, though the perſon who feels this abhorrence is entirely ignorant of its cauſe, and can by no means account for it. Such is the invincible averſion of particular perſons againſt eats, mice, ſpiders, &c.; a prepoſſeſſion which is ſometimes ſo violent, as to make them faint at the ſight of theſe animals. Of the moſt common and natural antipathies the ancient naturaliſts, the ſchoolmen, and the vulgar, form ſo many legends; and relate them as certain facts.

To explore the matter without prejudice, we ſhall find it neceſſary to abſtract from the ſubjects of this diſquiſition, 1. All ſuch antipathies as are not aſcertained; as that which is ſuppoſed to be felt by hens at the ſound of an harp whoſe ſtrings are made of a fox's bowels, between the ſalamander and tortoiſe, and between the weaſel and the toad. Nothing is leſs confirmed, or rather nothing is more falſe, than theſe facts, with which vulgar credulity and aſtoniſhment are amuſed and actuated: and though ſome of theſe antipathies ſhould be aſcertained, this would be no proof that the animals which feel them are not acquainted with their cauſes, according to their mode and proportion of knowledge; in which caſe, it will be no longer the antipathy which we have defined.

2. We muſt abſtract thoſe antipathies which can be extinguiſhed or reſumed at pleaſure; thoſe fictitious averſions, which certain perſons feel, or pretend to feel, with affected airs, that they may appear more preciſe and finical, or ſingularly and prodigiouſly elegant; that they may ſeem to have qualities ſo exquiſitely fine, as require to be treated with peculiar delicacy. One who beſtows any attention on the ſubject, would be aſtoniſhed to find how many of theſe chimerical averſions there are, which are pretended, and paſſed upon the world by thoſe who affect them as natural and unconquerable.

3. When we abſtract thoſe averſions the cauſes of which are known and evident; we ſhall be ſurpriſed, after our deduction of theſe pretended antipathies from the general ſum, how ſmall, how inconſiderable, is the quantity of thoſe which are conformable to our definition. Will any one pretend to call by the name of *antipathy*, thoſe real, innate, and inconteſtable averſions which prevail between ſheep and wolves? Their cauſe is obvious: the wolf devours the ſheep, and ſubſiſts upon his victims; and every animal naturally flies with terror from pain or deſtruction: ſheep ought therefore to regard wolves with horror, which for their nutrition tear and mangle the unreſiſting prey. From principles ſimilar to this, ariſes that averſion which numbers of people feel againſt ſerpents; againſt ſmall animals, ſuch as reptiles in general, and the greateſt number of inſects. During the credulous and ſuſceptible period of infancy, pains have been taken to impreſs on our minds the frightful idea that they are venomous; that their bite is mortal; that their ſting is dangerous, productive of tormenting inflammations or tumours, and ſometimes fatal: they have been repreſented to us as ugly and ſordid; as being, for that reaſon, pernicious to thoſe who touch them; as poiſoning thoſe who have the misfortune to ſwallow them. Theſe horrible prepoſſeſſions are induſtriouſly inculcated from our infancy; they are ſometimes attended and ſupported by diſmal tales, which are greedily imbibed, and indelibly engraven on our memories. It has been taught us both by precept and example, when others at their approach have aſſumed in our view the appearance of deteſtation and even of terror, that we ſhould fly from them, that we ſhould not touch them. Is it then wonderful (if our falſe impreſſions as to this ſubject have been corrected neither by future reflections nor experiments) that we ſhould entertain, during our whole lives, an averſion from theſe objects, even when we have forgot the admonitions, the converſations, and examples, which have taught us to believe and apprehend them as noxious beings? and in proportion to the ſenſibility of our frame, in proportion as our nerves are irritable, our emotions at the ſight of what we fear will be more violent, eſpecially if they anticipate our expectation, and ſeize us unprepared, though our ideas of what we have to fear from them are the moſt confuſed and indiſtinct imaginable. To explain theſe facts, is it neceſſary to fly to the exploded ſubterfuge of occult qualities inherent in bodies, to latent relations productive of antipathies, of which no perſon could ever form an idea?

It is often ſufficient to influence a perſon who had formerly no averſion for an object, if he lives with ſome other aſſociate who gives himſelf up to ſuch capricious panics; the habit is inſenſibly contracted to be agitated with diſagreeable emotions at the preſence of an object which had been formerly beheld with indifference and cold blood. I was acquainted (ſays the author of the article *Antipathy* in the French Encyclopédie) with a perſon of a very ſound underſtanding, whom thunder and lightning by no means terrified; nay, to whom the ſpectacle appeared magnificent and the ſound majeſtic; yet to a mind thus ſeemingly fortified againſt the infectious terror, no more was neceſſary than ſpending the ſummer with a friend in whom the appearance of lightning excited the ſtrongeſt emotions, and whom the remoteſt clap of thunder affected with extravagant paroxyſms, to become timid in exceſs at the approach of thunder, nor could he ever afterwards ſurmount the fear which it inſpired.—The frightful ſtories of dogs and cats, which have killed their maſters, or which have given them mortal wounds, are more than ſufficient to inſpire a timorous perſon with averſion againſt theſe animals; and if the olfactory nerves of ſuch a perſon be delicate, he will immediately diſcover the ſmell of them in a chamber: diſturbed by the apprehenſion which theſe effluvia excite in his mind, he gives himſelf up to the moſt violent uneaſineſs, which is tranquillized when he is aſſured that the animal is no longer in the room. If by chance, in the ſearch which is made to calm the uneaſineſs of this timorous perſon, one of theſe creatures ſhould at laſt be diſcovered, every one preſently exclaims, *A miracle!* and admits the reality of *antipathies* into his creed; whilſt all this is nothing but the effect of a childiſh fear, founded on certain confuſed and exaggerated ideas of the hazard which one may run with theſe animals. The antipathy which ſome people entertain againſt eels, though they are eaten by others with pleaſure, ariſes from nothing but the fear of ſerpents, to which theſe fiſhes are in ſome degree ſimilar. There are likewiſe other antipathies which do not originate in the imagination, but ariſe from ſome natural incongruity; ſuch as we often remark in children, for particular kinds of victuals,

with which their taſte is not offended, but which their ſtomachs cannot digeſt, and which are therefore diſgorged as ſoon as ſwallowed.

To what then are thoſe antipathies, of which we have heard ſo much, reducible? Either to legendary tales; or to averſions againſt objects which we believe dangerous; or to a childiſh terror of imaginary perils; or to a diſreliſh, of which the cauſe is diſguiſed; or to a ridiculous affectation of delicacy; or to an infirmity of the ſtomach; in a word, to a real or pretended reluctance for things which are either inveſted, or ſuppoſed to be inveſted, with qualities hurtful to us. Too much care cannot be taken in preventing, or regulating, the antipathies of children; in familiarizing them with objects of every kind; in diſcovering to them, without emotion, ſuch as are dangerous; in teaching them the means of defence and ſecurity, or the methods of eſcaping their noxious influence; and, when the rational powers are matured by age, in reflecting on the nature of thoſe objects which we fear, in aſcertaining what has been told concerning their qualities, or in vigorouſly operating upon our own diſpoſitions to overcome thoſe vain repugnances which we may feel. See SYMPATHY, which is the oppoſite of *Antipathy*.

ANTIPATHY, in ethics, hatred, averſion, repugnance. *Hatred* is entertained againſt perſons; *averſion*, and *antipathy*, indiſcriminately againſt perſons or things; and *repugnance*, againſt actions alone. *Hatred* is more voluntary than *averſion*, *antipathy*, or *repugnance*. Theſe laſt have greater affinity with the animal conſtitution. The cauſes of ANTIPATHY are leſs known than thoſe of *averſion*. *Repugnance* is leſs permanent than either the one or the other.—We hate a vicious character, we feel *averſion* to its exertions: we are affected with ANTIPATHY for certain perſons at firſt ſight; there are ſame affairs which we tranſact with *repugnance*.—*Hatred* calumniates; *averſion* keeps us at a diſtance from certain perſons; ANTIPATHY makes us deteſt them; *repugnance* hinders us from imitating them.

ANTIPHLOGISTIC, in chemiſtry, a term heretofore employed to denote ſuch a ſtate of any body or ſubſtance as ſtood oppoſed to or contraindicated the exiſtence of phlogiſton in it. See PHLOGISTON. This term is rejected by the new chemiſts, and bids fair to be exploded with the doctrine which gave it birth. It is often uſed in medicine merely to denote ſuch a courſe of remedies as tend to counteract inflammation and heat in the ſyſtem, or even in a part of the body. Thus we read of *antiphlogiſtic ointments* which were uſed in trials by fire, &c. See *Du Cange, gloſſ.* tom. iii. col. 397. *Henry*'s Britain, vol. iii. p. 437.

ANTIRRHIUM, a promontory at the mouth of the Corinthian bay, where it is ſcarce a mile broad, and where it ſeparates the Ætolians from the Peloponneſus; ſo called from its oppoſite ſituation to Rhium in Peloponneſus (Pliny): both are now called the *Dardanelles of Lepanto*.

ANTISTHENES, a Greek philoſopher, and founder of the Cynics. He was born at Athens, and paſſed the former part of his life as a ſoldier. Having afterwards been an attendant at the lectures of Socrates, he was principally charmed with thoſe exhortations of that great philoſopher, which perſuaded to frugality, to temperance, and to moderation: theſe Antiſthenes was reſolved to practiſe by carrying every precept to its utmoſt extent. Permitting therefore his beard to grow, he went about the ſtreets in a thread-bare coat, ſcarcely to be diſtinguiſhed from a common beggar. He prided himſelf upon the moſt rigid virtue, and thought himſelf obliged to attack the vicious wherever he found them. This gave him ſome reputation in the city; but it may be ſuppoſed, that, in a place ſo very luxurious as Athens, he had more enemies than diſciples. His philoſophy conſiſted rather in action than ſpeculation: it was therefore his conſtant maxim, That to be virtuous was to be happy, and that all virtue conſiſted in action; that the wiſe man ſhould live for himſelf, contented in all ſituations, and happy alone in the conſciouſneſs of his own virtue. He acknowledged nothing to be good but what was honourable; and aſſerted, that virtue might be acquired by practice. Laertius tells us there were 10 tomes of his works; and he has given us many of his apophthegms.

ANTIUM (Livy), *Antia*, Dionyſius Halicarnaſſæus; a city of the Volſci (Livy); ſituated on the Tuſcan ſea, yet without a harbour, becauſe they had a neighbouring hamlet, called *Ceno*, with a harbour (Strabo). The Romans gained their firſt reputation in naval affairs againſt the Antiates; part of whoſe ſhips they conveyed into the arſenal of Rome, and part they burnt, and with their beaks, or roſtra, adorned the pulpit erected in the Forum, thence called *Roſtra* (Livy, Florus). Several colonies were ſucceſſively ſent thither (Livy, Tacitus). The epithet is *Antianus*, *Antienſis*, *Antiatinus*, and *Antias-atis*; the people *Antiates*. Here ſtood a famous temple of Fortune (Horace). Addiſon ſays, there were two Fortunæ worſhipped at Antium.—The birth-place of Caligula and Nero (Sueton): but, according to Pliny, the Ambiatinus Vicus was the birth-place of Caligula. It is now extinct, but the name ſtill remains in the *Capo d'Anzo*.

ANTONIA (St.), a town of France, in Rouergue, in the dioceſe of Rhodez, whoſe fortifications are demoliſhed. It is ſeated on the river Aveirou. E. long. 0. 55. N. lat. 44. 10.

ANTONIANO (Silvio), a man of great learning, who raiſed himſelf from a low condition by his merit, was born at Rome in the year 1540. When he was but ten years old, he could make verſes upon any ſubject propoſed to him; and theſe ſo excellent, though pronounced extempore, that even a man of genius could not compoſe the like without a good deal of time and pains. The duke de Ferrara coming to Rome, to congratulate Marcellus II. upon his being raiſed to the pontificate, was ſo charmed with the genius of Antoniano, that he carried him to Ferrara, where he provided able maſters to inſtruct him in all the ſciences. From thence he was ſent for by Pius IV. who made him profeſſor of the belles-lettres in the college at Rome. Antoniano filled this place with ſo much reputation, that, on the day when he began to explain the oration *pro Marco Marcello*, he had a vaſt crowd of auditors, and among theſe no leſs than twenty-five cardinals. He was afterwards choſen rector of the college; and after the death of Pius IV. being ſeized with a ſpirit of devotion, he joined himſelf to Philip Neri, and accepted the office of ſecretary to the ſacred college, offered him by Pius V. which he executed for twenty-five years with the reputation of an honeſt and able man. He refuſed a biſhopric which Gregory XIV. would have given him; but he accepted the office of ſecretary to the briefs, offered him by Clement VIII. who made him his chamberlain, and afterwards a cardinal. Antoniano killed himſelf by too great fatigue: for he ſpent whole nights in writing letters; which brought on a ſickneſs, whereof he died, in the ſixty-third year of his age. He wrote with ſuch eaſe and fluency, that he never almoſt made any blot or eraſures, and it is ſaid of him, that he preſerved himſelf from ſexual indulgences during his whole life.

ANTONIDES, VANDER GOES (John), an eminent Dutch poet, born at Goes, in Zealand, the 3d of April, 1647. His parents were Anabaptiſts, people of good character, but of low circumſtances. They went to live at Amſterdam when Antonides was about four years old; and, in the ninth year

of his age, he began his ſtudies, under the direction of Hadrian Junius and James Cocceius. Antonides took great pleaſure in reading the Latin poets, and carefully compared them with Grotius, Heinſius, &c. By this means he acquired a taſte for poetry, and enriched his mind with noble ideas. He firſt attempted to tranſlate ſome pieces of Ovid, Horace, and other ancients; and, having formed his taſte on theſe excellent models, he at length undertook one of the moſt difficult taſks in poetry, to write a tragedy: this was entitled *Trazil*, or *The Invaſion of China*. Antonides, however, was ſo modeſt, as not to permit it to be publiſhed. Vondel, who was then engaged in a dramatic piece, which was taken alſo from ſome event that happened in China, read Antonides's tragedy; and was ſo well pleaſed with it, that he declared, if the author would not print it, he would take ſome paſſages out of it, and make uſe of them in his own tragedy. He accordingly did ſo; and it was reckoned much to the honour of Antonides, to have written what might be adopted by ſo great a poet, as Vondel was acknowledged to be by all good judges. Upon the concluſion of the peace between Great Britain and Holland, in the year 1697, Antonides wrote a piece, entitled *Bellona aan band*, i. e. "Bellona chained:" a very elegant poem, conſiſting of ſeveral hundred verſes. He next wrote an ingenious heroic poem, which he entitled *The river Y* (the river on which Amſterdam is built).

Antonides's parents had bred him up an apothecary; but his remarkable genius for poetry ſoon gained him the eſteem and friendſhip of ſeveral perſons of diſtinction: and particularly of Mr. Buiſero, one of the lords of the admiralty at Amſterdam, and a great lover of poetry, who ſent him at his expence to purſue his ſtudies at Leyden, where he remained till he took his degree of doctor of phyſic, and then his patron gave him a place in the admiralty. In 1678, Antonides married Suſanna Bermans, a miniſter's daughter, who had alſo a talent for poetry. His marriage was celebrated by ſeveral eminent poets, particularly by the famous Peter Francius, profeſſor of eloquence, who compoſed ſome Latin verſes on the occaſion. After marriage, he did not much indulge his poetic genius: and within a few years he fell into a conſumption, of which he died on the 18th September, 1684, being then but thirty-ſeven years and a few months old. He is eſteemed the moſt eminent Dutch poet, after Vondel. His works have been printed ſeveral times, having been collected by his father Anthony Tanſz. The laſt edition was printed by Nicholas Ten Hoom, at Amſterdam, in the year 1714, in quarto, under the direction of David Van Hoogſtraaten, one of the maſters of the Latin ſchool of that city, who added to it alſo the life of the poet.

ANTONINUS's *Wall* (*Encycl.*). The firſt barrier erected by the Romans was the chain of forts made by Agricola from the frith of Forth to that of Clyde, in the year 81, to protect his conqueſts from the inroads of the Caledonians. The ſecond was the vallum, or dyke, flung up by Adrian in the year 121. It terminated on the weſtern ſide of the kingdom, at *Axelodunum*, or *Brugh*, on the Solway ſands; and was ſuppoſed to have reached no further than *Pons Ælii*, or *Newcaſtle*, on the eaſtern. But from an inſcription lately diſcovered, it appears to have extended as far as the wall of Severus. This rampart of Adrian's was ſituated much further ſouth than Agricola's chain; the country to the north having been either, according to ſome authors, recovered by the native Britons after the departure of Agricola; or, according to others, voluntarily ſlighted by Adrian. However, this work of Adrian's did not long continue to be the extreme boundary of the Roman territories to the north in Britain. For Antoninus Pius, the adopted ſon and immediate ſucceſſor of Adrian, having, by his lieutenant Lollius Urbicus, recovered the country once conquered by Agricola, commanded another rampart to be erected between the friths of Forth and Clyde, in the tract where Agricola had formerly built his chain of forts. The great number of inſcriptions which have been found in or near the ruins of this wall, or rampart, to the honour of Antoninus Pius, leave us no room to doubt its having been built by his direction and command. If the fragment of a Roman pillar with an inſcription, now in the college library of Edinburgh, belonged to this work, as it is generally ſuppoſed to have done, it fixes the date of its execution to the third conſulſhip of Antoninus, which was A. D. 140, only twenty years after that of Adrian, of which this ſeems to have been an imitation. This wall or rampart, as ſome imagine, reached from Caer-ridden on the frith of Forth, to Old Kirkpatrick on the Clyde; or, as others think, from Kinniel on the eaſt, to Dunglaſs on the weſt. Theſe different ſuppoſitions hardly make a mile of difference in the length of this work, which, from ſeveral actual menſurations, appears to have been thirty-ſeven Engliſh or forty Roman miles. Capitolinus, in his life of Antoninus Pius, directly affirms, that the wall which that emperor built in Britain was of turf. This in the main is unqueſtionably true; though it is evident (from the veſtiges of it ſtill remaining, which not very many years ago were dug up and examined for near a mile together) that the foundation was of ſtone. Mr. Camden alſo tells us, from the papers of one Mr. Anthony Pont, that the principal rampart was faced with ſquare ſtone, to prevent the earth from falling into the ditch. The chief parts of this work were as follows: 1. A broad and deep ditch, whoſe dimenſions cannot now be diſcovered with certainty and exactneſs, though Mr. Pont ſays it was twelve feet wide. 2. The principal wall or rampart was about twelve feet thick at the foundation, but its original height cannot now be determined. This wall was ſituated on the ſouth brink of the ditch. 3. A military way on the ſouth ſide of the principal wall, well paved, and raiſed a little above the level of the ground. This work, as well as that of Adrian, was defended by garriſons placed in forts and ſtations along the line of it. The number of theſe forts or ſtations, whoſe veſtiges were viſible in Mr. Pont's time, were eighteen, ſituated at about the diſtance of two miles from each other. In the intervals between the forts, there were turrets or watch-towers. But the number of theſe, and their diſtance from each other, cannot now be diſcovered.

It is not a little ſurpriſing, that though it is now more than 1600 years ſince this work was finiſhed, and more than 1300 ſince it was ſlighted, we can yet diſcover, from authentic monuments, which are ſtill remaining, by what particular bodies of Roman troops almoſt every part of it was executed. This diſcovery is made from inſcriptions upon ſtones, which were originally built into the face of the wall, and have been found in or near its ruins, and are carefully preſerved. The number of ſtones with inſcriptions of this kind now extant, is eleven: of which ſix may be ſeen at one view in the college of Glaſgow, one in the college of Aberdeen, one in the college of Edinburgh, one in the collection of Baron Clerk, one at Cochnoch-houſe, and one at Calder-houſe. From theſe inſcriptions it appears in general, that this great work was executed by the ſecond legion, the vexillations of the ſixth legion and of the twentieth legion, and one cohort of auxiliaries. If theſe corps were all complete, they would make in all a body of 7800 men. Some of theſe inſcriptions have ſuffered greatly by the injuries of time and other accidents; ſo that we cannot diſcover from them with abſolute certainty, how many paces of this work were executed by each of theſe bodies of troops. The ſum of the certain and probable information contained in

theſe inſcriptions, as it is collected by the learned and illuſtrious Mr. Horſley, ſtands thus:

	Paces.
The ſecond legion built - -	11,603
The vexillation of the ſixth legion - -	7,411
The vexillation of the twentieth legion -	7,801
All certain - - -	26,815
The vexillation of the twentieth legion, the monument certain, and the number probable -	3,411
The ſame vexillation, on a plain monument, no number viſible, ſuppoſed - -	3,500
The ſixth legion, a monument, but no number, ſuppoſed - - -	3,000
Cohort prima Cugernorum - -	3,000
Total	39,726

or 39 miles 726 paces, nearly the whole length of the wall. It would have been both uſeful and agreeable to have known how long time theſe troops were employed in the execution of this great work. But of this we have no information. Neither do we know what particular bodies of troops were in garriſon in the ſeveral forts and ſtations along the line of this wall, becauſe theſe garriſons were withdrawn before the *Notitia Imperii* was written.

ANTONIO (Nicholas), knight of the order of St. James, and canon of Seville, did great honour to the Spaniſh nation by his Bibliothêque of their writers. He was born at Seville, in 1617, being the ſon of a gentleman whom King Philip IV. made preſident of the admiralty eſtabliſhed in that city in 1626. After having gone through a courſe of philoſophy and divinity in his own country, he went to ſtudy law at Salamanca, where he cloſely attended the lectures of Franciſco Ramos del Manzano, afterwards counſellor to the king, and preceptor to Charles II. Upon his return to Seville, after he had finiſhed his law-ſtudies at Salamanca, he ſhut himſelf up in the royal monaſtery of Benedictines, where he employed himſelf ſeveral years in writing his *Bibliotheca Hiſpanica*, having the uſe of the books of Bennet de la Sana, abbot of that monaſtery, and dean of the faculty of divinity at Salamanca. In the year 1659 he was ſent to Rome by King Philip IV. in the character of agent-general from this prince: he had alſo particular commiſſions from the inquiſition of Spain, the viceroys of Naples and Sicily, and the governor of Milan, to negociate their affairs at Rome. The Cardinal of Arragon procured him, from Pope Alexander VII. a canonry in the church of Seville, the income whereof he employed in charity and purchaſing of books: he had above 30,000 volumes in his library. By this help, joined to continual labour and indefatigable application, he was at laſt enabled to finiſh his Bibliotheca Hiſpanica, in four volumes in folio, two of which he publiſhed at Rome in the year 1672. The work conſiſts of two parts; the one containing the Spaniſh writers who flouriſhed before the 15th century, and the other thoſe ſince the end of that century. After the publication of theſe two volumes, he was recalled to Madrid by King Charles II. to take upon him the office of counſellor to the cruſade; which he diſcharged with great integrity till his death, which happened in 1684. He left nothing at his death but his vaſt library, which he had brought from Rome to Madrid; and his two brothers, and nephews, being unable to publiſh the remaining volumes of his Bibliotheca, ſent them to Cardinal D'Aguiſne, who paid the charge of the impreſſion, and committed the care thereof to Monſieur Marti, his librarian, who added notes to them, in the name of the cardinal.

ANTONIUS (Marcus) the triumvir, grandſon to the orator of that name (vide *Encyclop.*), was very handſome in his youth; for which reaſon he was greatly beloved by Curio a ſenator, who, by carrying him about in all his debaucheries, made him contract ſuch heavy debts, that his own father forbad him his houſe. Curio, however, was ſo generous as to bail him for 250 talents. When the civil war broke out, Curio took Cæſar's party, and prevailed with Antonius to do the ſame; for which he was made a tribune of the people, and in that office did Cæſar great ſervice. Cæſar, having made himſelf maſter of Rome, gave Antonius the government of Italy: at the battle of Pharſalia, Cæſar confided ſo much in him, that he gave him the command of the left wing of his army, whilſt he himſelf led the right. After Cæſar was made dictator, he made Antonius general of the horſe, though he had never been prætor; in which command he exerted his power with the utmoſt violence. He was made conſul, when Cæſar enjoyed that honour for the fifth time, the laſt year of that uſurper's life. On Cæſar's death, he harangued the populace with great art, and raiſed their fury againſt his murderers; flattering himſelf that he ſhould eaſily get into the place which Cæſar had filled: but his haughty behaviour made him loſe all the advantages his affected concern for Cæſar had gained him. His ill treatment of Octavius, and quarrel with him, produced another civil war; which ended in an accommodation between him, Octavius, and Lepidus, fatal to the peace of Rome. They agreed to ſhare the ſupreme power among them; and many of the moſt illuſtrious Romans were ſacrificed by proſcription to cement this bloody league, which is known by the name of the *Second Triumvirate*. But the triumvirs were too ambitious, and hated one another too much, to be long united. Antonius went into Aſia to raiſe money for his ſoldiers; during his abſence, Fulvia his wife quarrelled with Octavius. When Antonius was in Aſia, indulging himſelf in all manner of luxury, the famous Cleopatra inſpired him with the moſt violent paſſion. Hearing of the quarrel between Fulvia and Octavius, and finding Octavius was become publicly his enemy, Antonius entered into a confederacy with Sextus Pompeius, who was ſtill maſter of Sicily. He then went into Italy in order to fight Octavius; but Fulvia, who had been the author and promoter of this war, dying, Octavius and Antonius came to an agreement. One of the conditions of this new peace was, that they ſhould together attack Pompey, though the former had lately made an alliance with him. Antonius then married Octavia, ſiſter to Octavius, as a pledge of their renewed friendſhip; but returned ſoon after to his beloved Cleopatra, and again lived with her in Alexandria. Octavius took hold of this pretence to inveigh againſt him, and begin the war again. At laſt they engaged in a ſea-fight at Actium, in which Octavius gained a complete victory; which was followed by the deaths both of Antonius and Cleopatra. The infatuated Antonius fell upon his own ſword; and Cleopatra ſtung herſelf to death with an aſp, as was ſuppoſed, to avoid gracing the victor's triumph at Rome.

ANXUR, a city of the Volſci (Pliny, Livy), in Latium; called *Tarracina*, by the Greeks and Latins: now *Terracina*; ſituated on an eminence (Livy, Horace, Sil. Italicus). *Anxuras*, a citizen of Anxur (Livy). And the epithet, *Anxurus*, a name of Jupiter, worſhipped without a beard at Anxur (Virgil). Though others read *Axurus*, or *Axyrus*, without a razor. E. Long. 14. 5. Lat. 41. 18.

ANZERMA, a town and province of Popayan, in South America, where there are mines of gold. The town is ſeated on the river Coca. Long. 75. 25. W. Lat. 4 58. N.

AORNUS (*Encycl.*). This rock was taken by Alexander the Great, in whoſe time there was a report that Hercules had attempted it in vain; however, according to Arrian, this

report was without foundation. It is probable indeed, that it was raſed after the place was taken, in order to magnify Alexander's exploit. While the Macedonian monarch was preparing all things neceſſary for the ſiege, an old man with his two ſons, who had long lived in a cave near the ſummit, came and offered to ſhew him a private way of aſcending. This being readily accepted, Ptolemy, with a conſiderable body of light-armed troops, was diſpatched with them, with orders, in caſe they ſucceeded, to entrench themſelves ſtrongly upon the rock, in the wood to which the old man was to direct them, before they ventured to attack the Indians. Ptolemy exactly exeeuted his orders; and gave notice by a lighted torch ſet upon a pole, that he had got ſafely up. Upon this, Alexander gave immediate orders for a body of troops to attempt the paſſage by which the rock was commonly aſcended; but they were repulſed with great ſlaughter. He then ſent an Indian with letters to Ptolemy, deſiring him, the next time an attack was made by the common way, to fall upon the enemy behind. But in the mean time, thoſe who defended the rock attacked Ptolemy with great vigour; but were at laſt repulſed, though with much difficulty: but the next day, when Alexander renewed the attack, though Ptolemy attacked the Indians in the rear, the Macedonians were repulſed on both ſides. At laſt the king, perceiving that the ſtrength of the Indians lay in the ſtraitneſs and declivity of the way by which they were attacked, cauſed a great quantity of trees to be felled, and with them filled the cavities between the plain on which the Indians were encamped, and the higheſt of his own advanced poſts. The Indians at firſt derided his undertaking; but at length perceiving the ardour with which the work was carried on, and having felt the effects of the miſſile weapons of the Macedonians, they ſent deputies to propoſe terms of capitulation. Alexander, ſuſpecting that their deſign was only to amuſe him till they made their eſcape, withdrew his guards from the avenues. As ſoon as he knew the Indians were deſcended, he, with 700 of Ptolemy's light-armed foot, took poſſeſſion of the deſerted rock, and then made a ſignal for his forces to fall upon the flying Indians. They ſetting up a loud ſhout, ſo terrified the fugitives, that numbers of them fell from the rocks and precipices, and were daſhed to pieces, while the greateſt part of the remainder were cut off in the roads.

APALACHIAN MOUNTAINS (*Encycl.*). A great part of theſe mountains are covered with rocks, ſome of which are of a ſtupendous height and bulk; the ſoil between them is generally black and ſandy, but in ſome places differently coloured, compoſed of pieces of broken rock and ſpar, of a glittering appearance, which ſeem to be indications of minerals and ores if proper ſearch was made for them. Cheſnuts and ſmall oaks are the trees that principally grow on theſe mountains, with ſome *chinkapin* and other ſmall ſhrubs. The graſs is thin, mixed with vetch and ſmall peaſe; and in ſome places there is very little vegetable appearance.

The rocks of the Apalachian mountains ſeem to engroſs one half of the ſurface. They are moſtly of a light grey colour: ſome are of a coarſe-grained marble like alabaſter; others, of a metallic luſtre: ſome pieces are in the form of ſlate, and brittle; others in lumps, and hard: and ſome appear with ſpangles, or covered over with innumerable ſmall ſhining ſpecks, like ſilver. Theſe frequently appear at the roots of trees when blown down. The different ſpars are found moſt on the higheſt and ſteepeſt parts of the hills, where there is little graſs and few trees; but the greateſt part of the ſoil between the rocks is generally a dark ſandy-coloured kind of mould, and ſhallow; yet fertile, and productive of good corn, which encourages the Tallipooſes, a clan of the Cherokee Indians, to ſettle among them in latitude 34°; and they are the only Indian nation that has a conſtant reſidence upon theſe mountains.

APAMEA, or APAMIA, a city of Bithynia, formerly called *Myrlea*, from Myrlus, general of the Colophonians: deſtroyed by Philip, father of Perſeus; and given to his ally Pruſias, who rebuilt it, and called it *Apamea*, from the name of his queen Apama (Strabo). Stephanus ſays, that Nicomedes Epiphanes, ſon of Pruſias, called it after his mother; and that it had its ancient name from Myrlea, an Amazon. The Romans led a colony thither (Strabo); called *Colonea Apamena* (Pliny, Appian). The gentilitious name is *Apamæus*, and *Apamenus* (Trajan in a letter to Pliny).—Another *Apamea*, called *Cibotos*, of Phrygia, at ſome diſtance from the Meander (Agathodæmon); but by a coin of Tiberius, on the Meander. The name is from Apame, mother of Antiochus Soter, the founder, and the daughter of Artabazus (Strabo). The riſe, or at leaſt the increaſe, of Apamea, was owing to the ruins of Celenæ. The inhabitants are called *Apamienſes* (Tacitus).—A third, on the confines of Parthia and Media, ſurnamed *Raphane* (Strabo, Pliny).—A fourth *Apamea*, a town of Meſene, an iſland in the Tigris (Pliny, Ammian); where a branch of the Euphrates, called the *Royal river*, falls into the Tigris (Ptolemy). A fifth in Meſopotamia, on the other ſide the Euphrates, oppoſite to Zeugma on this ſide, both founded by Seleucus, and joined by a bridge, from which the latter takes its name (Pliny, Iſidor, Characenus).—A ſixth *Apamea*, now *Afamia*, alſo in Syria, below the confluence of the Orontes and Marſyas; a ſtrong city, and ſituated in a peninſula, formed by the Orontes and a lake: it was a place of ſuch plenty, that Seleucus, the founder of it, there maintained 500 elephants (Strabo).—*Apamea* was alſo the ancient name of *Pella*, in the Decapolis.

APEE, one of the New Hebrides, in the South Sea, near Mallicoli. Long. 168. 32. E. Lat. 55. 6. N.

APERTURE (*Encycl.*). When water iſſues from a ſmall aperture in the bottom or ſide of a veſſel, which is kept conſtantly full, it has been ſuppoſed, that the force accelerating the loweſt plate of water, of indefinitely little altitude, immediately over the orifice, is the weight of the incumbent water only; and, therefore, that after the motion of the plate has once commenced, the preſſure of the incumbent column will be diminiſhed, and of conſequence the force accelerating the plate, during its deſcent through its own altitude, will not be conſtant.

But, in fact, it is not the preſſure of the incumbent water, which accelerates the loweſt plate; for every plate of water immediately incumbent over the hole, abſtracting from all lateral preſſure, begins to be accelerated equally at the ſame moment; and therefore the incumbent column, excluſive of any lateral preſſure, could produce no increaſe of velocity, in proportion to its increaſed height. The force which really accelerates the iſſuing plate, is the preſſure of the ambient water, which ſurrounds the cylinder immediately over the aperture; and this lateral preſſure being communicated to the upper ſurface of the plate, muſt be as much increaſed by the velocity of the ſuperior deſcending plate, as it is diminiſhed by that of the inferior iſſuing plate, ſo as to remain conſtantly of the ſame magnitude.

On this principle it can be eaſily demonſtrated, that the velocity with which water ſpouts from an aperture in the bottom or ſide of a veſſel, is equal to that which a heavy body would acquire in falling through the height of the fluid above the orifice.

This demonſtration, however, as Mr. Atwood obſerves, is true only on the hypotheſis that the water ſuffers no reſiſtance, but iſſues in a cylindrical or priſmatic form correſponding to the hole. But, in fact, the velocity of the water according to

theory will be diminiſhed by the friction of the particles againſt the edges of the orifice, from their mutual attraction, by which the iſſuing particles are retarded by thoſe which are ſtill in the veſſel, and have not acquired the velocity of thoſe which precede them, but principally from the obliquity of their motions.

For, as Chev. Du Buat obſerves, when water iſſues from an orifice, the particles will flow from all ſides, towards the orifice, with an accelerated motion, and in all directions. If the orifice be horizontal, that filament of particles which anſwers to the centre of the hole will deſcend in a vertical line, and will ſuffer no other reſiſtance than that of the friction cauſed by the exceſs of its velocity above that of the collateral filaments, or by the retardation which ariſes from the attraction ſubſiſting between them. The other filaments, after they have deſcended vertically for ſome time, are compelled to turn from their vertical courſe, and to approach the orifice in different curves; and when they arrive at it, their directions become more or leſs horizontal, according as they paſs nearer to or farther from the edge of the orifice. The motion thereof is decompoſed according to two directions, the one horizontal, which is deſtroyed by the equal and contrary reſiſtance of the filaments which are diametrically oppoſite; the other vertical, in proportion to which the quantity of water diſcharged is to be eſtimated. Hence we ſee, that the vertical velocity of the filaments decreaſes from the centre of the orifice to its circumference; and that the total diſcharge is leſs than if all the filaments had iſſued vertically in the ſame manner with that which anſwers to the centre of the aperture. It alſo follows, that the filaments which are nearer to the centre, moving faſter than thoſe which are nearer to the edges, the vein of the fluid, after it has iſſued from the orifice, will form a cone whoſe baſe is the orifice; that is to ſay, that its diameter will diminiſh, at leaſt, to a certain diſtance, becauſe the exterior filaments are gradually drawn on, in conſequence of their mutual attraction, by the interior filaments whoſe velocity is greater; whence there follows a diminution in the diameter of the vein.

This manner of accounting for the contraction of the vein ſeems more reaſonable than that which is given by Newton; as there appears to be no adequate cauſe for the acceleration of the water, after it has been diſcharged from the orifice.

The diminution of the mean velocity of the water, cauſed ſolely by the obliquity of the motions of the iſſuing particles, excluſive of any other impediment, may be thus determined:

Let *m n* (fig. 1. Pl. 11.) be the diameter of the aperture in the veſſel ABDC filled with water: in whatever direction the water iſſues, its velocity in that direction will, in all caſes, be the ſame, becauſe the preſſure of fluids is the ſame in all directions; thus, whether a fluid ſpouts perpendicularly upwards or downwards, horizontally or obliquely, the ſpace through which it is projected, in a given time, is the ſame. Now to determine this direction, ſince the horizontal and vertical preſſures are equal, the iſſuing particles will aſſume the intermediate direction, which will therefore form an angle of 45° with the plane of the orifice: its vertical velocity therefore will be leſs than its direct or total velocity in the proportion of the diagonal of a ſquare to its ſide, or as 7 to 5 nearly; but the particles of the central filament iſſue with the full velocity due to the entire height of the water; therefore the velocity of the central particles will be to the mean velocity as 7 to the mean between 7 and 5, or as 7 to 6. This is the diminution, as has been ſaid, which takes place in conſequence ſolely of the obliquity of the motions with which the particles iſſue from the orifice: if the other cauſes of retardation be taken into the account, we may conclude, that the velocity ſhould be diminiſhed perhaps in the ratio of 8 or even 9 to 6; which accords very well with experiments. Thus Polenus makes the ratio of the diameters of the contracted vein and aperture, which is the ſame with that of the mean and greateſt velocity, to be as $5\frac{1}{2}$ to $6\frac{1}{2}$; Bernouilli 5 to 7; Chev. Du Buat 6 to 9. When the orifice is infinitely little, the cylinder of iſſuing water becomes a ſingle filament, which is therefore diſcharged without any obliquity, and there will be no diminution of velocity, except ſuch as ariſes from friction and the tenacity of the particles. If the aperture be increaſed ſo as to become equal to the baſe of the veſſel, the column of water will then deſcend like a falling body, and therefore the velocity will be the ſame as before; but it will not acquire this velocity until the uppermoſt plate of water has been diſcharged. At the beginning of the motion, the firſt or loweſt plate will flow out with a velocity indefinitely little; the next plate with a greater velocity; and ſo on, until the upper plate ſhall have deſcended to the orifice, which will then iſſue with the greateſt velocity. But if the veſſel be ſuppoſed to be kept conſtantly full, the velocity of the effluent water will increaſe ſo as at length to become equal to that which a heavy body would acquire in falling from an infinite height.

Since the middle filament of particles is diſcharged with the full velocity due to the entire altitude of the fluid above the orifice, experiments made on the diſtance or height to which fluids ſpout, will be found to agree very well with theory, but it by no means follows, that all the filaments ſhould be diſcharged with the ſame velocity: the quantity of the fluid therefore diſcharged in a given time, may be leſs than that which would be diſcharged, if all the filaments were diſcharged with the velocity due to the entire altitude; becauſe this quantity depends on the mean velocity of all the filaments. Hence, therefore, it cannot be inferred from theſe experiments, compared with thoſe which relate to the height or diſtance to which the fluid ſpouts, that the velocity of the water in the orifice is leſs than that which is due to the entire altitude: and that it is accelerated immediately after it gets out of it; becauſe the diſtance to which the fluid ſpouts depends on the central filament only, but the quantity diſcharged on the mean velocity of the whole.

"To bring this queſtion to the teſt of experiment (ſays the Rev. Dr. Matthew Young, from whoſe paper in the Tranſactions of the Royal Iriſh Academy we quote), if all the particles were equally accelerated at their diſcharge from their orifice, and immediately after they leave it, they ought all to be projected horizontally to the very ſame diſtance upon an horizontal plane; but on experiment I found, that when the fluid ſpouted through an orifice of ,08 of an inch diameter, and was kept conſtantly at the ſame height, the greateſt and leaſt diſtances at which it ſtruck the horizontal plane were nearly 15 and 12 inches; but theſe diſtances are proportional to the velocities with which they are diſcharged. It follows, therefore, that all the particles are not projected with the ſame velocity. It is to be obſerved, that the particles which are diſcharged with the greateſt and leaſt velocities are few in compariſon of thoſe which are diſcharged with intermediate velocities, for while the entire ſhower extended from 15 to 12 inches on the horizontal plane, the denſer part was found to occupy only the ſpace between $14\frac{1}{4}$ and $12\frac{3}{4}$ inches; ſo that the limits of the velocities of the parts of the denſer ſhower were as 7 and 6,26; but the limits of the whole were 15 and 12, or as 7 and 5,6; and the limits by theory are as 7 and 5. But we may perceive, that when the fluid ſpouts horizontally, the particles which iſſue from the upper part of the aperture, and which therefore ought to move with the leaſt velocity, muſt encounter thoſe below them moving with a greater velocity, which will increaſe the diſtance to which they are projected on an horizontal plane. Likewiſe, the particles which iſſue from the loweſt part of the orifice, and which ought to move with

a leſs velocity, than that with which thoſe in the axis move, in the ratio of 5 to 7, will have their velocity increaſed by their being at a greater depth. The limit therefore of the ratio of the diſtances to which the particles are projected on an horizontal plane, muſt be leſs than that which reſults from the theory of water iſſuing through an horizontal aperture. But it is obvious that the greater depth of the lower particles, when the orifice is vertical, cannot account for the entire difference of diſtance to which the particles are projected; for the depth of the orifice being 8,55 inches, and the diameter of the orifice ,08 of an inch, the velocities on account of the difference of depth would be only as $\sqrt{8,55}$ to $\sqrt{8,63}$, or as 14,6 to 15 nearly. Perhaps it might be ſaid, that this difference of diſtance was cauſed, not by the different velocities, but by the different directions in which the particles are diſcharged; ſo that thoſe which are projected in the axis of the vein, will ſtrike the horizontal plane at a greater diſtance than thoſe which are projected from the edges of the orifice with the ſame velocity, but in a different direction. But this cannot be the cauſe; for when the aperture is horizontal, the particles which iſſue from the oppoſite ſides *m*, *n*, of the orifice (fig. 2.), meeting each other, deſtroy their convergence, and afterwards proceed in the direction of the axis of the vein, and therefore the vein will continue nearly of the ſame diameter: whereas, if the particles croſſed each other, with the ſame velocity, in different directions, they would deſcribe interſecting parabolas *n s*, *m t*, and the diameter of the vein would continually increaſe. In order to determine whether this were the caſe, I cauſed the fluid to iſſue through an aperture in the bottom of the veſſel, and at the diſtance of 12 inches I found the diameter of the vein a little increaſed, when the velocity of the efflux was conſiderable; but not ſenſibly augmented, when the velocity was much diminiſhed. Since the dilatation of the vein in this caſe depends on the velocity with which the water iſſues from the aperture, it is to be inferred, that it is cauſed by the reſiſtance of the air, which producing a retardation of the preceding particles, thoſe which follow impinge againſt them, and the thickneſs of the vein is increaſed; for the ſame reaſon as when the jet is made perpendicularly upwards, a broad head is formed in conſequence of the retardation of the uppermoſt particles. Now, ſince it appears that the dilatation of the vein which ariſes either from the different directions of the particles, or the reſiſtance which they undergo from the air, or both together, cannot account for the difference of diſtance to which the particles are projected on an horizontal plane, we muſt conclude that this difference is cauſed by the different velocities with which they eſcape from the orifice.

"When a tube *m n r s* (fig. 3.) is inſerted into the veſſel ABCD, it is found, that the velocity is increaſed nearly in the ſub-duplicate ratio of the length of the pipe, when the tubes are ſhort; and that it approaches nearer to that ſub-duplicate ratio, according as the length of the pipe is increaſed. To account for this increaſe of velocity has appeared a matter of ſome difficulty, ſince the water cannot iſſue at *r s* with a greater velocity than it enters at *m n;* and it does not appear how the velocity at *m n* can be increaſed by inſerting a tube beneath it. In order to explain the cauſe of this effect, we are to conſider, that the whole force with which the plate *m n* is preſſed down is the weight of a column of water equal to *e m n f*, together with the weight of a column of air of the ſame baſe, reaching to the top of the atmoſphere; and the whole force with which it is preſſed up is the weight of an equal column of air, diminiſhed by the weight of a column of water equal to *m n r s;* therefore the actual force with which the plate *m n* is preſſed down is the weight of a column of water equal to *e f r s;* the velocity therefore with which the plate *m n* will iſſue through the orifice *m n* will be the ſame as through the orifice *r s* in the veſſel A *b c* D; that is, equal to the velocity which a heavy body would acquire in falling through the altitude *e r*; and all the plates of water in the tube *m n r s* will deſcend with the ſame velocity; for they cannot deſcend faſter, becauſe otherwiſe there would be a vacuum left in the tube, which is prevented by the upward preſſure of the atmoſphere. And the velocity of the effluent water will be the ſame, whatever be the preſſure of the atmoſphere, provided the weight of a column of air of the ſame baſe with *r s*, and whoſe height is equal to that of the atmoſphere, be either greater than or equal to the weight of the pillar of water *m n r s*. This might be proved experimentally by a veſſel of water with a pipe inſerted in the bottom, placed under an exhauſted receiver. But as the operation of exhauſtion is obſtructed more by the evaporation of water than of mercury, it will be better to uſe mercury in theſe experiments. Now, if D be the defect of the gauge from the ſtandard altitude, it will meaſure the preſſure of the air on the ſurface of the mercury in the veſſel: Let A be the altitude of the mercury in the veſſel above the upper orifice of the pipe, and P the length of the pipe; then the whole force preſſing downwards the plate of mercury which is immediately in the upper orifice of the pipe, will be = D + A; and the whole force preſſing the ſame plate upwards will be D — P; and the difference between theſe forces will be the abſolute force preſſing the ſame plate of mercury downwards; while D is greater than P, this abſolute force will conſequently be equal to A + P; when D = P, D—P vaniſhes, and the force preſſing the plate downwards is = D + A = P + A; hence, therefore, no variation in the time of the efflux will be perceived, while the altitude of the mercury in the gage is equal to or leſs than the difference between the length of the pipe and the ſtandard altitude. When D is leſs than P, the force upwards is alſo nothing; and therefore, as before, the whole force preſſing the plate downwards is = D + A; and A being given, it decreaſes according as D decreaſes; and when D vaniſhes, that is, when the receiver is abſolutely exhauſted, the force becomes equal to A, and the time of the efflux will be the ſame as if the pipe had not been inſerted in the bottom of the veſſel. To try the truth of theſe things by experiment, I inſerted a tube 7,8 inches long in a cylindrical veſſel, and cloſing the orifice of the pipe, I filled the veſſel with mercury to the height of 6 inches; then placing the apparatus under the receiver of an air-pump, when the barometer was at 30 inches, and the gauge at 28,5, the time of the efflux was 26 ſeconds: when the experiment was repeated preciſely in the ſame manner, but in the open air, the time of the efflux was only 19 ſeconds. Now, as the gauge ſtood at 28,5, the defect D was 30 — 28,5 = 1,5, and the preſſure on the plate of mercury was = 6 + $1\frac{1}{2}$ = $7\frac{1}{2}$; in the open air the preſſure was = 6 + 7,8 = 13,8; therefore the ratio of the velocity of the efflux in both caſes, which is the ſame with the reciprocal ratio of the times, was $\sqrt{7\frac{1}{2}}$ to $\sqrt{13,8}$, or as 2,73 to 3,7; but 2,73 is to 3,7 as 19 to 26 very nearly. No difference was obſerved in the times of the efflux, when in the open air and exhauſted receiver, unleſs the gauge ſtood higher than $22\frac{1}{2}$ inches; that is, unleſs the height of the mercury in the gauge was greater than the difference between the length of the pipe and the ſtandard altitude. In another experiment, when the gauge ſtood at 27,9, the height of the barometer was 29,9; the defect therefore was = 2, and the preſſure = 8. But $\sqrt{8}$ = 2,828, and $\sqrt{13,8}$ = 3,7 but 2,828 : 3,7 :: 19 : 24, and by experiment the time of the efflux appeared to be 23 ſeconds. When the efflux is made in vacuo, it is obvious to obſerve, that the pipe is not filled during the efflux, as it is while the diſcharge is made in the open air.

"Since the column of water in the pipe *m n r s* adds to

the preſſure which the plate *m n* ſuſtains, by diminiſhing the upward preſſure of the air through the pipe, it appears that it produces this increaſe of preſſure in the plate *m n* alone, without producing any lateral preſſure in the water which is on a level with *m n*; for it is manifeſt, that if an aperture were made in *m* B or *n* C, the velocity of the water iſſuing through it would not be affected by the inſertion of the pipe; and conſequently that the plate *m n*, which is immediately in the orifice of the pipe, is the only one, on the ſame level, whoſe tendency downwards is increaſed by the inſertion of the pipe. Hence, the particles of water at the edge of the aperture, having their perpendicular preſſure increaſed by the weight of the column *m n r s*, without any increaſe of their lateral preſſure, they will iſſue through the orifice *m n* more perpendicularly; the ſides alſo of the tube will obſtruct the converging motion of the particles, and conſequently, on both theſe accounts, the quantity of water diſcharged through a pipe thus inſerted will exceed that diſcharged through a ſimple orifice, in a greater ratio than the ſub-duplicate of the height of the water. And according as the length of the pipe increaſes, the ratio of the quantity of water actually diſcharged by experiment, to that which ſhould be diſcharged according to theory, will increaſe; becauſe the ratio of the perpendicular to the horizontal preſſure increaſes, in the ratio of the ſum of the depth of the veſſel, and length of the pipe, to the depth of the veſſel. It follows therefore, that experiments made in this manner, will approach nearer to coincidence with theory, than when made with a ſimple orifice; except either when the tube is ſo long as that the friction of the fluid againſt the ſides of the tube ſhall produce a ſenſible effect, or when it is ſo ſhort, as not to be ſufficient to give the particles a vertical direction. All which agrees very well with the experiments made by the ingenious Mr. Vince, of which he has given us an account in the Phil. Tranſ. for the year 1795. Thus he tells us, that having inſerted a tube, a quarter of an inch in length, into a cylindrical veſſel 12 inches deep, he found that the velocity did not ſenſibly differ from that through the orifice; the cauſe of which he diſcovered to be this, that the ſtream did not fill the pipe, but that the fluid was contracted, as when it flowed through the ſimple orifice. When the pipe was half an inch long, inſerted into a veſſel of the ſame depth as before, the velocity of the water from the pipe and from the orifice, which ought by theory to have been as $\sqrt{12,5}$ to $\sqrt{12}$, or as 49 to 48, was by experiment found to be nearly in the proportion of 4 to 3. Now if the ratio of 49 to 48 be increaſed in the ratio of 7 to 6 (becauſe this is the ratio of the diminution of the velocity on account of the contraction of the vein, and this contraction either nearly or entirely vaniſhes in a pipe), we ſhall have the ratio of 3,57 to 3. When the pipe was an inch long, the velocity from the pipe and from the orifice, which, according to theory, ought to have been as $\sqrt{13}$ to $\sqrt{12}$, or as 26 to 25, appeared by experiment, very nearly in the ratio of 4 to 3; now if the ratio of 26 to 25 be increaſed in the ratio of 7 to 6, we ſhall have the ratio of 3,64 to 3. When he made uſe of longer pipes, the velocity of the effluent water by experiment approached nearer to that which ought to have been diſcharged according to theory; ſo that in long pipes the difference between theory and experiment, he ſays, was not greater than what might be expected from the friction of pipes, and other cauſes which may be ſuppoſed to retard the velocity. When he inſerted a pipe of the ſame diameter with the aperture, which terminated in a truncated cone fixed in the orifice (fig. 4. ſee the Philoſophical Tranſactions for the year 1795), he expected, that the quantity of water diſcharged in a given time would have been diminiſhed, becauſe the water, iſſuing through the orifice *m n*, would have room to form the *vena contracta* in the enlarging cone; but he found, that the ſame quantity of water was diſcharged, as if the pipe had continued throughout of the ſame diameter with the orifice. The reaſon of this is manifeſt from what has been ſaid, for the preſſure of the air will not ſuffer the truncated cone to remain partly empty, as it would be if the *vena contracta* were formed; it will therefore continue full, and conſequently the water will paſs through it in the ſame manner as if the water in the cone, ſurrounding the pipe *m a b n*, were congealed."

Mr. Vince likewiſe inſerted into the bottom of the veſſel a perpendicular pipe, in form of a truncated cone, the narrower part being fixed in the orifice; by which he found the efflux to be increaſed more than if he had inſerted a cylindrical pipe of the ſame length, whoſe diameter was equal to that of the narroweſt part of the conical pipe. This effect may be explained on the ſame principle by which we accounted for the augmentation of the diameter of a vertical vein of water, through a ſimple orifice, when the velocity of the efflux is conſiderable. For when a perpendicular pipe is inſerted, the velocity of the diſcharge being conſiderably increaſed, the reſiſtance from the air will be ſo likewiſe; and thus the diameter of the vein has a tendency to enlarge itſelf; now in the widening cone, the pipe admits of this augmentation, at the ſame time that it increaſes the velocity; but the cylindrical pipe, though it equally increaſes the velocity, yet it does not permit the vein to enlarge itſelf, and by thus confining it, the efflux is obſtructed, and the quantity diſcharged in a given time is diminiſhed. Accordingly, under the receiver of an air-pump, even in a moderate degree of exhauſtion, there is no difference perceived between the velocities with which a fluid is diſcharged through a conical or cylindrical pipe.

APHACA, the name of a place in Syria, ſituated between the Heliopolis and Byblus, near Lebanon (Zoſimus); infamous for a temple of Venus, called *Aphacitis*, near which was a lake, round which fire uſually burſt forth, and its waters were ſo heavy, that bodies floated on them. The temple was deſtroyed by Conſtantine, as being a ſchool of incontinence (Euſebius). The name is of Syriac origin, ſignifying *embraces*.

APHRODISIAS, an iſland on the coaſt of Carmania (Pliny); ſacred to Venus (Arrian). Another iſland on the coaſt of Cyrene, with a road for ſhips (Scylax); called *Laea*, or the iſland of Venus (Ptolemy).

APHRODISIUS, an inland city of Caria, called the *Metropolis* (Ptolemy, Stephanus); ſaid by Suidas to have been called *Ninoe*. Another of Cilicia (Ptolemy); ſo called from the worſhip and a temple of Venus (Pliny). A third of Thrace, to the north of the iſthmus of the Cherſoneſus; an open town, till ſtrongly fortified by Juſtinian (Procopius).

APHYTIS, a town of the Cherſoneſus, called *Pallare*, in Macedonia (Pliny); famous for an oracle of Apollo.

APINA, or *Apinæ*, a town of Apulia, built by Diomedes, as was alſo Tricæ (Pliny). *Apinæ* and *Tricæ* is a proverbial ſaying for things trifling and of no value (Martial); and *Apinarii* was the appellation for triflers or buffoons (Trebellius Pollio).

APION, a famous grammarian, born in Egypt, was a profeſſor at Rome in the reign of Tiberius. He had all the arrogance of a mere pedant, and amuſed himſelf with difficult and inſignificant enquiries. One of his principal works was his Antiquities of Egypt.

APOBATANA, the metropolis of Media, and where the kings kept their treaſure (Iſidorus Characenus); ſuppoſed to be the ſame with *Echatana*.

APOBATHRA, a place near Seſtos (Strabo); the landing place where Xerxes's ſhips were frozen, and ſtuck in the ice (Euſtathius).

APOCALYPSE (*Encycl.*). This book consists of twenty-two chapters. The three first are an instruction to the bishops of the seven churches of Asia Minor. The fifteen following chapters contain the persecutions which the church was to suffer from the Jews, heretics, and Roman emperors. Next, St. John prophesies of the vengeance of God, which he will exercise against those persecutors, against the Roman empire, and the city of Rome, which, as the Protestants suppose, he describes under the name of Babylon, the great whore, seated upon seven hills. In the last place, the 19th, 20th, 21st, and 22d chapters, describe the triumph of the church over its enemies, the marriage of the Lamb, and the happiness of the church triumphant.

"It is a part of this prophecy (says Sir Isaac Newton), that it should not be understood before the last age of the world; and therefore it makes for the credit of the prophecy, that it is not yet understood. The folly of interpreters has been to foretel times and things by this prophecy, as if God designed to make them prophets. By this rashness they have not only exposed themselves, but brought the prophecy also into contempt. The design of God was much otherwise: he gave this and the prophecies of the Old Testament, not to gratify men's curiosities, by enabling them to foreknow things; but that, after they were fulfilled, they might be interpreted by the events; and his own providence, not the interpreters, be then manifested thereby to the world. And there is already so much of the prophecy fulfilled, that as many as will take pains in this study, may see sufficient instances of God's providence."

APOLLINARIS (Caius Sulpicius), a very learned grammarian, born at Carthage, lived in the 2d century, under the Antonines; he is supposed to be the author of the verses which are prefixed to the comedies of Terence, and contain the arguments of them. He had for his successor in the profession of grammar Helvius Pertinax, who had been his scholar, and was at last emperor.

Apollinaris Sidonius (Caius Sollius), an eminent Christian writer and bishop in the 5th century, was born of a noble family in France. He was educated under the best masters, and made a prodigious progress in the several arts and sciences, but particularly in poetry and polite literature. After he had left the schools, he applied himself to the profession of war. He married Papianilla, the daughter of Avitus, who was consul, and afterwards emperor, by whom he had three children. But Majorianus in the year 457 having deprived Avitus of the empire, and taken the city of Lyons, in which our author resided, Apollinaris fell into the hands of the enemy. However, the reputation of his learning softened Majorianus's resentment, so that he treated him with the utmost civility, in return for which Apollinaris composed a panegyric to his honour; which was so highly applauded, that he had a statue erected to him at Rome, and was honoured with the title of *Count*. In the year 467 the Emperor Anthemius rewarded him for the panegyric, which he had written in honour of him, by raising him to the post of governor of Rome, and afterwards to the dignity of a patrician and senator, and erecting a statue to him. But he soon quitted these secular employments for the service of the church. The bishopric of Clermont being vacant in 472 by the death of Eparchius, Apollinaris, who was then only a laymen, was chosen to succeed him without any interest or solicitations on his part, in which see he acted with the greatest integrity. Clermont being besieged by the Goths, he animated the people to the defence of that city, and would never consent to the surrender of it; so that, when it was taken about the year 480, he was obliged to retire; but he was soon restored by Evarigcs king of the Goths, and continued to govern the church as he had done before. He died in peace the 21st of August, 487, and his festival is still observed in the church of Clermont, where his memory is had in great veneration. He is esteemed the most elegant-writer of his age, both in prose and verse. He wrote a great many little pieces; but preserved none but those which he thought were worthy of being continued down to posterity. He collected himself the nine books which we have remaining of his letters. His chief pieces in poetry are the three panegyrics upon the emperors Avitus, Majorianus, and Anthemius. The rest of them are a collection of poems addressed to his friends upon particular subjects. His letters contain a variety of particulars relating to polite literature and profane history.

APOLLINARIUS (Claudius), a learned bishop of Hierapolis, who, about the year 170, presented to Marcus Aurelius an excellent Apology for the Christians.

Apollinarius the Younger, thus called to distinguish him from his father, called *Apollinarius the Elder*, was at first lector or reader of Loadicea, and afterwards bishop of that city. He was universally esteemed the greatest man of his age, both for learning and piety, and a most accurate and nervous defender of the faith against all its enemies: but notwithstanding this, on his advancing some opinions that were not approved, he was anathematized as an heretic by the second general council of Constantinople in 381.

APOLLODORUS, born at Damascus, a famous architect under Trajan and Hadrian: he had the direction of the bridge of stone which Trajan ordered to be built over the Danube in the year 104, which was esteemed the most magnificent of all the works of that emperor. Hadrian, one day as Trajan was discoursing with this architect upon the buildings he had raised at Rome, would needs give his judgment, and shewed he understood nothing of the matter. Apollodorus turned upon him bluntly, and said to him, "Go paint citruls, for you are very ignorant of the subject we are talking upon." Hadrian at this time boasted of his painting citruls well. This insult cost Apollodorus his life.

Apollodorus, a celebrated painter of Athens, about 408 years before the birth of Christ, was the first who invented the art of mingling the colours, and of expressing the lights and shadows. He was admired also for his judicious choice of subjects, and for the beauty and strength of colouring surpassed all the masters that went before him. He excelled likewise in statuary.

Apollodorus the Athenian, a famous grammarian, the son of Asclepiades, and disciple of Aristarchus. He wrote many works not now extant; but his most famous production was his *Bibliotheca*, concerning the origin of the gods: this work consisted of twenty-four books, but only three are now in being. Several other pieces of his are to be found in Fabricius's *Bibliotheca Græca*. There were various other persons of this name: Scipio Tetti, a Neapolitan, has written a treatise of the Apollodoruses, which was printed at Rome in 1555; and Dr. Thomas Gale published a work of the same kind in 1675.

Apollonia, feasts sacred to Apollo, instituted upon the following occasion. Apollo, having vanquished Python, went with his sister Diana to Ægialea; but, being driven from thence, he removed to the island of Crete. The Ægialeans were soon after visited with a plague; upon which, consulting the soothsayers, they were ordered to send seven young men, and as many virgins, to appease those deities and bring them back into their country. Apollo and Diana being thus appeased, returned to Ægialea: in memory of which, they dedicated a temple to Pitho, the *goddess of persuasion*; whence a custom arose of choosing every year seven young men, and as many virgins, to go as it were in search of Apollo and Diana.

APOLLONIUS Rhodius, the author of the *Argonautics*, was born at Alexandria in Egypt: he taught rhetoric at

Rhodes, and hence was called *Rhodius*. He flouriſhed about the 137th Olympiad, and was keeper of the Alexandrian library. Longinus, in his treatiſe *Of the Sublime*, commends this poet. The ancient Scholia upon his *Argonautics*, ſtill extant, are extremely uſeful, and full of learning.

Apollonius of Perga, a city of Pamphylia, was a great geometrician, under the reign of Ptolemy Euergetes, which reaches from the 2d year of the 133d Olympiad to the 3d year of the 139th. He ſtudied a long time at Alexandria, under the diſciples of Euclid; and compoſed ſeveral works, of which that only of the Conics remains.

Apollonius, a Pythagorean philoſopher, born at Tyana in Cappadocia, about the beginning of the firſt century. At ſixteen years of age he became a ſtrict obſerver of Pythagoras's rules, renouncing wine, women, and all ſorts of fleſh; not wearing ſhoes, letting his hair grow, and wearing nothing but linen. He ſoon after ſet up for a reformer of mankind, and choſe his habitation in a temple of Æſculapius, where he is ſaid to have performed many wonderful cures. Philoſtratus has wrote the Life of Apollonius, in which there are numberleſs fabulous ſtories recounted of him. We are told that he went five years without ſpeaking; and yet, during this time, that he ſtopped many ſeditions in Cilicia and Pamphylia: that he travelled, and ſet up for a legiſlator; and that he gave out he underſtood all languages, without having ever learned them; that he could tell the thoughts of men, and underſtood the oracles which birds gave by their ſinging. The heathens were fond of oppoſing the pretended miracles of this man to thoſe of our Saviour: and by a treatiſe which Euſebius wrote againſt one Hierocles, we find that the drift of the latter, in the treatiſe which Euſebius refutes, ſeems to have been to draw a parallel betwixt Jeſus Chriſt and Apollonius, in which he gives the preference to this philoſopher. Mr. Du Pin has wrote a confutation of Philoſtratus's Life of Apollonius. Apollonius wrote ſome works, *viz.* four books of judicial aſtrology; a treatiſe upon the ſacrifices, ſhewing what was proper to be offered to each deity; and a great number of letters, all of which are now loſt.

APONO (Peter d'), a famous philoſopher and phyſician of his age, was born in 1250, in a village near Padua. He ſtudied ſome time at Paris, and was there promoted to the degree of doctor in philoſophy and phyſic. When he came to practiſe as a phyſician, he is ſaid to have inſiſted on very large ſums for his viſits: we are not told what his demands were in the place of his reſidence, but it is affirmed that he would not attend the ſick in any other place under an hundred and fifty florins a-day; and when he was ſent for by Pope Honorius IV. he demanded four hundred ducats for each day's attendance. He was ſuſpected of magic, and proſecuted by the inquiſition on that account, but he died before the proceſs againſt him was finiſhed, being then in the eightieth year of his age. The moſt remarkable book which Aponó wrote, was that which procured him the ſurname of Conciliator; he wrote alſo a piece entitled "De medicina omnimoda."

APOSTACY (*Encycl.*). The perverſion of a Chriſtian to Judaiſm, Paganiſm, or other falſe religion, was puniſhed by the emperors Conſtantius and Julian with confiſcation of goods; to which the emperors Theodoſius and Valentinian added capital puniſhment, in caſe the apoſtate endeavoured to pervert others to the ſame iniquity. A puniſhment too ſevere for any temporal laws to inflict: and yet the zeal of our anceſtors imported it into this country; for we find by Bracton, that in his time apoſtates were to be burnt to death. Doubtleſs the preſervation of Chriſtianity, as a national religion, is, abſtracted from its own intrinſic truth, of the utmoſt conſequence to the civil ſtate: which a ſingle inſtance will ſufficiently demonſtrate. The belief of a future ſtate of rewards and puniſhments, the entertaining juſt ideas of the moral attributes of the ſupreme Being, and a firm perſuaſion that he ſuperintends and will finally compenſate every action in human life (all which are clearly revealed in the doctrines, and forcibly inculcated by the precepts, of our ſaviour Chriſt), theſe are the grand foundation of all judicial oaths; which call God to witneſs the truth of thoſe facts, which perhaps may be only known to him and the party atteſting: all moral evidence therefore, all confidence in human veracity, muſt be weakened by apoſtacy, and overthrown by total infidelity. Wherefore all affronts to Chriſtianity, or endeavours to depreciate its efficacy, in thoſe who have once profeſſed it, are highly deſerving of cenſure. But yet the loſs of life is a heavier penalty than the offence, taken in a civil light, deſerves; and, taken in a ſpiritual light, our laws have no juriſdiction over it. This puniſhment, therefore, has long ago become obſolete; and the offence of apoſtacy was for a long time the object only of the eccleſiaſtical courts, which corrected the offender *pro ſalute animæ*. But about the cloſe of the laſt century, the civil liberties to which we were then reſtored being uſed as a cloke of maliciouſneſs, and the moſt horrid doctrines ſubverſive of all religion being publicly avowed both in diſcourſe and writings, it was thought neceſſary again for the civil power to interpoſe, by not admitting thoſe miſcreants to the privileges of ſociety, who maintained ſuch principles as deſtroyed all moral obligation To this end it was enacted by ſtatute 9 and 10 W. III. c. 32. That if any perſon educated in, or having made profeſſion of, the Chriſtian religion, ſhall by writing, printing, teaching, or adviſed ſpeaking, deny the Chriſtian religion to be true, or the holy Scriptures to be of divine authority, he ſhall upon the firſt offence be rendered incapable to hold any office or place of truſt; and, for the ſecond, be rendered incapable of bringing any action, or of being guardian, executor, legatee, or purchaſer of lands, and ſhall ſuffer three years' impriſonment without bail. To give room however for repentance, if, within four months after the firſt conviction, the delinquent will in open court publicly renounce his error, he is diſcharged for that once from all diſabilities.

APOTOME (*Encycl.*). This term is employed by Euclid to denote the difference between two lines or quantities which are only commenſurable in power. Such is the difference between 1 and $\sqrt{2}$, or the difference between the ſide of a ſquare and its diagonal. The doctrine of apotomes in lines, as delivered by this ancient mathematician in the tenth book of his Elements, is a very curious ſubject, and has always been admired by ſuch as underſtood it. The firſt algebraical writers in Europe, ſuch as Lucas de Burgo, Cardan, Tartalea, Stifelius, &c. employed a conſiderable portion of their works on an algebraical expoſition of that which led them to the doctrine of ſurd quantities.

APPALACHIKOLA, a river of North America, formed by the junction of the rivers Chatahouchee and Flint, which have their ſource in the Appalachian Mountains, and running nearly parallel in a ſoutherly direction, flow united into the gulf of Mexico, oppoſite St. George's Iſland.

APPENZEL, a town of Switzerland, capital of the canton of the ſame name, which is divided into twelve communities; ſix called the interior, are Roman-catholics; the ſix exterior, are Proteſtants. It is forty miles E. of Zurich. Long. 9. 31. E. Lat. 47. 21. N.

APPIAN, an eminent writer of the Roman hiſtory in Greek, under the reigns of Trajan and Hadrian. He was of a good family in Alexandria in Egypt; whence he went to Rome, and there diſtinguiſhed himſelf ſo well as an advocate, that he was choſen one of the procurators of the empire, and the government of a province was committed to him. He

did not complete the Roman hiſtory in a continued ſeries; but wrote diſtinct hiſtories of all nations that had been conquered by the Romans, in which he placed every thing relating to thoſe nations in the proper order of time. His ſtyle is plain and ſimple: in the opinion of Photius, he has ſhewn the greateſt knowledge of military affairs, and the happieſt talent at deſcribing them, of any of the hiſtorians; for while we read him, we in a manner ſee the battles which he deſcribes. Of all this voluminous work there remains only what treats of the Punic, Syrian, Parthian, Mithridatic, and Spaniſh wars, with thoſe againſt Hannibal, the civil wars, and the wars in Illyricum, and ſome fragments of the Celtic or Gallic wars.

APPIUS CLAUDIUS, a Sabine by birth, one of the principal inhabitants of Regillum: his ſhining merit having drawn the envy of his fellow-citizens upon him, he retired to Rome with all his family. Appius was admitted into the ſenate, and was made conſul, with Publius Servilius Priſcus, in 258 from the building of Rome: but he was hated by the plebeians, being an auſtere oppoſer of their clamours and ſeditions. The Claudian family continued long one of the moſt illuſtrious of the patrician families in Rome; and ſeveral in ſucceſſion of the name of Appius ſupported the ſame ſtern character that diſtinguiſhed their firſt founder.

APRIES, ſon of Pſammis king of Egypt; the ſame with Pharaoh Hophrah in Jeremiah and Ezekiel. He ruined Sidon, and ſome ſay he put Jeremiah to death. He thought neither God nor man could dethrone him; which yet was eaſily done by Amaſis, and he himſelf was ſtrangled by the Egyptians.

APRIL-FOOL, a ludicrous trick played on the unſuſpecting, on the firſt day of April. The origin of this childiſh and not very innocent frolic, has been variouſly accounted for; but probably it had its riſe merely in the ficklenes of the weather uſual at this period of the year; ſince thoſe whom ſun-ſhine may have enticed abroad are liable to return wet to the ſkin by the rain.

APROSIO (Angelico), born at Ventimiglia, in the republic of Genoa, 1607, was a man of great reputation among the learned, and wrote ſeveral books. At fifteen years of age he entered into the order of the Auguſtins, where he became ſo much eſteemed, that he was appointed vicar-general of the congregation of our Lady of Conſolation at Genoa. As ſoon as he had finiſhed his ſtudies, he taught philoſophy, which he continued to do for five years; after which he travelled into ſeveral parts of Italy, and ſettled at Venice in the year 1639, in the convent of St. Stephen. What rendered him moſt famous, was the library of the Auguſtins at Ventimiglia, which being chiefly collected by him, was a proof of his love for books, and his excellent taſte. He publiſhed a book concerning this library, which is much ſought after by the curious. He uſed to diſguiſe himſelf under fictitious names in the title-pages of his books; which conduct might, perhaps, be owing to the ſubjects he wrote upon; they not being always ſuited to a religious life: ſuch, for inſtance, as the Adonis of the cavalier Marino, &c. And if we conſult the authors who have given us a catalogue of the writers of Liguria, we find that he aſſumed ſometimes the name of Maſoto Galiſtoni, ſometimes that of Carlo Galiſtoni, Scippio Glareano, Sapricio Saprici, Oldauro Scioppio, &c. His life is written in the book entitled La Bibliotheca Aproſiana. Several authors have beſtowed upon him very great encomiums, ſome of whom have been perhaps rather too extravagant in their praiſes.

APT, an ancient town of France, in the department of the Mouths of the Rhone and late province of Provence. Its commerce conſiſts in prunes, coarſe ſerges, and wax chandlery, for which laſt there is a great demand. There are many fine Roman antiquities, and it is ſeated on the river Calaron, twenty miles N. of Aix, and twenty-five S. E. of Orange. Long. 5. 30. E. Lat. 43. 51. N.

APTA, or APTA JULIA (Pliny); now *Apt*, in Provence, on the river Calavon, ſeven leagues to the north of Aix, and nine to the north of Avignon. In the Notitiæ it is called *Civitas Aptenſium*: Pliny reckons it among the Latin towns. That it was a colony, appears from an inſcription on a ſtone found at Arles (Sirmond). E. Long. 5. 56. Lat. 43. 23.

APTERA (Strabo, Stephanus); APTERON (Pliny); APTERIA (Ptolemy): an inland town of Crete, whoſe port was Ciſamus, on the weſt ſide of the iſland (Strabo); twelve miles to the ſouth of Cydonia, towards the Montes Leuci, and as many from the Sinus Amphimales. So called from the Sirens, who, being there vanquiſhed in ſong by the Muſes, ſtript themſelves of their wings, and out of grief leaped into the ſea (Stephanus). There was a town of Lycia of the ſame name. E. Long. 25. Lat. 35. 50.

APULEIUS (Lucius), a Platonic philoſopher, univerſally known by his performance of the Golden Aſs. He lived in the ſecond century, under the Antonines; and was born at Madaura, a Roman colony in Africa. He ſtudied firſt at Carthage, then at Athens, and afterwards at Rome, where he learned the Latin tongue without the help of a maſter. He was a man of a curious and inquiſitive diſpoſition, eſpecially in religious matters: this prompted him to take ſeveral journeys, and to enter into ſeveral ſocieties of religion. He ſpent his whole fortune almoſt in travelling; ſo that, at his return to Rome, when he was about to dedicate himſelf to the ſervice of Oſiris, he had not money enough to defray the expence attending the ceremonies of the reception, and was obliged to pawn his clothes to raiſe the neceſſary ſum. He ſupported himſelf afterwards by pleading cauſes; and as he was a great maſter of eloquence, and of a ſubtle genius, many conſiderable cauſes were truſted to him. But he availed himſelf more by a good marriage than by his pleadings: a widow, named *Pudentilla*, who was neither young nor handſome, but wanted a huſband, and was very rich, took a great fancy to him. This marriage drew upon him a troubleſome law-ſuit. The lady's relations, pretending he made uſe of ſorcery to gain her heart and money, accuſed him of being a magician before Claudius Maximus, proconſul of Africa. Apuleius was under no great difficulty of making his defence. As Pudentilla was determined, from conſiderations of health, to enter upon a ſecond marriage, even before ſhe had ſeen this pretended magician, the youth, deportment, pleaſing converſation, vivacity, and other agreeable qualities, of Apuleius, were charms ſufficient to engage her heart. He had the moſt favourable opportunities too of gaining her friendſhip, for he lodged ſome time at her houſe: Pudentilla's eldeſt ſon having a great friendſhip for him, was likewiſe deſirous of the match, and ſolicited him in favour of Pudentilla. "Do you make a wonder (ſaid Apuleius, in his defence) that a woman ſhould marry again, after having lived a widow 13 years? it is much more wonderful that ſhe did not marry again ſooner. You think that magic muſt have been employed to prevail with a widow of her age, to marry a young man; on the contrary, this very circumſtance ſhews how little occaſion there was for magic." He offered to prove by his marriage-contract, that he got nothing of Pudentilla but a promiſe of a very moderate ſum, in caſe he ſurvived her and had children by her. He was alſo obliged to make ſuch confeſſions in court as Pudentilla would gladly have excuſed. He ſaid ſhe was neither handſome nor young, nor ſuch as could anyways tempt him to have recourſe to inchantments: moreover, he added, that Pontianus her ſon propoſed the marrying his mother to him only as a burden, and the action of a friend and philoſopher. He alſo took notice of many inconveniences which attend the

marrying of widows, and ſpoke highly of the advantages of a maid above a widow: "A handſome virgin (ſaid he), let her be ever ſo poor, is abundantly portioned; ſhe brings to her huſband a heart quite new, together with the flower and firſt-fruits of her beauty. It is with great reaſon that all huſbands ſet ſo great a value upon the flower of virginity: all the other goods which a woman brings her huſband are of ſuch a nature, that he may return them again, if he has a mind to be under no obligation to her; that alone cannot be reſtored, it remains in the poſſeſſion of the firſt huſband. If you marry a widow, and ſhe leaves you, ſhe carries away all that ſhe brought you." Upon which paſſage Mr. Bayle makes a very coarſe remark, *viz.* "That this good which is never taken back out of the hands of a huſband, is very chimerical; and that there is never a baker nor a butcher, who would lend ſixpence upon this unperiſhable poſſeſſion." The apology is ſtill extant, and is reckoned a very fine piece. Apuleius was extremely indefatigable in his ſtudies; and compoſed ſeveral books, ſome in verſe, and others in proſe; but moſt of them have been loſt. He took great pleaſure in declaiming, and was heard generally with great applauſe: when he declaimed at Oea, the audience cried out with one voice, that they ought to confer upon him the honour of citizen. The citizens of Carthage heard him with great ſatisfaction, and erected a ſtatue to him; and ſeveral other cities did him the ſame honour. Several critics have publiſhed notes on Apuleius's Golden Aſs, and there have been tranſlations of it into different languages.

APULIA, now PUGLIA, a territory of Italy, bordering on the Adriatic, and extending from the river Frento to Tarentum in length, and from the Adriatic to the Lucani in breadth. *Apuli* the people (Horace), divided into the *Apulia Daunia*, now called *Puglia Pinna*, or the *Capitanata*; and into the *Apulia Peucetia*, now *Terra di Barri* (Pliny, Ptolemy). Apulia abounded in ſheep, which yielded the fineſt wool (Martial). It is now the eaſt ſide of the kingdom of Naples.

APURIMA, or APORAMIA, a rapid river of South America, in Peru, thirty miles from the river Abanzai.

AQUA-NEGRA, a town of Italy, in the Mantuan, on the river Chieſa, twelve miles W. of Mantua. Long. 10. 25. E. Lat. 45. 12. N.

AQUA REGIA (*Encycl.*). In this article, line tenth, for "except *ſilver*," read "except *gold*."

AQUÆ AUGUSTÆ (Ptolemy); AQUÆ TARBELLICÆ (Antonine); AQUENSIS CIVITAS, in the Notitia. Now *Acqs*, or *Dax*, a town in Gaſcony, on the river Adour, famous for its baths. W. long. 1. 40. Lat. 43. 56.

AQUÆ CUTILIÆ, a lake of the Sabines, in the territory of Reate (Pliny); LACUS CUTILIENSIS (Varro); with a moveable iſland in it (Seneca, Pliny); ſuppoſed to be the centre of Italy (Varro). The waters were medicinal, and extremely cold, good for a weak ſtomach and in weak nerves (Pliny). Veſpaſian uſed them every ſummer; and there he died (Sueton, Xiphilin of Dio). Now *Lago di Contigliano*.

AQUÆ FLAVIÆ, a town on the confines of Galicia and Portugal, ſo called from Veſpaſian and Titus. The inhabitants are called *Aquiflavienſes* (Coins). Now called *Chiaves*, a mean hamlet: but the ruins of its bridge teſtify its former grandeur. W. long. 6. 6. Lat. 41. 40.

AQUÆ TAURI, hot waters or baths in Tuſcany, at the diſtance of three miles from the ſea, ſaid to be diſcovered by a bull; whence the appellation. There are ſtill to be ſeen the ruins of theſe baths. The people are called *Aquenſes Taurini* (Pliny). Now *Acquapendente*, in Orvieto. E. long. 12. 40. Lat. 42. 40.

AQUARIANS (*Encycl.*). Epiphanius calls theſe aquarians mentioned in our original article *Encratites*, from their abſtinence; St. Auſtin, *Aquarians*, from their uſe of water; and Theodoret, who ſays they ſprang from Tatian, *Hydroparaſtatæ*, becauſe they offered water inſtead of wine. But beſides theſe there was another ſort of Aquarians, who did not reject the uſe of wine as unlawful; for they adminiſtered the euchariſt in wine at evening ſervice; but, in their morning aſſemblies, they uſed water, for fear the ſmell of wine ſhould diſcover them to the heathens.

AQUILEIA, a large city of the Carni, or Veneti, and a noble Roman colony, which was led thither between the firſt and ſecond Macedonian wars (Livy). It is waſhed by two rivers, the Natiſo and Turrus (Pliny). The reaſon of leading this colony was, in order to be a bulwark againſt the neighbouring barbarians. The colony was afterwards increaſed with 1500 families by a decree of the ſenate (Livy); from which it became a very famous port-town (Herodian). The emperor Julian aſcribes the appellation to the augury of an eagle at the time of building it; but Iſaac Voſſius on Mela, to the great plenty of water, as if the town were called *Aquilegia*. The harbour, at the mouth of the Natiſo, is diſtant ſixty ſtadia from the city; ſo that ſhips of burden are towed up the river (Strabo). It it ſtill called *Aquileia*, but greatly fallen from its former ſplendor. E. long. 15. 32. Lat. 45. 45.

AQUILINE, ſomething belonging to or reſembling an eagle: thus, an aquiline noſe is one bent ſomewhat like an eagle's beak.

AQUINAS (St. Thomas), ſtyled the *Angelical Doctor*, was of the ancient and noble family of the counts of Aquino, deſcended from the kings of Sicily and Arragon; and was born in the caſtle of Aquino, in the Terra di Lavora in Italy, in the year 1224 or 1225. He entered into the order of the Dominicans; and, after having taught ſchool-divinity in moſt of the univerſities of Italy, at laſt ſettled at Naples, where he ſpent the reſt of his life in ſtudy, in reading of lectures, and in acts of piety; and was ſo far from the views of ambition or profit, that he refuſed the archbiſhopric of that city, when it was offered him by Pope Clement IV. He died in 1274, leaving an amazing number of writings, which were printed at Venice in 17 volumes, folio, in the year 1490. He was canonized by Pope John XXII. in the year 1323; and Pius V. who was of the ſame order with him, gave him, in 1567, the title of the Fifth Doctor of the church, and appointed his feſtival to be kept with the ſame ſolemnity as thoſe of the other four doctors. His authority has always been of great importance in the ſchools of the Roman Catholics. Lord Herbert in his Life of Henry VIII. tells us, that one of the principal reaſons which induced that king to write againſt Luther, was, that the latter had ſpoken contemptuouſly of Aquinas.

AQUINO (Philip d'), in Latin *Aquinas* or *Aquinius*, having turned from Judaiſm, had a penſion from the clergy of France; and acquired much reputation by his knowledge of the Hebrew language, which he taught at Paris, in the reign of Lewis XIII. and by the books he publiſhed, among which is his *Dictionarium Hebræo-Chaldæo-Thalmudico-Rabbinicum*. His grandſon, Anthony D'Anquin, was firſt phyſician to Lewis XIV.

ARACAN (*Encycl.*). It is capital of a ſmall kingdom to the north-eaſt of the bay of Bengal, ſituated in E. long. 93. 0. N. Lat. 20. 30. It has the conveniency of a ſpacious river, and a harbour large enough to hold all the ſhips in Europe. It is ſaid by Schouten to be as large as Amſterdam; but the houſes are ſlight, being made with palm-trees and bamboo-canes, and covered with leaves of trees. They are ſeldom above ſix feet high, but have many windows or air-holes. But the people of the higheſt rank are much better accommodated. They have no kitchens, chimneys, or cellars, which obliges the women to dreſs the victuals out of doors. Some of the ſtreets are on the ridges of rocks, wherein are a great many ſhops.

Their orchards and gardens contain all the fruit common to the Indies, and their trees are green all the year. Their common drink is toddy; which is the ſap of the cocoa-tree, and when new will intoxicate like wine, but ſoon grows ſour. Elephants and buffaloes are very numerous here, and are made uſe of inſtead of horſes. They have plenty of proviſions, and but little trade: for when Mr. Channoch was here in 1686, with ſix large ſhips, there was nothing to be had in the way of commerce; and yet the country produces lead, tin, ſtick-lac, and elephants' teeth. The Mogul's ſubjects come here to purchaſe theſe commodities; and ſometimes meet with diamonds, rubies, and other precious ſtones. They were formerly governed by a king of their own, called the king of the *White Elephant;* but this country has been conquered by the king of Pegu. They pay little or no regard to the chaſtity of their women, and the common ſailors take great liberties among them. Their religion is Paganiſm; and their idols, temples, and prieſts, are very numerous. The dreſs of the better ſort is very ſlight, for it conſiſts chiefly of a piece of white cotton over their arms, breaſt, and belly, with an apron before. The complexion of the women is tolerable; they wear thin flowered gauze over their breaſt and ſhoulders, and a piece of cotton, which they roll three or four times round their waiſt, and let it hang as low as their feet. They curl their hair, and put glaſs rings in their ears, and ſtretch them of a monſtrous length. On their arms and legs they have hoops of copper, ivory, ſilver, &c. The country produces great quantities of rice, and the water is good. Their flocks of ſheep and herds of cattle are alſo numerous near Aracan; but what they ſay of the towns and villages, with which the country is pretended to be overſpread, may be doubted. Captain Hamilton affirms, that there are but few places inhabited, on account of the great number of wild elephants and buffaloes, which would deſtroy the fruits of the ground; and that the tigers would deſtroy the tame animals. There are ſome iſlands near the ſea, inhabited by a few miſerable fiſhermen, who can juſt keep themſelves from ſtarving, though they are out of the reach of oppreſſion. The rich burn the dead bodies; but the poor, who are not able to buy wood, throw them into the river.

ARÆ PHILÆNON, or PHILÆNORUM (Strabo); to the ſouth of the Syrtis Major; but in Peutinger, more weſterly, to the ſouth almoſt of the Syrtis Minor. In Strabo's time, the altars were not extant, but a village of the ſame name ſtood on the ſpot. On a diſpute about limits, between the Cyreneans and Carthaginians, it was agreed that two of each people ſhould ſet out on the ſame day, and that where they ſhould happen to meet, there the limits of both ſhould be fixed. The Philæni, two brothers, Carthaginians, undertook it for Carthage: theſe, after having advanced a great many miles into the territory of the Cyreneans, were met by their antagoniſts; who enraged at their being before-hand with them ſo far, gave them the option of either returning back, or of being buried alive on the ſpot: like zealous patriots, they choſe the latter; and there the Carthaginians raiſed two altars in honour of the Philæni. (Salluſt, Valerius Maximus.)

ARAL (*Encycl.*). Of this great lake, the length from north to ſouth is ſaid to be near 150 miles, and its breadth from eaſt to weſt about ſeventy. The ſhore on the weſt ſide is high and rocky, and deſtitute of good water: yet there are abundance of wild horſes, aſſes, antelopes, and wolves; as alſo a fierce creature called a *jolhart,* which the Tartars ſay is of ſuch a prodigious ſtrength as to carry off a horſe. It is ſurpriſing that this lake ſhould be quite unknown to geographers till within theſe few years. Several great rivers, which were ſuppoſed to run into the Caſpian ſea, are now known to fall into this lake, particularly the Sihun or Sirr, and the Gihun or Amo, ſo often mentioned by the Oriental hiſtorians. This lake, like the Caſpian ſea, has no viſible outlet. Its water is alſo very ſalt; and for that reaſon is conveyed by the neighbouring inhabitants by ſmall narrow canals into ſandy pits, where the heat of the ſun, by exhaling the water, leaves them a ſufficient quantity of ſalt. The ſame kinds of fiſh are found in Aral that are found in the Caſpian ſea. The former is alſo called the *Lake of Eagles.*

ARAM (Eugene), a man of conſiderable erudition, remarkable for his unhappy fate, and the ſingular circumſtances that occaſioned and attended it, was born at Ramſgill, a little village, in Netherdale, Yorkſhire, in the year 1704. He was removed, when very young, together with his mother, to Skelton, near Newby: and when he was five or ſix years old, his father making a little purchaſe in Bondgate near Rippon, his family went thither. He was there ſent to ſchool, where he learned to read the New Teſtament in Engliſh, which was all he was ever taught, except that, ſome conſiderable time after, he was under the tuition of the Reverend Mr. Alcock of Burnſal, for about a month. When he was about thirteen or fourteen years of age, he went to his father at Newby, and attended him in the family there, till the death of Sir Edward Blackett. It was in the houſe of this gentleman, to whom his father was gardener, that his propenſity to literature firſt appeared. He was, indeed, always of a ſolitary diſpoſition, and uncommonly fond of retirement and books; and here he enjoyed all the advantages of leiſure and privacy. He applied himſelf at firſt chiefly to mathematical ſtudies, in which he made a conſiderable proficiency. At about ſixteen years of age, he was ſent to London to the houſe of Mr. Chriſtopher Blackett, whom he ſerved for ſome time in the capacity of book-keeper. After continuing here a year or more, he was taken with the ſmall-pox, and ſuffered ſeverely under that diſtemper. He afterwards returned into Yorkſhire, in conſequence of an invitation from his father, and there continued to proſecute his ſtudies, but found in polite literature much greater charms than in the mathematics; which occaſioned him now chiefly to apply himſelf to poetry, hiſtory, and antiquities. After this he was invited to Netherdale, where he engaged in a ſchool and married. But his marriage proved an unhappy connection; for to the miſconduct of his wife he afterwards attributed the misfortunes that befel him. In the mean while, having perceived his deficiency in the learned languages, he applied himſelf to the grammatical ſtudy of the Latin and Greek tongues; after which he read, with great avidity and diligence, all the Latin claſſics, hiſtorians, and poets. He then went through the Greek Teſtament; and, laſtly, ventured upon Heſiod, Homer, Theocritus, Herodotus, and Thucydides, together with all the Greek tragedians. In 1734, William Norton, eſq. a gentleman who had a friendſhip for him, invited him to Knareſborough. Here he acquired the knowledge of the Hebrew, and read the Pentateuch in that language. In 1744 he returned to London, and ſerved the Reverend Mr. Painblanc, as uſher in Latin and writing, in Piccadilly; and, with this gentleman's aſſiſtance, he acquired the knowledge of the French language. He was afterwards employed, as an uſher and tutor, in ſeveral different parts of England; during which time he became acquainted with heraldry and botany. He alſo ventured upon Chaldee and Arabic, the former of which he found eaſy from its near connection with the Hebrew. He then inveſtigated the Celtic, as far as poſſible, in all its dialects; and having begun to form collections, and made compariſons between the Celtic, the Engliſh, the Latin, the Greek, and the Hebrew, and found a great affinity between them, he reſolved to proceed through all theſe languages, and to form a comparative lexicon. But in the midſt of theſe learned labours and inquiries, it appears,

that Aram committed a crime, which could not naturally have been expected from a man of ſo ſtudious a turn, and which is the more extraordinary, as the inducement that led him to it is ſaid to have been only gain, though he himſelf afterwards aſſigned a different motive. On the 8th of February, 1744-5, he murdered Daniel Clark, a ſhoemaker, in conjunction with whom, and another perſon, he ſeems before to have been concerned in ſome fraudulent practices. The murder, however, was concealed near fourteen years, and then was diſcovered by a ſkeleton being accidentally found, which was ſuppoſed to be that of Clark. This was a miſtake; but it led to a diſcovery of the whole tranſaction; and Aram's wife, from whom he had ſeparated a conſiderable time, was a principal evidence againſt him. When he was apprehended, on ſuſpicion of this murder, he was uſher of a ſchool at Lynn in Norfolk. He was brought from thence to York-caſtle, and on the 3d of Auguſt, 1759, was tried at the county-aſſizes for the murder. He was found guilty on the teſtimony of Richard Houſeman, corroborated by that of his own wife, and other circumſtantial evidence. After his conviction, he confeſſed the juſtice of his ſentence, but made an attempt upon his own life, by cutting his arm in two places with a razor, which he had concealed for that purpoſe. By proper applications, he was brought to himſelf, and, though weak, was conducted to the place of execution; where, being aſked if he had any thing to ſay, he replied in the negative. He was immediately after executed, and his body being conveyed to Knareſborough foreſt, he was there hung in chains, purſuant to his ſentence.

ARANDE-DE-DOUERO, a town of Old Caſtile in Spain, on the Douero, 42 miles E. of Valladolid. Long. 3. 30. W. Lat. 41. 40. N.

ARAR (Cæſar, Strabo); *Araris* (Dio Caſſius); *Saucona* (Ammian); a river of Celtic Gaul, now the *Saone*; which riſes out of mount Vogeſus on the confines of Lorrain, runs through the Franche Comte and Burgundy, and below Lyons falls into the Rhone. It is ſo incredibly ſlow, that the eye cannot diſtinguiſh which way it moves (Cæſar); and therefore Pliny calls it the *Sluggiſh River*. Its courſe is from north to ſouth. It is famous for a bridge of Cæſar, which was built by the ſoldiers in one day. It is navigable equally with the Rhone.

ARATUS, general of the Achæans, conquered Nicocles tyrant of Sicyon Two years after, he ſurpriſed the caſtle called *Acrocorinthus*, and drove out the king of Macedonia: he delivered Argos from its tyrants, and was poiſoned by Philip II. king of Macedonia, whom he had newly reſtored: he was about 62 when he died, the ſecond year of the 141ſt Olympiad. He was interred at Sicyon, and received the greateſt honours from his countrymen. His ſon, who had alſo been prætor, was poiſoned by King Philip. Polybius gives us ſo great a character of Aratus, the father's, Commentaries on Hiſtory, that the loſs of ſo valuable a work is highly to be regretted.

ARATUS, a Greek poet, born at Soli, or Solæ, a town in Cilicia, which afterwards changed its name, and was called *Pompeiopolis*, in honour of Pompey the Great. He flouriſhed about the 124th, or, according to ſome, the 126th Olympiad, in the reign of Ptolemy Philadelphus king of Egypt. He diſcovered in his youth a remarkable poignancy of wit, and capacity for improvement; and having received his education under Dionyſius Heracleotes, a Stoic philoſopher, he eſpouſed the principles of that ſect. Aratus was phyſician to Antigonus Gonatus, the ſon of Demetrius Poliorcetes, king of Macedon: this prince, being a great encourager of learned men, ſent for him to court, admitted him to his intimacy, and encouraged him in his ſtudies. The *Phænomena* of Aratus, which is ſtill extant, gives him a title to the character of an aſtronomer, as well as a poet; in this piece he deſcribes the nature and motion of the ſtars, and ſhews the particular influences of the heavenly bodies, with their various diſpoſitions and relations. He wrote this poem in Greek verſe: it was tranſlated into Latin by Cicero; who tells us, in his firſt book *De oratore*, that the verſes of Aratus are very noble. This piece was tranſlated by others as well as Cicero; there being a tranſlation by Germanicus Cæſar, and another into elegant verſe by Feſtus Avienus. An edition of the *Phænomena* was publiſhed by Grotius, at Leyden, in 4to. 1600, in Greek and Latin, with the fragments of Cicero's verſion, and the tranſlations of Germanicus and Avienus, all which the editor has illuſtrated with curious notes. He was certainly much eſteemed by the ancients, ſince we find ſo great a number of ſcholiaſts and commentators upon him. There are ſeveral other works alſo aſcribed to Aratus. Suidas mentions the following: Hymns to Pan; Aſtrology and Aſtrothefy; a compoſition of Antidotes; an Επιθηκον on Theopropus; an Ηθοποια on Antigonus; an Epigram on Phila, the daughter of Antipater, and wife of Antigonus; an Epicedium of Cleombrotus; a Correction of the Odyſſey; and ſome Epiſtles, in proſe. Virgil, in his Georgics, has imitated or tranſlated many paſſages from this author; and St. Paul has quoted a paſſage of Aratus. It is in his ſpeech to the Athenians (Acts xvii. 28.) wherein he tells them, tha ſome of their own poets have ſaid, Τουτου και γενος εσμεν: "For we are alſo his offspring" Theſe words are the beginning of the fifth line of the *Phænomena* of Aratus.

ARAUSIO, or *Civitas Arauſienſis*, or *Arauſicorum* (Notitiæ); *Colonia Secundanorum* (Mela, Pliny, Coins), ſo called becauſe the veterans of the ſecond legion were there ſettled: the capital of the Cavares, in Gallia Narbonenſis; now *Orange*, in the weſt of Provence, on an arm of the rivulet Egue, which ſoon after falls into the Rhone, from which it is diſtant a league to the eaſt, at the foot of a mountain. Here is an ancient amphitheatre to be ſtill ſeen. E. long. 4. 46. Lat. 44. 10.

ARBACES, governed Media under Sardanapalus. Seeing him ſpinning among a company of his women, he ſtirred up his people to revolt, and dethroned Sardanapalus; who thereupon burnt himſelf in his palace. Arbaces being crowned, began the monarchy of the Medes, which laſted 317 years under nine kings, till Aſtyages was expelled by Cyrus. Arbaces reigned 22 years, and died A. M. 3206.

ARBE, an epiſcopal town of the republic of Venice, in an iſland of the ſame name, on the coaſt of Dalmatia, from which it is but five miles diſtant.

ARBURY, a village of Cambridgeſhire, where are the remains of a camp, and where many coins have been found. It is one mile N. of Cambridge.

ARBUTHNOT (Alexander), principal of the univerſity of Aberdeen in the reign of James VI. of Scotland, was born in the year 1538. He ſtudied firſt at Aberdeen; and was afterwards ſent over to France, where, under the famous Cujacius, he applied himſelf to the ſtudy of the civil law. In the year 1563 he returned to Scotland, and took orders. Whether he was ordained by a biſhop, or by preſbyters, is a matter of uncertainty. In 1568 he was appointed miniſter of Arbuthnot and Logy-Buchan; and in the following year, Mr. Alexander Anderſon being deprived, our author was made principal of the King's College at Aberdeen, in his room. In the general aſſembly which met at Edinburgh in the years 1573 and 1577, he was choſen moderator; and to the end of his life was an active ſupporter of the reformed religion. He died in 1583, in the 45th year of his age; and was buried in the college church of Aberdeen. We are told in the Biographia, that he was eminent as a poet, a philoſopher, a mathematician, a lawyer, a divine, and a phyſician. He wrote, *Orationes de origine*

et dignitate juris, printed Edinb. 1572, 4to. His contemporary, Thomas Maitland, wrote a copy of Latin verſes on the publication of this book: they are printed in the *Delic. Poetar. Scot.* He publiſhed Buchanan's Hiſtory of Scotland in the year 1582.

ARCADIA (*Encycl.*). This diſtrict has to the north Achaia, to the eaſt Argos and Laconia, Meſſenia to the ſouth, and Elis to the weſt. According to Pliny, the wine of this country cured barrenneſs in women, and inſpired the men with rage; and the berries of the yew gathered there were ſo ſtrong a poiſon, that whoever ſlept or took refreſhment under that tree were ſure to die. In Strabo's time there were few cities remaining in it, moſt of them being deſtroyed in the Grecian wars. Euſtathius ſays, that the country was anciently called *Pelaſgia*, from Pelaſgos, who brought the people, from roots, herbs, and leaves of trees, to feed on acorns, eſpecially beechmaſt; as Artemidorus obſerves, that the Arcadians uſually lived on acorns. It was alſo called *Lycaonia*, *Gigantes*, and *Parrhaſia* (Stephanus). The Arcadians are greatly commended for their love of, and ſkill in, muſic (Virgil, Polybius). To imitate the Arcadians, is to labour and toil for the benefit of others, never conquering their own, but the enemies of others (Heſychius). This probably took its riſe from the ancient Arcadians being accuſtomed to hire themſelves out as mercenaries to foreign nations. Homer commends their martial proweſs, their paſtures, their ſheep, and their country well-watered. The gentilitious name is *Arcades*; who boaſted of their great antiquity, and that they were older than the ſun and moon (Apollonius Rhodius, Nonnius, Plutarch, Ovid, Statius). They were the firſt who had a year of three months, and therefore called *Proceleni*, becauſe their year was prior to that adjuſted in Greece to the courſe of the moon (Cenſorinus).

ARCESILAUS, a celebrated Greek philoſopher, about 300 years before the Chriſtian æra, was born at Pitane in Eolis. He founded the ſecond academy, which is called the *ſecond ſchool*. He was a man of great erudition, and well verſed in the writings of the ancients. He was remarkable for the ſeverity of his criticiſms; but nevertheleſs he knew how to accommodate himſelf to the age, and purſue the allurements of pleaſure. He had a great number of diſciples. His doctrines were different in ſeveral reſpects from thoſe of the ancient ſchool: and perhaps he was led into this diverſity of opinions by many capital errors in the ancient ſchool, ſuch as the incredible arrogance of the dogmatiſts, who pretended to aſſign cauſes for all things; the myſterious air they had thrown upon the doctrine of ideas; the entirely diſcarding the teſtimony of the ſenſes; the objections of the Pyrrhoniſts, who now began to broach their opinions; the powerful oppoſition of the Stoics and Peripatetics, who diſcovered the feeble parts of the academic philoſophy. Theſe might have given cauſe to reform the ancient ſchool, and to found a new one. The middle ſchool, therefore, laid it down as a principle, that we could know nothing, nor even aſſure ourſelves of the certainty of this poſition; from whence they inferred, that we ſhould affirm nothing, but always ſuſpend our judgment. They advanced, that a philoſopher was able to diſpute upon every ſubject, and bring conviction with him, even upon contrary ſides of the ſame queſtion; for there are always reaſons of equal force both in the affirmative and negative of every argument. According to this doctrine, neither our ſenſes, nor even our reaſon, are to have any credit; and therefore, in common affairs, we are to conform ourſelves to received opinions. Arceſilaus was ſucceeded by his diſciple Lacydes.

ARCEUIL, a village of France, three miles ſouth of Paris, remarkable for an aqueduct, which is thought to equal the works of the ancient Romans. It was built in 1624, by Mary de Medicis: its water is diſtributed into the different parts of Paris.

ARCHELAUS, a celebrated Greek philoſopher, the diſciple of Anaxagoras, flouriſhed about 440 years before Chriſt. He read lectures at Athens, and did not depart much from the opinions of his maſter. He taught that there was a double principle of all things, namely, the *expanſion* and *condenſation* of the air, which he regarded as infinite. Heat, according to him, was in continual motion. Cold was ever at reſt. The earth, which was placed in the midſt of the univerſe, had no motion. It originally reſembled a wet marſh, but was afterwards dried up; and its figure, he ſaid, reſembled that of an egg. Animals were produced from the heat of the earth, and even men were formed in the ſame manner. All animals have a ſoul, which was born with them; but the capacities of which vary according to the ſtructure of the organs of the body in which it reſides.—Socrates, the moſt illuſtrious of his diſciples, was his ſucceſſor.

ARCHELAUS, the ſon of Herod the Great, was declared king of Judea the ſecond year after the birth of Chriſt. He put to death 3000 perſons before he went to Rome to be confirmed by Auguſtus. However, that emperor gave him half of what had been poſſeſſed by his father; but at length, on freſh complaints exhibited againſt him by the Jews, he baniſhed him to Vienne in Gaul, A. D. 6, where he died.

ARCHELAUS, the ſon of Apollonius, one of the greateſt ſculptors of antiquity, was a native of Ionia, and is thought to have lived in the time of the Emperor Claudius. He executed, in marble, the apotheoſis of Homer. This maſterpiece in ſculpture was found in 1568, in a place named *Fratocchia*, belonging to the princes of Colonna, where, it is ſaid, the Emperor Claudius had a pleaſure-houſe. Father Kircher, Cupert, Spanheim, and ſeveral other learned antiquaries, have given a deſcription and explication of this work.

ARCHILOCUS, a famous Greek poet and muſician, was, according to Herodotus, contemporary with Candaules and Gyges, kings of Lydia, who flouriſhed about the 14th Olympiad, 724 years before Chriſt. But he is placed much later by modern chronologiſts; viz. by Blair 686, and by Prieſtley 660 years, B. C.

He was born at Paros, one of the Cyclades. His father Teleſicles was of ſo high a rank, that he was choſen by his countrymen to conſult the oracle at Delphos concerning the ſending a colony to Thaſos: a proof that he was of one of the moſt diſtinguiſhed families upon the iſland. However, he is ſaid to have ſullied his birth by an ignoble marriage with a ſlave called *Enipo*, of which alliance our poet-muſician was the fruit.

Though Archilochus ſhewed an early genius and attachment to poetry and muſic, theſe arts did not prevent his going into the army, like other young men of his birth; but in the firſt engagement at which he was preſent, the young poet, like Horace, and like our own Suckling, loſt his buckler, though he ſaved his life by the help of his heels. *It is much eaſier*, ſaid he, *to get a new buckler, than a new exiſtence*. This pleaſantry, however, did not ſave his reputation; nor could his poetry or prayers prevail upon Lycambes, the father of his miſtreſs, to let him marry his daughter, though ſhe had been long promiſed to him. After theſe mortifications, his life ſeems to have been one continued tiſſue of diſgrace and reſentment.

Archilochum proprio rabies armavit iambo. HOR. Art. Poet. 79.

Archilochus, with fierce reſentment warm'd,
Was with his own ſevere Iambics arm'd. FRANCIS.

The *rage of Archilochus* was proverbial in antiquity; which

compared the provoking this ſatyriſt to the treading upon a ſerpent; a compariſon not very ſevere, if it be true that Lycambes, and, as ſome ſay, his three daughters, were ſo mortified by his ſatire, as to be driven to the conſolation of a halter.

In this piece many adventurers are mentioned, full of defamation, and out of the knowledge of the public. There were likewiſe many looſe paſſages in it; and it is ſaid to have been on account of this ſatire that the Lacedæmonians laid a prohibition on his verſes.

However, according to Plutarch, there is no bard of antiquity by whom the two arts of poetry and muſic have been ſo much advanced, as by Archilochus. To him is attributed particularly the ſudden tranſition from one rhythm to another of a different kind, and the manner of accompanying thoſe irregular meaſures upon the lyre. Heroic poetry, in hexameter verſe, ſeems to have been ſolely in uſe among the more ancient poets and muſicians; and the tranſition from one rhythm to another, which lyric poetry required, was unknown to them: ſo that, if Archilochus was the firſt author of this mixture, he might with propriety be ſtyled the *Inventor of Lyric Poetry*, which, after his time, became a ſpecies of verſification wholly diſtinct from heroic.—To him is likewiſe aſcribed the invention of *Epodes*. See EPODE.

Our poet-muſician is generally ranked among the firſt victors of the Pythic games: and we learn from Pindar, that his muſe was not always a termagant; for though no mortal eſcaped her rage, yet ſhe was at times ſufficiently tranquil and pious to dictate hymns in praiſe of the gods and heroes. One in particular, written in honour of Hercules, acquired him the acclamations of all Greece; for he ſung it in full aſſembly at the Olympic games, and had the ſatisfaction of receiving from the judges the crown of victory conſecrated to real merit. This hymn, or ode, was afterwards ſung in honour of every victor at Olympia, who had no poet to celebrate his particular exploits.

Archilochus was at laſt ſlain by one Callondax Corax, of the iſland of Naxos; who, though he did it in fight, according to the laws of war, was driven out of the temple of Delphi, by command of the oracle, for having deprived of life a man conſecrated to the Muſes.

The names of Homer and Archilochus were equally revered and celebrated in Greece, as the two moſt excellent poets which the nation had ever produced. This appears from an epigram in the Anthologia; and from Cicero, who ranks him with poets of the firſt claſs, and in his Epiſtles tells us that the grammarian Ariſtophanes, the moſt rigid and ſcrupulous critic of his time, uſed to ſay, that the longeſt poem of Archilochus always appeared to him the moſt excellent.

ARCHIMAGUS, the high-prieſt of the Perſian Magi, or worſhippers of fire. He reſided in the higheſt fire-temple; which was had in the ſame veneration with them, as the temple of Mecca among the Mahometans. Zoroaſtres firſt ſettled it at Balch; but after the Mahometans had over-run Perſia in the 7th century, the Archimagus was forced to remove from thence into Kerman, a province of Perſia, lying on the ſouthern ocean, where it hath continued to this day. Darius Hyſtaſpes took upon himſelf the dignity of Archimagus: for Porphyry tells us, he ordered before his death, that among the other titles, it ſhould be engraven on his monument, that he had been *Maſter of the Magi;* which plainly implies that he had borne this office among them, for none but the Archimagus was maſter of the whole ſect. From hence it ſeems to have proceeded, that the kings of Perſia were ever after looked on to be of the ſacerdotal tribe, and were always initiated into the ſacred order of the Magi, before they took on them the crown, and were inaugurated into the kingdom.

ARCHIMEDES. (*Encycl.*) Of the death of this celebrated geometrician, others have related the circumſtances ſomewhat differently. Cicero, when he was quæſtor in Italy, diſcovered his tomb, on which was carved a cylinder and ſphere. Some of the works of this great mathematician are loſt, but others are preſerved. His pieces which remain are, 1. Two books of the Sphere and Cylinder. 2. The Dimenſions of a Circle. 3. Of Centres of Gravity, or Æquiponderants. 4. Of Spheroids and Conoids. 5 Of Spiral Lines. 6. The Quadrature of a Parabola. 7. Of the Number of the Sand. 8. Of Bodies that float on Fluids. The beſt edition of theſe is that publiſhed at London, in 1675, 4to. Among the works of Archimedes which are loſt, we may reckon the deſcriptions of the following inventions, which we may gather from himſelf and other ancient authors. 1. Περι της στεφανης, or his account of the method which he uſed to diſcover the mixture of gold and ſilver in the crown. 2. His deſcription of the Κοχλια, or Κοχλιον, an engine to draw water out of places where it is ſtagnated. Athenæus, ſpeaking of the prodigious ſhip built by the order of Hiero, tells us, that Archimedes invented the cochlion, by means of which the hold, notwithſtanding its depth, could be drained by one man. (Δειπνοσοφιστων, lib. v.) Diodorus Siculus informs us (lib. v.) that he contrived this machine to drain Egypt, and that by a wonderful mechaniſm it would empty the water from any depth. 3. The Ελιξ, by means of which (according to Athenæus, Δειπνος, lib. v.) he launched Hiero's great ſhip. 4. The Τριστωτον, of the power of which Tzetzes gives a hyperbolical relation, Chil. ii. hiſt. 35. 5. The machines he uſed in the defence of Syracuſe againſt Marcellus. Of theſe we have an account in Polybius, Livy, and Plutarch. 6. His burning-glaſſes, with which he is ſaid to have ſet fire to the Roman galleys. Galen, Περι κρασεων, lib. iii. 7. His pneumatic and hydraulic engines, concerning which he wrote books, according to Tzetzes, Chil. ii. hiſt. 35.

ARCHITECTURE (*Encycl.*). Correct the following errors in page 293: laſt line of the ſecond column, for pl. 25. read pl. 26. In the title to Part III. omit the words "including aquatic works." The reference alſo in Sect. XVII. p. 293, is erroneous: for pl. 25. read pl. 26.

Under this article, vol. i. p. 277, we have ſpoken of that ſpecies of architecture generally termed *Gothic*, which we ſhall extend with the following extracts from a memoir publiſhed in the fourth volume of the Tranſactions of the Royal Society of Edinburgh, by Sir James Hall, bart. whoſe profeſſed object is, to enquire how ſtructures of ſuch beauty, taſte, and magnificence, could be the work of a people "whom we are accuſtomed to call ignorant and barbarous."

"Although the connection between beauty and utility (ſays the author) be ſtill involved in ſuch obſcurity, that we are unable to decide concerning the univerſality of that connection; of one thing we are certain, that, in a work intended to anſwer ſome uſeful purpoſe, whatever viſibly counteracts that purpoſe always occaſions deformity. Hence it is, that, even where ornament is principally intended, the oſtenſibly uſeful object of the work, if it have any ſuch, muſt be provided for, in the firſt place, in preference to every other conſideration.

"But in moſt uſeful works, ſome parts occur, the ſhape of which is quite indifferent with reſpect to the propoſed

utility, and which, therefore, the artiſt is at liberty to execute as he pleaſes: a liberty which has opened a wide field to the taſte and invention of ingenious men of every age and country, who have turned their attention to the compoſition of ornaments; and whoſe exertions have been more or leſs influenced by the ſtate of civilization in which they lived It would ſeem, however, if we may judge by thoſe various efforts, that little has been effected by mere human ingenuity; ſince we ſee that recourſe has been had, almoſt univerſally, to nature, the great and legitimate ſource of beauty; and that ornament has been attained by the imitation of objects, to which ſhe has given a determinate and characteriſtic form.

"Where the materials employed are themſelves poſſeſſed of variety and elegance, the attainment of this object requires little or no alteration of their natural forms. Thus cups are made of ſhells, of cocoa nuts, or of oſtrich eggs; the character and beauty of which depend upon the natural form of the materials: and in the caſe of the bottles uſed by the Roman-catholic pilgrims, an example occurs of an utenſil, in which the natural form has undergone little or no variation, ſince it conſiſts of the hard outward ſkin of a gourd, of the ſame ſhape in which it grew upon the plant. This laſt claſs of forms has been introduced, by imitation, into works compoſed of ſhapeleſs materials. Thus we have ſilver cups in the form of thoſe made of ſhells, and fruit-diſhes of ſtone-ware in the form of baſkets.

"As ſtone is not naturally poſſeſſed of any peculiar ſhape, and as the uſeful object propoſed, by ſtructures formed of it, may be accompliſhed in various ways, very great latitude is left to the invention of the artiſt. We ſee, accordingly, that in every country where much refinement has been introduced, great pains have been beſtowed in ornamenting ſtone buildings with figures repreſenting various natural objects; whilſt the building itſelf has been executed in imitation of a ſtructure, compoſed of materials which naturally poſſeſs a determinate and characteriſtic form. Such was the method followed by the architects of ancient Greece, who conſtructed temples, and other public edifices, in imitation of a ruſtic fabric, compoſed of ſquare beams, ſupported upon round poſts or ſtems of trees, and who derived the numerous ornaments of that beautiful ſtyle from circumſtances which would naturally take place in ſuch a ſtructure.

"A faint and diſtant reſemblance, however, of the original, has generally been found to anſwer all the end propoſed by the imitation; a reſemblance, which may ſometimes be traced in the general diſtribution of the edifice, ſometimes in its minute parts, and not unfrequently in both.

"But the forms of nature thus introduced have been greatly modified by thoſe of maſonry. For though ſtone is by nature ſhapeleſs, yet, in the courſe of practice, many peculiar forms have been long eſtabliſhed, and currently employed, in working it; ſuch as ſtraight lines, plane ſurfaces, ſquare angles, and various mouldings uſed to ſoften the effect of abrupt terminations: all of which, originating in motives of mechanical convenience, and of ſimple ornament, had, in very early times, been appropriated to maſonry, and conſidered as eſſential in every finiſhed work of ſtone; ſo that, when the imitation of nature was introduced, theſe maſonic forms ſtill maintained their ground, and, being blended with the forms of nature, the two claſſes reciprocally modified each other.

"This combination of art with nature, of which we ſee the moſt perfect example in the Corinthian capital, produces what are called architectonic forms, in which the variety of nature, being ſubjected to the regularity of art, the work acquires that peculiar character which, in a natural object, we conſider as offenſive, under the name of *formality*; but which, in architecture, we admire as a beauty, under the name of *ſymmetry*: thus, we reprobate the formality of an avenue, and praiſe the ſymmetry of a colonnade.

"Such is the nature of architectonic imitation; a device which probably originated in accident, but to which architecture is indebted for its higheſt attainments."

The ſtone edifices of ancient Greece having been conſtructed in imitation of wooden fabrics, compoſed of ſquare beams laid at right-angles on round poſts or ſtems of trees, Sir James Hall conceives that the Gothic ſtructures with pointed arches have been executed in imitation of a ruſtic dwelling, conſtructed in the following manner: "Suppoſe a ſet of round poſts driven firmly into the ground in two oppoſite rows, the interval between the neighbouring poſts in the ſame row being equal to that between the rows, and each poſt being raiſed above the ground to a height equal to three of thoſe intervals: then a ſet of long and flexible rods of willow being applied to each poſt, let them be thruſt into the ground at its baſe, and bound to it by two tyings, one near the ground, and another at two-thirds of its height; the rods being let looſe from this laſt point upwards, and free to be moved in any direction. Let three rods be connected with each outſide corner poſt, and five with each of the others, and let their poſition be ſuch as to cover the inſide of the poſt, ſo that when ſeen from between the rows the lower part of each poſt ſhall be concealed from the view, and appear to the eye like a bundle of rods (ſee Pl. 14).

"Thus the ſkeleton of a thatched roof may be formed by means of the looſe ends of the rods. A rod from one of the poſts being ſo bent as to meet a ſimilar one from the poſt immediately oppoſite to it, in the middle of the ſpace between them, let the two rods be made to croſs each other, and let them be bound together at their croſſing (fig. 2.), and we ſhall have the exact form of the Gothic arch. The ſame being done with each pair of oppoſite poſts, and a ſet of pointed arches being formed, let them be connected together by means of a ſtraight pole laid upon the forks of the croſſing rods, and bound to each of them, as in fig. 3: then let a looſe rod be brought from each of any two contiguous poſts in the ſame row, ſo as to form a pointed arch, ſimilar to that juſt deſcribed, and nearly of the ſame height. This being done with every two contiguous poſts (fig. 4.), and a new ſet of pointed arches being thus produced, ſtanding oppoſite to each other in pairs, let each pair be bound by a horizontal pole lying on the oppoſite forks, and croſſing the longitudinal pole already ſpoken of.

"Two of the rods of each corner poſt, and three of thoſe of each of the others, being thus diſpoſed of, we have one of each corner poſt and two of each middle poſt ſtill to employ, which is done as follows: A pair of theſe unoccupied rods being brought from any two poſts which ſtand diagonally to each other, and made to meet in the middle, not as in the firſt caſe croſſing in an angle, but ſide by ſide, forming a ſemicircle, and joined together after the manner of a hoop; and the ſame being done with every pair of diagonal poſts (fig 5.), the whole rods will have been employed.

"In this manner a frame would be conſtructed fit to ſupport thatch or other covering; and ſuch a one has probably been often uſed. It would ſeem, however, that, for the ſake of ſtrength, the number of rods has been increaſed in each cluſter, by the introduction, between every two of them, of an additional rod, which riſing with them to the

roof, ſtill continues its middle poſition, as they ſpread aſunder, and meets the horizontal pole at an intermediate point." This is ſhewn in fig. 6. which is drawn with its covering of thatch; and, from the imitation of a dwelling ſo conſtructed, we may eaſily trace the three leading characteriſtics of Gothic architecture, the pointed arch, the cluſtered column, and the branching roof, as exhibited in fig. 7.

Our author, upon ſimilar principles, accounts for the peculiar forms of the Gothic door and window, the pointed ſpire, &c. but it ſeems he has not contented himſelf with ſpeculative theories, but has actually ſubmitted his hypotheſis to the teſt of experiment. In ſhort, Sir James Hall has conſtructed a building in this ſtyle, which has far ſurpaſſed even his own expectation, and has alſo gained the approbation of every man of taſte and ſcience by whom it has been ſeen. "A ſet of poſts of aſh, about three inches in diameter, were placed in two rows, four feet aſunder, and at the interval of four feet in the rows; then a number of ſlender and tapering willow rods, ten feet in length, were applied to the poſts, and, in the manner which we have deſcribed, formed into a frame, which being covered with thatch, produced a very-ſubſtantial roof, under which a perſon can walk with eaſe.

"This little ſtructure exhibits, in miniature, all the characteriſtic features of the Gothic ſtyle. It is in the form of a croſs, with a nave, a choir, and a north and ſouth tranſept. The thatch, being ſo diſpoſed on the frame as not to hide the rods of which it is compoſed, they repreſent accurately the pointed and ſemicircular arches, and all the other peculiarities of a groined roof."

As the architects of the preſent age are miſerably deficient in this beautiful ſpecies of building, the public are greatly indebted to Sir James Hall for his ſpirited endeavours to preſerve and reſtore it in this country.

ARCHONS (*Encycl.*). The tribunal of the archons was compoſed of nine officers. The firſt was properly the *archon*; by whoſe name the year of his adminiſtration was diſtinguiſhed. The title of the ſecond was *king*; that of the third *polemachus:* to theſe were added ſix *theſmothetæ*. Theſe magiſtrates, elected by the ſcrutiny of beans, were obliged to prove, before their reſpective tribes, that they had ſprung, both in their father's and their mother's ſide, for three deſcents, from citizens of Athens. They were likewiſe to prove that they were attached to the worſhip of Apollo, the tutelary god of their country; that they had in their houſe an altar conſecrated to Apollo; and that they had been reſpectfully obedient to their parents; an important and ſacred part of their character, which promiſed that they would be faithful ſervants to their country. They were likewiſe to prove, that they had ſerved in a military capacity the number of years which the republic required of every citizen: and this qualification gave the ſtate experienced officers; for they were not allowed to quit the army till they were forty years of old. Their fortune too, of which they were to inform thoſe before whom they were examined, was a warrant for their fidelity.

After the commiſſioners, who were appointed to enquire into their character and other requiſites, had made a report of them, they were then to ſwear that they would maintain the laws; which obligation if they neglected, they engaged to ſend to Delphi a ſtatue of the weight of their bodies. According to a law of Solon, if an archon got drunk, he was condemned to pay a heavy fine, and ſometimes even puniſhed with death. Such magiſtrates as the Athenian archons were well entitled to reſpect. Hence it was eternal infamy to inſult them; and hence Demoſthenes obſerved, that to treat the theſmothetæ with diſreſpect, was to ſhew diſreſpect to the republic.

Another qualification indiſpenſably required of the ſecond officer of this tribunal, who was called the *king*, was, that he had married the daughter of an Athenian citizen, and that he had eſpouſed her a virgin. This was exacted of him, ſays Demoſthenes, becauſe part of his duty was to ſacrifice to the gods, jointly with his wife, who, inſtead of appeaſing, would have irritated them, if ſhe had not poſſeſſed both thoſe honours.

The enquiry into the private title of the nine archons was very ſevere; and this attention was the more neceſſary, as they had a right to take a ſeat in the Areopagus, after they had quitted their office, and given an account of their adminiſtration.

When any obſcurity occurred in the laws, relative to religion and the worſhip of the gods, the interpretation was ſubmitted to the tribunal of the archons.

Ariſtotle obſerves, that Solon, whoſe aim was to make his people happy, and who found their government in his time ariſtocratical, by the election of the nine archons, who were annual magiſtrates, tempered their power, by eſtabliſhing the privilege of appealing from them to the people, called by lot to give their ſuffrage, after having taken the oath of the Heliaſtæ, in a place near the Panathenæum, where Hiſſus had formerly calmed a ſedition of the people, and bound them to peace by an oath.

ARCHYTAS of Tarentum, a philoſopher of the Pythagorean ſect, and famous for being the maſter of Plato, Eudoxas, and Philolaus, lived about 408 years before Chriſt. He was an excellent mathematician, particularly in that part of the ſcience which regards mechanics: he is ſaid to have made a wooden pigeon that could fly, and to be the firſt that brought down mathematics to common uſes. He is ſaid to be the inventor of the ten categories. He aſſerted, that God was the beginning, the ſupporter, and the end, of all things. There are two epiſtles preſerved in Diogenes Laertius, one from Archytas to Plato, and another from Plato to Archytas. He acquired great reputation in his legiſlative capacity. He likewiſe commanded the army ſeven times, and was never defeated; but was at laſt caſt away in the Adriatic Sea, and thrown upon the coaſt of Apulia.

ARCOT, a city of Hindooſtan, and capital of the Carnatic, ſituated on the river Paliar. In a diſpute among ſome of the native princes of India, Colonel Clive, with a ſmall party of Engliſh, took poſſeſſion of Arcot, in the year 1751, for Mahommed Ali Khan, ſon of Anawerdi Khan, the nabob of Arcot, who had been killed in battle. The French attempted in vain to wreſt it from him, but were compelled to raiſe the ſiege. In the year 1760, in a quarrel with the nabob, it was taken by Colonel Coote, after defeating the French at Wandewaſh; and the garriſon ſurrendered priſoners of war after the batteries had been opened againſt it from the ſecond to the ſixth of February: fifty-five miles W.S.W. Madras, and ſixty-five N.N.W. Pondicherry. Long. 79. 30. E. Greenwich. Lat. 12. 50. N.

ARDEA, a town of Latium, the royal reſidence of Turnus, king of the Rutuli (Livy); ſo called, either from the augury of the heron (Hyginus); or from the exceſſive heat of the country (Martial). It was a marſhy ſickly ſituation (Strabo, Seneca). It was built by Danaë, the mother of Perſeus (Virgil); about five miles diſtant from the ſea, and 20 from Rome: now a hamlet. It was a Roman colony (Livy). The inhabitants are called *Ardeates*. E. Long. 17. 49. Lat. 41. 30.

ARDECHE, a river of France, which gives name to one

of the departments, and rifes three leagues from Langogne, and runs into the Rhone, about a league above Pont St. Eſprit.

ARDENNE, a foreſt in France, formerly of vaſt extent; but the trees are in many places grubbed up, and where they ſtood are built cities, towns, and abbeys. At preſent it extends from Thionville, near the country of Liege, to Donchery and Sedan, on the confines of Champagne. The roads are ſo narrow in ſome places, that two waggons cannot paſs each other; and therefore the waggoners are obliged to provide themſelves with bells or horns to give one another notice to ſtop in time.

ARDENNES, a foreſt of Germany and France, formerly of a great extent, comprehending, according to ſome, all the country between the Meuſe and the Rhine, and according to others all between the Rhine and the Scheldt; what now remains is ſituated principally on the Meuſe, from Montmedy to the biſhopric of Liege. One of the departments of France takes its name from this foreſt; the principal towns are Mezieres, Sedan, Grandpre, Vouziers, Rethel, Rocroy, Donchery, and Givet.

ARDS, barony of, in the county of Down in Ireland: it is a narrow ſlip of land, in ſome places three, and in none above ſix miles broad; but the ſoil is for the moſt part tolerably good. It lies between the lake of Strangford and the ſea, and in the ſouth part it is oppoſite to Lecale. Sir Thomas Smith obtained a patent for this barony from Queen Elizabeth, and ſent his natural ſon with a colony to poſſeſs it; but he was intercepted and ſlain by an Iriſhman. After Sir Thomas's death, Ards was granted by James I. to ſome of the Scots nobility.

ARDUBA, an ancient city of the Pannonians. It was taken by Germanicus about the 7th year of the Chriſtian æra; but its reduction was more owing to the diſagreement that reigned among the inhabitants, than to the valour of the Romans. The greater part of the citizens were for ſubmitting; but the women, more fond of their ancient laws and liberties than the men, joined ſome Roman deſerters, and, falling upon their huſbands, killed a great number of them: but being at laſt overcome by the men, who then ſubmitted to the Romans, the women either threw themſelves headlong from the tops of the walls, or ſetting fire to their houſes, burnt themſelves and their children to death.

AREKEA, a ſea-port town on the coaſt of Africa, in the Red Sea: fifty-five miles from Suaken.

ARELATE, or ARELATUM, is a town of Gallia Narbonenſis, ſituated on the Rhone, denoting a town on, or beyond, a marſh, according to the particular ſituation of the ſpeaker; called *Arelate Sextanorum* (Pliny, Mela, Coin), becauſe it had a colony of the ſixth legion. Writers of the lower age call it *Arelas, atis* (Prudentius, Auſonius). There was a double Arelas, one on each ſide of the river and joined by a bridge (Auſonius); that on the left ſide is thought to have been built by Conſtantine. Tiberius's father was ſent by Julius Cæſar at the head of the colony (Suetonius); and hence the appellation *Julia Paterna*, as appears from an inſcription. It was the favourite place of the Romans, and greatly ornamented; and hence called *Gallula Roma* (Auſonius). It is now called *Arles*. E. Long. 5. 5. Lat. 43. 40.

ARENSHARD, a tract in Denmark, in the duchy of Sleſwick, containing the greateſt part of the famous rampart, built by the Daniſh king Gotric, in the beginning of the 9th century, as a defence againſt the irruptions of the Saxons and Slavi. It extends acroſs the country, about nine miles in length.

ARENSWALDE, a town of Germany, in the circle of Upper Saxony, and New Mark of Brandenburg: ninety-four miles N.E. Berlin, fifty N.N E. Kuſtrin. Long. 33. 14. E. Ferro. Lat. 53. 10. N.

AREOPAGUS (*Encycl.*). The edifice of the Areopagus was extremely ſimple; and its roof, which was at firſt of the moſt common materials, remained in that ſtate till the time of Auguſtus. This we learn from Vitruvius. Oreſtes was the firſt who thought of embelliſhing it. He raiſed in it an altar to Minerva. He likewiſe adorned it with two ſeats of ſolid ſilver; on one of which the *accuſer* ſat, and the *accuſed* on the other. The one ſeat was conſecrated to *Injury*, and the other to *Impudence*. This religious ſketch was brought to perfection by Epimenides, who erected altars to thoſe allegorical deities and ſoon after a temple, which Cicero mentions in his ſecond book of laws. This temple correſponded with *that* which Oreſtes had built to the *Furies*, who brought him to Athens, and procured him the protection of Minerva. Epimenides dedicated it a ſecond time to the Furies, or *ſevere Goddeſſes*, as they were termed by the Athenians. A man was thought loſt without reſource, and a victim to every human ill, if he enforced a perjury by invoking the ſacred name of thoſe tremendous divinities.

Thoſe who employed their thoughts in ſolving the myſteries of Paganiſm, imagined that the Eumenides had their temple ſo near the court Areopagus, that they might enlighten the judges by their inſpiration, and, by their continual aſſiſtance, prevent them from committing thoſe errors to which human weakneſs is liable. To propitiate thoſe terrible deities, and to procure their favour for the Areopagus, they were worſhipped with great punctuality and devotion; and the ſenate itſelf appointed their prieſts. Demoſthenes had been nominated to preſide over their ſacrifices; and he thought it very extraordinary, that he, to whom the republic had confided ſo important an office, ſhould be publicly impeached.

It was natural to aſſociate with the Eumenides the other deities who ſhared with them the ſovereign empire over the dead. Epimenides placed in their temples the ſtatues of Pluto, of Mercury, and of Tellus. They were all, according to Pauſanias, of an agreeable form. Each of them was placed upon an altar, on which the citizens, or ſtrangers, who had been acquitted by the Areopagus, made their grateful offerings.

But it was not to gratitude alone that theſe ſeveral deities owed all their incenſe that ſmoked upon their altars. They who had been accuſed before the ſenate, haraſſed with ſuperſtition, and uncertain how theſe deities would be affected towards them, were laviſh of ſacrifices to obtain their clemency, by which they hoped their judges would likewiſe be influenced.

The tomb of Oedipus was another of the ornaments of the Areopagus. It was in the outward court of the Areopagus, where a barge was likewiſe placed, which made a part of the pomp at the public games.

Whatever homage and implicit obedience the court of Areopagus might derive from all this religious parade, the public good was always dearer to them than any lower advantages they might have drawn from the altars and temples with which they were ſurrounded.

The ſenate aſſembled in a hall built on the ſummit of a hill, which was aſcended with difficulty by the old men bent with age. However, as for ſome time they only aſſembled on the three laſt days of each month, they bore with patience this inconvenient ſituation. But public affairs multiplied to ſuch a degree, that they were obliged to add to the three former ſittings, a fourth, which was held on the

ſeventh day of the month, and which was ſoon ſucceeded by an aſſembly every day. Their meetings were ſo regular, that they were not interrupted by the moſt ſolemn feſtivals, till Cephiſodorus was archon, who, in the third year of the 105th Olympiad, made a decree, which obliged the Areopagites to celebrate, after the example of the other courts, the Apaturian feaſts, which laſted five days.

This aſſiduous and painful exerciſe of their office made the Areopagites feel all the inconvenience of the ſituation of their tribunal, and determined them to remove it to a part of the city, called the *Royal Portico*. It was a ſquare, expoſed to all the inclemencies of the weather. When the judges, who aſſembled there in profound ſilence, had taken their places, they were incloſed by a thread, or rather a cord, drawn around them.

They held their aſſemblies in the night, that their attention to public affairs might not be diverted by external objects,—and (adds Lucian) that they might only be influenced by the arguments, and not by the preſence and action, of the ſpeakers. This circumſtance explains a paſſage in Athenæus, who tells us, that none knew the numbers nor faces of the Areopagites. The cuſtom of adminiſtering juſtice in the open air was not peculiar to them. It was followed by all the other tribunals, when they tried for murder; for two reaſons:—1ſt, That the judges, the ſworn protectors of innocence, might not be hurt by being under cover with criminals, whoſe hands were polluted with blood. 2dly, That the accuſer and the accuſed might not be under the ſame roof.

When all the members of the ſenate were convened, a herald enjoined ſilence, and ordered the people to retire. As ſoon as they had departed, the aſſembly proceeded to buſineſs; and as they deemed the leaſt preference a flagrant injuſtice, the cauſes which they were to determine were drawn by a kind of lottery; and the ſame chance which brought them up, diſtributed them to different numbers of judges, ſmall or great, according to the importance of the ſeveral cauſes.

In early times, the parties themſelves ſtated their cauſe in a ſimple manner. The eloquence of advocates was thought a dangerous talent, fit only to varniſh crimes. But afterwards the Areopagus, on this point, relaxed from their ſeverity;—at firſt the accuſed, and ſoon after the accuſers, were permitted to engage thoſe to make the attack and the defence, whoſe profeſſion it was to exert the art of ſpeaking, for others, with accuracy and elegance.

Sextus Empericus ſeems not to have ſufficiently diſtinguiſhed times, where he ſays, that the court of Areopagus did not ſuffer thoſe who were to be tried at their bar to avail themſelves of the abilities of others. What undoubtedly led him into that miſtake, was, an inviolable cuſtom of that tribunal, which prohibited, in pleadings, all that warm and picturesque oratory which ſeduces the judgment and inflames the paſſions. When the ſuffrages were collected, each perſon gave his in ſilence. They voted with a ſmall flint, which they held betwixt the thumb and the two next fingers, and which they put into one of the two urns that ſtood in a corner of the hall. One ſtood before the other. The firſt was called the *urn of death*; the ſecond, the *urn of compaſſion*. That of death was of braſs, and was termed *proper*; that of compaſſion was of wood, and was termed *improper*. The judges commonly brought their flint to the aſſembly, and put it into the urn; but, that all the ſuffrages might be collected, the herald took the two urns, and preſented them, one after another, to every ſenator, commanding him, in the name of the republic, no longer to defer his acquittal, or condemnation. For this method of giving ſentence, which was called κρυβδην ψηφος, becauſe it kept the vote of each perſon undiſcovered, the Thirty Tyrants, to make themſelves maſters of the deciſions of the Areopagus, ſubſtituted another, by means of which they knew exactly the opinion of each of the judges: for they obliged them to bring their flints publicly, and lay them upon two tables placed before them, the ſituation of which was quite oppoſite to that of the urns; for the firſt of thoſe tables was that of *life*, and the ſecond that of *death*.

The firſt ſubſtances with which they gave their ſuffrages were not ſmall pieces of the bones of a hog, as ſome authors aſſert, but ſea ſhells, for which pieces of braſs of the ſame form, termed *ſpondyla*, were afterwards ſubſtituted. The ſubſtances with which they voted were diſtinguiſhed by their form and colour. Thoſe which condemned were black, and perforated in the middle; the others were white, and not perforated. The precaution of piercing the black ones tends to prove, what we have already obſerved, that the court of Areopagus ſat in the night: for what end did it ſerve to pierce the black ſhells or flints, if the judges could have ſeen them and the white ones, and conſequently have diſtinguiſhed their colours by the aſſiſtance of the light? But as they paſſed ſentence in the dark, it is evident that a difference beſides that of colour was neceſſary, to know the black ones from the white. The judges were likewiſe permitted to multiply at pleaſure the diſtinction between ſigns, which eſſentially diſtinguiſhed the fates of men.

After the ſuffrages were collected, they were taken out of the two urns, and put into a third vaſe of braſs. They were then counted; and as the number of white or black flints was higher or inferior, one of the judges drew with his nail a ſhorter or a longer line, on a tablet, with a waxen ſurface, on which the reſult of each cauſe was marked. The ſhort line expreſſed acquittal; the long condemnation.

With regard to the emoluments of the judges, they were as moderate as thoſe of the advocates. The length of the proceſs did not enhance its expence; and when the deciſion of a cauſe was poſtponed till the next day, the committee were only paid an obolus on that day. Hence Mercury, in Lucian, is ſurpriſed that ſuch ſenſible old men as the ſenators of Areopagus were, ſhould ſell at ſo low a price the trouble of aſcending ſo high.

As to the number of the judges which compoſed the Areopagus, ſome authors, attentive only to a part of Solon's regulations, by which he enacted, that for the future none but the nine archons ſhould be admitted members of the Areopagus, have imagined that this tribunal was filled anew every year, and that it never conſiſted of more than nine magiſtrates. This opinion, and ſome others, are refuted by the circumſtantial account which Diogenes Laertius gives us of the condemnation of Socrates. This great man had wiſhed to ſubſtitute a rational hypotheſis for the fabulous and extravagant ſyſtem of religion which prevailed in his time. His project, however laudable, appeared impious in the eye of ſuperſtition. Information was laid againſt him before the Areopagus, and he had as many accuſers as fellow-citizens. After the charges and the anſwers were heard, they proceeded to ſuffrages; the opinions were divided, but not equally, for the number of thoſe who condemned him exceeded by 281 the number of thoſe who declared him innocent. He made an ironical reply to this iniquitous ſentence, by telling his judges, that he took it for granted, they would admit him to a maintenance in the Prytanæum. On this ſarcaſm, 80 of thoſe who had voted in his favour forſook him, went over to the oppoſite party, and condemned him to die. Here then we have 361 judges who condemn; to whom if we add thoſe who perſiſt in acquitting him, the number muſt be very conſiderable.

Of all the judgments of the Areopagus, the moſt famous one, excepting that of Mars, was the ſentence which they paſſed on Oreſtes. His trial, which happened under Demophon the 12th king of Athens, in 375 of the Attic æra, owed all it's fame to a remarkable circumſtance, that gave riſe to a cuſtom which was obſerved ever afterwards. Oreſtes had killed his mother; he was accuſed before the Areopagus, and cited to appear in that court. He would have loſt his life in conſequence of the equal diviſion of the votes, had not Minerva, moved with his misfortunes, declared herſelf for thoſe who had abſolved him, and joined her ſuffrage to theirs. Thus Oreſtes was ſaved. In veneration to this miracle, the Areopagites, whenever the ſuffrages were equally divided, decided in favour of the accuſed, by granting him what they termed *the ſhell of Minerva*. Cephalus and Dædalus were condemned by the Areopagus long before the time of Oreſtes.

We find in ancient authors ſome deciſions of this tribunal, which bear the ſtrongeſt marks of juſtice, though their objects are not intereſting. We ſhall here quote an anecdote from Aulus Gellius, and Valerius Maximus, of a woman who was accuſed of having poiſoned her huſband and her ſon. She was taken, and brought before Dolabella, who was then proconſul of Aſia. She was no ſooner in his preſence, than ſhe owned the fact; and added, that ſhe had very good reaſons for putting her huſband and her ſon to death.—"I had (ſaid ſhe), to my firſt huſband, a ſon whom I tenderly loved, and whoſe virtues rendered him worthy of my affection. My ſecond huſband, and the ſon whom I bare to him, murdered my favourite child. I thought it would have been unjuſt to have ſuffered thoſe two monſters of barbarity to live. If you think, ſir, that I have committed a crime, it is your province to puniſh it; I certainly ſhall never repent of it." This affair embarraſſed Dolabella. She was afterwards ſent to the Areopagus; and that court, when they had examined her a long time, ordered her and her accuſer to appear before them again a hundred years after, from the firſt day of her trial.

We muſt not, however, ſuppoſe that the Areopagus always preſerved its own reputation; for ſuch is the conſtitution of human affairs, that perfection, with regard to them, is a violent, conſequently a tranſitory, ſtate. Pericles, who lived about a hundred years after Solon, to flatter the people and win them to his party, uſed his utmoſt efforts to weaken the authority of the Areopagus, which was then diſliked by the multitude. He took from it the cognizance of many affairs which had before come under its juriſdiction; and, to forward his deſign of humbling it, employed the eloquence of Ephialtes, whoſe talents were formidable, and who was an avowed enemy to the great men of Athens.

The Areopagus itſelf ſeemed to ſecond the endeavours of a man who projected its ruin, and by its miſconduct haſtened its fall. The old rules of the court, by which none were admitted its members but thoſe whoſe unexceptionable conduct would ſupport its majeſty, ſeemed too ſevere. They grew leſs delicate in their choice; and preſuming that the faults with which they diſpenſed, would ſoon be reformed in the ſociety of ſo many good examples, vice imperceptibly crept among them: corruption, at firſt ſecret and timid, grew inſenſibly open and daring, and made ſuch progreſs, that the moſt ſhameful crimes were ſoon exhibited on the ſtage; and they were not copied from the low and abandoned multitude, but from thoſe ſenators, once the venerable and auſtere cenſors of idleneſs and of vice. Demetrius, the comic poet, wrote a piece, which he entitled *The Areopagite*, where he ſtrips the maſk off thoſe hypocritical legiſlators, who were now equally apt to be ſeduced by wealth and by beauty. So much had the Athenian ſenate degenerated in the days of Iſocrates, cir. 340 years before the Chriſtian æra.

Before this tribunal St. Paul was called to give an account of his doctrine, and converted Dionyſius one of their number.

The end of this court of judicature is as obſcure as its origin, which was derived from very remote antiquity. It exiſted, with the other magiſtracies, in the time of Pauſanius, i. e. in the 2d century. The term of its ſubſequent duration is not aſcertained; but a writer, who lived under the emperors Theodoſius the elder and younger, in the 5th century, mentions it as extinct.

ARETIN (Guido), famous for his muſical improvements, lived in the 11th century. He was a native of Arezzo, a city in Tuſcany; and having been taught the practice of muſic in his youth, and probably retained as a choriſter in the ſervice of the Benedictine monaſtery founded in that city, he became a monk profeſſed, and a brother of the order of St. Benedict.

In this retirement he ſeems to have devoted himſelf to the ſtudy of muſic, particularly the ſyſtem of the ancients, and, above all, to reform their method of notation. The difficulties that attended the inſtruction of youth in the church-offices were ſo great, that, as he himſelf ſays, ten years were generally conſumed barely in acquiring the knowledge of the plain-ſong; and this conſideration induced him to labour after ſome amendment, ſome method that might facilitate inſtruction, and enable thoſe employed in the choral office to perform the duties of it in a correct and decent manner. If we may credit thoſe legendary accounts that are extant in old monkiſh manuſcripts, we ſhould believe he was aſſiſted in his pious intention by immediate communications from heaven; ſome ſpeak of the invention of the ſyllables as the effect of inſpiration; and Guido himſelf ſeems to have been of the ſame opinion, by his ſaying it was revealed to him by the Lord; or, as ſome interpret his words, in a dream: but graver hiſtorians ſay, that being at veſpers in the chapel of his monaſtery, it happened that one of the offices appointed for that day was the hymn to St. John.

UT queant laxis *REſonare fibris*
MIra geſtorum *FAmuli tuorum*
SOLve pollutis *LAbiis reatum,*
Sancte Joannes.

During the performance of the hymn, he remarked the iteration of the words, and the frequent returns of UT, RE, MI, FA, SOL, LA: he obſerved likewiſe a diſſimilarity between the cloſeneſs of the ſyllable MI, and the broad open ſound of FA, which he thought could not fail to impreſs upon the mind a laſting idea of their congruity; and immediately conceived a thought of applying the ſix ſyllables to perfect an improvement either then actually made by him, or under conſideration, viz. that of converting the ancient tetrachords into hexachords.

Struck with the diſcovery, he retired to his ſtudy; and having perfected his ſyſtem, began to introduce it into practice: the perſons to whom he communicated it were the brethren of his own monaſtery, from whom it met with but a cold reception, which, in the epiſtle to his friend, he aſcribes undoubtedly to its true cauſe, envy: however, his intereſt with the abbot, and his employment in the chapel, gave him an opportunity of trying the efficacy of his method on the boys who were training up

for the choral ſervice, and it exceeded the moſt ſanguine expectation. "To the admiration of all (ſays Cardinal Baronius), a boy thereby learnt, in a few months, what no man, though of great ingenuity, could before that attain in ſeveral years."

The fame of Guido's invention ſoon ſpread abroad, and his method of inſtruction was adopted by the clergy of other countries: we are told by Kircher, that Hermanus biſhop of Hamburg, and Elviricus biſhop of Oſnaburg, made uſe of it; and by the authors of the *Hiſtoire Littéraire de la France*, that it was received in that country, and taught in all the monaſteries in the kingdom. It is certain that the reputation of his great ſkill in muſic had excited in the pope a deſire to ſee and converſe with him; of which, and of his going to Rome for that purpoſe, and the reception he met with from the pontiff, he himſelf has given a circumſtantial account in the epiſtle hereafter mentioned.

The particulars of this relation are very curious; and as we have his own authority, there is no room to doubt the truth of it. It ſeems that John XX. or, as ſome writers compute, the 19th pope of that name, having heard of the fame of Guido's ſchool, and conceiving a deſire to ſee him, ſent three meſſengers to invite him to Rome; upon their arrival, it was reſolved by the brethren of the monaſtery that he ſhould go thither attended by Grimaldo the abbot, and Peter the chief of the canons of the church of Arezzo. Arriving at Rome, he was preſented to the holy father, and by him received with great kindneſs. The pope had ſeveral converſations with him, in all which he interrogated him as to his knowledge in muſic; and upon ſight of an antiphonary which Guido had brought with him, marked with the ſyllables agreeable to his new invention, the pope looked on it as a kind of prodigy; and ruminating on the doctrines delivered by Guido, would not ſtir from his ſeat till he had learned perfectly to ſing off a verſe: upon which he declared, that he could not have believed the efficacy of the method, if he had not been convinced by the experiment he had himſelf made of it. The pope would have detained him at Rome; but labouring under a bodily diſorder, and fearing an injury to his health from the air of the place, and the heats of the ſummer, which was then approaching, Guido left that city upon a promiſe to reviſit it, and explain to his holineſs the principles of his new ſyſtem. On his return homewards, he made a viſit to the Abbot of Pompoſa, a town in the duchy of Ferrara, who was very earneſt to have Guido ſettle in the monaſtery of that place; to which invitation it ſeems he yielded, being, as he ſays, deſirous of rendering ſo great a monaſtery ſtill more famous by his ſtudies there.

Here it was that he compoſed a tract on muſic, entitled *Micrologus*, i. e. "a ſhort diſcourſe;" which he dedicated to Theobald biſhop of Arezzo; and finiſhed, as he himſelf at the end of it tells us, under the pontificate of John XX. and in the 34th year of his age. Voſſius ſpeaks alſo of another muſical treatiſe written by him, and dedicated to the ſame perſon.

Moſt of the authors who have taken occaſion to mention Guido, ſpeak of the Micrologus as containing the ſum of his doctrine: but it is in a ſmall tract, entitled *Argumentum novi Cantus inveniendi*, that his declaration of his uſe of the ſyllables, with their ſeveral mutations, and in ſhort his whole doctrine of ſolmiſation, is to be found. This tract makes part of an epiſtle to a very dear and intimate friend of Guido, whom he addreſſes thus, "Beatiſſimo atque dulciſſimo fratri Michaëli;" at whoſe requeſt the tract itſelf ſeems to have been compoſed.

Whether Guido was the author of any other tracts, is not eaſy to determine. It no where appears that any of his works were ever printed, except that Baronius, in his *Annales Eccleſiaſtici, tom.* XI. p. 73, has given at length the epiſtle from him to his friend Michael of Pompoſa, and that to Theobald biſhop of Arezzo, prefixed to the Micrologus; and yet the writers on muſic ſpeak of the Micrologus as a book in the hands of every one. Martini cites ſeveral manuſcripts of Guido; namely, two in the Ambroſian library at Milan, the one written about the 12th century, the other leſs ancient; another among the archives of the chapter of Piſtoja, a city in Tuſcany; and a third in the Mediceo-Laurenziano library at Florence, of the 15th century: theſe are clearly the Micrologus. Of the epiſtle to Michael of Pompoſa, together with the *Argumentum novi Cantus inveniendi*, he mentions only one, which he ſays is ſomewhere at Ratiſbon. Of the ſeveral tracts above mentioned, the laſt excepted, a manuſcript is extant in the library of Baliol College in Oxford. Several fragments of the two firſt, in one volume, are alſo among the Harleian manuſcripts now in the Britiſh Muſeum, No. 3199; but ſo very much mutilated, that they afford but ſmall ſatisfaction to a curious enquirer.

ARETIN (Leonard), one of the moſt learned men of the 15th century, was ſecretary to the republic of Florence, and tranſlated from the Greek into Latin ſome of the Lives of Plutarch, and Ariſtotle's Ethics: he alſo compoſed three books of the Punic war, that may ſerve as a ſupplement to thoſe wanting in Livy; the hiſtory of the tranſactions in Italy during his time; that of ancient Greece; that of the Goths; that of the republic of Florence; and many other books. He died in 1443, aged 74.

ARETIN (Francis), a man of great reading, and well acquainted with the Greek language. He tranſlated into Latin the Commentaries of St. Chryſoſtom upon St. John, and about twenty Homilies of the ſame father: he alſo tranſlated the Letters of Phalaris into Latin, and wrote a treatiſe *De balneis Puteolanis*. He ſtudied at Sienna, about the year 1443; and afterwards taught law there with ſuch reputation, that they called him the *Prince of Subtleties*, and his wit became a proverb. He diſplayed his talents chiefly in diſputes, in which nobody could withſtand him. He gave his opinions in law with ſo much confidence, as to aſſure thoſe who conſulted him, that they ſhould carry their cauſe: nor did experience contradict him; for it was a common ſaying at the bar, ſuch a cauſe has been condemned by Aretin, it muſt therefore be loſt. He taught alſo in the univerſity of Piſa, and in that of Ferrara. He was at Rome under the pontificate of Sixtus IV. but did not ſtay here long; for he ſoon perceived that the great hopes which he had built upon his reputation would come to nothing. This pope, however, declared he would have given him a cardinal's hat, had he not thought he ſhould have done a public injury by depriving the youth of ſuch an excellent profeſſor. When old age would not permit him to go through the duties of his office, they diſpenſed with his reading of lectures, and his ſalary was continued. He continued, however, ſometimes to mount the chair; and although his lectures had now but little ſpirit in them, yet he had ſtill many hearers on account of his reputation. One day when the ſtudents were gone to ſome public ſhows, there were but forty perſons in his auditory: which ſo mortified him, that he threw away his book; and cried out, "Aretin ſhall never explain law to a few perſons," retired in a paſſion, and would teach no more. He was ſevere in his temper, and never kept a ſervant longer than a month or two; for it was a maxim of his, "That new-hired ſervants always ſerve beſt." He was honoured with the title of *knight*, and ſpent all his life in celibacy; and his way of living was ſo parſimonious, that he was thereby enabled to amaſs a great deal of wealth. He had deſigned this wealth for the maintenance of a college; but he altered his reſolution, and left it to his relations.

ARETIN (Peter), a native of Arezzo, who lived in the 16th

century. He was famous for his ſatirical writings; and was ſo bold as to carry his invectives even againſt ſovereigns, and from thence got the title of the *Scourge of Princes*. Francis I. the Emperor Charles V. moſt of the princes of Italy, ſeveral cardinals, and many noblemen, courted his friendſhip by preſents, either becauſe they liked his compoſitions, or perhaps from an apprehenſion of falling under the laſh of his ſatire. Aretin became thereupon ſo inſolent that he is ſaid to have got a medal ſtruck, on one ſide of which he is repreſented with theſe words IL DIVINO ARETINO; and on the reverſe, ſitting upon a throne, receiving the preſents of princes, with theſe words, I PRINCIPI TRIBUTATI DA POPOLI, TRIBUTANO IL SERVIDOR LORO. Some imagine that he gave himſelf the title of *Divine*, ſignifying thereby that he performed the functions of a god upon earth, by the thunderbolts with which he ſtruck the heads of the higheſt perſonages. He uſed to boaſt, that his lampoons did more ſervice to the world than ſermons; and it was ſaid of him, that he had ſubjected more princes by his pen, than the greateſt had ever done by their arms. Aretin wrote many irreligious and obſcene pieces; ſuch are his dialogues, which are called *Ragionamenti*. There is likewiſe imputed to him another very obſcene performance, *De omnibus Veneris ſchematibus*. "It was about the year 1525 (ſays Mr. Chevilier), that Julio Romano, the moſt famous painter of Italy, inſtigated by the enemy of the ſalvation of mankind, invented drawings to engrave 20 plates: the ſubjects are ſo immodeſt, that I dare only name them. Peter Aretin compoſed ſonnets for each figure. George Vaſari, who relates this in his Lives of the Painters, ſays, he does not know which would be the greateſt impurity, to caſt one's eyes upon the drawings of Julio, or to dip into the verſes of Aretin." Some ſay that Aretin changed his libertine principles; but however this may be, it is certain that he compoſed ſeveral pieces of devotion. He wrote a Paraphraſe on the penitential Pſalms, and another on Geneſis; he wrote alſo the Life of the Virgin Mary, and that of St. Catherine of Siana, and of St. Thomas Aquinas. He was author likewiſe of ſome comedies. He died in the year 1556, being about 65 years old.

ARGALL (John), was the third ſon of Thomas Argall, by Margaret his wife, daughter of John Talkarne of the county of Cornwall. He was born in London, and entered a ſtudent in Chriſt-church, in Oxford, towards the latter end of Queen Mary's reign. He took the degree of maſter of arts in 1565, and was ſenior of the act celebrated the eighteenth of February the ſame year. Afterwards he applied himſelf to the ſtudy of divinity, and having taken holy orders, obtained the living of Haleſworth in Suffolk. Being at a feaſt at Cheſton, a mile diſtant from that town, he died ſuddenly at the table. His body was carried to Haleſworth, and buried there, Oct. 8, 1606. During his ſtay at the univerſity, he was a noted diſputant, and a great actor of plays at Chriſt-church, particularly when the queen was entertained there in 1566. He was eſteemed a very good ſcholar, and was ſo much devoted to his ſtudies that he lived and died like a philoſopher, with a thorough contempt for the things of this world. He was the author of two tracts, the one entitled "De vera Pœnitentia, the other "Introductio ad Artem Dialecticum."

ARGEIA, or *Argolis*, a diſtrict of Peloponneſus, ſituated between Arcadia to the weſt, the Egean Sea to the eaſt, Laconica and the Sinus Argolicus to the ſouth, and to the north the territory of Corinth and the Sinus Saronicus (Livy, Ptolemy); ſo called from Argos the capital: now *Romania di Morea*.

ARGEII, a people of Greece, ſo called by the Greeks, from *Argi*, or *Argos*; *Argivi*, by the Romans: Homer ſeems to call the Greeks in general *Argeii*, as alſo *Achæi*.

ARGENS (Jean Baptiſte de Boyer, marquis de), a French writer, famous for the number of his productions, was born at Aix in Provence, in 1704. His talents ſhewed themſelves early, and his father intended him for the magiſtracy; but a gallant and voluptuous humour diſpoſed him rather to the military, in which he ſerved ſome time. Diſguſted, however, with this profeſſion, he paſſed into Holland, and devoted himſelf to the exerciſe of the pen; when the King of Pruſſia gave him an invitation, and attached him to him in quality of chamberlain. After having ſpent about five-and-twenty years with this monarch, he began to look towards his native country, and returned to Aix, where he lived like a philoſopher, and died at the end of 1770. He had an ardent deſire of knowledge, and knew a great deal. He was maſter of many languages: he painted very well; and was a conſiderable proficient in anatomy and chemiſtry. His works are very well known to the public, the principal of which are "Lettres Juives, Lettres Chinoiſes, Lettres Cabaliſtiques, Philoſophie du bon Sens," &c. &c. He tranſlated alſo from the Greek into French, "Ocellus Lucanus," and "Julian's Diſcourſe upon Paganiſm." There is learning, knowledge, and good ſenſe, ſcattered through all his writings; but they are very little favourable to religion; on the contrary, they are ſtrongly tinctured with libertiniſm.

ARGENTARIA, a town of ancient Gaul, thought to ſtand in the place where the city Colmar now ſtands. It is remarkable for a great victory gained by the emperor Gratian over the Lentienſes, in the month of May, A.D. 378. The Romans, being but few in number, were at firſt overpowered, and obliged to give ground; but ſoon returning to the charge, they gained in the end a complete victory. Thirty thouſand of the barbarians, and among the reſt their king Priarius, were killed on the ſpot; and all the reſt, except 5000, taken priſoners.

ARGENTIERE, a town of France, in the late province of Provence, now a diſtrict of the department of Ardeche. It is five miles S.W. of Aubenas, and 17 W. of Viviers. Long. 4. 22. E. Lat. 44. 30. N.

ARGENTORA, *Argentina* (Notitiæ); *Argentoratum* (Ptolemy); *Argentoratus* (Ammian); a city of the Tribocci; one of the fifty forts built by Druſus on the Rhine (Florus): an appellation formed by the Romans from the German, *Argen Struſſen*, or *Straten*, "unſafe roads for travellers," from the marauding parties of the garriſons that infeſted the roads. Now *Straſburg*, in the lower Alſace, on the rivulet Ill, near the Rhine. E. Long. 7. 35. Lat. 48. 38.

ARGIPPEANS, a part of the ancient Scythian nation. The men and the women were bald, hump-backed, and had great chins. Their language was totally peculiar to themſelves. Their dreſs was the ſame with that of the other Scythians. Their food was the fruit of a tree called *Pontica*, about as high as a fig-tree: it bore a kind of filbert; the kernel of which in form reſembled a bean. They ſucked from it a thick black liquor; and this liquor they ſometimes drank with milk. The groſſer part of this fruit, after it had been preſſed, ſerved them inſtead of animal food; for they had but few cattle, and were therefore unſkilled in the care of flocks and herds. They lay in winter under trees, over which they ſpread a white covering; this covering they uſed not in the ſummer. None dared to offer them any injury; for they were deemed ſacred. Therefore they had no arms; and were unacquainted with the art of war. They determined the differences and diſputes of their neighbours; and whoever fled to them from perſecution, found a ſafe aſylum; it would have been ſacrilege to hurt, to inſult him in their county.

ARGIVI (*Encycl.*). For the ſubject referred to, but accidentally omitted, ſee ARGEIA, in this Supplement.

ARGOS, an ancient name of Peloponneſus; from Argos, one of the kings. (Homer. Strabo.)

ARGOS, the capital, and an inland town, of Argolis. It had different furnames; as *Achaicum*, from the country, or an ancient people (Homer); *Inachium*, from the river Inachus, which runs by (Pliny); &c. It had two citadels (Livy); the one called *Larissa* (Strabo); the other unnamed. At the siege of this city, Pyrrhus king of Epirus was killed by a tile thrown by an old woman. *Argos* was 26 stadia distant from Temenium, a maritime town, and 50 to the south of Mycenæ: now *Argo*. E. Long. 23. 5. Lat. 37. 30.

ARGOS HIPPIUM, the ancient name of *Arpi*; but *Lampe* is a still more ancient; afterwards called *Argyrippa*, and *Argippa*; built by, and the residence of, Diomedes, on the Cerbalus (Virgil); afterwards a large and populous city (Livy). A town of Apulia; now in ruins, and the place called *Arpe*.

ARGOSTOL, a seaport of the isle of Cefalonia, over-against Albania. It is the best harbour in all the island, and the proveditor resides in the fortress, which is five miles distant.

ARGUN, a river of Asia, which divides the Russian from the Chinese empire.

ARGUN, a town of Eastern Tartary, on the frontiers of the Chinese empire. There are mines of silver and lead near it; and a pearl fishery in the river Argun. Long. 103. 56. E. Lat. 42. 30. N.

ARGYROPOEIA, among alchemists, a pretended art of transmuting or changing other metals into silver.

ARGYROPYLUS (Joannes), one of the first of those learned persons, who fled into Italy upon the taking of Constantinople by Mahomet II. in 1453, and contributed to the revival of the Greek learning in the west. Cosmo de Medicis, duke of Tuscany, made him professor of Greek at Florence, and appointed him preceptor to his son Peter, and to his grandson Laurence. He had several illustrious pupils at Florence, to whom he read lectures in the Greek language and philosophy; and among the rest Angelus Politianus. In 1456 he went into France, to implore the assistance of Charles VII. in behalf of some friends and relations, whom he wanted to redeem from Turkish slavery. He continued many years in his professorship at Florence; but the plague at length obliging him to quit it, he went to Rome, where he publicly read lectures upon the Greek text of Aristotle. He was carried off by an autumnal fever, which he got by an intemperate eating of melons, in the 70th year of his age, and about the year 1480.

ARGYRUNTUM, a maritime town of Illyria (Ptolemy, Pliny). Now Novigrad, a town of Dalmatia. E. Long. 17. 30. Lat. 44. 30.

ARIANO, a town of Italy, in the Ferrarese, on a branch of the river Po, 22 miles N. E. of Ferrara. Long. 12. 8. E. Lat. 45. 0. N.

ARIAS MONTANUS, a learned Spanish divine, employed by Philip II. of Spain to publish another edition of the Bible, after that of Cardinal Ximenes; which he finished with applause, and died at Seville in 1598.

ARICONIUM, a town of the Silures (Antonine); near Hereford (Camden). W. Long. 2. 42. Lat. 52. 6.

ARIMASPI (Pliny), a people of Sarmatia Europea, to the south of the Montes Riphæi, said by Mela to have but one eye; a fable broached by Aristeas Proconnesius, according to Herodotus.

ARIMINUM, a town of Umbria, or Romagna, at the mouth of the Ariminus, on the Gulf of Venice. The seizing on by Cæsar gave rise to the civil war. Now called *Rimini*. E. Long. 13. 30. Lat. 44. 8.

ARION, an excellent musician and poet, inventor of dithyrambics. Periander entertained him at his court, where getting an estate, and returning to Corinth, the sailors, for lucre of his money, threw him into the sea; when according to the poets, a dolphin, charmed with his music, took him on her back and carried him safe to shore.

ARISTANDER, a famous soothsayer under Alexander the Great, over whom he gained a wonderful influence by the good success of his art. He had already had the same employment at the court of King Philip; and it was he who explained better than his brethren the dream that this prince had after having married Olympias.

ARISTARCHUS, a Grecian philosopher of Samos, one of the first that maintained that the earth turns upon its own centre. We are not sure of the age in which he lived; and have none of his works but *a Treatise of the Greatness and Distance of the Sun and Moon*, translated into Latin by Frederic Commandine, and published with Pappus's explanations in 1572.

ARISTARCHUS, a celebrated grammarian, much esteemed by Ptolemy Philometor, who committed to him the education of his son. He applied himself chiefly to criticism, and made a revisal of Homer's poems, but in too magisterial a way; for such verses as he did not like he treated as spurious. He commented on other poets. Cicero and Horace made use of his name to express a very rigid critic.

ARISTIDES, surnamed the *Just*, flourished at Athens at the same time with Themistocles, who triumphed over him by his boisterous eloquence, and got him banished, 483 years before Christ; but Aristides being recalled a short time after, would never join with the enemies of Themistocles, to get him banished; for nothing could make him deviate from the strictest rules of moderation and justice. Aristides brought the Greeks to unite against the Persians; distinguished himself at the famous battle of Marathon, and that of Salamine and Platea; and established an annual income of 460 talents for a fund to supply the expences of war. This great man died so poor, though he had the management of the revenues of Greece, that the state was obliged to pay his funeral expences, to give fortunes to his daughters in marriage, and a maintenance to his son Lysimachus.

ARISTIDES of Miletus, a famous Greek author, often cited by the ancients.

ARISTIDES, a very eloquent Athenian orator, who became a convert to the Christian religion, and about the year 124 presented to the Emperor Adrian an apology for the Christians.

ARISTIDES (Ælius), a celebrated orator, born in Mysia, about 129 years before the Christian æra. The best edition of his works is that of Oxford, printed in Greek and Latin, in two volumes quarto.

ARISTIDES, a painter contemporary with Apelles, flourished at Thebes about the 122d Olympiad. He is said to have been the first who attempted to delineate the passions of the mind in colours. His Bacchus was so excellent a piece, as to become proverbial.

ARISTIPPUS, the founder of the Cyrenaic sect of philosophy, was the son of Aretades, and born at Cyrene in Lybia. He flourished about the 96th Olympiad. The great reputation of Socrates induced him to leave his own country, and remove to Athens, that he might have the satisfaction of hearing his discourses. He was chiefly delighted with those discourses of Socrates that related the most to pleasure; which he asserted to be the ultimate end in which all happiness consists. His manner of life was agreeable to his opinion; for he indulged himself extremely in all the luxuries of dress, wine, and women. Though he had a good estate, and three country seats, yet he was the

only one of the disciples of Socrates who took money for teaching; which being observed by the philosopher, he asked Aristippus, How he came to have so much? Who in reply asked him, How he came to have so little? Upon his leaving Socrates, he went to Ægina, as Athenæus informs us, where he lived with more freedom and luxury than before. Socrates sent frequent exhortations to him, in order to reclaim him; but all in vain: and with the same view he published that discourse which we find in Xenophon. Here Aristippus became acquainted with Lais, the famous courtezan of Corinth; for whose sake he took a voyage to that city. He continued at Ægina till the death of Socrates, as appears from Plato's *Phædo*, and the epistle which he wrote upon that occasion. He returned at last into his own country Cyrene, where he professed philosophy, and instituted a sect which, as we observed above, was called the *Cyrenaic*, from the place, and by some writers the *Hedonic*, or voluptuous, from its doctrines. During the height of the grandeur of Dionysius the Sicilian tyrant, a great many philosophers resorted to him; and among the rest Aristippus, who was tempted thither by the magnificence of that court. Dionysius asking him the reason of his coming, he replied, "That it was in order to give what he had, and to receive what he had not:" or, as others represent it, "That when he wanted wisdom, he went to Socrates; but now as he wanted money, he was come to him." He very soon insinuated himself into the favour of Dionysius; for, being a man of a soft easy temper, he conformed himself exactly to every place, time, and person, and was a complete master of the most refined complaisance.

We have several remarkable passages concerning him during his residence at that court, mentioned by Diogenes Laertius. Dionysius, at a feast, commanded that all should put on women's purple habits, and dance in them. But Plato refused, repeating these lines:

> I cannot in this gay effeminate dress
> Disgrace my manhood, or my sex betray.

But Aristippus readily submitted to the command, and made this reply immediately:

> ——At feasts, where mirth is free,
> A sober mind can never be corrupted.

At another time, interceding with Dionysius in behalf of a friend, but not prevailing, he cast himself at his feet: being reproved by one for that excess of humility, he replied, "That it was not he who was the cause of that submission; but Dionysius, whose ears were in his feet." Dionysius shewed him three beautiful courtezans, and ordered him to take his choice. Upon which, he took them all three away with him, alleging, that Paris was punished for preferring one to the other two; but when he had brought them to his door, he dismissed them, in order to shew that he could either enjoy or reject with the same indifference. Having desired money of Dionysius, the latter observed to him, that he had assured him a wise man wanted nothing. "Give me (says he) what I ask, and we will talk of that afterwards." When Dionysius had given it him, "Now (says he), you see I do not want." By this complaisance he gained so much upon Dionysius, that he had a greater regard for him than for all the rest of the philosophers, though he sometimes spoke with such freedom to that king, that he incurred his displeasure. When Dionysius asked, Why philosophers haunted the gates of rich men, but not rich men those of philosophers? he replied, "Because the latter know what they want, and the others not." Another time, Dionysius repeating (out of Sophocles, as Plutarch affirms, who ascribes this to Zeno) these verses,

> He that with tyrants seeks for bare support,
> Enslaves himself, though free he came to court;

he immediately answered,

> He is no slave, if he be free to come.

Diocles, as Laertius informs us, related this in his *Lives of the Philosophers*; though others ascribe this saying to Plato. Aristippus had a contest with Antisthenes, the Cynic philosopher; notwithstanding which, he was very ready to employ his interest at court for some friends of Antisthenes, to preserve them from death, as we find by a letter of his to that philosopher. Diogenes followed the example of his master Antisthenes in ridiculing Aristippus, and called him the *court-spaniel*.

We have many apophthegms of his preserved. Suidas observes, that he surpassed all the philosophers in the acuteness of his apophthegms. Being once railed at, he left the room; and the person who abused him, following him, and asking him why he went away, he answered, "Because it is in your power to rail, but it is not in my power not to hear you." A person observing, that the philosophers frequented the houses of rich men; "Why (says he), the physicians frequent the chambers of the sick yet that is no reason why a man should rather choose to lie sick than be cured." To one who boasted of his great reading, he said, "That as they who feed and exercise most are not always more healthy than they who only eat and exercise to satisfy nature; so neither they who read much, but they who read no more than is useful, are truly learned." Among other instructions which he gave to his daughter Arete, he advised her particularly to despise superfluity. To one who asked him what his son would be the better for being a scholar? "If for nothing else (said he), yet for this alone, that when he comes into the theatre, one stone will not sit upon another." When a certain person recommended his son to him, he demanded 500 drachmas; and upon the father's replying, that he could buy a slave for that sum, "Do so (said he), and then you'll be master of a couple." Being reproached, because, having a suit of law depending, he fee'd a lawyer to plead for him, "Just so (said he), when I have a great supper to make, I always hire a cook." Being asked what was the difference between a wise man and a fool, he replied, "Send both of them together naked to those who are acquainted with neither of them, and then you'll know." Being reproved by a certain person (who, according to Mr. Stanley, was Plato) for his costly and voluptuous feasts, "I warrant you (said he), that you would not have bestowed three farthings upon such a dinner;" which the other confessing, "Why then (said he) I find myself less indulgent to my palate, than you are to your covetous humour;" or, as it is otherwise represented, "I find, that I love my belly, and you love your money." When Simus, treasurer to Dionysius, shewed him his house magnificently furnished, and paved with costly marble (for he was a Phrygian, and consequently profuse); Aristippus spit in his face: upon which the other growing angry, "Why, truly (said he), I could not find a fitter place." His servant carrying after him a great weight of money, and being ready to sink upon the road under his burden, he bid him throw away all what was too much for him to carry. Horace mentions this fact in his third satire of the second book:

> Quid simile isti
> Græcus Aristippus? qui servos projicere aurum
> In media jussit Libya, quia tardius irent
> Propter onus segnes.

Being asked what things were most proper for children to be instructed in? he answered, "Those which might prove of

the greateſt advantage to them when they came to be men." Being reproached for going from Socrates to Dionyſius, he replied, "That he went to Socrates when he wanted ſerious inſtruction, and to Dionyſius for diverſion." Having received money of Dionyſius at the ſame time that Plato accepted a book only, and being reproached for it, "The reaſon is plain (ſays he), I want money, and Plato wants books." Having loſt a conſiderable farm, he ſaid to one who ſeemed exceſſively to compaſſionate his loſs, "You have but one field; I have three left: why ſhould not I rather grieve for you?" Plutarch, who relates this in his book *De Tranquillitate Animi*, obſerves upon it, that it is very abſurd to lament for what is loſt, and not to rejoice for what is left. When a perſon told him, "That the land for his ſake was loſt," he replied, "That it was better ſo, than that he ſhould be loſt for the land." Being caſt by ſhipwreck aſhore on the iſland of Rhodes, and perceiving mathematical ſchemes and diagrams drawn upon the ground, he ſaid, "Courage, friends; for I ſee the footſteps of men."

After he had lived a long time with Dionyſius, his daughter Arete ſent to him, to deſire his preſence at Cyrene, in order to take care of her affairs, ſince ſhe was in danger of being oppreſſed by the magiſtrates. But he fell ſick in his return home, and died at Lipara, an Æolian iſland. With regard to his principal opinions, like Socrates, he rejected the ſciences as they were then taught, and pretended that logic alone was ſufficient to teach truth and fix its bounds. He aſſerted, that pleaſure and pain were the criterions by which we were to be determined; that theſe alone made up all our paſſions; that the firſt produced all the ſoft emotions, and the latter all the violent ones. The aſſemblage of all pleaſure, he aſſerted, made true happineſs, and that the beſt way to attain this was to enjoy the preſent moments. He wrote a great many books: particularly the Hiſtory of Libya, dedicated to Dionyſius; ſeveral Dialogues; and four books Of the Luxury of the Ancients. There are four epiſtles of his extant in the Socratic Collection publiſhed by Leo Allatius.

Beſides Arete his daughter, whom he educated in philoſophy, Ariſtippus had alſo a ſon, whom he diſinherited for his ſtupidity. Arete had a ſon, who was named *Ariſtippus* from his grandfather, and had the ſurname of Μητροδιδακτος from his mother's inſtructing him in philoſophy. Among his auditors, beſides his daughter Arete, we have an account of Æthiops of Ptolemais, and Antipater of Cyrene. Arete communicated the philoſophy, which ſhe received from her father, to her ſon Ariſtippus, who tranſmitted it to Theodorus *the Atheiſt*, who inſtituted the ſect called *Theodorean*. Antipater communicated the philoſophy of Ariſtippus to Epitimedes his diſciple; Epitimedes to Paræbates; Paræbates to Hegeſias and Anniceris; and theſe two laſt, improving it by ſome additions of their own, obtained the honour each of them of giving a name to the *Hegeſiac* and *Annicerian* ſect.

Laertius mentions two other perſons of the name of Ariſtippus; one, who wrote the Hiſtory of Arcadia; the other, a philoſopher of the New Academy.

ARISTO, a Stoic philoſopher, the diſciple of Zeno the chief of the Stoics, flouriſhed about 290 years before the Chriſtian æra. He differed but little from his maſter Zeno. He rejected logic as of no uſe, and natural philoſophy as being above the reach of the human underſtanding. It is ſaid, that being bald, the ſun burnt his head; and that this cauſed his death. There is a ſaying of his recorded, which might render the doctrine of Ariſtippus leſs odious than it ordinarily is (ſee ARISTIPPUS). He uſed to ſay, "That a philoſopher might do thoſe of his hearers a prejudice who put a wrong interpretation upon good meanings; as for example, that the ſchool of Ariſtippus might ſend out debauchees, and that of Zeno Cynics:" which ſeems to imply, that the doctrine of this philoſopher never produced this effect but when it was miſunderſtood. He ſhould alſo have added, that every teacher is therefore obliged to forbear laying down ambiguous maxims, or to prevent falſe gloſſes being put upon them.

ARISTO (Titus), a Roman lawyer, perfect maſter of the public and civil law, of hiſtory and antiquity. The Pandects mention ſome books of his, as does Aulus Gellius.—He was contemporary with Pliny the Younger, who gives him a noble character, and had a moſt tender friendſhip for him. See *Plinii Epiſt.* lib. i. ep. 22.

ARISTOGITON, a famous Athenian, who, with Armodius, killed Hipparchus, tyrant of Athens, about 513 years before the Chriſtian æra. The Athenians erected a ſtatue to him.

ARISTOMENES, a general of the Meſſenians, renowned for his valour and virtue.

ARISTOTLE (*Encycl.*), beſides his treatiſes on philoſophy, wrote alſo on poetry, rhetoric, law, &c. to the number of 400 treatiſes, according to Diogenes Laertius; or more, according to Francis Patricius of Venice. An account of ſuch as are extant, and of thoſe ſaid to be loſt, may be ſeen in Fabricius's *Bibliotheca Græca*. He left his writings with Theophraſtus, his beloved diſciple and ſucceſſor in the Lycæum; and forbade that they ſhould ever be publiſhed. Theophraſtus, at his death, truſted them to Neleus, his good friend and diſciple; whoſe heirs buried them in the ground at Scepſis, a town of Troas, to ſecure them from the king of Pergamus, who made great ſearch every-where for books to adorn his library. Here they lay concealed 160 years, until, being almoſt ſpoiled, they were ſold to one Apellicon, a rich citizen of Athens. Sylla found them at this man's houſe, and ordered them to be carried to Rome. They were ſome time after purchaſed by Tyrannium a grammarian: and Andronicus of Rhodes having bought them of his heirs, was in a manner the firſt reſtorer of the works of this great philoſopher; for he not only repaired what had been decayed by time and ill-keeping, but alſo put them in a better order, and got them copied. There were many who followed the doctrine of Ariſtotle in the reigns of the twelve Cæſars, and their numbers increaſed much under Adrian and Antonius: Alexander Aphrodinus was the firſt profeſſor of the Peripatetic philoſophy at Rome, being appointed by the emperors Marcus Aurelius and Lucius Verus; and in ſucceeding ages the doctrine of Ariſtotle prevailed among almoſt all men of letters, and many commentaries were written upon his works.

The firſt doctors of the church diſapproved of the doctrine of Ariſtotle, as allowing too much to reaſon and ſenſe; but Anatolius biſhop of Laodicea, Didymus of Alexandria, St. Jerome, St. Auguſtin, and ſeveral others, at length wrote and ſpoke in favour of it. In the ſixth age, Boethius made him known in the weſt, and tranſlated ſome of his pieces into Latin. But from the time of Boethius to the eighth age, Joannes Damaſcenus was the only man who made an abridgement of his philoſophy, or wrote any thing concerning him. The Grecians, who took great pains to reſtore learning in the 11th and following ages, applied much to the works of this philoſopher, and many learned men wrote commentaries on his writings: amongſt theſe were Alfarabius, Algazel, Avicenna, and Averoes. They taught his doctrine in Africa, and afterwards at Cordova in Spain. The Spaniards introduced his doctrine into France, with the commentaries of Averroes and Avicenna; and it was taught in the univerſity of Paris, until Amauri, having ſupported ſome particular tenets on the principles of this philoſopher, was condemned of hereſy, in a coun-

cil held there in 1210, when all the works of Ariſtotle that could be found were burnt, and the reading of them forbidden under pain of excommunication. This prohibition was confirmed, as to the phyſics and metaphyſics, in 1215, by the Pope's legate; though at the ſame time he gave leave for his logic to be read, inſtead of St. Auguſtin's uſed at that time in the univerſity. In the year 1265, Simon, cardinal of St. Cecil, and legate from the holy ſee, prohibited the reading of the phyſics and metaphyſics of Ariſtotle. All theſe prohibitions, however, were taken off in 1366; for the cardinals of St. Mark and St. Martin, who were deputed by Pope Urban V. to reform the univerſity of Paris, permitted the reading of thoſe books, which had been prohibited: and in the year 1448, Pope Stephen approved of all his works, and took care to have a new tranſlation of them into Latin.

Paſſing from hand to hand, in the manner above mentioned, the works of Ariſtotle have greatly ſuffered from the ignorance or the inaccuracy of tranſcribers. This has given birth to much obſcurity, and to omiſſions that are now irreparable: it is this which has rendered the ſenſe of Ariſtotle ſo doubtful, and opened ſuch a wide field for the combats of ſcholaſtic philoſophy. Beſides, our philoſopher was not himſelf very much inclined to be perfectly plain and familiar. His ſtyle was difficult and conciſe. He has employed a mathematical manner of communication; often uſes terms which have no determinate meaning; and, with many of his doctrines, he mixes ancient opinions as taken for granted, which are altogether falſe or uncertain. In a word, the Peripatetic philoſophy is very obſcure in itſelf, and commentators have rather contributed to increaſe the obſcurity.

ARISTOXENUS, the moſt ancient muſical writer, of whoſe works any tracts are come down to us. He was born at Tarentum, a city in that part of Italy called *Magna Græcia*, now Calabria. He was the ſon of a muſician, whom ſome call *Mneſias*, others *Spintharus*. He had his firſt education at Mantinæa, a city of Arcadia, under his father, and Lamprus of Erythræ; he next ſtudied under Xenophilus, the Pythagorean; and laſtly under Ariſtotle, in company with Theophraſtus. Suidas, from whom theſe particulars are tranſcribed, adds, that Ariſtoxenus, enraged at Ariſtotle having bequeathed his ſchool to Theophraſtus, traduced him ever after. But Ariſtocles the Peripatetic, in Euſebius, exculpates Ariſtoxenus in this particular, and aſſures us that he always ſpoke with great reſpect of his maſter Ariſtotle. From the preceding account it appears that Ariſtoxenus lived under Alexander the Great, and his firſt ſucceſſors. His *Harmonics* in three books, all that are come down to us, together with Ptolemy's Harmonics, were firſt publiſhed by Gogavinus, but not very correctly, at Venice, 1562, in 4to, with a Latin verſion. John Meurſius next tranſlated the three books of Ariſtoxenus into Latin, from the MS. of Joſ. Scaliger; but, according to Meibomius, very negligently. With theſe he printed at Leyded, 1616, 4to. Nicomachus and Alypius, two other Greek writers on muſic. After this, Meibomius collected theſe muſical writers together; to which he added Euclid, Bacchius ſenior, Ariſtides Quintilianus; and publiſhed the whole, with a Latin verſion and notes, from the elegant preſs of Elzevir, Amſt. 1652. The learned editor dedicates theſe ancient muſical treatiſes to Chriſtina queen of Sweden. Ariſtoxenus is ſaid by Suidas to have written 452 different works, among which thoſe on muſic were the moſt eſteemed; yet his writings on other ſubjects are very frequently quoted by ancient authors, notwithſtanding Cicero and ſome others ſay that he was a bad philoſopher, and had nothing in his head but muſic. The titles of ſeveral of the loſt works of Ariſtoxenus, quoted by Athenæus and others, have been collected by Meurſius in his notes upon this author, by Tonſius and Menage, all which Fabricius has digeſted into alphabetical order.

ARLESHEM, a handſome town of Switzerland, in the biſhopric of Baſil, where the canons of that city reſide.

ARMACALES, a river of Babylon (Abydenus); called *Foſſa Regia*, the *Royal Trench*, or *Cut* (Polybius); the *Royal River* (Ptolemy); *Almarchur* (Pliny); *Naarmalcha* (Ammian); a factitious channel, or cut, made by Nebuchadanoſor, and a horn or branch of the Euphrates (Abydenus). The Euphrates naturally divides into two channels, one paſſing through Babylon, the other through Seleucia, and then falls into the Tigris; the factitious channel between theſe two is the Royal River; which mixes with the Tigris, a great deal lower down than Seleucia, at Apamea (Ptolemy).

ARMAGH, a city of Ireland, and capital of the county ſo called, the ſee of an archbiſhop, who is lord primate of all Ireland. St. Patrick founded the ſee in the year 444. This city was much decayed, but by the munificence of Lord Rokeby, the archbiſhop, it has been conſiderably increaſed; he has built a handſome palace, and a noble houſe for the ſchool, which is a royal foundation; to which he added a public library for the promotion of ſcience. He has alſo erected an obſervatory, with a liberal income for an aſtronomer, ſecuring the endowments by ſeveral acts of the legiſlature; 62 miles N. Dublin, and 46 S. S. E. Londonderry. Long. 6. 35. W. Greenwich. Lat. 54. 21. N.

ARMENE, or ARMINA, anciently a hamlet of Paphlagonia (Ptolemy). The inhabitants encompaſſed it with a wall, becauſe of the coldneſs of the place, imagining by that means to render it warmer. But this proving ineffectual, gave riſe to the proverb *Armenen muro cingere*, uſed to expreſs ſome egregious folly.

ARMENIA (*Encycl.*). The Armenians are an honeſt, civil, polite people, ſcarce troubling themſelves about any thing elſe but trade, which they carry on in moſt parts of the world, by which means they have ſpread themſelves over the eaſt, and alſo great part of Europe; and wherever they come, commerce is carried on with ſpirit and advantage.

The religion of the Armenians is the Chriſtian, of the Eutychian ſect: that is, they own but one nature in Jeſus Chriſt; and when they ſpeak of the hypoſtatical union, that he is perfect God and perfect man without mixture. They have a high eſteem for a book they call the *Little Goſpel*, which treats of the infancy of Jeſus, and ſays that the Virgin Mary being pregnant, her ſiſter Salome accuſed her of having proſtituted herſelf; to which the Virgin anſwered, that ſhe needed only to lay her hand on her belly, and ſhe would know how ſhe came to be with child: this Salome accordingly did, and fire came out of her belly, which conſumed the half of her arm; upon which ſhe acknowledged her fault, and drew it back: after which it was healed by putting it to the ſame place.

The Armenian clergy conſiſt of patriarchs, archbiſhops, doctors, ſecular prieſts, and monks. The ſecular prieſts are not allowed to marry a ſecond time; and therefore they take care to chooſe young healthy wives: they maintain themſelves and families by following ſome occupation, inſomuch, that they have hardly time to perform their eccleſiaſtical functions: they lie in the churches on the vigils of thoſe days they are obliged to officiate.

The Armenian monks are of the order of St. Baſil; and every Wedneſday and Friday they eat neither fiſh, nor eggs, nor oil, nor any thing made of milk, and during Lent they live upon nothing but roots: they are allowed wine only on the Saturday in the Holy Week, and meat on the Eaſter Sunday. Beſides the great Lent, they have four others of eight

days each, which are inſtituted to prepare for the four great feſtivals of the Nativity, the Aſcenſion, the Annunciation, and of St. George; in which times they muſt not ſo much as ſpeak of eggs, fiſh, oil, or butter.

The Armenians have ſeven ſacraments; baptiſm, confirmation, penance, the euchariſt, extreme unction, orders, and matrimony. In baptiſm, the child is plunged three times into the water, and the ſame form of words that is uſed with us is repeated every time; the prieſt then puts a ſmall cord made with ſilk and cotton on the neck of the infant, and anoints his forehead, chin, ſtomach, arm-pits, hands, and feet, making the ſign of the croſs on each part. When the child is baptized, he is carried home by the godfather with the ſound of drums and trumpets. The women do not go to church till forty days after their delivery; and they obſerve many Jewiſh cuſtoms.

At the communion, to which infants of two or three months old are admitted, the prieſts give a piece of the conſecrated hoſt, ſoaked in the conſecrated wine. The elements are covered with a great veil, and placed in a cup-board near the altar, on the ſide of the goſpels. When the prieſt takes the chalice and pattin, he is followed by his deacons, and ſub-deacons, with flambeaux and plates of copper furniſhed with bells: in this manner, with a cenſer before him, he goes in proceſſion round the ſanctuary; he then ſets them on the altar, pronounces the words of conſecration, and turns himſelf to the people, who fall down, kiſs the earth, and beat their breaſts: then, after taking it himſelf, he diſtributes the hoſt ſoaked in wine to the people.

The Armenians ſeem to place the chief part of their religion in faſtings and abſtinences: and among the clergy, the higher the degree, the lower they muſt live; inſomuch that it is ſaid the archbiſhops live on nothing but pulſe. They conſecrate holy water but once a-year, at which time every one fills a pot and carries it home, which brings in a conſiderable revenue to the church.

ARMINIUS (James), whoſe real name in Low Dutch was James Harmanni, a famous Proteſtant divine, from whom the modern ſect of Arminians take their name, was born at Oudewater, in Holland, in 1560. He was ordained miniſter at Amſterdam on the 11th of Auguſt, 1588; when he ſoon diſtinguiſhed himſelf by his ſermons, which were remarkable for their ſolidity and learning, and gained him univerſal applauſe: but Martin Lydias, profeſſor of divinity at Franeker, judging him a fit perſon to refute a writing in which Beza's doctrine of predeſtination had been attacked by ſome miniſters of Delft, Arminius at his intreatics undertook the taſk; but upon thoroughly examining the reaſons on both ſides, he came into the opinions he propoſed to deſtroy, and afterwards went ſtill farther than the miniſters of Delft had done. In 1600 he oppoſed thoſe who maintained that miniſters ſhould ſubſcribe the confeſſion and catechiſm every year. In 1602 a peſtilential diſeaſe raged at Amſterdam, during which he acted with the greateſt reſolution and courage, in aſſiſting the poor, and comforting the ſick; and Lucas Trelcatius and Francis Junius dying of that diſeaſe at Leyden, the curators of that univerſity choſe Arminius profeſſor of divinity there, and he was afterwards made doctor of divinity. Diſputes upon grace were ſoon after kindled in that univerſity; and he was at length engaged in a new conteſt, occaſioned by a diſputation of his concerning the divinity of the Son. Theſe conteſts, his continual labour, and the concern of ſeeing his reputation blaſted by a multitude of ſlanders in relation to his opinions, impaired his health, and threw him into a fit of ſickneſs, of which he died on the 19th of October, 1609.

Arminius was eſteemed an excellent preacher: his voice was low, but very agreeable; and his pronunciation admirable: he was eaſy and affable to perſons of all ranks, and facetious in his converſation amongſt his friends. His great deſire was, that Chriſtians would bear with one another in all controverſies which did not affect the fundamentals of their religion; and when they perſecuted each other for points of indifference, it gave him the utmoſt diſſatisfaction. The curators of the univerſity of Leyden had ſo great a regard for him, that they ſettled a penſion upon his wife and children.

He left ſeveral works, viz. 1. Diſputationes de diverſis Chriſtianæ religionis capitibus. 2. Orationes, itemque tractatus inſigniores aliquot. 3. Examen modeſti libelli Gulielmi Perkinſii de prædeſtinationis modo et ordine, itemque de amplitudine gratiæ divinæ. 4. Analyſis capitis noni ad Romanos. 5. Diſſertatio de vero et genuino ſenſu capitis ſeptimi epiſtolæ ad Romanos. 6. Amica collatio cum D. Franciſco Junio de prædeſtinatione per literas habita. 7. Epiſtola ad Hippolytum a collibus.

ARMOZA, or HARMOZIA, a town in Carmania, at the mouth of the Anamis, which falls into the Perſian Gulf (Arrian); *Armuza* (Ptolemy); and from this the neighbouring iſland, and a ſmall kingdom, take the modern name of *Ormus*. E. long. 56. 17. N. lat. 27. 20.

ARMSTRONG (*Encycl.*), like Akenſide, another poet and phyſician, never arrived at much practice. In 1735 he publiſhed a little humorous fugitive pamphlet, entitled, An Eſſay for abridging the Study of Phyſic; to which is added, A Dialogue betwixt Hygeia, Mercury, and Pluto; as alſo an Epiſtle from Uſbek the Perſian to Joſhua Ward, Eſq. In 1737 he publiſhed A Synopſis of the Hiſtory and Cure of Venereal Diſeaſes. This was ſoon followed by the Œconomy of Love, a poem which has much merit, but is too ſtrongly tinctured with the licentiouſneſs of Ovid. His Art of preſerving Health, which was publiſhed in 1744, is his beſt performance, and will tranſmit his name to poſterity as one of the firſt Engliſh writers. In 1746 Dr. Armſtrong was appointed one of the phyſicians to the hoſpital for lame and ſick ſoldiers, behind Buckingham-houſe. In 1751 he publiſhed his poem On Benevolence; and in 1753, Taſte, an Epiſtle to a young Critic. In 1760 he had the honour of being appointed phyſician to the army in Germany; where, in 1761, he wrote a poem called Day, an Epiſtle to John Wilkes, of Ayleſbury, Eſq. In this poem, which is not collected in his works, he wantonly hazarded a reflection on Churchill, which drew on him the ſerpent-toothed vengeance of that ſevereſt of ſatiriſts. In 1770 Dr. Armſtrong publiſhed a collection of Miſcellanies in two volumes; containing, 1. The Art of preſerving Health. 2. Of Benevolence, an Epiſtle to Eumenes. 3. Taſte, an Epiſtle to a young Critic, 1753. 4. Imitations of Shakſpeare and Spenſer. 5 The Univerſal Almanac, by Noureddin Ali. 6. The Forced Marriage, a Tragedy. 7. Sketches. In 1771 he publiſhed A ſhort Ramble through ſome Parts of France and Italy, by Lancelot Temple; and in 1773, a quarto pamphlet, under the title of Medical Eſſays. He died in September 1779.

ARMSTRONG (Sir Thomas), deſcended of an ancient and loyal family, was born at Nimeguen in Holland. As he grew up, he diſcovered a vigorous, martial diſpoſition, which recommended him to the acquaintance and eſteem of many perſons of quality, who looked upon him as a man of a warm heart, and a good head. He was a very ſtirring and active royaliſt during the exile of King Charles II. which expoſed him to the malice of the Protector, Cromwell, who cauſed him to be confined a year in Lambeth-houſe, which in thoſe times was a priſon. He ſuffered greatly in this impriſonment; for the royaliſts were at that time ſo exhauſted, that, how warm ſoever their charity might be in their hearts, its effects were but cold, and therefore Mr. Armſtrong was very near ſinking

under this misfortune, when by some accident or other he recovered his liberty. This usage, hard and cruel as it was, could neither break his spirits, nor abate his loyalty, which induced the principal friends the king had in his dominions, to make choice of him to go to his majesty, then at Brussels, with bills of exchange of great value, and other papers of still greater importance, which commission he executed with such diligence and discretion, that he not only put the bills and papers safely into the king's hands, but brought home and delivered as safely the answers with which he was entrusted. But the Protector had so good intelligence, that within a week after he came back, he was seized and sent to the Gatehouse, where he suffered another sharp imprisonment, and was in great danger of losing his life. This service was so acceptable to the king when performed, that he conferred on him the honour of knighthood; and yet the remembrance of it was so far from being of any service to him in his troubles, that it was thought one principal reason for taking away his life. After this he was again imprisoned in the Tower, and obtained his liberty only by the death of the Protector, and on his obtaining it, returned to the service of his master, and was one of those distinguished royalists, that signed that excellent address to the Lord General Monk, that operated so strongly in favour of the Restoration. On the king's return he was taken into great favour, was employed in many services of importance, promoted to the rank of lieutenant in one of the troops of horseguards, and was gentleman of horse to his majesty. The heat and vehemence of his temper betrayed him however into some excesses, and particularly into one, which was extremely fatal to his reputation, and, but for the king's favour, might have been fatal also to his life. This was the killing one Mr. Scroop in a play-house-quarrel, which misfortune rendered it necessary, or at least expedient, for him to leave the kingdom, but he did it in an honourable way, and as an attendant upon the king's natural son, Mr. James Crofts, afterwards so well known to the world, by the title of Duke of Monmouth. He served with him in Flanders with great reputation, and there acquired such a degree of military skill, as made him be considered as an active and accomplished officer, which made him the more dear to those noblemen of a martial disposition who attached themselves to that duke. After the war was over he returned to England, and stood in all appearance in as high favour, and as great credit with the king, as ever. But this did not continue long; for the times growing troublesome, and factions arising both in the court and country, he had the misfortune to fall into such measures as disobliged his master, drew upon him at first his coldness and displeasure, and ended at last in removing him from all his places, and in his total dismission from court. The long intercourse of friendship he had with, and his great dependence on, the Duke of Monmouth, proved the first cause of his troubles, and in the end that of his ruin. The court had no sooner received informations of a traitorous nature against Sir Thomas, than they took all imaginable pains to get him into their hands; but he having timely notice of the discoveries made against him, made his escape, and after some time spent, with as much secrecy as possible, in England, he withdrew into Holland, and passed by the name of Mr. Henry Lawrence, and there thought himself safe; but Mr. Chudleigh, King Charles's minister there, obtaining a warrant from the States, for apprehending such of the conspirators as had fled from England, he was seized at Leyden, and delivered up to the king's minister, who sent him to England. While this unfortunate gentleman was in Holland, an indictment was preferred against him in London, for high-treason, upon which he was outlawed, and upon his being brought home, it was resolved to proceed against him upon this outlawry, without allowing him the benefit of a trial. He was accordingly committed to Newgate, and on the 20th of June, 1684, executed at Tyburn as a traitor.

ARNA, a town of Andros, an island of the Archipelago, with a good harbour.

ARNALD (Richard), was born at London, and admitted a pensioner of Benet College, Cambridge, in 1714. After taking the degree of B. A. being disappointed of a fellowship, he removed to Emanuel College, March 10, 1718, where he proceeded M. A. and was elected fellow in 1721. He commenced B. D. seven years after, as the statutes of that house required, and continued there till the society presented him to the rectory of Thurcaston in Leicestershire. Whilst fellow of that college, he printed two copies of Sapphics on the death of King George; a sermon preached at Bishop Stortford schoolfeast, August 3, 1726; and another at the archdeacon's visitation at Leicester, April 22, 1737. A third, preached at Thurcaston, October 9, 1746, was published under the title of The Parable of the Cedar and Thistle, exemplified in the great victory at Culloden, 4to. In 1744 he published his celebrated Commentary on Wisdom, in folio; that on Ecclesiasticus, in 1748; and another on Tobit, &c. in 1752. He married a daughter of Mr. Wood, rector of Wilford, near Nottingham, and died in 1756.

ARNALL (William), a noted political writer in defence of Sir Robert Walpole, was originally an attorney's clerk; but being recommended to Walpole, he employed him for a course of years in writing the *Free Briton* and other papers in defence of his administration. By the report of the secret committee, he appears to have received, in the space of four years, no less than 10,997*l.* 6*s.* 8*d.* out of the treasury for his writings! but spending his money as fast as it came, and his supplies stopping on Sir Robert's resignation, he died broken-hearted and in debt, in the 26th year of his age. His invention was so quick, that his honourable employer used to say, no man in England could write a pamphlet in so little time as Arnall.

ARNAUD DE MEYRVEILH, or MEREUIL, a poet of Provence, who lived at the beginning of the 13th century. He wrote a book entitled, *Las recaſtenas de ſa comteſſe*; and a collection of poems and sonnets. He died in the year 1220. Petrarch mentions him in his Triumph of Love.

ARNAUD DE VILLA NOVA, a famous physician, who lived about the end of the 13th and beginning of the 14th century. He studied at Paris and Montpelier, and travelled through Italy and Spain. He was well acquainted with languages, and particularly with the Greek, Hebrew, and Arabic. He was at great pains to gratify his ardent desire after knowledge; but this passion carried him rather too far in his researches: he endeavoured to discover future events by astrology, imagining this science to be infallible; and upon this foundation he published a prediction, that the world would come to an end in the middle of the 14th century. He practised physic at Paris for some time: but having advanced some new doctrines, he drew upon himself the resentment of the university; and his friends, fearing he might be arrested, persuaded him to retire from that city. Upon his leaving France, he retired to Sicily, where he was received by King Frederic of Arragon with the greatest marks of kindness and esteem. Some time afterwards, this prince sent him to France, to attend Pope Clement in an illness; and he was shipwrecked on the coast of Genoa, about the year 1313. The works of Arnaud, with his life prefixed, were printed in one volume, in folio, at Lyons, in 1520; and at Basil in 1585, with the notes of Nicholas Tolerus.

ARNAUD D'ANDILLY (Robert), the son of a celebrated advocate of the parliament of Paris, was born in 1588; and, being introduced young at court, was employed in many considerable offices, all which he discharged with great integrity and reputation. In 1644 he quitted business, and retired into

the convent of Port Royal des Champs, where he paſſed the remainder of his days in a continued application to works of piety and devotion; and enriched the French language with many excellent tranſlations of different writers, as well as with religious compoſitions of his own. He died in 1674, and his works are printed in eight volumes folio.

ARNAUD (Anthony), brother of the preceding, and a doctor of the Sorbonne, was born in 1612. He publiſhed, in 1643, *A Treatiſe on frequent Communion*, which highly diſpleaſed the Jeſuits; and the diſputes upon grace, which broke out about this time in the univerſity of Paris, and in which he took a zealous part with the Janſeniſts, helped to increaſe the animoſity between him and the Jeſuits. But nothing raiſed ſo great a clamour againſt him, as the two letters he wrote on *Abſolution*; in the ſecond of which the faculty of divinity found two propoſitions which they condemned, and M. Arnaud was expelled the ſociety. Upon this he retired; and during a retreat which laſted near 25 years, he compoſed that great variety of works which are extant of his, on grammar, geometry, logic, metaphyſics, and theology. In 1679 he withdrew from France, living in obſcurity in the Netherlands, and died in 1694. His heart, at his own requeſt, was ſent to be depoſited in the Port Royal. Arnaud had a remarkable ſtrength of genius, memory, and command of his pen, nor did theſe decay even to the laſt year of his life. Mr. Bayle ſays, he had been told by perſons who had been admitted into his familiar converſation, that he was a man very ſimple in his manners; and that unleſs any one propoſed ſome queſtion to him, or deſired ſome information, he ſaid nothing that was beyond common converſation, or that might make one take him for a man of great abilities; but when he ſet himſelf to give an anſwer to ſuch as propoſed a point of learning, he ſeemed as it were transformed into another man: he would then deliver a multitude of fine things with great perſpicuity and learning, and had a particular talent at making himſelf intelligible to perſons of not the greateſt penetration.

ARNDT (John), a famous proteſtant divine of Germany, born at Ballenſtad in the duchy of Anhalt, in the year 1555. At firſt he applied himſelf to the ſtudy of phyſic: but falling into a dangerous ſickneſs, he made a vow to change his profeſſion for that of divinity, if he ſhould be reſtored to health; which he accordingly did upon his recovery. He was miniſter firſt at Quedlinburg, and then at Brunſwick. He met with great oppoſition in this laſt city: his ſucceſs as a preacher raiſed the enmity of his brethren, who became his bitter enemies. In order to ruin his character, they aſcribed a variety of errors to him; and perſecuted him to ſuch a degree, that he was obliged to leave Brunſwick, and retire to Iſleb, where he was miniſter for three years. In 1611, George duke of Lunenburg, who had a high opinion of his integrity and ſanctity, gave him the church of Zell, and appointed him ſuperintendant of all the churches in the duchy of Lunenburg; which office he diſcharged for 11 years, and died in 1621. It is reported that he foretold his death, having ſaid to his wife, upon his return home after his laſt ſermon, that now he had preached his funeral ſermon. He wrote in High Dutch A Treatiſe on true Chriſtianity, which has been tranſlated into ſeveral languages.

ARNE (Dr. Thomas Auguſtine), diſtinguiſhed by his great muſical talents, was the ſon of Mr. Arne, an upholſterer in Covent-Garden, whom Addiſon is ſuppoſed to have characteriſed in No. 155, and No. 160, of The Tatler; and brother of Mrs. Cibber, the player. He was early devoted to muſic, and ſoon became eminent in his profeſſion. July 6, 1759, he had the degree of doctor of muſic conferred on him at Oxford. His compoſitions are univerſally applauded, and he was alſo particularly ſkilful in inſtructing vocal performers. He died March 5, 1778, having written the following pieces: Artaxerxes, 1762; The Guardian Outwitted, 1764; The Roſe, 1778; all of them operas, and in high eſteem.

ARNEBERG, a town of Germany in Brandenburg, on the Elbe, between Angermund and Werben, three miles from each.

ARNEDO, a ſea-port of Peru, 25 miles N. of Lima.

ARNISÆUS (Henningus), a philoſopher and phyſician of great reputation, about the beginning of the 17th century. He was born at Halberſtad in Germany, and was profeſſor of phyſic in the univerſity of Helmſtad. His political works are much eſteemed. The moſt remarkable of them is his book *De authoritate principum in populum ſemper inviolabili*, printed at Frankfort in 1612. In this he maintains that the authority of princes ought not to be violated. He wrote alſo upon the ſame doctrine his three books *De jure majeſtatis*, printed at the ſame place in 1610; and his *Reflectiones politicæ*, printed at Frankfort in 1615. Having received an invitation to go to Denmark, he went thither, and was made counſellor and phyſician to the king. He travelled into France and England, and died in November 1635. Beſides the pieces already mentioned, he wrote ſeveral philoſophical, medicinal, and political treatiſes.

ARNO, a large river in Tuſcany. It has its ſource in the Appennines, and paſſing by Florence and Piſa, falls into the ſea a little below the latter.

ARNOBIUS, profeſſor of rhetoric at Sicca in Numidia, towards the end of the third century. It was owing to certain dreams which he had, that he became deſirous of embracing Chriſtianity. For this purpoſe he applied to the biſhops to be admitted into the church. But they, remembering the violence with which he had always oppoſed the true faith, had ſome diſtruſt of him; and, before they would admit him, inſiſted on ſome proofs of his ſincerity. In compliance with this demand, he wrote againſt the Gentiles; wherein he has refuted the abſurdities of their religion, and ridiculed their falſe gods. In this treatiſe he has employed all the flowers of rhetoric, and diſplayed great learning: but from an impatience to be admitted into the body of the faithful, he is thought to have been in too great a hurry in compoſing his work, and thence it is that there does not appear in this piece ſuch an exact order and diſpoſition as could be wiſhed; and not having a perfect and exact knowledge of the Chriſtian faith, he publiſhed ſome very dangerous errors. Mr. Bayle remarks, that his notions about the origin of the ſoul, and the cauſe of natural evil, and ſeveral other important points, are highly pernicious. St. Jerom, in his epiſtle to Paulinus, is of opinion that his ſtyle is unequal and too diffuſe, and that his book is written without any method; but Dr. Cave thinks this judgment too ſevere, and that Arnobius wants neither elegance nor order in his compoſition. Voſſius ſtyles him *the Varro of the eccleſiaſtical writers*. Du Pin obſerves that his work is written in a manner worthy of a profeſſor of rhetoric: the turn of his ſentiments is very oratorical; but his ſtyle is a little African, his expreſſions being harſh and inelegant. We have ſeveral editions of this work of Arnobius againſt the Gentiles, one publiſhed at Rome in 1542, at Baſil in 1546 and 1560, at Paris in 1570, at Antwerp in 1582, and one at Hamburg in 1610, with notes by Gebhard Elmenhorſtius, beſides many others. He wrote alſo a piece entitled, *De rhetorica inſtitutione*; but this is not extant.

ARNOLD, of Breſcia, in Italy, diſtinguiſhed himſelf by being the founder of a ſect, which oppoſed the wealth and power of the Romiſh clergy. He went into France, where he ſtudied under the celebrated Peter Abelard. Upon his return to Italy, he put on the habit of a monk, and maintained in his ſermons, That the pope and the clergy ought not to enjoy any

temporal eſtate; and that thoſe eccleſiaſtics who had any eſtates of their own, or held any lands, were entirely cut off from the leaſt hopes of ſalvation: that the clergy ought to ſubſiſt upon the alms and voluntary contributions of Chriſtians; and that all other revenues belonged to princes and ſtates, in order to be diſpoſed of amongſt the laity, as they thought proper. He maintained alſo ſeveral hereſies with regard to baptiſm and the Lord's ſupper. St. Bernard has drawn his character in very ſtrong colours. "Would to God (ſays he) that his doctrine was as holy as his life is ſtrict: would you know what ſort of man this is? Arnold of Breſcia is a man that neither eats nor drinks; who, like the devil, is hungry and thirſty after the blood of ſouls; who goes to and fro upon the earth, and is always doing among ſtrangers what he cannot do amongſt his own countrymen; who ranges like a roaring lion, always ſeeking whom he may devour; an enemy to the croſs of Chriſt, an author of diſcords, an inventor of ſchiſms, and a diſturber of the public peace: he is a man, whoſe converſation has nothing but ſweetneſs, and his doctrine nothing but poiſon in it; a man who has the head of a dove, and the tail of a ſcorpion." He engaged a great number of perſons in his party, who were diſtinguiſhed by his name, and proved very formidable to the popes. His doctrines rendered him ſo obnoxious, that he was condemned in the year 1139, in a council of near 1000 prelates, held in the church of St. John Lateran at Rome, under Pope Innocent II. Upon this he left Italy, and retired to Switzerland. After the death of that pope, he returned to Italy, and went to Rome, where he raiſed a ſedition againſt Pope Eugenius III. and afterwards againſt Hadrian IV. who laid the people of Rome under an interdict till they had baniſhed Arnold and his followers. This had its deſired effect: the Romans ſeized upon the houſes which the Arnoldiſts had fortified, and obliged them to retire to Otricoli in Tuſcany; where they were received with the utmoſt affection by the people, who conſidered Arnold as a prophet. However, he was ſeized ſome time after by Cardinal Gerard; and, notwithſtanding the efforts of the viſcounts of Campanio, who had reſcued him, he was carried to Rome, and condemned by Peter, the prefect of that city, to be hanged, and was accordingly executed in the year 1155. Thirty of his followers went from France to England, about the year 1160, in order to propagate their doctrine there; but they were immediately ſeized and deſtroyed.

ARNOLDUS (Gothofredus), paſtor and inſpector of the churches of Perleberg, and hiſtoriographer to the King of Pruſſia, was born at Annaburg in the mountains of Miſnia, in 1666. He was a zealous defender of Pietiſts, a ſect among the German Proteſtants, and compoſed a great number of religious works; particularly an *Eccleſiaſtical Hiſtory*, which expoſed him to the reſentment of the divines; and another giving an account of the doctrines and manners from the firſt ages, in which he frequently animadverts upon Cave's primitive Chriſtianity. He died in 1714. Various are the opinions concerning Arnoldus in Germany; ſome of his own countrymen and profeſſion extolling him to the ſkies as a ſaint of the laſt century, and ſetting an ineſtimable value upon his works; while others pronounce damnation upon him as an arch-heretic, and condemn his writings as heterodox.

ARNSHEIM, a town of Germany, in the palatinate of the Rhine, eight miles from Crutzenach.

ARNULPH, or ERNULPH, biſhop of Rocheſter in the reign of Henry I. He was born in France, where he was ſome time a monk of St. Lucian de Beauvais. The monks led moſt irregular lives in this monaſtery; for which reaſon he reſolved to quit it, but firſt took the advice of Lanfranc archbiſhop of Canterbury, under whom he had ſtudied in the abbey of Bec, when Lanfranc was prior of that monaſtery. This prelate invited him over to England, and placed him in the monaſtery of Canterbury, where he lived a private monk till Lanfranc's death. When Anſelm came to the archiepiſcopal ſee, Arnulph was made prior of the monaſtery of Canterbury, and afterwards abbot of Peterborough. In 1115 he was conſecrated biſhop of Rocheſter, which ſee he held nine years, and died in March 1124, aged 84.

Arnulph wrote, 1. A piece in Latin concerning the foundation, endowment, charters, laws, and other things relating to the church of Rocheſter: it is generally known by the title of *Textus Roffenſis*, and is preſerved in the archives of the cathedral church of Rocheſter. 2. An Epiſtle in Anſwer to ſome Queſtions of Lambert, Abbot of Munſter; and, 3. An Epiſtle on Inceſtuous Marriage.

ARNWAY (John), a clergyman diſtinguiſhed by his benevolence and loyalty to King Charles I. was deſcended from a very good family in the county of Salop, from which he inherited a conſiderable eſtate. He was educated at Oxford; and, having received holy orders, obtained the rectories of Hodnet and Ightfield, where he diſtinguiſhed himſelf by his piety and exemplary charity: for it was his cuſtom to clothe annually 12 poor people, and every Sunday to entertain as many at his table, not only plentifully, but with intimacy and reſpect. The civil war breaking out, he preached againſt rebellion, and raiſed and clothed eight troopers for the ſervice of King Charles I. upon which his houſe was plundered by the parliament's army. He then went to Oxford to ſerve the king in perſon, which ſubjected him to a new train of misfortunes: for his eſtate was ſoon after ſequeſtered, and himſelf impriſoned till the king's death; after which, he went to the Hague, where he publiſhed, 1. The Tablet, or the Moderation of Charles I. the Martyr; and, 2. An Alarm to the Subjects of England. He at laſt went to Virginia, where he died in 1653.

AROBE (*Encycl.*). The word AROBAS, referred to in that article ſhould have been ſpelled ARROBAS.

AROMATA, a town of Lydia, famous for its generous wines; and hence the appellation (Strabo). Alſo the name of a trading town and promontory of Ethiopia, at the termination of the Sinus Avalites of the Red Sea (Arrian).

ARPINAS, or ARPINO (Joſeph Cæſar), a famous painter, born in the year 1560, at the caſtle of Arpinas, in the kingdom of Naples. He lived in great intimacy with Pope Clement VIII. who conferred upon him the honour of knighthood, and beſtowed on him many other marks of his friendſhip. In the year 1600 he went to Paris with Cardinal Aldobrandin, who was ſent legate to the French court on the marriage of Henry IV. with Mary of Medicis. His Chriſtian majeſty gave Arpinas many conſiderable preſents, and created him a knight of St. Michael. The colouring of this painter is thought to be cold and inanimate; yet there is ſpirit in his deſigns, and his compoſitions have ſomewhat of fire and elevation. The touches of his pencil being free and bold, give therefore pleaſure to connoiſſeurs in painting; but they are generally incorrect. What he painted of the Roman hiſtory is the moſt eſteemed of all his works. The French king has in his collection the following pieces of this maſter, *viz.* the nativity of our Saviour, Diana and Acteon, the rape of Europa, and a Suſanna. He died at Rome in 1640.

ARPINUM, a town of the Volſci, a little to the eaſt of the confluence of the rivers Liris and Fibrenus, in the Terra di Lavora; now decayed, and called *Arpino*. It was the native place of Cicero, and of C. Marius (Salluſt).

ARRAN, a town of Switzerland, on the Aar, 25 miles S. W. of Baden.

ARRETIUM (Cicero, Cæſar); *Arrhetium* (Ptolemy); *Urbs Arrhetinorum* (Polybius); one of the twelve ancient towns of Tuſcany, near the Arnus and Clanis, ſituated in a

pleaſant valley. Now *Arezzo*, 42 miles eaſt of Florence. E. long. 13. 18. Lat. 43. 15.

ARRIAN, a famous philoſopher and hiſtorian under the Emperor Hadrian and the two Antonines, was born at Nicomedia in Bithynia. His great learning and eloquence procured him the title of *The ſecond Xenophon*; and raiſed him to the moſt conſiderable dignities at Rome, even the conſulſhip itſelf. We have four books of his *Diſſertations upon Epictetus*, whoſe ſcholar he had been; and his *Hiſtory of Alexander the Great*, in ſeven books, is greatly admired by the beſt judges.

ARRIEGE, a department of France, containing the late provinces of Couſerans and Foix. It is ſo named from a river which riſes in the Pyrenées, and paſſing by Foix and Pamiers, falls into the Garonne, near Toulouſe. Gold duſt is found among its ſands.

ARSAMAS, a town of the Ruſſian empire, ſeated on the river Mokcha-reca, on the road to Aſtracan, 300 miles S. by E. of Moſcow, and 500 N. by W. of Aſtracan.

ARSENIATES, in the new chemiſtry, are combinations of arſenic with metallic ſubſtances. In the Phil. Tranſ. Part I. for 1801, we find a deſcription of the arſeniates of copper, and of iron, from the county of Cornwall, by the Count de Bournon.

This paper is divided into two ſections: the firſt of which contains an account of the *arſeniates of copper*, the natural combination of the arſenic acid with copper; and the different aſpects under which this combination appears, according to the proportions in which theſe two ſubſtances are united, Count de Bournon obſerves, were among thoſe objects of mineralogy, reſpecting which our imperfect knowledge required the aid of ſtudy and obſervation. A new copper mine, lately worked, called Huel Gorland, in the pariſh of Gwennap, in the county of Cornwall, having, within the laſt two years, enriched the cabinets of London with ſome very fine ſpecimens of theſe arſeniates, he was induced to pay particular attention to them; and in this paper he gives a very accurate deſcription of the different ſpecies of theſe ores. He ſays,

"It is now above twenty years ſince arſeniate of copper was diſcovered in the county of Cornwall; it was firſt found either in Carrarach mine, in the pariſh of Gwennap, or in Tincroft mine, in the pariſh of Allogan. Its matrix, like that of almoſt all the copper ores of this country, was ſiliceous, and conſiſted of a decompoſed granite, of which the greateſt part of the feldſpar had paſſed into the ſtate known by the name of kaolin. It was accompanied with grey vitreous copper-ore, frequently in conſiderable maſſes: alſo with much black oxyd of copper; and with various oxyds of iron.

"The arſeniate here ſpoken of, which had never been found in large quantity, had ceaſed to exiſt in the above-mentioned mines, when Huel Gorland mine, lately wrought, began to enrich mineralogy with this uncommon ſubſtance. The matrix of this is likewiſe ſiliceous; ſometimes cryſtalline; and ſometimes in an amorphous maſs. Here and there we find mixed with it, in greater or leſs profuſion, all the known oxyds of copper; many of the argillaceous oxyds of iron; alſo grey vitreous copper ore; arſenical pyrites; and the rich deep-coloured yellow copper ore."

The exiſtence of arſeniate of copper ſeems, even at this day, to be an object of doubt among the French mineralogiſts: for "the Abbé Hauy does not mention it in the 28th and following numbers of the Journal des Mines, although they contain an intereſting extract of a ſyſtem of mineralogy, which he was then preparing for the preſs; nor has M. Fourcroy even hinted at it, in his Syſtême des Connoiſſances Chimiques, lately publiſhed."

Nature appears to have "eſtabliſhed very remarkable differences between the arſeniates of copper; and theſe take place not only in their forms, but likewiſe in their hardneſs and ſpecific gravity. Theſe differences ariſe, either from the manner in which the arſenic acid is combined with the copper, or from the different proportions in which theſe two ſubſtances are combined."

The Count follows the ſame order, and divides the arſeniates of copper into four different ſpecies; and the very intereſting analyſis of this ſubſtance, made by Mr. Chenevix, has, he obſerves, afforded the moſt ſatisfactory ſanction to this diviſion.

The firſt ſpecies is, arſeniate of copper in the form of an obtuſe octaedron—2d, in hexaedral laminæ, with inclined ſides—3d, in the form of an acute octaedron: of this ſpecies, he deſcribes five varieties—4th, in the form of a triedral priſm.

The ſecond ſection contains an account of the *arſeniates of iron*.

"Muttrell mine," our author obſerves, "which is immediately contiguous to Huel Gorland mine, in the county of Cornwall, has produced ſome ſpecimens of arſeniates of copper, exactly ſimilar to thoſe deſcribed in the former part of this paper. But this mine is ſtill more intereſting to mineralogiſts, on account of a combination found therein, of arſenic acid with iron, and alſo a double combination of that acid with both iron and copper.

"The firſt mentioned of theſe arſeniates ſeems analogous to thoſe cryſtals, or cubes, of a fine green colour, of which ſome ſpecimens had already been found in Carrarach and Tincroft mines, and which Klaproth, in his Memoir upon the Mineralogy of Cornwall, conſidered as belonging to the arſeniates of copper; but, according to the analyſis made by Mr. Chenevix, with all the care which his extenſive knowledge and extreme zeal for ſcience would naturally lead him to employ, it appears to be a true arſeniate of iron, containing only a ſmall quantity of copper; and even that quantity ſeems to be merely an accidental mixture. As, in the ſpecimens from the old mines of Tincroft and Carrarach, the greateſt part of the cryſtals adhered to vitreous grey copper ore, it is poſſible that ſome particles of that ore remained attached to the cryſtals; or, as I have frequently found to be the caſe, that ſome ſuch particles had penetrated into the cryſtals, and that Mr. Klaproth had been thereby deceived, by finding in the button left by the blow-pipe, a much greater proportion of copper than this ore really contains. The natural decompoſition of this arſeniate, which produces an oxyd of iron of a fine reddiſh yellow colour, ſtrongly confirms the reſult of Mr. Chevenix's analyſis.

"The double combination of the arſenic acid with iron and copper, although it had appeared to exiſt in the arſeniate juſt ſpoken of, in the mines of Tincroft and Carrarach, had not excited the attention of mineralogiſts. It is however poſſible, that the tranſparency, the brilliancy, and the pale blue colour of its cryſtals, might occaſion them to be miſtaken for cryſtals of a ſtony nature. Beſides, their ſmallneſs might eaſily cauſe them to eſcape the notice of common obſervation, particularly when they are not in pretty large groups."

The matrix of theſe arſeniates appears, from our author's deſcription, to be exactly the ſame as that of the arſeniates of copper; "conſiſting, like that, of quartz, mixed with yellow, grey, and vitreous ores of copper, with oxyds of iron, and with miſpickel. The mines of Huel Gorland and Muttrell, although not ſituated in the diſtrict of the tin mines, have yet produced ſome ſpecimens of tin, the cryſtals of which are covered with thoſe of the arſeniate here ſpoken of. Two ſpecimens of this kind are in the collection of Sir John St. Aubyn."

Of theſe arſeniates, the count deſcribes two ſpecies: 1ſt,

Simple arſeniate of iron, which cryſtallizes in perfect cubes 2d, Cupreous arſeniate of iron. The cryſtals of this ſpecies are of uncommon brilliancy, and perfectly tranſparent. Their form is a rhomboidal tetraedral priſm, having two of its edges very obtuſe, and the other two very acute.

Our limits do not permit us to preſent our readers with the deſcriptions of this very accurate mineralogiſt, but we refer them to the work itſelf: the paper is accompanied by two plates, containing delineations of the figures of the cryſtals of the different ſpecies.

The next article in the volume contains the "Analyſis of the Arſeniates of Copper, and of Iron, deſcribed in the preceding Paper; likewiſe an Analyſis of the red octaedral Copper Ore of Cornwall; with Remarks on ſome particular modes of Analyſis, by Richard Chenevix, Eſq. M. R. I. A."

Mr. Chenevix writes thus, "when the Count de Bournon had completed what appeared to him the mineralogical claſſification of theſe copper ores, he gave me ſome ſpecimens of each kind, numbered indiſcriminately, for the very purpoſe of excluding prejudice; and it was not till my taſk was ended, that we compared our obſervations. If I had been admitted into any previous knowledge of the arrangement dictated to him by the principles of cryſtallography, I ſhould have been afraid, that I had merely thought true, what I wiſhed to be ſo. But I can, moſt conſcientiouſly, indulge in the ſatisfaction which the according reſults of different means to prove the ſame propoſition naturally excite; and which is juſtly due to the truth of the outward marks, however delicate, yet ſtill to be perceived, that Nature has left viſible to thoſe who will obſerve her."

The following are the general reſults of this analyſis.

The firſt ſpecies deſcribed by the Count de Bournon in the preceding paper, according to Mr. Chenevix, contains 49 parts of oxyd of copper, 14 of arſenic acid, and 35 of water. The ſecond ſpecies contains 58 of oxyd of copper, 21 of arſenic acid, and the ſame quantity of water. The third ſpecies was found to contain 60 parts of oxyd of copper, and 39.7 of arſenic acid. In the fourth were found 54 parts of oxyd of copper, 30 of arſenic acid, and 16 of water.

After having expelled the water of cryſtallization by expoſure to a proper degree of heat in a platina crucible, the reſiduum was diſſolved in diluted nitric acid, and nitrat of lead poured in. Arſeniate of lead and nitrat of copper were thus formed, by double decompoſition. To ſeparate theſe two ſalts, alkohol was added, on which the arſeniate of lead fell to the bottom, while the nitrat of copper was held in ſolution. From the arſeniate of lead procured by filtration, it was eaſy to calculate the quantity of arſenic acid which the ore contained; and the ſpirituous ſolution being diſtilled, from the nitrat of copper remaining, the quantity of that metal was obtained, by boiling the ſolution with potaſh or ſoda.

Mr. Chenevix next proceeds to the examination of the arſeniates of iron, which were formerly included among the arſeniates of copper, but which are now ſeparated from them upon the authority of chemical analyſis. Our author very properly obſerves, that "although to recogniſe, by external character and form, in all their modifications, ſubſtances already known, is particularly the province of cryſtallography; yet he, who would expect that it ſhould declare the nature of thoſe ſubſtances which it beholds for the firſt time, would exact more than it ever has promiſed, or ever could perform. Among foſſils, it may claſs, and find new ſpecies; but chymical analyſis is the baſis of all arrangement, among metallic ores. In them, to ſeparate, is the taſk of the one; to aſſign a place, is the buſineſs of the other."

The cupreous arſeniate of iron was found to be compoſed of 3 parts of ſilica, 33.5 of arſenic acid, 27.5 of oxyd of iron, 22.5 of oxyd of copper, and 12 of water.

The ſimple arſeniate of iron is found to contain 4 parts of ſilica, 31 of arſenic acid, 45.5 of oxyd of iron, 9 of oxyd of copper, and 13.5 of water. This ore, our author obſerves, appears to be a pure arſeniate, mixed accidentally with a little copper, as ſome of the cupreous arſeniates caſually give traces of iron.

The third ſection of this ingenious and elaborate eſſay, contains an "Analyſis of the red octaedral Copper Ore, in which the Metal exiſts in a State hitherto unknown in Nature."

In the courſe of the experiments which have been ſtated in the preceding ſections, the author obſerves, that he had occaſion to examine a great number of copper ores, particularly thoſe from Cornwall; but the only ore which afforded any intereſting reſults, was the well-known ſpecies called red copper ore, cryſtallized in regular and brilliant octaedrons. This ore has been ſo long known, and ſo often mentioned by mineralogiſts, that it may excite our ſurpriſe when we reflect that its chemical nature has not been accurately aſcertained before; and that mineralogiſts differ ſo very much in their accounts of it.

"Romé de Liſle, the Baron de Born, Lametherie, the Abbé Hauy, and indeed every other mineralogiſt, concur in calling this ſubſtance red calx of copper; but ſome of them aſſert, that it contains a portion of carbonic acid. Among the many analyſes which have been made of this ore, by Fontana, Monnet, de Born, Renovantz, and others, I could not find one, that in the proportions, or even in the ingredients, reſembled what I had found to be its contents. The higheſt amount of copper (that given by Fontana), does not exceed 66 per cent. and is far ſhort of the real quantity. The remainder, as he ſtates, conſiſts of water, and of pure and fixed airs."

The difference in the reſults which our author obtained, together with ſome new facts he had occaſion to obſerve during his experiments, induced him, he ſays, to conſider the ſubject at ſome length; he particularly deſcribes his experiments, which preſented a number of curious and ſome unexpected reſults, and ſtates the component parts of this ore to be 88.5 of copper, and 11.5 of oxygen; ſo that this ore is a ſuboxyd of copper; a ſtate in which it has not before been ſuppoſed to exiſt in nature.

Mr. Chenevix obſerves, that when "we reflect, not ſo much on the quantity as upon the extreme purity of the copper, and the wonderful facility with which this uſeful metal may be extracted, it will be found much ſuperior to every copper ore hitherto diſcovered. It would be well worth the attention of miners to keep a conſtant look-out for this ſubſtance, which, I am informed, is not rare in Cornwall. It contains no iron, and no ſulphur; the abſence of which latter is a peculiar advantage. It is a fact not generally known, I believe, that there is hardly ſuch a thing in commerce, as copper which does not contain a little ſulphur; at leaſt I have rarely met with any ſuch; and it requires but a very minute portion of ſulphur, to increaſe the fuſibility of copper. The advantage of obtaining copper free from ſulphur, is too obvious to require to be pointed out; and that advantage does this ore poſſeſs."

Beſides an account of the experiments for the purpoſes of analyſis, this paper contains a number of ingenious obſervations and diſquiſitions, and ſome valuable remarks on the methods generally uſed in the docimaſtic art, which we have not room to tranſcribe, and they are incapable of abridgment. We ſhall conclude our account with a quotation, which we have little doubt will afford as great pleaſure to the reader.

"But, what is not the leaſt to be admired, is the wonderful accordance in the order which two ſciences operating with very different inſtruments, have allotted to be the ſame ſubſtances.

By that, not only the ſagacity of nature becomes very ſtriking; but, from the acknowledged accuracy of one method of inveſtigation, the reliance to be placed upon the other is rendered more conſpicuous; and each receives additional ſtrength and confirmation. Chemiſtry has long been in the habit of aiding the ſcience of mineralogy, of which it laid the foundation; but it was not till lately, that cryſtallography could form a judgment of its own, much leſs confirm the truth of the ſource from which it ſprung."

ARSENIUS, a deacon of the Roman church, of great learning and piety. He was pitched upon by the pope to go to the Emperor Theodoſius, as tutor to his ſon Arcadius. Arſenius arrived at Conſtantinople in the year 383. The emperor happening one day to go into the room where Arſenius was inſtructing Arcadius, his ſon was ſeated and the preceptor ſtanding; at this he was exceedingly diſpleaſed, took from his ſon the imperial ornaments, made Arſenius ſit in his place, and ordered Arcadius for the future to receive his leſſons ſtanding uncovered. Arcadius, however, profited but little by his tutor's inſtructions, for ſome time after he formed a deſign of diſpatching him. The officer, to whom Arcadius had applied for this purpoſe, divulged the affair to Arſenius, who retired to the deſerts of Scete, where he paſſed many years in the exerciſes of the moſt ſtrict and fervent devotion. He died there, at ninety-five years of age.

ARTS, *Progreſs of the* (*Encycl.*). In all countries where the people are barbarous and illiterate, the progreſs of arts is extremely ſlow. It is vouched by an old French poem, that the virtues of the loadſtone were known in France before anno 1180. The mariner's compaſs was exhibited at Venice anno 1260, by Paulus Venetus, as his own invention. John Goya of Amalphi was the firſt who, many years afterward, uſed it in navigation; and alſo paſſed for being the inventor. Though it was uſed in China for navigation long before it was known in Europe, yet to this day it is not ſo perfect as in Europe. Inſtead of ſuſpending it in order to make it act freely, it is placed upon a bed of ſand, by which every motion of the ſhip diſturbs its operation. Hand-mills, termed *querns*, were early uſed for grinding corn; and when corn came to be raiſed in greater quantity, horſe-mills ſucceeded. Water-mills for grinding corn are deſcribed by Vitruvius. Wind-mills were known in Greece and in Arabia as early as the ſeventh century; and yet no mention is made of them in Italy till the fourteenth. That they were not known in England in the reign of Henry VIII. appears from a houſhold book of an earl of Northumberland, contemporary with that king, ſtating an allowance for three mill-horſes, "two to draw in the mill, and one to carry ſtuff to the mill and fro." Water-mills for corn muſt in England have been of a later date. The ancients had mirror-glaſſes, and employed glaſs to imitate cryſtal vaſes and goblets: yet they never thought of uſing it in windows. In the 13th century, the Venetians were the only people who had the art of making cryſtal glaſs for mirrors. A clock that ſtrikes the hours was unknown in Europe till the end of the 12th century. And hence the cuſtom of employing men to proclaim the hours during night; which to this day continues in Germany, Flanders, and England. Galileo was the firſt who conceived an idea that a pendulum might be uſeful for meaſuring time; and Huygens was the firſt who put the idea in execution, by making a pendulum clock. Hook, in the year 1660, invented a ſpiral ſpring for a watch, though a watch was far from being a new invention. Paper was made no earlier than the 14th century; and the invention of printing was a century later. Silk manufactures were long eſtabliſhed in Greece before ſilk-worms were introduced there. The manufacturers were provided with raw ſilk from Perſia: but that commerce being frequently interrupted by war, two monks, in the reign of Juſtinian, brought eggs of the ſilk-worm from Hindoſtan, and taught their countrymen the method of managing them.—The art of reading made a very ſlow progreſs. To encourage that art in England, the capital puniſhment for murder was remitted if the criminal could but read, which in law-language is termed *benefit of clergy*. One would imagine that the art muſt have made a very rapid progreſs when ſo greatly favoured: but there is a ſignal proof of the contrary; for ſo ſmall an edition of the Bible as 600 copies, tranſlated into Engliſh in the reign of Henry VIII. was not wholly ſold off in three years. The people of England muſt have been profoundly ignorant in Queen Elizabeth's time, when a forged clauſe added to the 20th article of the Engliſh creed paſſed unnoticed till about forty years ago.

The diſcoveries of the Portugueſe on the weſt coaſt of Africa is a remarkable inſtance of the ſlow progreſs of arts. In the beginning of the 15th century, they were totally ignorant of that coaſt beyond Cape Non, 28 deg. north latitude. In 1410 the celebrated Prince Henry of Portugal fitted out a fleet for diſcoveries, which proceeded along the coaſt to Cape Bojadore in 26 deg. but had not courage to double it. In 1418 Triſtan Vaz diſcovered the iſland Porto Santo; and the year after, the iſland Madeira was diſcovered. In 1439 a Portugueſe captain doubled Cape Bojadore; and the next year the Portugueſe reached Cape Blanco, lat. 20. deg. In 1446 Nuna Triſtan doubled Cape Verd, lat. 14. 40. In 1448 Don Gonzallo Vallo took poſſeſſion of the Azores. In 1449 the iſlands of Cape Verd were diſcovered for Don Henry. In 1471 Pedro d'Eſcovar diſcovered the iſland St. Thomas and Prince's iſland. In 1484 Diego Cam diſcovered the kingdom of Congo. In 1486 Bartholomew Diaz, employed by John II. of Portugal, doubled the Cape of Good Hope, which he called *Carbo Tormentoſo*, from the tempeſtuous weather he found in the paſſage.

The exertion of national ſpirit upon any particular art, promotes activity to proſecute other arts. The Romans, by conſtant ſtudy, came to excel in the art of war, which led them naturally to improve upon other arts. Having, in the progreſs of ſociety, acquired ſome degree of taſte and poliſh, a talent for writing broke forth. Nevius compoſed in verſe ſeven books of the Punic war; beſides comedies, replete with bitter raillery againſt the nobility. Ennius wrote annals, and an epic poem. Lucius Andronicus was the father of dramatic poetry in Rome. Pacuvius wrote tragedies. Plautus and Terence wrote comedies. Lucilius compoſed ſatires, which Cicero eſteems to be ſlight and void of erudition. Fabius Pictor, Cincius Alimentus, Piſo Frugi, Valerius Antias, and Cato, were rather annaliſts than hiſtorians, confining themſelves to naked facts, ranged in order of time. The genius of the Romans for the fine arts was much inflamed by Greek learning, when free intercourſe between the two nations was opened. Many of thoſe who made the greateſt figure in the Roman ſtate commenced authors; Cæſar, Cicero, &c.: Sylla compoſed memoirs of his own tranſactions, a work much eſteemed even in the days of Plutarch.

The progreſs of art ſeldom fails to be rapid, when a people happen to be rouſed out of a torpid ſtate by ſome fortunate change of circumſtances: proſperity contraſted with former abaſement, gives to the mind a ſpring, which is vigorouſly exerted in every new purſuit. The Athenians made but a mean figure under the tyranny of Piſiſtratus; but upon regaining freedom and independence, they were converted into heroes. Miletus, a Greek city of Ionia, being deſtroyed by the King of Perſia, and the inhabitants made ſlaves, the Athenians, deeply affected with the miſery of their brethren, boldly attacked the king in his own dominions, and burnt the city of Sardis. In leſs than ten years after, they gained a

ſignal victory at Marathon; and, under Themiſtocles, made head againſt that prodigious army with which Xerxes threatened utter ruin to Greece. Such proſperity produced its uſual effect: arts flouriſhed with arms, and Athens became the chief theatre for ſciences as well as for fine arts. The reign of Auguſtus Cæſar, which put an end to the rancour of civil war, and reſtored peace to Rome with the comforts of ſociety, proved an auſpicious æra for literature; and produced a cloud of Latin hiſtorians, poets, and philoſophers, to whom the moderns are indebted for their taſte and talents. One who makes a figure rouſes emulation in all: one catches fire from another, and the national ſpirit is every-where triumphant: claſſical works are compoſed, and uſeful diſcoveries made in every art and ſcience. With regard to Rome, it is true, that the Roman government under Auguſtus was in effect deſpotic: but deſpotiſm, in that ſingle inſtance, made no obſtruction to literature, it having been the politic of that reign to hide power as much as poſſible. A ſimilar revolution happened in Tuſcany about three centuries ago. That country having been divided into a number of ſmall republics, the people, excited by mutual hatred between ſmall nations in cloſe neighbourhood, became ferocious and bloody, flaming with revenge for the ſlighteſt offence. Theſe republics being united under the Great Duke of Tuſcany, enjoyed the ſweets of peace in a mild government. That comfortable revolution, which made the deeper impreſſion by a retroſpect to recent calamities, rouſed the national ſpirit, and produced ardent application to arts and literature. The reſtoration of the royal family in England, which put an end to a cruel and envenomed civil war, promoted improvements of every kind: arts and induſtry made a rapid progreſs among the people, though left to themſelves by a weak and fluctuating adminiſtration. Had the nation, upon that favourable turn of fortune, been bleſſed with a ſucceſſion of able and virtuous princes, to what a height might not arts and ſciences have been carried! In Scotland, a favourable period for improvement was the reign of the firſt Robert, after ſhaking off the Engliſh yoke: but the domineering ſpirit of the feudal ſyſtem rendered abortive every attempt. The reſtoration of the royal family, mentioned above, animated the legiſlature of Scotland to promote manufactures of various kinds: but in vain; for the union of the two crowns had introduced deſpotiſm into Scotland, which ſunk the genius of the people, and rendered them heartleſs and indolent. Liberty, indeed, and many other advantages, were procured to them by the union of the two kingdoms; but the ſalutary effects were long ſuſpended by mutual enmity, ſuch as commonly ſubſiſts between neighbouring nations. Enmity wore out gradually, and the eyes of the Scots were opened to the advantages of their preſent condition; the national ſpirit was rouſed to emulate and to excel; talents were exerted, hitherto latent; and Scotland at preſent makes a figure in arts and ſciences, above what it ever made while an independent kingdom.

Another cauſe of activity and animation, is the being engaged in ſome important action of doubtful event; a ſtruggle for liberty, the reſiſting a potent invader, or the like. Greece, divided into ſmall ſtates, frequently at war with each other, advanced literature and the fine arts to unrivalled perfection. The Corſicans, while engaged in a perilous war for defence of their liberties, exerted a vigorous national ſpirit: they founded an univerſity for arts and ſciences, a public library, and a public bank. After a long ſtupor during the dark ages of Chriſtianity, arts and literature revived among the turbulent ſtates of Italy. The Royal Society in London, and the Academy of Sciences in Paris, were both of them inſtituted after civil wars that had animated the people and rouſed their activity.

As the progreſs of arts and ſciences toward perfection is greatly promoted by emulation, nothing is more fatal to an art or ſcience than to remove that ſpur, as where ſome extraordinary genius appears who ſoars above rivalſhip. Mathematics ſeem to be declining in Britain: the great Newton, having ſurpaſſed all the ancients, has not left to the moderns even the faineſt hope of equalling him; and what man will enter the liſts who deſpairs of victory?

In a country thinly peopled, where even neceſſary arts want hands, it is common to ſee one perſon exerciſing more arts than one: in ſeveral parts of Scotland, one man ſerves as a phyſician, ſurgeon, and apothecary. In every populous country, even ſimple arts are ſplit into parts, and each part has an artiſt appropriated to it. In the large towns of ancient Egypt, a phyſician was confined to a ſingle diſeaſe. In mechanic arts that method is excellent. As a hand confined to a ſingle operation becomes both expert and expeditious, a mechanic art is perfected by having its different operations diſtributed among the greateſt number of hands: many hands are employed in making a watch; and a ſtill greater number in manufacturing a web of woollen cloth. Various arts or operations carried on by the ſame man, envigorate his mind, becauſe they exerciſe different faculties; and as he cannot be equally expert in every art or operation, he is frequently reduced to ſupply want of ſkill by thought and invention. Conſtant application, on the contrary, to a ſingle operation, confines the mind to a ſingle object, and excludes all thought and invention: in ſuch a train of life, the operator becomes dull and ſtupid, like a beaſt of burden. The difference is viſible in the manners of the people: in a country, where, from want of hands, ſeveral occupations muſt be carried on by the ſame perſon, the people are knowing and converſable; in a populous country, where manufactures flouriſh, they are ignorant and unſociable. The ſame effect is equally viſible in countries where an art or manufacture is confined to a certain claſs of men. It is viſible in Indoſtan, where the people are divided into caſts, which never mix even by marriage, and where every man follows his father's trade. The Dutch lintboors are a ſimilar inſtance: the ſame families carry on the trade from generation to generation; and are accordingly ignorant and brutiſh even beyond other Dutch peaſants. The inhabitants of Buckhaven, a ſea-port in the county of Fife, were originally a colony of foreigners, invited hither to teach our people the art of fiſhing. They continue fiſhers to this day, marry among themſelves, have little intercourſe with their neighbours, and are dull and ſtupid to a proverb.

Uſeful arts paved the way to fine arts. Men upon whom the former had beſtowed every convenience, turned their thoughts to the latter. Beauty was ſtudied in objects of ſight; and men of taſte attached themſelves to the fine arts, which multiplied their enjoyments and improved their benevolence. Sculpture and painting made an early figure in Greece; which afforded plenty of beautiful originals to be copied in theſe imitative arts. Statuary, a more ſimple imitation than painting, was ſooner brought to perfection: the ſtatue of Jupiter by Phidias, and of Juno by Polycletes, though the admiration of all the world, were executed long before the art of light and ſhade was known. Apollodorus, and Zeuxis his diſciple, who flouriſhed in the 15th Olympiad, were the firſt who figured in that art. Another cauſe concurred to advance ſtatuary before painting in Greece, viz. a great demand for ſtatues of their gods. Architecture, as a fine art, made a ſlower progreſs. Proportions, upon which its elegance chiefly depends, cannot be accurately aſcertained, but by an infinity of trials in great buildings: a model cannot be relied on; for a large and a ſmall building, even of the ſame form, require different proportions.

From the fine arts mentioned, we proceed to *literature*. It is agreed, among all antiquaries, that the firſt writings were

in verſe, and that writing in proſe was of a much later date. The firſt Greek who wrote in proſe was Pherecides Syrus: the firſt Roman was Appius Cæcus, who compoſed a declamation againſt Pyrrhus. The four books of the Chatah Bhade, which is the ſacred book of Hindoſtan, are compoſed in verſe ſtanzas; and the Arabian compoſitions in proſe followed long after thoſe in verſe. To account for that ſingular fact, many learned pens have been employed; but without ſucceſs. By ſome it has been urged, that as memory is the only record of events where writing is unknown, hiſtory originally was compoſed in verſe, for the ſake of memory. This is not ſatisfactory. To undertake the painful taſk of compoſing in verſe, merely for the ſake of memory, would require more fore-ſight than ever was exerted by a Barbarian: not to mention that other means were uſed for preſerving the memory of remarkable events; a heap of ſtones, a pillar, or other object that catches the eye. The account given by Longinus is more ingenious. In a fragment of his treatiſe on verſe, the only part that remains, he obſerves, "that meaſure or verſe belongs to poetry, becauſe poetry repreſents the various paſſions with their language; for which reaſon the ancients, in their ordinary diſcourſe, delivered their thoughts in verſe rather than in proſe." Longinus thought, that anciently men were more expoſed to accidents and dangers, than when they were protected by good government, and by fortified cities. But he ſeems not to have adverted, that fear and grief, inſpired by dangers and misfortunes, are better ſuited to humble proſe than to elevated verſe. It may be added, that however natural poetical diction may be when one is animated with any vivid paſſion, it is not ſuppoſeable that the ancients never wrote nor ſpoke but when excited by paſſion. Their hiſtory, their laws, their covenants, were certainly not compoſed in that tone of mind.

An important article in the progreſs of the fine arts, which writers have not ſufficiently attended to, will, perhaps, explain this myſtery. The article is the profeſſion of a bard, which ſprung up in early times, before writing was known (ſee the article WRITING), and died away gradually as writing turned more and more common (ſee BARD).

The ſongs of the bards, being univerſal favourites, were certainly the firſt compoſitions that writing was employed upon: they would be carefully collected by the moſt ſkilful writers, in order to preſerve them in perpetual remembrance. The following part of the progreſs is obvious. People acquainted with no written compoſitions, but what were in verſe, compoſed in verſe their laws, their religious ceremonies, and every memorable tranſaction that was intended to be preſerved in memory by writing. But when ſubjects of writing multiplied, and became more and more involved; when people began to reaſon, to teach, and to harangue; they were obliged to deſcend to humble proſe; for to confine a writer or ſpeaker to verſe in handling ſubjects of that nature, would be a burden unſupportable.

The proſe compoſitions of early *hiſtorians* are all of them dramatic. A writer deſtitute of art is naturally prompted to relate facts as he ſaw them performed: he introduces his perſonages as ſpeaking and conferring; and he himſelf relates what was acted, and not ſpoke. The hiſtorical books of the Old Teſtament are compoſed in that mode; and ſo addicted to the dramatic are the authors of thoſe books, that they frequently introduce God himſelf into the dialogue. At the ſame time, the ſimplicity of that mode is happily ſuited to the poverty of every language in its early periods. The dramatic mode has a delicious effect in expreſſing ſentiment, and every thing that is ſimple and tender. Read, as an inſtance of a low incident becoming, by that means, not a little intereſting, Ruth i. 8. to iv. 16.

The dramatic mode is far from pleaſing ſo much in relating bare hiſtorical facts. Read, as an example, the ſtory of Adonijah in 1 Kings i. 11—49.

In that paſſage there are frequent repetitions; not however by the ſame perſon, but by different perſons who have occaſion in the courſe of the ſtory to ſay the ſame things; which is natural in the dramatic mode, where things are repreſented preciſely as they were tranſacted. In that view, Homer's repetitions are a beauty, not a blemiſh; for they are confined to the dramatic part, and never occur in the narrative.

But the dramatic mode of compoſition, however pleaſing, is tedious and intolerable in a long hiſtory. In the progreſs of ſociety new appetites and new paſſions ariſe; men come to be involved with each other in various connections; incidents and events multiply, and hiſtory becomes intricate by an endleſs variety of circumſtances. Dialogue accordingly is more ſparingly uſed, and in hiſtory plain narration is mixed with it. Narration is as it were the ground-work; and dialogue is raiſed upon it, like flowers in embroidery. Homer is admitted by all to be the great maſter in that mode of compoſition.

The narrative mode came in time ſo to prevail, that in a long chain of hiſtory, the writer commonly leaves off dialogue altogether. Early writers of that kind appear to have very little judgment in diſtinguiſhing capital facts from minute circumſtances, ſuch as can be ſupplied by the reader without being mentioned. The hiſtory of the Trojan war by Dares Phrygius is a curious inſtance of that cold and creeping manner of compoſition. The Roman hiſtories before the time of Cicero are chronicles merely. Cato, Fabius Pictor, and Piſo, confined themſelves to naked facts. In the Auguſtæ Hiſtoriæ Scriptores we find nothing but a jejune narrative of facts, commonly of very little moment, concerning a degenerate people, without a ſingle incident that can rouſe the imagination or exerciſe the judgment. The Monkiſh hiſtories are all of them compoſed in the ſame manner.

The dry narrative manner being very little intereſting or agreeable, a taſte for embelliſhment prompted ſome writers to be copious and verboſe. Saxo-Grammaticus, who in the 12th century compoſed in Latin a hiſtory of Denmark, ſurpriſingly pure at that early period, is extremely verboſe and full of tautologies. Such a ſtyle, at any rate unpleaſant, is intolerable in a modern tongue, before it is enriched with a ſtock of phraſes for expreſſing aptly the great variety of incidents that enter into hiſtory.

The perfection of hiſtorical compoſition, which writers at laſt attain to after wandering through various imperfect modes, is a relation of intereſting facts, connected with their motives and conſequences. An hiſtory of that kind is truly a chain of cauſes and effects.

The hiſtory of Thucydides, and ſtill more that of Tacitus, are ſhining inſtances of that mode.

Eloquence was of a later date than the art of literary compoſition; for till the latter was improved, there were no models for ſtudying the former. Cicero's oration for Roſcius is compoſed in a ſtyle diffuſe and highly ornamented; which, ſays Plutarch, was univerſally approved, becauſe at that time the ſtyle in Aſia, introduced into Rome with its luxury, was in high vogue. But Cicero, in a journey to Greece, where he leiſurely ſtudied Greek authors, was taught to prune off ſuperfluities, and to purify his ſtyle, which he did to a high degree of refinement. He introduced into his native tongue a ſweetneſs, a grace, a majeſty, that ſurpriſed the world, and even the Romans themſelves. Cicero obſerves with great regret, that if ambition for power had not drawn Julius Cæſar from the bar to command legions, he would have become the moſt complete orator in the world. So partial are men to the profeſſion in which they excel. Eloquence triumphing at

popular aſſembly, makes ſome figure in a court of law compoſed of many judges, very little where there is but a ſingle judge, and none at all in a deſpotic government. Eloquence flouriſhed in the republics of Athens and Rome; and makes ſome figure at preſent in a Britiſh Houſe of Commons.

The Greek ſtage has been juſtly admired among all polite nations. The *tragedies* of Sophocles and Euripides in particular are by all critics held to be perfect in their kind, excellent models for imitation, but far above rivalſhip. If the Greek ſtage was ſo early brought to maturity, it is a phenomenon not a little ſingular in the progreſs of arts. The Greek tragedy made a rapid progreſs from Theſpis to Sophocles and Euripides, whoſe compoſitions are wonderful productions of genius, conſidering that the Greeks at that period were but beginning to emerge from roughneſs and barbarity into a taſte for literature. The compoſitions of Eſchylus, Sophocles, and Euripides, muſt have been highly reliſhed among a people who had no idea of any thing more perfect. We judge by compariſon, and every work is held to be perfect that has no rival. It ought at the ſame time to be kept in view, that it was not the dialogue which chiefly enchanted the Athenians, nor variety in the paſſions repreſented, nor perfection in the actors; but machinery and pompous decoration, joined with exquiſite muſic. That theſe particulars were carried to the greateſt height, we may with certainty conclude from the extravagant ſums beſtowed on them: the exhibiting a ſingle tragedy was more expenſive to the Athenians, than their fleet or their army in any ſingle campaign.

One would imagine, however, that theſe compoſitions were too ſimple to enchant for ever; as variety in action, ſentiment, and paſſion, is requiſite, without which the ſtage will not continue long a favourite entertainment: and yet we find not a ſingle improvement attempted after the days of Sophocles and Euripides. The manner of performance, indeed, prevented abſolutely any improvement. A fluctuation of paſſion and refined ſentiments would have made no figure on the Grecian ſtage. Imagine the diſcording ſcene between Brutus and Caſſius in Julius Cæſar to be there exhibited, or the handkerchief in the Moor of Venice: how ſlight would be their effect, when pronounced in a maſk, and through a pipe? The workings of nature upon the countenance, and the flections of voice expreſſive of various feelings, ſo deeply affecting in modern repreſentation, would have been entirely loſt. If a great genius had ariſen with talents for compoſing a pathetic tragedy in perfection, he would have made no figure in Greece. An edifice muſt have been erected of a moderate ſize: new actors muſt have been trained to act with a bare face, and to pronounce in their own voice. And after all there remained a greater miracle ſtill to be performed, *viz.* a total reformation of taſte in the people of Athens. In one word, the ſimplicity of the Greek tragedy was ſuited to the manner of acting; and that manner excluded all improvements.

With reſpect to *comedy*, it does not appear that the Greek comedy ſurpaſſed the tragedy in its progreſs toward perfection. Horace mentions three ſtages of Greek comedy. The firſt well ſuited to the rough and coarſe manners of the Greeks, when Eupolis, Cratinus, and Ariſtophanes, wrote. Theſe authors were not aſhamed to repreſent on the ſtage real perſons, not even diſguiſing their names: of which we have a ſtriking inſtance in a comedy of Ariſtophanes, called *The Clouds*, where Socrates is introduced, and moſt contemptuouſly treated. This ſort of comedy, ſparing neither gods nor men, was reſtrained by the magiſtrates of Athens, ſo far as to prohibit perſons to be named on the ſtage. This led writers to do what is done at preſent: the characters and manners of known perſons were painted ſo much to the life, that there could be no miſtake; and the ſatire was indeed heightened by this regulation, as it was an additional pleaſure to find out the names that were meant in the repreſentation. This was termed the *middle comedy*. But as there ſtill remained too great ſcope for obloquy and licentiouſneſs, a law was made prohibiting real events or incidents to be introduced upon the ſtage. This law happily baniſhed ſatire againſt individuals, and confined it to manners and cuſtoms in general. Obedient to this law are the comedies of Meander, Philemon, and Diphilus, who flouriſhed about 300 years before the Chriſtian æra. And this is termed the *third ſtage* of Greek comedy. The comedies of Ariſtophanes, which ſtill remain, err not leſs againſt taſte than againſt decency. But the Greek comedy is ſuppoſed to have been conſiderably refined by Menander and his contemporaries. Their works, however, were far from perfection, if we can draw any conjecture from their imitator Plautus, who wrote about a century later. Plautus was a writer of genius; and it may be reaſonably ſuppoſed that his copies did not fall much ſhort of the originals, at leaſt in matters that can be faithfully copied; and he ſhews very little art, either in his compoſitions, or in the conduct of his pieces. With reſpect to the former, his plots are wondrous ſimple, very little varied, and very little intereſting. The ſubject of almoſt every piece is a young man in love with a muſic-girl, deſiring to purchaſe her from the procurer, and employing a favourite ſlave to cheat his father out of the price; and the different ways of accompliſhing the cheat is all the variety we find. In ſome few of his comedies the ſtory riſes to a higher tone, the muſic-girl being diſcovered to be the daughter of a free-man, which removes every obſtruction to a marriage between her and her lover. In the conduct of his pieces there is a miſerable defect of art. Inſtead of unfolding the ſubject in the progreſs of the action, as is done by Terence, and by every modern writer, Plautus introduces a perſon for no other end but to explain the ſtory to the audience. In one of his comedies, a houſehold-god is ſo obliging as not only to unfold the ſubject, but to relate before-hand every particular that is to be repreſented, not excepting the cataſtrophe.

The *Roman theatre*, from the time of Plautus to that of Terence, made a rapid progreſs. Ariſtotle defines comedy to be "an imitation of light and trivial ſubjects, provoking laughter." The comedies of Plautus correſpond accurately to that definition: thoſe of Terence riſe to a higher tone.

Nothing is more evident than the ſuperiority of Terence above Plautus in the art of writing; and, conſidering that Terence is a later writer, nothing would appear more natural, if they did not copy the ſame originals. It may be owing to genius that Terence excelled in purity of language, and propriety of dialogue; but how account for his ſuperiority over Plautus in the conſtruction and conduct of a play? It will not certainly be thought, that Plautus would imitate the worſt conſtructed plays, leaving the beſt to thoſe who ſhould come after him. This difficulty does not ſeem to have occurred to any of the commentators. Had the works of Menander and of his contemporaries been preſerved, they probably would have explained the myſtery; which for want of that light will probably remain a myſtery for ever.

Homer has for more than 2000 years been held the prince of poets. Such perfection in an author who flouriſhed when arts were far ſhort of maturity, is truly wonderful. The nations engaged in the Trojan war are deſcribed by him as in a progreſs from the ſhepherd-ſtate to that of agriculture. Frequent mention is made in the Iliad of the moſt eminent men being ſhepherds. Andromache, in particular, mentions ſeven of her brethren who were ſlain by Achilles as they tended their father's flocks and herds. In that ſtate, garments

of woollen cloth were uſed; but the ſkins of beaſts, the original clothing, were ſtill worn as an upper garment: every chief in the Iliad appears in that dreſs. Such indeed was the ſimplicity of this early period, that a black ewe was promiſed by each chief to the man who would undertake to be a ſpy. In times of ſuch ſimplicity, literature could not be far advanced; and it is a great doubt, whether there was at that time a ſingle poem of the epic kind for Homer to imitate or improve upon. Homer is undoubtedly a wonderful genius, perhaps the greateſt that ever exiſted: his fire, and the boldneſs of his conceptions, are inimitable. But in that early age, it would fall little ſhort of a real miracle, to find ſuch ripeneſs of judgment, and correctneſs of execution, as in modern writers are the fruits of long experience and progreſſive improvements during the courſe of many centuries. Accordingly, that Homer is far from being ſo ripe, or ſo correct, cannot eſcape the obſervation of any reader of taſte and diſcernment. One ſtriking particular is, his digreſſions without end, which draw our attention from the principal ſubject. Diomedes, for inſtance, meeting with Glaucus in the field of battle, and doubting, from his majeſtic air, whether he might not be an immortal, enquires who he was, declaring that he would not fight with a god. Glaucus lays hold of this very ſlight opportunity, in the very heat of action, to give a long hiſtory of his family. In the mean time, the reader's patience is put to a trial, and his ardour cools. Again, Agamemnon deſiring advice how to reſiſt the Trojans, Diomedes ſprings forward; but, before he offers advice, gives the hiſtory of all his progenitors, and of their characters, in a long train. And, after all, what was the ſage advice that required ſuch a preface? It was, that Agamemnon ſhould exhort the Greeks to fight bravely. At any rate, was Diomedes ſo little known, as to make it proper to ſuſpend the action at ſo critical a juncture, for a genealogical hiſtory? There is a third particular, which juſtly merits cenſure; and that is, an endleſs number of minute circumſtances, eſpecially in the deſcription of battles, where they are moſt improper. The capital beauty of an epic poem is, the ſelection of ſuch incidents and circumſtances as make a deep impreſſion, keeping out of view every thing low or familiar. An account of a ſingle battle employs the whole fifth book of the Iliad, and a great part of the ſixth: yet in the whole there is no general action; but unknown warriors, whom we never heard of before, killed at a diſtance with an arrow or a javelin; and every wound deſcribed with anatomical accuracy. The whole ſeventeenth book is employed in the conteſt about the dead body of Patroclus, ſtuffed with minute circumſtances, below the dignity of an epic poem. In ſuch ſcenes the reader is fatigued with endleſs particulars; and has nothing to ſupport him but the melody of Homer's verſification.

Having traced the progreſs of the fine arts toward maturity, in a ſummary way, the *decline of theſe arts* comes next in order. An art, in its progreſs toward maturity, is greatly promoted by emulation; and, after arriving at maturity, its downfal is not leſs promoted by it. It is difficult to judge of perfection but by compariſon; and an artiſt, ambitious to outſtrip his predeceſſors, cannot ſubmit to be an imitator, but muſt ſtrike out ſomething new, which, in an art advanced to ripeneſs, ſeldom fails to be a degeneracy. This cauſe of the decline of the fine arts may be illuſtrated by various inſtances. The perfection of vocal muſic is to accompany paſſion, and to enforce ſentiment. In ancient Greece, the province of muſic was well underſtood; which, being confined within its proper ſphere, had an enchanting influence. Harmony at that time was very little cultivated, becauſe it was of very little uſe: melody reaches the heart, and it is by it chiefly that a ſentiment is enforced, or a paſſion ſoothed: harmony, on the contrary, reaches the ear only; and it is a matter of undoubted experience, that the moſt melodious airs admit but of very ſimple harmony. Artiſts, in latter times, ignorant why harmony was ſo little regarded by the ancients, applied themſelves ſeriouſly to its cultivation; and they have been wonderfully ſucceſsful. But they have been ſucceſsful at the expence of melody; which, in modern compoſitions, generally ſpeaking, is loſt amid the blaze of harmony. Theſe compoſitions tickle the ear by the luxury of complicated ſounds, but ſeldom make any impreſſion on the heart. The Italian opera, in its form, reſembles the Greek tragedy, from which it is evidently copied; but very little in ſubſtance. In the latter, muſic being made ſubſervient to ſentiment, the dialogue is nervous and ſublime: in the former, the whole weight is laid on muſic; and the dialogue, devoid of ſentiment, is weak and ſpiritleſs. Reſtleſs man knows no golden mean, but will be attempting innovations without end.—By the ſame ambition, architecture has viſibly declined from its perfection. The Ionic was the favourite order when architecture was in its height of glory. The Corinthian order came next; which, in attempting greater perfection, has deviated from the true ſimplicity of nature: and the deviation is ſtill greater in the Compoſite order. With reſpect to literary productions, the firſt eſſays of the Romans were very imperfect. We may judge of this from Plautus, whoſe compoſitions are abundantly rude, though much admired by his contemporaries, being the beſt that exiſted at that time. The exalted ſpirit of the Romans hurried them on to the grand and beautiful; and literary productions of all kinds were in perfection when Auguſtus reigned. In attempting ſtill greater perfection, the Roman compoſitions became a ſtrange jumble of inconſiſtent parts: they were tumid and pompous; and, at the ſame time, full of antitheſes, conceit, and tinſel wit. Every thing new in the fine arts pleaſes, though leſs perfect than what we are accuſtomed to; and, for that reaſon, ſuch compoſitions were generally reliſhed. We ſee not by what gradual ſteps writers, after the time of Auguſtus, deviated from the patterns that were before them; for no book of any moment after that time is preſerved, till we come down to Seneca, in whoſe works nature and ſimplicity give place to artificial thought and baſtard wit. He was a great corrupter of the Roman taſte; and after him nothing was reliſhed but brilliant ſtrokes of fancy, with very little regard to ſentiment: even Virgil and Cicero made no figure in compariſon. Lucan has a forced elevation of thought and ſtyle, very difficult to be ſupported; and, accordingly, he ſinks often into puerile reflections; witneſs his encomium on the river Po, which, ſays he, would equal the Danube, had it the ſame number of tributary ſtreams. Quintillian, a writer of true and claſſical taſte, who was protected and encouraged by Veſpaſian, attempted to ſtem the tide of falſe writing. His rhetoric is compoſed in an elegant ſtyle; and his obſervations contain every delicacy of the critical art. At the ſame time flouriſhed Tacitus, poſſeſſing a more extenſive knowledge of the nature of man than any other author, ancient or modern, if Shakſpeare be not excepted. His ſtyle is original, conciſe, compact, and comprehenſive; and, in what is properly called his *hiſtory*, perfectly correct and beautiful. He has been imitated by ſeveral, but never equalled by any. Brutus is ſaid to be the laſt of the Romans for love of liberty: Quintillian and Tacitus may be ſaid to be the laſt of the Romans for literary genius. Pliny the Younger is no exception: his ſtyle is affected, turgid, and full of childiſh brilliancy. Seneca and Pliny are proper examples of writers who ſtudy ſhow more than ſubſtance, and who make ſenſe yield to ſound. The difference between theſe authors and thoſe of the Auguſtan age, reſembles the difference between Greek and Italian muſic. Muſic, among the Greeks,

limited itſelf to the employment to which it is deſtined by nature, viz. to be the handmaid of ſenſe, to enforce, enliven, or ſweaten a ſentiment. In the Italian opera, the miſtreſs is degraded to be handmaid; and harmony triumphs, with very little regard to ſentiment.

Another great cauſe that precipitates the downfal of every fine art is deſpotiſm. The reaſon is obvious; and there is a diſmal example of it in Rome, particularly with regard to eloquence. We learn from a dialogue accounting for the corruption of the Roman eloquence, that in the decline of the art it became faſhionable to ſtuff harangues with impertinent poetical quotations, without any view but ornament merely: and this alſo was long faſhionable in France. It happened unluckily for the Romans, and for the world, that the fine arts were at their height in Rome, and not much upon the decline in Greece, when deſpotiſm put an end to the republic. Auguſtus, it is true, retarded their fall, particularly that of literature; it being the politic of his reign to hide deſpotiſm, and to give his government an air of freedom. His court was a ſchool of urbanity, where people of genius acquired that delicacy of taſte, that elevation of ſentiment, and that purity of expreſſion, which characterize the writers of his time. He honoured men of learning, admitted them to his table, and was bountiful to them. It would be painful to follow the decline of the fine arts in Rome to their total extirpation. The tyranny of Tiberius, and of ſubſequent emperors, broke at laſt the elevated and independent ſpirit of the brave Romans, reduced them to abject ſlavery, and left not a ſpark of genius. The ſcience of law is the only exception, as it flouriſhed even in the worſt of times: the Roman lawyers were a reſpectable body, and leſs the object of jealouſy than men of power and extenſive landed property. Among the Greeks alſo, a conquered people, the fine arts decayed; but not ſo rapidly as at Rome; the Greeks, farther removed from the ſeat of government, being leſs within the reach of a Roman tyrant. During their depreſſion, they were guilty of the moſt puerile conceits; witneſs verſes compoſed in the form of an ax, an egg, wings, and ſuch like. The ſtyle of Greek authors, in the reign of the Emperor Adrian, is unequal, obſcure, ſtiff, and affected. Lucian is the only exception that may be made.

We need ſcarce any other cauſe but deſpotiſm, to account for the *decline of ſtatuary and painting* in Greece. Theſe arts had arrived at their utmoſt perfection about the time of Alexander the Great; and from that time they declined gradually with the vigour of a free people: for Greece was now enſlaved by the Macedonian power. It may in general be obſerved, that when a nation becomes ſtationary in that degree of power which it acquires from its conſtitution and ſituation, the national ſpirit ſubſides, and men of talents become rare. It is ſtill worſe with a nation that is ſunk below its former power and pre-eminence; and worſt of all when it is reduced to ſlavery. Other cauſes concurred to accelerate the downfal of the arts mentioned. Greece in the days of Alexander was filled with ſtatues of excellent workmanſhip; and there being little demand for more, the later ſtatuaries were reduced to heads and buſts. At laſt the Romans put a total end both to ſtatuary and painting in Greece, by plundering it of its fineſt pieces; and the Greeks, expoſed to the avarice of the conquerors, beſtowed no longer any money on the fine arts.

The *decline of the fine arts in Rome* is by Petronius Arbiter, a writer of taſte and elegance, aſcribed to a cauſe different from any above mentioned, a cauſe that overwhelms manhood as well as the fine arts wherever it prevails; and that is *opulence*, joined with its faithful attendants avarice and luxury. "In ancient times (ſays he), when naked virtue had her admirers, the liberal arts were in their higheſt vigour; and there was a generous conteſt among men, that nothing of real and permanent advantage ſhould long remain undiſcovered. Democritus extracted the juice of every herb and plant; and, leſt the virtue of a ſingle ſtone or twig ſhould eſcape him, he conſumed a lifetime in experiments. Eudoxus, immerſed in the ſtudy of aſtronomy, ſpent his age upon the top of a mountain. Chryſippus, to ſtimulate his inventive faculty, thrice purified his genius with hellebore. To turn to the imitative arts: Lyſippus, while labouring on the forms of a ſingle ſtatue, periſhed from want. Myron, whoſe powerful hand gave to the braſs almoſt the ſoul of man, and animals—at his death found not an heir! Of us of modern times what ſhall we ſay? Immerſed in drunkenneſs and debauchery, we want the ſpirit to cultivate thoſe arts which we poſſeſs. We inveigh againſt the manners of antiquity; we ſtudy vice alone; and vice is all we teach. Where now is the art of reaſoning? Where aſtronomy? Where is the right path of wiſdom? What man now-a-days is heard in our temples to make a vow for the attainment of eloquence, or for the diſcovery of the fountain of true philoſophy? Nor do we even pray for health of body, or a ſound underſtanding. One, while he has ſcarce entered the porch of the temple, devotes a gift in the event of the death of a rich relation; another prays for the diſcovery of a treaſure; a third for a miniſterial fortune. The ſenate itſelf, the exemplary preceptor of what is good and laudable, has promiſed a thouſand pounds of gold to the capitol; and, to remove all reproach from the crime of avarice, has offered a bribe to Jupiter himſelf. How ſhould we wonder that the art of painting has declined, when, in the eyes both of the gods and men, there is more beauty in a maſs of gold, than in all the works of Phidias and Apelles."—In England, the fine arts are far from ſuch perfection as to ſuffer by opulence. They are in a progreſs, it is true, toward maturity: but they proceed in a very ſlow pace.

There is ſtill another cauſe that never fails to undermine a fine art in a country where it is brought to perfection, abſtracting from every one of the cauſes above mentioned. It is remarked a little above, that nothing is more fatal to an art or to a ſcience than a performance ſo much ſuperior to all of the kind as to extinguiſh emulation. This remark is exemplified in the great Newton, who, having ſurpaſſed all the ancients, has not left to his countrymen even the faineſt hope of rivalling him; and to that cauſe is attributed the viſible decline of mathematics in Great Britain. The ſame cauſe would have been fatal to the arts of ſtatuary and painting among the Greeks, even though they had continued a free people. The decay of painting in modern Italy is, probably, owing to the ſame cauſe: Michael Angelo, Raphael, Titian, &c. are lofty oaks that bear down young plants in their neighbourhood, and intercept from them the ſunſhine of emulation. Had the art of painting made a ſlower progreſs in Italy, it might have there continued in vigour to this day. Velleius Paterculus ſays judiciouſly, "Ut primo ad conſequendos quos priores ducimus accendimur; ita, ubi aut præteriri aut æquari eos poſſe deſperavimus, ſtudium cum ſpe ſeneſcit; et quod adſequi non poteſt, ſequi deſinit: præteritoque eo in quo eminere non poſſimus, aliquid in quo nitamur conquirimus."

The decline of an art or ſcience proceeding from the forgoing cauſe, is the moſt rapid where a ſtrict compariſon can be inſtituted between the works of different maſters. The ſuperiority of Newton above every other mathematician can be aſcertained with preciſion; and hence the ſudden decline of that ſcience in Great Britain. In Italy a talent for painting continued many years in vigour, becauſe no painter appeared with ſuch ſuperiority of genius as to carry perfection in every branch of the art. As one ſurpaſſed in deſigning, one in colouring, one in graceful attitudes, there was ſtill ſcope for emulation. But when at laſt there was not a ſingle perfection but what one

or other maſter had excelled in, from that period the art began to languiſh. Architecture continued longer in vigour than painting, becauſe the principles of compariſon in the former are leſs preciſe than in the latter. The artiſt who could not rival his predeceſſors in an eſtabliſhed mode, ſought out a new mode for himſelf, which though perhaps leſs elegant or perfect, was for a time ſupported by novelty.

Uſeful ARTS will never be neglected in a country where there is any police; for every man finds his account in them. Fine arts are more precarious. They are not reliſhed but by perſons of taſte, who are rare; and ſuch as can ſpare great ſums for ſupporting them, are ſtill more rare. For that reaſon they will never flouriſh in any country, unleſs patroniſed by the ſovereign, or by men of power and opulence. They merit ſuch patronage, as one of the ſprings of government: and a capital ſpring they make, by multiplying amuſements, and humanizing manners; upon which account they have always been encouraged by good princes.

General Theory of the Polite ARTS. The eſſence of the polite arts, as before obſerved, conſiſts in *expreſſion*. The end of all theſe arts is *pleaſure*; whereas the end of the ſciences is *inſtruction* and *utility*. Some of the polite arts indeed, as eloquence, poetry, and architecture, are frequently applied to objects that are uſeful, or exerciſed in matters that are inſtructive, as we ſhall ſhew more particularly in their proper place; but in theſe caſes, though the ground-work belongs to thoſe ſciences which employ the underſtanding, yet the expreſſion ariſes from the inventive faculty. It is a picture that is deſigned by Minerva, to which the muſes add the colouring, and the graces the frame. This union forms therefore the perfection of the art, according to that ſententious and well-known precept of Horace: *Omne tulit punctum, qui miſcuit utile dulci.*

Under the denomination, therefore, of Polite Arts, we comprehend, 1. Eloquence; 2. Poetry; 3. Muſic; 4. Painting; 5. Sculpture; 6. Graving; 7. Architecture; 8. Declamation; 9. Dancing. Particular deſcriptions of theſe arts are given under their reſpective names. This branch of the preſent article is intended as a general introduction to them; and, as ſuch, will be occaſionally referred to.

There is one very eſſential reflection, which it appears to us proper to make in the firſt place, on the polite arts in general. All the rules in the world are not ſufficient to make a great poet, an able orator, or an excellent artiſt; becauſe the quality, neceſſary to form theſe, depends on the natural diſpoſition, the fire of genius, which no human art can confer, but which is the pure gift of Heaven. The rules, however, will prevent a man from being a bad artiſt, a dull orator, or a wretched poet; ſeeing they are the reflections of the greateſt maſters in thoſe arts, and that they point out the rocks which the artiſt ſhould ſhun in the exerciſe of his talents. They are of uſe, moreover, in facilitating his labours, and in directing him to arrive by the ſhorteſt and ſureſt road to perfection. They refine, ſtrengthen, and confirm his taſte. Nature, abandoned to herſelf, has conſtantly ſomething wild and ſavage. Art, founded on juſt and ſagacious rules, gives her elegance, dignity, and politeneſs; and it is impoſſible to ſacrifice properly to the graces, without knowing the incenſe that is pleaſing to them.

Beauty is the object of all the polite arts. It is not however ſo eaſy, as it may ſeem, to give a clear and determinate idea of what we preciſely mean by that term. Many able writers, who have treated expreſsly on the ſubject, have ſhewn that they were totally ignorant of what it was. It is one of thoſe expreſſions that we comprehend immediately, that preſent us with a clear and preciſe idea, that leave a diſtinct impreſſion on our minds, when it is ſimply written or pronounced; but which philoſophers envelope in darkneſs, when they attempt to elucidate it by definitions and deſcriptions; and the more, as mankind have different ideas of beauty, their opinions and taſtes being as various as their underſtandings and phyſiognomies. We may ſay, however, in general, that beauty reſults from the various perfections of which any object is ſuſceptible, and which it actually poſſeſſes; and that the perfections which produce beauty conſiſt principally in the agreeable and delightful proportions which are found, 1. Between the ſeveral parts of the ſame object; 2. Between each part and the whole together; 3. Between the parts and the end or deſign of the object to which they belong. *Genius*, or invention, is that faculty of the mind by which *beauty* is produced. *Taſte*, diſpoſition, or rather the natural ſenſation of the mind refined by art, ſerves to guide the genius in diſcerning, embracing, and producing, that which is beautiful of every kind. From whence it follows, that the general theory of the polite arts is nothing more than the knowledge of what they contain that is truly beautiful and agreeable; and it is this knowledge, this theory, which modern philoſophers call by the Latin name of *æſthetica*.

It ſhould be conſtantly remembered, that the eſſence of the polite arts conſiſts in expreſſion. This expreſſion lies ſometimes in the words, and ſometimes in the pen; ſometimes in ſounds and their harmony, and at others in corporeal attitudes; ſometimes in the pencil or in the chiſel, and at others in the graver; ſometimes in a proper diſpoſition or judicious employment of the mechanic arts, and at others merely in their manner of acting. From whence ariſe thoſe arts that we have mentioned, and which are deſcribed in their order.

The general theory of the polite arts, or *æſthetics*, neceſſarily ſuppoſes, therefore, certain rules; but theſe general rules are of no great number. The firſt is, That whoever would devote himſelf to the polite arts, ſhould above all things *conſult his genius*: diveſt himſelf of all ſelf-love; and examine if he be a true ſon of Apollo, and cheriſhed by the muſes: for

> In vain, raſh author, doſt thou ſtrive to climb,
> By lofty verſe, Parnaſſus' height ſublime,
> If Heaven does not by ſecret powers inſpire,
> Or if thy natal ſtar darts not poetic fire.

This precept, with regard to poetry in particular, is applicable to all the polite arts in general; for their moſt happy ſucceſs is founded on *imagination*. By this term we underſtand, in general, a faculty of the mind, a particular genius, a lively invention, a certain ſubtil ſpirit, which gives a facility in diſcovering ſomething new. But it is neceſſary alſo to preſcribe juſt bounds to this term *new*, which muſt not be here taken in an abſolute ſenſe. Solomon wiſely remarks, that, even in his time, *there was nothing new under the ſun*. In fact, all that exiſts, and all that is capable of being diſcovered in the known world, has already been diſcovered. The fine arts in their imitations of nature, in their expreſſions, can borrow images, figures, compariſons, from thoſe things only that exiſt and are known. As there have been, from the beginning of the world to our days, millions of authors in each of the polite arts, almoſt all the poſſible combinations of the various ſubjects have been produced by their lively imaginations; and when we hear the ignorant part of mankind talk of a work of wit or of art *that is entirely new*, that offers ideas which were before utterly unknown, that had never entered into the brain of any other man, we ſhould refer ſuch aſſertions to the claſs of popular errors; and reflect on thoſe ſtories we every day hear of certain empirics, who pretend to be alone poſſeſſed of marvellous methods of cure by means of ſimples; as if there were any plant, any ſtalk of graſs that grows in our world, that can have eſcaped the reſearches of botaniſts. But the novelty, of which we here ſpeak, conſiſts in the ingenious uſe of combinations of all the various objects of nature, that are new, happy, and agreeable, that have not yet been exhauſted, and

which appear even to be inexhauſtible; and of the uſe which the artiſt makes of all new diſcoveries, which he turns to his advantage, by a judicious application. Invention therefore ſuppoſes a conſiderable fund of preliminary knowledge, ſuch as is capable of furniſhing ideas and images, to form new combinations. But there is no art by which invention itſelf can be produced; for that, as we have already ſaid, is the gift of Heaven; and it is an endowment which we cannot even make uſe of whenever we pleaſe. We would rather ſay, therefore, that invention conſiſts in producing, in works of genius, *that which is unexpected*; an object, a harmony, a perfection, a thought, an expreſſion, of which we had no idea, that we could not foreſee, nor hope to find, where the artiſt has ſo happily placed it, and where we perceive it with delight. This idea appears applicable to ſuch of the polite arts as affect the mind by the hearing as well as by the ſight; and it is a matter that is highly eſſential.

The *ſecond rule* is, That every artiſt ought inceſſantly to labour in the improvement of his *taſte*; in acquiring that ſenſible, refined, and clear diſcernment, by which he will be enabled to diſtinguiſh the real beauties in each object, the ornaments that are agreeable to it, and the proportions and relations that ſubſiſt among the ſeveral parts: and by this faculty, he will be regulated in the employment of his natural talents. This labour conſiſts not only in the profound reflections he will make on the properties of objects as they relate to the fine arts, but alſo in a conſtant, aſſiduous ſtudy of the grand models of beauty.

The *third rule*, to be obſerved in the practice of the polite arts, is *the imitation of nature*. Every object in the univerſe has its peculiar nature, of which the artiſt ſhould never loſe ſight in his manner of treating it. In vain will he otherwiſe ornament his work with the moſt refined and moſt brilliant ſtrokes; for, if nature be not juſtly imitated, it will for ever remain imperfect. The ſublime Homer has ſometimes ſinned againſt this rule: for, as the gods have a nature peculiar to themſelves, it cannot be a juſt imitation when we attribute to them paſſions that are ſcarce pardonable in mortals, and make them frequently converſe in a language that is at once vulgar and ridiculous. It was not to imitate nature, to put into the mouth of a hero, at the moment of a deciſive battle, an harangue that muſt become tedious by its exceſſive length, and which certainly could not have been heard by the thouſandth part of a numerous army: but we have already touched upon ſome of the faults that are ſtrewed over the poems of that great man; to multiply or dwell upon them would be ungrateful. We muſt however obſerve, that this imitation of nature, which appears at firſt view ſo ſimple and ſo eaſy, is of all things the moſt difficult in practice; and that it requires a diſcernment ſo ſagacious, and an expreſſion ſo happy, as is rarely beſtowed by Heaven on mortal man.

Perſpicuity forms the fourth rule of expreſſion. In all the fine arts, in general, an obſcure, perplexed, ambiguous, and elaborate expreſſion, is always bad. The true, ſtriking beauty muſt be manifeſt, and perceptible to the moſt ignorant of mankind as well as the moſt learned. Thoſe are very falſe or inferior beauties that have occaſion for a covering, a kind of veil that may make them appear greater than they really are: true beauty wants no veil, but ſhines by its native luſtre. From the union of the true imitation of nature with perſpicuity of expreſſion ariſes that *truth* which is ſo eſſential in the productions of the fine arts.

In all the polite arts, and in all the ſubjects they embrace, there muſt neceſſarily reign an *elevation of ſentiment*, that expreſſes each object in the greateſt perfection of which it is ſuſceptible; that imitates Nature in her moſt exalted beauty. This makes the fifth general rule. The deſign of the fine arts being to excite pleaſure by the expreſſion of that which is beautiful, every artiſt ſhould raiſe himſelf above his ſubject; and, chooſing the moſt favourable light wherein to place it, ſhould there embelliſh it with the greateſt, moſt noble, and beautiful ornaments, that his own genius can ſuggeſt; ſtill, however, obſerving a ſtrict imitation of nature.

From the obſervation of theſe two laſt rules reſults *the ſublime*, which is the union of the greateſt perſpicuity with the ſtricteſt truth and moſt exalted elevation poſſible. It is neceſſary to remark here, that the moſt ſimple and common ſubjects are ſuſceptible of a ſublime that is agreeable to their nature. An idyl or landſcape may be as ſublime in their kinds as an epic poem or a hiſtory-piece. When Moſes begins the book of Geneſis with theſe words, *In the beginning, God created the heaven and the earth*; or when he tells us, that God ſaid, *Let there be light, and there was light*; theſe expreſſions are ſublime in the higheſt degree, becauſe they are perfectly clear, true, and elevated. Every author ſhould therefore endeavour after the ſublime in every ſubject that he undertakes; and this makes the ſixth and laſt general rule in the practice of the polite arts. But if he cannot attain to this, it is, however, indiſpenſably neceſſary that he conſtantly make uſe of expreſſions that are *noble and refined*. Every thing that is *low, indecent*, or *diſagreeable*, is naturally repugnant to the ſublime, and ought to be for ever baniſhed from all works that proceed from the noble and liberal arts.

ARTABANUS, the name of ſeveral kings of Parthia. See PARTHIA.

ARTABAZUS, the ſon of Pharnaces, commanded the Parthians and Choraſmians in the famous expedition of Xerxes. After the battle of Salamis, he eſcorted the king his maſter to the Helleſpont with 60,000 choſen men; and after the battle of Platea, in which Mardonius engaged contrary to his advice, he made a noble retreat, and returned to Aſia with 40,000 men under his command.

ARTALIS (Joſeph), born at Mazara in Sicily, 1628, had an early paſſion for poetry, and a ſtrong inclination for arms. He finiſhed his ſtudies at fifteen years of age, about which time he fought a duel, in which he mortally wounded his adverſary. He ſaved himſelf by taking ſhelter in a church; and it was owing to this accident that he afterwards applied himſelf to the ſtudy of philoſophy. His parents being dead, and himſelf much embarraſſed in his circumſtances, he reſolved to quit his country, and ſeek his fortune elſewhere. He accordingly went to Candia, at the time when that city was beſieged by the Turks; and gave there ſo many proofs of his bravery, that he obtained the honour of knighthood in the military order of St. George. When he was upon his return for Italy, he was often obliged to draw his ſword: he was ſometimes wounded in theſe rencounters, but being an excellent ſwordſman had often the advantage. He rendered himſelf ſo formidable even in Germany, that they uſed to ſtyle him Chevalier de Sang. Earneſt duke of Brunſwick and Lunenburgh appointed him captain of his guards; but this did not make him neglect the muſes, for he cultivated them amidſt the noiſe of arms. He was member of ſeveral academies in Italy, and became highly in favour with many princes, eſpecially the Emperor Leopold. He died in 1679 at Naples.

ARTAXATA, *oram*, the royal reſidence, and metropolis of Armenia Major (Strabo, Pliny, Juvenal), and built according to a plan of Hannibal, for King Artaxias, after whom it was called. It was ſituated on an elbow of the river Araxes, which formed a kind of peninſula, and ſurrounded the town like a wall, except on the ſide of the Iſthmus, but this ſide was ſecured by a rampart and ditch. This town was deemed ſo ſtrong, that Lucullus, after having defeated Tigranes, durſt not lay ſiege to it; but Pompey compelled him to deliver it

up without ſtriking a blow. It was then levelled with the ground; but the Armenians have a tradition that the ruins of it are ſtill to be ſeen at a place called *Ardachat*. Sir John Chardin ſays, that it has the name of *Ardachat* from Artaxias, whom in the Eaſt they call *Ardechier*. Here are the remains of a ſtately palace which the Armenians take to be that of Tiridates who reigned in the time of Conſtantine the Great. One front of this building is but half ruined, and there are many other fine antiquities which the inhabitants call *Tact. Tardat*, that is, the throne of Tiridates. Tavernier alſo mentions the ruins of Artaxata between Erivan and mount Ararat, but does not ſpecify them. The ancient geographers mention another city of the ſame name, likewiſe ſituated on the Araxis, but in the northern part of Media, known among the ancients by the name of *Atropatia*.

ARTAXERXES, the name of ſeveral kings of Perſia. See Perſia.

ARTEMIDORUS, famous for his Treatiſe upon Dreams. He was born at Epheſus, but took upon him the ſurname of *Daldianus* in this book, by way of reſpect to his mother's country, Daltis. He ſtyled himſelf *the Epheſian* in his other performances. He not only bought up all that had been written concerning the explication of dreams, which amounted to many volumes; but he likewiſe ſpent many years in travelling, in order to contract an acquaintance with fortune-tellers: he alſo carried on an extenſive correſpondence with all the people of this ſort in the cities and aſſemblies of Greece, Italy, and the moſt populous iſlands; collecting at the ſame time all the old dreams, and the events which are ſaid to have followed them. The work which he wrote on dreams conſiſted of five books: the firſt three were dedicated to one Caſſius Maximus; and the laſt two to his ſon, whom he took a good deal of pains to inſtruct in the nature and interpretation of dreams. This work, though filled with frivolous obſervations, contains ſome things that are intereſting. It was firſt printed in Greek, at Venice, in 1518; and Rigaltius publiſhed an edition at Paris, in Greek and Latin, in 1603, and added ſome notes. Artemidorus wrote alſo a treatiſe upon Auguries, and another upon Chiromancy; but they are not extant. He lived under the Emperor Antoninus Pius.

ARTEMISIA, wife of Mauſolus king of Caria, has immortalized herſelf by the honours which ſhe paid to the memory of her huſband. She built for him in Halicarnaſſus a very magnificent tomb, called the *Mauſoleum*, which was one of the ſeven wonders of the world, and from which the title of *mauſoleum* was afterwards given to all tombs remarkable for their grandeur: but ſhe died of regret and ſorrow before the Mauſoleum was finiſhed. She appointed panegyrics to be made in honour of him, and propoſed a prize of great value for the perſon who ſhould compoſe the beſt. He died about the end of the 106th Olympiad, 351 years before the Chriſtian æra.

ARTEMISIA, queen of Caria, and the daughter of Ligdamis, marched in perſon in the expedition of Xerxes againſt the Greeks, and performed wonders in the ſea-fight near Salamis, 480 years before the Chriſtian æra. Being purſued by an Athenian veſſel, ſhe attacked one of the Perſian ſhips, commanded by Demaſithymus, king of Calyndus, her enemy, and ſunk it; on which the Athenians, thinking that her ſhip was on the ſide of the Greeks, ceaſed their purſuit: but Xerxes was the principal perſon impoſed upon in this affair; for believing ſhe had ſunk an Athenian veſſel, he declared, that "the men had behaved like women, and the women like men." Xerxes intruſted her with the care of the young princes of Perſia, his ſons; when, agreeably to her advice, he abandoned Greece, in order to return to Aſia. Theſe great qualities did not ſecure her from the weakneſs of love: ſhe was paſſionately fond of a man of Abydos, whoſe name was Dardanus, and was ſo enraged at his neglect of her, that ſhe put out his eyes while he was aſleep. The gods, in order to puniſh her for this, inſpired her with ſtill a ſtronger paſſion for him; ſo that the oracle having adviſed her to go to Leucas, which was the uſage of deſperate lovers, ſhe took the leap from thence, and was interred at that place.—Many writers confound this Artemiſia with the former, the wife of Mauſolus.

ARTEMISIUM, either a promontory (Harpocration), or a part of the ſea-coaſt, on the north-eaſt of Eubœa (Plutarch); called *Leon*, and *Cale Acte* (Ptolemy); memorable for the firſt ſea-engagement between the Greeks and Xerxes.—Another promontory of Caria (Strabo). A third in Spain, now called *Cape Martin*, in Valencia: in the meridian of London, and lat. 38. 50.

ARTEMISIUM, a town of Oenotria (Stephanus): now *S. Agatha*, in the Hither Calabria, on the river Piſaurus, or La Foglia, diſtant eight miles from the Tuſcan Sea.—Another of the Conteſtani, in Spain (Strabo); otherwiſe called *Dianium*: now *Denia*, on the ſea-coaſt of Valencia. W. long. 20. Lat. 39.

ARTHINGTON (Henry), a gentleman of a good family in Yorkſhire, who, towards the latter end of the reign of Queen Elizabeth, engaged in ſome ſeditious practices againſt the government. He was a man of moderate ſenſe and learning, zealouſly addicted to the Geneva diſcipline, and was engaged for ſeveral years in diſtributing books in defence of a farther reformation, and containing ſevere reflections on the lords of the privy-council, the judges, and other magiſtrates. In the proſecution of his deſigns, he became acquainted with Mr. Edmund Coppinger, a younger brother of a good family, and ſworn ſervant to Queen Elizabeth, who was as far gone as himſelf in fanatical opinions, and who was continually repreſenting to him the neceſſity of a thorough reformation in church and ſtate. This acquaintance of theirs laſted ſeveral years, till by frequent converſations, hearing warm ſermons, and praying together, they had greatly heated their imaginations, in conſequence of which, they began to believe themſelves very extraordinary perſons. Some time in Eaſter term, 1591, Coppinger became acquainted with Hacket, and ſoon after introduced Arthington alſo to his acquaintance. On Thurſday, the 14th of July, 1591, Arthington penned his prophecy of judgments againſt England. Coppinger alſo drew up a life of Hacket, which Arthington wrote over again fair, and annexed to it his prophecy. The ſame day they penned a joint letter to Mr. Thomas Lancaſter, a ſchool-maſter, ſigned by Coppinger as the meſſenger of peace, and by Arthington as the prophet of God's judgments, though it ſeems Arthington did well know why he ſtyled himſelf ſo. For on Friday, the 15th of July, Coppinger having ſent for Arthington out of his bed, declared to him, that he had had a revelation, which aſſured him that he was prophet of mercy, and Arthington prophet of judgment; that Hacket was king of Europe, and that they were to go before him, and ſeparate the ſheep from the goats. Arthington the more readily credited this, becauſe he found a mighty burning in himſelf, which he interpreted a commencement of the angelic nature. Their firſt exploit was to go together to the houſe of a gentleman in the city, between ſix and ſeven in the morning, to appoint him chief governor under her majeſty; but he would have nothing to do with them, nor would he ſuffer them to pray. Then they went to Wood-ſtreet Compter, to Mr. Wigginton, a miniſter, with whom they had a long conference; then they left him and went to Hacket's chamber, at the houſe of one Walker, at Broken Wharf. Afterwards they went together towards Cheapſide, by Watling-ſtreet, and the Old 'Change, crying out, "Chriſt is come," &c. To this Arthington added, "Repent, England, repent;"

threatening alſo ſtrange judgments againſt the city of London. A paper was taken out of Arthington's ſleeve, which he ſaid he was glad of, for it was an epiſtle to the queen, which ſhe would not receive, and therefore ſhe was no longer queen, but deprived of her dignity. About one o'clock they were apprehended and conducted to the lord mayor's, where ſeveral privy-counſellors were met, to whom Arthington refuſed to ſhew the leaſt reſpect. He did not recede in the leaſt from his ſtrange notions, even after he had heard that Hacket was tried and condemned; but in the afternoon of Wedneſday the 28th of July, when he was aſſured that Hacket was actually hanged, drawn, and quartered, he preſently diſcerned his own deluſion and great danger. Upon this he wrote in the moſt humble manner to the chancellor, and to the treaſurer, beſeeching them to pardon the injuries he had done them; and afterwards he wrote to the body of the council, giving the beſt account he was able of the whole buſineſs, beſeeching them to intercede with her majeſty for him, that he might not be proceeded againſt as his companions had been. As for Coppinger, he, a little after he was apprehended, ran abſolutely diſtracted, and never recovered his ſenſes, but obſtinately refuſing all nouriſhment, died of hunger the day after Hacket was executed. It was thought proper to detain Arthington ſome time in Wood-ſtreet Compter, in order to diſcover whether his repentance was ſincere, as alſo whether there was no danger of his relapſing into his enthuſiaſtic fit. But he remaining perfectly ſober and ſenſible, the queen was pleaſed to extend her mercy towards him, by granting him a pardon. He afterwards recovered his reputation ſo far, as to be thought an honeſt and ſincere, though a warm and weak man.

ARTICLES *of Religion*, in the church of England. In the beginnings of Chriſtianity, the declaration that was required of a Chriſtian's faith was conceived in very general terms; but, as hereſies ſprung up, it was found neceſſary to guard againſt them, by enlarging the creeds or confeſſions of faith. It was in imitation of this procedure that the reformers were ſo copious in ſtating the doctrines of the church of England in that work which is entitled, "Articles whereupon it was agreed by Archbiſhops and Biſhops of both provinces, and the whole Clergie, in the convocation holden at London, in the yeare of our Lorde God 1562, according to the computation of the Church of Englande, for the voiding of the diverſities of opinions, and for the eſtabliſhing of conſent touching true religion." There were two particular circumſtances in hat time which made this ſeem to be the more neceſſary: the one was, that there ſprung up, together with the reformation, many impious and extravagant ſects; the other, that, having but juſt got rid of Popery, it was abſolutely neceſſary to take the utmoſt precautions againſt it for the future. Theſe articles were prepared, as is moſt probable, by the biſhops Cranmer and Ridley, and were publiſhed by royal authority. The moſt authentic manuſcript of them is in the library of Corpus Chriſti College in Cambridge. It belonged to Archbiſhop Parker, and was left by him to that college.

The ſubſcription to theſe articles is enjoined by ſtatute, which eſtabliſhes them, and requires every clergyman to declare his aſſent, and ſubſcribe them in the preſence of his ordinary. The form of the ſubſcription is not preſcribed by the ſtatute; but by the canon it is expreſsly required, that he acknowledge them, and every one of them, to be agreeable to the word of God. There is a clauſe in the ſtatute, which ſubjects every miniſter, who maintains any doctrine repugnant to theſe articles, to deprivation.

ARTIGI, indeclinable (Pliny); *Artigis* (Ptolemy); a town of the Turduli, in Bætica. Now *Alhama*. See ALHAMA.

ARTOBRIGA, a town of Vindelicia (Ptolemy); now *Altzburg*, in Bavaria, on the Danube, below Ingolſtadt (Aventinus); but Cluverius ſuppoſes it to be *Lebenau*, on the Saltzbach, below Lauffen, in the archbiſhopric of Saltzburg.

ARUCCI, a town of Bætica, in the Conventus Hiſpalenſis (Pliny): now *Moron*, in Andaluſia, from an ancient inſcription; five leagues to the weſt of Oſſuna. W. long. 5. 20. Lat. 37.

ARVERNI, an appellation early uſed for the capital of the Arverni, according to the cuſtom of the latter ages of naming towns from the people; it was formerly called *Nemoſſus* (Strabo). The *Arverni*, a brave and ancient people, and one of the moſt powerful nations of Gaul, claimed affinity with the Romans, as deſcendants from Antenor (Lucan): and after their conqueſt by the Romans, their ancient liberty was preſerved to them, on account of their bravery (Pliny). Above 1000 years ago the town was called *Clarus Mons*, from its ſituation (Valeſius). Now *Clermont*, in Auvergne. E. long. 3. 20. N. lat. 45. 42.

ARVIRAGUS, an ancient Britiſh king who flouriſhed in the time of the Emperor Domitian. He gained a complete victory over Claudius; but being ſoon after beſieged in the city of Wincheſter, he made a treaty with the Romans, and married the emperor's daughter Genuiſſa. This monarch lived to a good old age; he confirmed the ancient laws, enacted new ones, and liberally rewarded perſons of merit.

ARUN, a river which riſes in the weſtern border of Suſſex, and falls into the ſea below Arundel. It is famous for mullets.

ARUNDA, a town of Hiſpania Bætica, on the Annas, or Guadiana (Ptolemy, Pliny): now ſaid to be *Ronda*, in the province of Granada, on the confines of Andaluſia. W. long. 5. 40. Lat. 36. 26.

ARUNDEL (Thomas), archbiſhop of Canterbury, in the reigns of Richard II. Henry IV. and Henry V. He was the ſecond ſon of Robert earl of Arundel and Warren, and brother to Richard earl of Arundel, who was beheaded. At twenty-two years of age (from being archdeacon of Taunton, he was raiſed to the biſhopric of Ely, the 6th of April, 1375, in the reign of Edward III. He was a great benefactor to the church and palace of this ſee. In 1386 he was appointed lord chancellor of England; two years after, he was tranſlated to the ſee of York; and in 1396, was advanced to the archiepiſcopal ſee of Canterbury, when he reſigned the chancellorſhip. This was the firſt inſtance of the tranſlation of an archbiſhop of York to the ſee of Canterbury. Scarce was he fixed in this ſee, when he had a conteſt with the univerſity of Oxford, about the right of viſitation. The affair was referred to King Richard, who determined it in favour of the archbiſhop. At his viſitation in London, he revived an old conſtitution, by which the inhabitants of the reſpective pariſhes were obliged to pay to their rector one halfpenny in the pound of the rent of their houſes. In the ſecond year of his tranſlation, a parliament being held at London, the commons, with the king's leave, impeached the archbiſhop, together with his brother the Earl of Arundel, and the Duke of Gloceſter, of high-treaſon. The archbiſhop was ſentenced to be baniſhed, and within forty days to depart the kingdom upon pain of death. He retired firſt to France, and then to the court of Rome, where Pope Boniface IX. gave him a kind reception, and wrote a letter to King Richard in his favour; but this having no effect, his holineſs reſolved to interpoſe his authority; he accordingly nominated Arundel to the biſhopric of St. Andrew's, and declared his intention of giving him ſeveral preferments in England. The king being informed of the pope's deſigns, wrote a letter, which had ſo good an

effect upon his holineſs, that he withheld his intended favours from Arundel; and, at the king's requeſt, promoted Roger Walden to the ſee of Canterbury.

Next year Arundel returned to England with the Duke of Lancaſter, afterwards Henry IV. upon whoſe acceſſion to the throne, the pope revoked the bull granted Walden, and reſtored Arundel to his ſee. In the year 1408, Arundel began to exert himſelf againſt the Lollards, or Wickliffites: he ſummoned the biſhops and clergy at Oxford, in order to ſtop the progreſs of this new ſect, and prevent the univerſity's being farther tinctured with their opinions. In 1411, being informed that this doctrine gained ground, notwithſtanding the condemnation thereof in a full congregation at Oxford, he reſolved to viſit the univerſity, and apply ſome farther remedy. His rigorous proceedings rendered Arundel extremely odious to the Wickliffites, and his zeal for ſuppreſſing that ſect, carried him to ſeveral unjuſtifiable ſeverities againſt the heads of it, particularly againſt Sir John Oldcaſtle and Lord Cobham. This prelate died at Canterbury, the 20th of February, 1413, having held the archiepiſcopal ſee ſeventeen years.

ARUNDEL (Thomas), earl of Arundel and Surrey, lord-marſhal of England, who ſent William Petty into Aſia to ſearch for ſome curious monuments of antiquity, where he bought thoſe which we call the *Arundel marbles*, of a Turk, who had taken them from a learned man ſent by the famous Pireſq into Greece and Aſia upon the ſame deſign. Theſe curious marbles were placed in the earl's houſe and gardens, upon the banks of the Thames, and afterwards entruſted to the care of the univerſity of Oxford, where they now are. This chronology, engraved 264 years before the Chriſtian æra, ſerves to rectify the dates of a great many events of the ancient hiſtory of Greece. The great Selden wrote a book on their contents, 1629. They have ſince been publiſhed by Dr. Prideaux, 1676, at Oxford; and again, at London, 1732, with commentaries, and an index, by Maittaire. The reader will meet with a correct Latin and Engliſh tranſlation of theſe marbles, in *The Chronological Tables of Univerſal Hiſtory*, by the learned Abbé Lenglet Dufrenoy, lately tranſlated into Engliſh.

ARUSINI CAMPI, plains in Lucania, famous for the laſt battle fought between the Romans and Pyrrhus, and the total defeat of the latter (Florus, Frontinus).

ARZINA, a river of Ruſſian Lapland, into a bay of which, in 1553, two Engliſh veſſels, which had penetrated as high as the 72d degree of latitude to the coaſt of Spitzbergen, were forced by ſtreſs of weather; and the crews of both were frozen to death.

ASAD-ABAD, a handſome town of Perſia, 68 miles N. E. of Amadon. Long 48. 25. Lat. 36. 20. N.

ASAPH (St.) gave his name to the epiſcopal ſee of St. Aſaph in Wales. He was deſcended of a good family in North Wales, and became a monk in the convent of Llan-Elvy, over which Kentigern the Scotch biſhop of that place preſided. That prelate, being recalled to his own country, reſigned both his convent and cathedral to Aſaph, who demeaned himſelf with ſuch ſanctity, that after his death Llan-Elvy loſt its name, and took that of the ſaint. St. Aſaph flouriſhed about the year 590, under Carentius king of the Britons. He wrote the Ordinances of his Church, the Life of his maſter Kentigern, and ſome other pieces. The time of his death is not certainly known. Bale tells us, he was the firſt who received unction from the pope.

ASAR-ADDON, or ESAR-HADDON, the ſon of Sennacherib, ſucceeded his father about 712 years before the Chriſtian æra, and united the kingdoms of Nineveh and Babylon. He rendered himſelf maſter of Syria; ſent a colony to Samaria; and his generals took King Maneſſes, and carried him loaded with chains to Babylon. Aſar-Addon died after a reign of 12 years.

ASBAMEA, a fountain of Cappadocia, near Tyana, ſacred to Jupiter, and to an oath. Though this fountain bubbled up, as in a ſtate of boiling, yet its water was cold; and never ran over, but fell back again; (Philoſtratus, Ammian).

ASCALON, an ancient city, and one of the five ſatrapies or principalities of the Philiſtines; ſituated on the Mediterranean, 43 miles to the ſouth-weſt of Jeruſalem (Antonine), between Azotus to the north, and Gaza to the ſouth. The birth place of Herod the Great, thence ſurnamed *Aſcalonita* (Stephanus). Famous for its ſcallions which take name from this town (Strabo, Pliny). Now *Scalona*. E. Long. 34. 30., Lat. 31. 30.

ASCANIUS, the ſon of Æneas and Creuſa, ſucceeded his father in the kingdom of the Latins, and defeated Mezentius king of the Tuſcans, who had refuſed to conclude a peace with him. At length he founded Alba Longa; and died about 1139 years before the Chriſtian æra, after a reign of 38 years.

ASCHAM (Roger), was born at Kirby-Wiſke, near North-Allerton in Yorkſhire, in the year 1516. His father was ſteward to the noble family of Scroop. Our author Roger was educated in the family of Sir Anthony Wingfield, who, about the year 1530, ſent him to St. John's College, Cambridge, where he was ſoon diſtinguiſhed for his application and abilities. He took his degree of bachelor of arts at the age of eighteen, was ſoon after elected fellow of his college, and in 1536 proceeded maſter of arts. In 1544 he was choſen univerſity orator; and in 1548 was ſent for to court, to inſtruct the Lady Elizabeth (afterwards queen) in the learned languages. In the year 1550 he attended Sir Richard Moryſine, as ſecretary, on his embaſſy to the Emperor Charles V. at whoſe court he continued three years, and in the mean time was appointed Latin ſecretary to King Edward VI. But, upon the death of that prince, he loſt his preferment and all his hopes, being profeſſedly of the reformed religion; yet, contrary to his expectations, he was ſoon after, by the intereſt of his friend Lord Paget, made Latin ſecretary to the king and queen. In June 1554 he married Mrs. Margaret How, a lady of a good family, with whom he had a conſiderable fortune. It is very remarkable of Mr. Aſcham, that though he was known to be a Proteſtant, he continued in favour not only with the miniſtry of thoſe times, but with Queen Mary herſelf. Upon the acceſſion of Queen Elizabeth, he was not only confirmed in his poſt of Latin ſecretary, but was conſtantly employed as preceptor to her Majeſty in the Greek and Latin languages. He died in the year 1568, much regretted, eſpecially by the queen, who ſaid ſhe had rather loſt ten thouſand pounds. Camden and ſome other writers tell us, that he had a great propenſity to dice and cock-fighting. He certainly died poor. He wrote,

1. Toxophilus. The ſchole or partitions of ſhooting, contayned in two bookes, written by Roger Aſcham, 1544, and now newly peruſed. Pleaſaunt for all gentlemen and yeomen of England, &c. Lond. 1571. Whilſt at the univerſity he was fond of archery by way of exerciſe and amuſement, for which he was cenſured; and on that account he ſat down to write this book, which was dedicated to Henry VIII. who ſettled a penſion of 10l. per annum on

the author. It is rather whimſical; but is admirably well written, and full of learning. 2. A report and diſcourſe, written by Roger Aſcham, of the affairs and ſtate of Germany and the Emperor Charles, his court, &c. 4to. A valuable curioſity. 3. The Schoolmaſter. Firſt printed in 1573, 4to. Mr. Upton publiſhed an edition with notes in 1711. It has uncommon merit; abounding in great good ſenſe, as well as knowledge of ancient and modern hiſtory: it is alſo expreſſive of the great humanity of the author, who was for making the paths of knowledge as level and pleaſant as poſſible, and for trying every gentle method of enlarging the mind and winning the heart. 4. Latin Epiſtles. Firſt publiſhed by Mr. Grant in 1576; have ſince paſſed many editions: the beſt is that of Oxford in 1703. Much admired on account of the ſtyle, and eſteemed almoſt the only claſſical work of that kind written by an Engliſhman. 5. Apologia contra miſſam: 1577, 8vo.

ASCHERLEBEN, a town of Germany, in the principality of Anhalt, ſeated on the river Eine.

ASCLEPIADES, one of the moſt celebrated phyſicians among the ancients, was a native of Pruſa, in Bithynia; and practiſed phyſic at Rome, under Pompey, ninety-ſix years before the Chriſtian æra. He was the head of a new ſect; and, by making uſe of wine and cold water in the cure of the ſick, acquired a very great reputation. He wrote ſeveral books, which are frequently mentioned by Galen, Celſus, and Pliny; but they are now loſt.

ASCLEPIADES, a famous phyſician under Hadrian, of the ſame city with the former: he wrote ſeveral books concerning the compoſition of medicines, both internal and external.

ASCONIUS (PEDIANUS), an ancient grammarian of Padua; and, if we believe Servius, an acquaintance of Virgil's. Yet Jerome ſays that he flouriſhed under the Veſpaſians, which is rather at too great a diſtance for one and the ſame man; but Jerome's account is rejected by the learned. We have ſome Commentaries of Aſconius upon the Orations, which indeed are but fragments: they have been publiſhed ſeparately, but they are to be found in many editions of Cicero's works.

ASCOT HEATH, a famous race-ground, four miles from Windſor, in the road from the Great Park to Reading. Here the King's ſtag-hounds are kept.

ASCOUGH (WILLIAM), doctor of laws, and biſhop of Saliſbury, in the reign of King Henry VI. was deſcended from a very ancient family, ſeated at Kelſey in Lincolnſhire. He was conſecrated to the afore-mentioned ſee in the chapel of Windſor, July 20, 1438: ſoon after which he was appointed king's confeſſor, this being the firſt inſtance of a biſhop's diſcharging that office. The moſt remarkable particular concerning this prelate was the tragical manner of his death. For after he had ſat near twelve years, the famous rebel Jack Cade and his followers, coming to Edington in Lincolnſhire, where the biſhop then was, and being joined by ſeveral of that prelate's own tenants, fell upon his carriages and plundered them. The next day they aſſaulted the biſhop himſelf, whilſt he was officiating at the altar, and dragged him away to a neighbouring hill, where they barbarouſly murdered him, by daſhing out his brains: then tearing his bloody ſhirt in pieces, to be preſerved in memory of the action; they left his body naked on the place. This maſſacre happened the 29th of June, 1450.

ASEER, or ASEERGUR, a ſtrong fortreſs of the ſoubah of Candeiſh, in the Deccan of Hindooſtan, 20 miles N. E. of Burhampore. Long. 76. 0. E. Lat. 31. 35. N.

ASGILL (John), a very humourous writer, was bred to the law, and practiſed in Ireland with great ſucceſs. He was there elected a member of the houſe of commons; but was expelled for writing a treatiſe on the poſſibility of avoiding death; and being afterwards choſen a member for the borough of Bramber in Suſſex, he was alſo on the ſame account expelled the parliament of England. After this, he continued thirty years a priſoner in the Mint, Fleet, and King's-bench; during which time he publiſhed a multitude of ſmall political pamphlets, ſeveral of which were in defence of the ſucceſſion of the houſe of Hanover, and againſt the Pretender. He died in the rules of the King's-bench, in the year 1738, when he was upwards of fourſcore.

ASHES (*Encycl.*). Some obſervations concerning the aſhes of different kinds of wood, by C. Piſſis, M. D. publiſhed in the Annales de Chimie, are worthy of being annexed to our original article.

"Having burnt a conſiderable quantity of poplar-wood," ſays Mr. Piſſis, "during the winter of the year 8 (of the French Republic), I obſerved that the aſhes when heated again formed ſemi vitreous cruſts, ſuch as that produced from the aſhes of the ſea-weed, excepting that they were very thin and ſmall, having been neither agitated, nor expoſed to any other heat than that of a moderate chamber fire.

"At firſt I ſuppoſed the cauſe to be an extraordinary quantity of potaſh, but as I could not attribute it to the quality of the wood, white woods having always been reckoned to yield a ſmaller quantity of ſalt than the others (for example, the aſpin (*populus tremula*, Linn.), a tree of the ſame genus as our poplar (*populus alba*), yields only gros. 45 grs. of potaſh to the quintal of the wood), I imagined that the circumſtance depended upon a change in the ligneous ſubſtance. We cultivate poplar for the purpoſe of procuring props for our vines; and as it is bad fuel, we do not cut it down till it has ceaſed to produce any more ſhoots. It is not rare to ſee poplars, the bark and branches of which appear ſtill to poſſeſs a great deal of life, whilſt the trunk is reduced to a few handfuls of mould.

"This idea of the augmentation of the potaſh in rotten wood was not ſtrictly juſt; but it ſhall be ſhewn that it has led me to ſome concluſions very different from the ideas generally received. I ſhall revert to all the points of theory, after having related the following facts, which tend to throw a light upon them.

"1. One hundred parts of dry ſound poplar wood yielded four parts of aſhes.

"2. One hundred parts of dry poplar wood, that was rotten, but not reduced to mould, yielded eight parts of aſhes.

"3. One hundred parts of each of theſe kinds of aſhes, lixiviated till the water was drawn off inſipid, and perfectly dried in a red heat, loſt twenty-eight parts of their weight; the firſt waters having been very ſtrongly impregnated.

"4. One hundred parts of the ſame aſhes, heated over again, and treated in the ſame manner as above, loſt twenty-two parts; the leys were more ſtrong and cauſtic than the preceding.

"5. One hundred parts of the aſhes of dry and ſound oak, when heated over again, and treated as above, loſt ſixteen parts.

"6. One hundred parts of the wet mould of rotten oak, of the colour of ochre, when placed upon a red hot plate of iron, were very ſoon dried and incinerated, leaving three parts of aſhes, which, even when heated over again, had the colour of iron filings. This is nearly twice as much as the quintal of dry oak has generally yielded. Theſe aſhes were perfectly inſipid.

"7. One hundred parts of the cruſts, of which I have ſpoken at the beginning of this memoir, when treated in the ſame manner as the aſhes No. 3, loſt thirty-ſeven parts of their weight. This cruſt at firſt ſeems inſipid, the potaſh being as it were in a latent ſtate; but after it has been kept for ſome time, and triturated, water extracts from it a large quantity of this ſalt; it is however probable, that ſome of it ſtill remains in reſiduum. Theſe leys are extremely cauſtic.

"8. Some pieces of this cruſt having been made red-hot, and afterwards extinguiſhed in a ſmall quantity of water, yielded a ley ſufficiently cauſtic to form ſoap with melted wax and tallow, upon which I poured the cold ley.

"9. This ley, when filtrated through plaſter (calcareous ſulphate mixed with lime), burnt into powder, loſt its alkaline taſte, and yielded, by ſpontaneous evaporation, fine cryſtals of ſulphate of potaſh.

"From theſe facts it appears:

"1. From the four firſt compared with the fifth, that the wood of the white poplar abounds more in ſalt than that of the oak; ſo that this is an exception from the maxim generally adopted, that the hard woods contain a greater abundance of potaſh than the ſoft.

"The wood of the poplar is of ſo ſpongy a texture, that rats cannot gnaw it through, as its fibres reſiſt the impreſſion of their teeth in the ſame manner as thoſe of hemp; it is alſo difficult to ſaw; this quality renders it expenſive for articles of furniture, and the more ſo, as this wood, which is very ſubject to rot, ought, in order to be fit for ſawing, to be cut down whilſt in its full vigour, againſt which there is a great objection, as has been already mentioned.

"This wood burns, when it is dry, with a white flame, emits very little heat, is quickly conſumed, and yields no live coal. It is evident that the combuſtible particles abound more in it than in the other kinds of wood; as is alſo the caſe with the willow, which yields twice as much aſhes, but only about the ſame quantity of ſalt as the oak; that is to ſay, 15 grammes for one myriagramme of the wood, whilſt our poplar yields 72. To what then are we to aſcribe this large quantity? this might be determined by analyſing its ſap: poſſibly alſo the acrid and viſcous fluid of its buds, which is uſed in pharmacy, might furniſh ſome data towards ſolving the queſtion.

"According to a calculation made from the returns of the revenue collectors, a myriagramme of aſpen wood yields only ſeven grammes of ſalt. (Ann. de Chimie, t. xix. p. 178.)

"This difference in the quantity of ſalt, which is in the proportion of more than ten to one, in two trees of the ſame genus, will not ſurpriſe thoſe who know that the dock and ſorrel are of the ſame genus, and that the ſour and the bitter cherry are of one and the ſame ſpecies. Nature is not ſubject to our confined ideas of analogy. It has been laid down as a principle, that plants of the ſame family may mutually ſupply the place of each other for medicinal purpoſes; but prudence requires that we ſhould not act upon this principle, till after having accurately analyzed the two plants which we intend to ſubſtitute the one for the other.

"2. From the five firſt experiments it appears, that rotten wood yields a larger quantity of aſhes than ſound, frequently more than twice as much. This circumſtance is eaſily accounted for. The wood, whilſt it rots, becomes ſpongy and light: I have ſeen ſome rotten wood which did not weigh more than half as much as an equal bulk of the ſound wood of the ſame tree. It burns without flame, like tinder, and it cannot be incinerated but with great difficulty. It appears that the hydrogen has been almoſt entirely deſtroyed; and that the carbon, by being ſheathed in the earthy particles, eſcapes the effects of combuſtion.

"This wood has frequently a phoſphoreſcent quality, the cauſe of which ſtill remains to be diſcovered. We ought not to confound rotten wood with wood that has been eaten by worms. In the latter caſe, the wood, without loſing its colour, is reduced to an impalpable powder, and in that portion of the wood which ſtill retains its ſolidity we may find the paſſage which the worm has formed for itſelf, and frequently the worm itſelf. One hundred parts of vine-ſtalks, reduced to an impalpable powder by the worms, and burnt in a red heat, were perfectly incinerated, leaving three parts of aſhes, which is nearly the quantity obtained from a quintal of dry vine twigs burnt under the inſpection of the revenue officers. This wood, to which the term of worm-eaten peculiarly belongs, has nothing in common with the rotten wood, which is alſo termed worm-eaten, excepting its appellation, which is very improperly applied to the latter.

"It has been aſſerted that rotten wood yields little ſalt; and this aſſertion is true as far as applied only to wood waſhed out by the rain, and it is proved by Experiment 8; but Experiment 3 proves that wood which has rotted without being waſhed out in this manner, has not loſt one particle of its potaſh; and that, as an equal weight of rotten wood yields twice as much aſhes of equal quality, it will furniſh double the quantity of ſalt: hence manufactories may derive great advantage, conſidering the ſmall value which this wood generally bears.

"One might employ, both in the preparation of leys for domeſtic purpoſes, and in the manufactories of nitre and ſalt, the aſhes of dead trees, whoſe ſummits and bark being ſtill in good preſervation have prevented the acceſs of the rain-water to the trunk. The mould of theſe trees might alſo be uſed as an excellent manure, ſince it retains the whole of its potaſh. It is further evident, that when this mould is waſhed by the rain it muſt be of advantage to the vegetation. The experiments of Citizen Vauquelin have ſhewn us, that in the ſap of trees the potaſh exiſts in the ſtate of an acetite: it would be intereſting to know alſo in what ſtate it exiſts as well in the wood as in the mould of trees.

"3. Experiment 4 ſhews that by baking the aſhes over again they loſe one-fifth of their ſalt: this is a neceſſary conſequence of their loſing more and more of their carbonic acid; but at the ſame time they gain in quality, as is proved by Experiment 8. However, if we bake over again aſhes of a very rich quality, like thoſe of our poplar, we ſhall obtain a half vitrified cruſt, which will retain a part of the potaſh; it will further be neceſſary to triturate this cruſt, in order to lixiviate it, which will add to the labour of the workmen. This cruſt, from which ſalt may be extracted in the proportion of 30 per cent. and which contains ſtill a good deal more in a concealed ſtate, might perhaps be employed in the manufacture of glaſs equally well with many kinds of ſoda. This ſemi-vitreous ſtate of the ſubſtance, and the ſolidity of the ſoaps obtained in Experiment 8, led me at firſt to ſuſpect that the aſhes of the poplar contained ſoda; but the Doctor was undeceived by Experiment 9. He made uſe of ſome parget, which he had by him for want of ſulphuric acid, which was not immediately at hand. Franklin ſays, it is good to know how to ſaw with a whimble. For the ſame reaſon he made uſe of wax and tallow."

Dr. Piſſis concludes with ſome ideas to which this experiment gave riſe. Melted wax, tallow, and hogs-lard, and heated oils, acquire a temperature higher than that of water, and even of boiling ley: when an alkaline ley is added, the mixture immediately puffs up in an extraordinary manner, the whole of the water is inſtantly evaporated; and when the ingredients are employed in equal proportions, the ſoap remains more ſolid than that made according to the proceſſes uſually employed in the manufactories; beſides which, it is dry as ſoon as formed. "Theſe advantages," ſays Dr. Piſſis, "are

well worth the trouble of making ſome experiments, by which we might examine the following queſtions:

" 1. If the oil were heated before the water, would not the expanſion, which takes place when they are mixed together, occaſion ſome accident?—To me it appears that it would not, provided the boiler were ſufficiently large, and only one-fourth of its capacity filled.

" 2. Might the mixture be ſtirred?—It might, after the whole of the ley has been added, as the mixture then remains in a tranquil ſtate of fuſion.

" 3. Would the ſalts which are of no uſe in forming the ſoap, particularly the alkaline carbonates, be carried off by the tube?—I apprehend they would not; for, in the experiments which I have made on a ſmall ſcale, no liquid was left behind.

" 4. Would not the only ſubſtances, by being too much heated, have their properties ſo altered as to affect the quality of the ſoap?—I fear they would; for the ſoaps which I obtained were of a greyiſh colour."

ASHLEY (Robert), a Wiltſhire gentleman, deſcended from the family of that name reſiding at Naſhhill, in that county, was admitted a gentleman-commoner of Hart Hall in Oxford, in the year 1580, being then fifteen years of age. From the univerſity he removed to the Middle Temple, where he was called to the dignity of barriſter at law. After ſome time, he travelled into Holland, France, &c. converſing with the learned, and frequenting the public libraries. Being returned into England, he lived many years in the Middle Temple, and honoured the commonwealth of learning with ſeveral of his lucubrations. He died, in a good old age, the beginning of October, 1641. His other works were for the moſt part tranſlations.

ASHMOLE (Elias), a great antiquary and herald, founder of the Aſhmolean muſeum at Oxford, was born at Lichfield in Staffordſhire, 1617. In the early part of his life he practiſed in the law; and in the civil war had a captain's commiſſion under the king, and was alſo comptroller of the ordnance. He married the Lady Mainwaring in 1649, and ſettled at London; where his houſe was frequented by all the learned and ingenious men of the time. Mr. Aſhmole was a diligent and curious collector of manuſcripts. In the year 1650 he publiſhed a treatiſe written by Dr. Arthur Dee, relating to the philoſopher's ſtone; together with another tract on the ſame ſubject, by an unknown author. About the ſame time, he was buſied in preparing for the preſs a complete collection of the works of ſuch Engliſh chemiſts as had till then remained in manuſcript. This undertaking coſt him great labour and expence; and at length the work appeared, towards the cloſe of the year 1652. He propoſed at firſt to have carried it on to ſeveral volumes; but he afterwards dropped this deſign, and ſeemed to take a different turn in his ſtudies. He now applied himſelf to the ſtudy of antiquity and records: he was at great pains to trace the Roman road, which in Antoninus's Itinerary is called *Bennevanna*, from Weedon to Lichfield, of which he gave Mr. Dugdale an account in a letter. In 1658 he began to collect materials for his hiſtory of the Order of the Garter, which he lived to finiſh, and thereby did no leſs honour to the order than to himſelf. In September following, he made a journey to Oxford, where he ſet about giving a full and particular deſcription of the coins preſented to the public library by Archbiſhop Laud.

Upon the reſtoration of King Charles II. Mr. Aſhmole was introduced to his Majeſty, who received him very graciouſly; and on the 18th of June, 1660, beſtowed on him the place of Windſor herald. A few days after, he appointed him to give a deſcription of his medals, which were accordingly delivered into his poſſeſſion, and King Henry VIII.'s cloſet was aſſigned for his uſe. On the 15th of February, Mr. Aſhmole was admitted a fellow of the Royal Society; and, on the 9th of February following, the king appointed him ſecretary of Surinam, in the Weſt Indies. On the 19th of July, 1699, the univerſity of Oxford, in conſideration of the many favours they had received from Mr. Aſhmole, created him doctor of phyſic by diploma, which was preſented to him by Dr. Yates, principal of Brazen Noſe College. On the 8th of May, 1672, he preſented his " Inſtitution, Laws, and Ceremonies, of the moſt noble Order of the Garter," to the king; who received it very graciouſly, and, as a mark of his approbation, granted him a privy ſeal for 400l. out of the cuſtom of paper. On the 26th January, 1679, a fire broke out in the Middle Temple, in the next chamber to Mr. Aſhmole's, by which he loſt a noble library, with a collection of 9000 coins, ancient and modern, and a vaſt repoſitory of ſeals, charters, and other antiquities and curioſities; but his manuſcripts and his moſt valuable gold medals were luckily at his houſe at Lambeth. In 1683, the univerſity of Oxford having finiſhed a magnificent repoſitory near the theatre, Mr. Aſhmole ſent thither his curious collection of rarieties; which benefaction was conſiderably augmented by the addition of his manuſcripts and library at his death, which happened at Lambeth, the 18th of May, in the 76th year of his age. He was interred in the church of Great Lambeth in Surrey, on the 26th of May, 1692, and a black marble ſtone laid over his grave, with a Latin inſcription.

Beſides the works which we have mentioned, Mr. Aſhmole left ſeveral which were publiſhed ſince his death, and ſome which remain ſtill in manuſcript.

ASHTED, a village of Surrey, ſituated near Epſom, on one of the moſt delightful ſpots in the county.

ASHTON (Charles), one of the moſt learned critics of his age, elected maſter of Jeſus College, Cambridge, July 5, 1701, was inſtalled in a prebend of Ely on the 14th of the ſame month. His great knowledge in eccleſiaſtical antiquities was excelled by none, and equalled by few; as his MS. remarks upon the fathers, and corrections of the miſtakes of tranſlators, will ſufficiently ſhew. His critical ſkill in the writers of the claſſics is well known. Dr. Taylor always ſpoke with raptures of his correction of the inſcription to Jupiter Urios, which he looked on as the happieſt thing, and the moſt to the credit of the doer, and the art itſelf, that he knew of. He lived to a good old age, but in the latter part of his life ſeldom appeared abroad.

ASHTON (Thomas), educated at Eton, and elected thence to King's College, Cambridge, 1733, was probably the perſon to whom Mr. Horace Walpole addreſſed his Epiſtle from Florence, in 1740, under the title of Thomas Aſhton, eſq. tutor to the Earl of Plymouth. He was preſented to the rectory of Aldingham in Lancaſhire, which he reſigned in March, 1749; and, on the 3d of May following, was preſented by the provoſt and fellows of Eton to the rectory of Sturminſter Marſhall in Dorſetſhire. He was then M. A. and had been choſen a fellow of Eton in December, 1745. In 1752 he was collated to the rectory of St. Botolph, Biſhopſgate: in 1759, took the degree of D. D.; December 10, 1760, he married Miſs Amyand; and in May, 1762, was elected preacher at Lincoln's Inn, which he reſigned in 1764. In 1770 he publiſhed, in 8vo. a volume of Sermons on ſeveral Occaſions. Dr. Aſhton died March 1, 1775, at the age of fifty-nine, after having for ſome years ſurvived a ſevere attack of the palſy. His diſcourſes, admirable as they are in themſelves, were rendered ſtill more ſo by the excellence of his delivery. His other publications were: 1. A Diſſertation on 2 Peter i. 19. 1750. 2. A Letter to the Rev. Mr. Thomas Jones. 3. An Extract from the Caſe of the Obligation of the

Electors of Eton College, to supply all Vacancies in that Society with those who are, or have been, Fellows of King's College, Cambridge, so long as Persons properly qualified are to be had within that Description. London, 1771. 4. A Letter to the Rev. Dr. Morell, on the Question of electing Aliens into the vacant Places in Eton College. 5. A Second Letter to Dr. Morell.

ASHTON-UNDER-LINE, a village of Lancashire, seven miles east of Manchester. It has a manufactory of cotton, and an iron foundry, both very considerable.

ASHWELL (George), rector of Hanwell, near Banbury, in Oxfordshire, son of Robert Ashwell, of Harrow on the Hill, Middlesex, was born in London, November 18, 1612. He was admitted a scholar of Wadham College, in Oxford, in 1627, took the degrees in arts, was elected fellow, and became a celebrated tutor in that house. In the time of the grand rebellion he continued in Oxford, and preached several times before the king, court, and parliament. A little before the surrender of the garrison of Oxford, he had the degree of bachelor in divinity conferred on him. About the latter end of the year 1658, he was presented to the living of Hanwell, vacant by the death of Dr. Robert Harris, having been before (as Mr. Wood thinks) chaplain in the family of Sir Anthony Cope, lord of the manor of Hanwell. He had the character of a very peaceable and religious man, and was well versed in logic, the schoolmen, and the fathers. He wrote the following books: 1. A Discourse asserting the received Authors and Authority of the Apostles Creed. Oxon. 1653. 2. A double Appendix, the first touching the Athanasian, the second touching the Nicene Creed. 3. Concerning the Gesture to be used at the receiving of the Sacrament. Oxon. 1668. 4. A Treatise concerning Socinus, and the Socinian Heresy. 5. A Dissertation concerning the Church of Rome. Oxon. 1688. 6. An Answer to Plato Redivivus. 7. He also translated out of Latin into English, Philosophus Autodidactus. Our author died at Hanwell, the 8th of February, 1693.

Ashwell, a village of Hertfordshire, in Doomsday Book called a borough, having 14 burgesses and a mayor. Near the church are the remains of a Roman camp, which consists of 12 acres of land, inclosed by a deep ditch, and formerly a rampart. It is situated near Caldicot, on the borders of Cambridgeshire.

ASINIUS (Pollio), consul and Roman orator, distinguished himself under Augustus by his exploits and his literary works. He is frequently mentioned with praises by Horace and Virgil, and is said to have collected the first library at Rome. He died at Frescati, at 80 years of age.

ASKEATON, a town of Ireland, in the county of Limerick, on the river Shannon. It sends two members to parliament.

ASMONEUS, or Assamoneus, the father of Simon, and chief of the Asmoneans, a family that reigned over the Jews during 126 years.

ASNA (*Encycl.*). This town in Upper Egypt is believed by some authors to be the ancient *Syena*, though others say the ruins of it are still to be seen near Assuan. It is so near the cataracts of the Nile, that they may be heard from thence. It contains several monuments of antiquity; and among the rest an ancient Egyptian temple, pretty entire, all painted throughout, except in some places that are effaced by time. The columns are full of hieroglyphic figures. This superb structure is now made use of for a stable, wherein they put oxen, camels, and goats. A little way from thence are the ruins of an ancient nunnery, said to be built by St. Helena, surrounded with tombs. Asna is the principal town in these parts, and the inhabitants are rich in corn and cattle. They drive a considerable trade into Lower Egypt and Nubia, by means of the Nile, and also by the caravans that pass over the Desert. The inhabitants are all Arabs, except about 200 Copts, the ancient inhabitants, and a sort of Christians. They are under the government of the Turks, who have a cadi, and the Arabs have two sheriffs of their own nation.

ASOPUS, a river of Phrygia Major, which, together with the Lycus, washes Laodicea (Pliny).—Another of Bœotia, which running from mount Cithæron, and watering the territory of Thebes, separates it from the territory of Platæa, and falls with an east course into the Euripus, at Tanagra. On this river Adrastus, king of Sicyon, built a temple to Nemesis, thence called Adrasteia. From this river Thebæ came to be surnamed Asopides (Strabo). It is now called Asopo. A third Asopus, a river of Peloponnesus, which runs by Sicyon (Strabo); and with a north-west course falls into the Sinus Corinthiacus, to the west of Corinth. A fourth, a small river of the Locri Epicnemidii, on the borders of Thessaly (Pliny); rising in Mount Oeta, and falling into the Sinus Maliacus.

Asopus, a town of Laconica (Pausanius); on the Sinus Laconicus, with a port in a peninsula, between Boæ to the east, and the mouth of the Eurotas to the west. The citadel only remains standing, now called by the sailors Castel Rampano.

ASPA, a town of Parthia (Ptolemy); now Ispahan (Holstenius). In Ptolemy the latitude seems to agree, being 33°; but whether the longitude does, is a question. E. Long. 51. Lat. 32. 30.

ASPICUETA (Martin de), commonly called the *Doctor of Navarre*, or *Doctor Navarrus*; was descended of a noble family, and born the 13th of December 1491, at Varasayn, a small city of Navarre, not far from Pampeluna. He entered very young into the monastery of Regular canons at Roncevaux, where he took the habit, which he continued to wear after he left the convent. He studied classical learning, natural and moral philosophy, and divinity, at Alcala, in New Castile, adopting chiefly the system of Petrus Lombardus, commonly called the *Master of the Sentences*. He applied to the study of the law at Ferrara, and taught it with applause at Toulouse and Cahors. After being first professor of canon law at Salamanca for fourteen years, he quitted that place to be professor of law at Coimbra, with a larger salary. The duties of this office he discharged for the space of twenty years, and then resigned it to retire into his own country, where he took care of his nieces, the daughters of his deceased brothers. Having made a journey to Rome, to plead the cause of Bartholomeo de Caranza archbishop of Toledo, who had been accused of heresy before the tribunal of the inquisition in Spain, and whose cause was, by the pope's order, to be tried in that city, Aspicueta's writings, which were well known, procured him a most honourable reception. Pope Pius V. made him assistant to Cardinal Francis Aciat, his vice-penitentiary; and Gregory XIII. never passed by his door without calling for him, and stopped sometimes a whole hour to talk with him in the street. His name became so famous, that even in his life-time the highest encomium on a learned man was to call him *a Navarrus*. He was consulted as an oracle. By temperance he prolonged his life to a great length. His œconomy enabled him to give substantial proofs of his charity. Being very old, he used to ride on a mule through the city, and relieved all the poor he met; to which his mule was so well accustomed, that it stopped of its own accord at the sight of every poor man, till its master had relieved him. He refused several honourable posts in church and state, that he might have leisure to correct and improve the works he had already written, and compose others. He

died at the age of ninety-four, on the 21ſt of June, 1586. He wrote a vaſt number of treatiſes, all which are either on morality or canon law.

ASSAM, a country of Aſia, bounded on the W. by Bengal and Bootan, on the N. by the mountains of Thibet, and on the S.E. and S. by Meckley. The river Burrampooter flows through the whole length of it. Its capital is Ghergon. The natives prefer the fleſh of dogs to any other kind of animal food. They pay no taxes, the king being the ſole proprietor of all the gold, ſilver, and other metals, found in his kingdom. They live comfortably; almoſt each houſekeeper having an elephant, for the conveniency of his wives. The invention of gunpowder is aſcribed to the Aſſameſe. It is certain that gunpowder was known in China and Hindooſtan, far beyond all periods of inveſtigation; and, in the code of Gentoo laws, is a prohibition of the uſe of fire-arms. Aſſam lies between 91° and 96° E. long. and 25° and 28° N. lat.

ASSELYN (John), a famous Dutch painter, was born in Holland, and became the diſciple of Iſaiah Vandevelde, the battle-painter. He diſtinguiſhed himſelf in hiſtory-paintings, battles, landſcapes, animals, and particularly horſes. He travelled into France and Italy; and was ſo pleaſed with the manner of Bambochio, that he always followed it. He painted many pictures at Lyons, where he married the daughter of a merchant of Antwerp, and returned with her to Holland. Here he firſt diſcovered to his countrymen a freſh and clear manner of painting landſcapes, like Claude Lorraine; upon which, all the painters imitated his ſtyle, and reformed the dark brown they had hitherto followed. Aſſelyn's pictures were ſo much admired at Amſterdam, that they ſold there at a high price. He died in that city, in 1660. Twenty-four pieces of landſcapes and ruins, which he painted in Italy, have been engraved by Perelle.

ASSER, John (or Asserius Menevensis, that is, *Aſſer of St. David's*), biſhop of Shirburn in the reign of Alfred the Great. He was born in Pembrokeſhire, in South Wales; and educated in the monaſtery of St. David's by the Archbiſhop Aſſerius, who, according to Leland, was his kinſman. In this monaſtery he became a monk, and by his aſſiduous application ſoon acquired univerſal fame as a perſon of profound learning and great abilities. Alfred, the munificent patron of genius, about the year 880, ſent for him to court. The king was then at Dean in Wiltſhire. He was ſo charmed with Aſſer, that he made him his preceptor and companion. As a reward for his ſervices, he appointed him abbot of two or three different monaſteries; and at laſt promoted him to the epiſcopal ſee of Shirburn, where he died, and was buried, in the year 910. He was, ſays Pits, a man of a happy genius, wonderful modeſty, extenſive learning, and great integrity of life. He is ſaid to have been principally inſtrumental in perſuading the king to reſtore the univerſity of Oxford to its pritine dignity and luſtre.—He wrote, *De vita et r[illegible]geſtis Alfredi*, &c. Lond. 1574, publiſhed by Archbiſhop [illegible] in the old Saxon character, at the end of *Walſingham hiſt.*—Francf. 1602, fol. Oxf. 1722, 8vo. Many other works are aſcribed to this author by Gale, Bale, and Pits; but all doubtful.

ASSHETON (William), doctor of divinity, and rector of Beckenham in Kent, was born in the year 1641, and was educated at Brazen-noſe College, Oxford. After entering into orders, he became chaplain to the Duke of Ormond, and was admitted doctor of divinity in 1673. Soon after, he was nominated to a prebend in the church of York, preſented to the living of St. Antholin, London, and to the rectory of Beckenham in Kent. He was the firſt projector of the ſcheme for providing for clergymen's widows, and others, by a jointure payable out of the mercers' company. He wrote ſeveral pieces againſt the Papiſts and Diſſenters, and ſome devotional tracts. He died at Beckenham, in September 1711, in the 70th year of his age.

ASSOS, a ſeaport town of Natolia, ſeated on a bay of the Archipelago, twelve miles S.E. of Troas, ſubject to the Turks. Long. 26. 36. E. Lat. 39. 32. N.

ASSUS, *i*, feminine (Strabo); *Aſſum*, or *Aſſon*, *i*, neuter (Ptolemy); a town of Troas (though by others ſuppoſed to be of Myſia), and the ſame with Apollonia (Pliny); but different from the Apollonia on the river Rhyndacus. Ptolemy places it on the ſea-coaſt, but Strabo more inland; if he does not mean the head of an inland bay, as appears from Diodorus Siculus. It was a town of the Leleges, the country of Cleanthes the ſtoic philoſopher, who ſucceeded Zeno; and is ſtill called *Aſſos*. E. long. 27. 30 N. lat 38. 30.

ASSYNT, a diſtrict in the weſtern part of Sutherlandſhire, in Scotland. It exhibits an aſſemblage of ſhattered mountains, heaped, as it were, upon each other; and ſeemingly torn and convulſed in a truly tremendous manner. Toward the rugged peninſula of Aſſynt Point, are ſeveral vaſt conic hills, the higheſt of which is diſtinguiſhed by the name of the Sugar Loaf.

ASTA, an inland town of Liguria, a colony (Ptolemy); on the river Tanarus: now *Aſti*. E. Long. 8. 15. Lat. 44. 40.

Asta *Regia*, a town of Bætica (Pliny); ſituated at that mouth of the Bætis, which was choaked up with mud, to the north of Cadiz; ſixteen miles diſtant from the port of Cadiz (Antonine). Its ruins ſhew its former greatneſs. Its name is Phœnician, denoting a *frith*, or arm of the ſea, on which it ſtood. It is ſaid to be the ſame with Xera; which ſee.

ASTAROTH, the royal reſidence of Og king of Baſhan; whether the ſame with Aſtaroth Carnaim, is matter of doubt: if one and the ſame, it follows from Euſebius's account, that it lay in Baſhan, and to the eaſt of Jordan, becauſe in the confines of Arabia.

ASTARTE, a city on the other ſide Jordan; one of the names of Rabbath Ammon, in Arabia Patræa (Stephanus).

ASTELL (Mary), the great ornament of her ſex, and country, was the daughter of —— Aſtell, an opulent merchant at Newcaſtle-upon-Tyne, where ſhe was born about the year 1668. She was educated in a manner ſuitable to her ſtation; and, amongſt other accompliſhments, was miſtreſs of the French, and had ſome knowledge of the Latin tongue. Her uncle, a clergyman, obſerving in her ſome marks of a promiſing genius, took her under his tuition, and taught her mathematics, logic, and philoſophy. She left the place of her nativity when ſhe was about twenty years of age, and ſpent the remaining part of her life at London, and at Chelſea. Here ſhe purſued her ſtudies with great aſſiduity, made great proficiency in the above-mentioned ſciences, and acquired a more complete knowledge of many claſſic authors. Among theſe Seneca, Epictetus, Hierocles, Antoninus, Tully, Plato, and Xenophon, were her principal favourites.

Her life was ſpent in writing for the advancement of learning, religion, and virtue; and in the practice of thoſe religious duties which ſhe ſo zealouſly and pathetically recommended to others, and in which perhaps no one was ever more ſincere and devout. Her ſentiments of piety, charity, humility, friendſhip, and other Chriſtian graces, were uncommonly refined and ſublime; and religion ſat gracefully upon her, unattended with any forbidding airs of ſourneſs or of gloom. Her mind was generally calm and ſerene; and her converſation was innocently facetious, and highly entertaining. She would ſay, "The good Chriſtian only hath reaſon, and he always ought to be chearful;" and, "That dejected looks and melancholy airs were very unſeemly in a Chriſtian." But theſe ſubjects ſhe hath treated at large in ſome of her excellent writings.

She was remarkably abſtemious; and ſeemed to enjoy an uninterrupted ſtate of health, till a few years before her death; when, having one of her breaſts cut off, it ſo much impaired her conſtitution, that ſhe did not long ſurvive it. This painful operation ſhe underwent without diſcovering the leaſt timidity, or ſo much as uttering a groan; and ſhewed the ſame reſolution and reſignation during her whole illneſs. When ſhe was confined to her bed by a gradual decay, and the time of her diſſolution drew near, ſhe ordered her ſhroud and coffin to be made, and brought to her bed-ſide; and there to remain in her view, as a conſtant memento of her approaching fate, and to keep her mind fixed on proper contemplation. She died in the year 1731, in the 63d year of her age, and was buried at Chelſea. She wrote, 1. A ſerious Propoſal to the Ladies. 2. An Eſſay in Defence of the Female Sex. 3. Letters concerning the Love of God. 4. Reflections upon Marriage. 5. Moderation truly ſtated. 6. The Chriſtian Religion, as profeſſed by a Daughter of the Church of England: and ſome other works.

ASTIGI, indeclinable; a colony, and conventus juridicus, of Bætica, ſurnamed *Auguſta Firma*, ſituated on the Singulus, which falls into the Bætis; ealled alſo *Collonia Aſtigitana* (Pliny): now *Ecya*, midway between Seville and Corduba. W. Long. 5. Lat. 37. 20.

ASTLEY (John), was born at Wem in Shropſhire, of parents much leſs ſhowy in their circumſtances, but, morally, much more enviable. His father practiſed medicine. After a little time ſpent at a country ſchool, which uſually does little more than turn ignorance into preſumption, John Aſtley came to London, and was apprenticed to Hudſon the portrait painter, who, bad as he was, was the beſt of his time; and, though otherwiſe not worth the remembering, will never be forgotten, as the maſter of Sir Joſhua Reynolds. Aſtley, too, though not ſo elegantly minded as Reynolds, might have been conſpicuous in his art. When he left Hudſon, and went to Rome, he ſhewed ſuch parts as got, and kept, the patronage of Lord Cheſterfield. The beſt pictures he ever painted, were copies of the Bentivoglios, and Titian's Venus, and a head much in the manner of Shakſpeare. When he returned from Rome, he was received for ſeveral months into the houſe of a friend, whoſe abundant kindneſs he never returned: he then went an adventurer to Ireland; there his fortune was ſo good, and his uſe of it ſo diligent, that in three years he left the country with three thouſand pounds more than he brought into it.

As he was painting his way back to London, in his own poſt-chaiſe, and with an out-rider, he loitered with a little pardonable vanity, in his native neighbourhood; and entering Knutsford aſſembly with Major Eſte, of the 68th, Lady Daniel was at once won by his appearance. She contrived the next day to ſit for her portrait, and the next week ſhe gave him the original: ſuperſeding the claims of Mr. Smith Barry, Lady Daniel married Mr. Aſtley. The marriage articles reſerved her fortune to herſelf; but ſo ſatisfactory was his behaviour, that ſhe ſoon gave him the Tably eſtate; and dying ſoon after, ſettled on him, after the death of her ideot daughter, by Sir W. Daniel, the whole Duckenfield eſtate in fee, amounting together to five thouſand pounds a-year.

In the ſtructure and decoration of ſmall buildings, rich as the time is in architecture, Aſtley's architecture was pre-eminent. Pall-Mall is one inſtance; Lady Archer's ſaloon and converſatory at Barnes is another; Duckenfield is yet finer than either. The ſaloon, the loggio in front, the chamber on each ſide, and the great octagon, are all as exquiſite as original, from their firſt idea to the laſt.

Aſtley's ingenuity led him alſo to commercial arts; but in this adventure the balance was againſt him. In the different ſinkings on his colliery, he ſunk more money than he raiſed; in the furnaces for his iron-ſtone, he conſumed more metal from his pocket than the mine.

But in the article of money, his deſtiny was inexhauſtible. The waſtes of folly were more than equalled by the wantonneſs of fortune. His brother, the Putney ſurgeon, was run over by a waggon at Wimbledon, and breathed his laſt on the road: this at once, more than replaced the ten thouſand pounds he had run down in the furnace. Eſtimating what he got by painting, by legacies, and by his marriage, he was worth above 100,000l. Of this, about 25,000l. were ſpent in arts, and elegant accommodations, blameleſs at leaſt, if not praiſe-worthy. Thirty thouſand pounds, he told Dr. Warren, he had ſpent on ſeven years' exceſſes, when he was languiſhing under their conſequences; and, in the ſelf-diſapprobation of a retroſpective hour, he declared he would give the remaining 100,000l. to redeem the time he had loſt. He died at Duckenfield, November 14, 1787.

ASTON (Sir Arthur), an officer of note in King Charles the Firſt's army, was ſon of Sir Arthur Aſton, of Fulham in Middleſex. He was a great traveller, and made ſeveral campaigns in foreign countries. Being returned to England about the beginning of the grand rebellion, with as many ſoldiers of note as he could bring with him, he took part with the king againſt the parliament. He commanded the dragoons in the battle of Edge-hill, and with them did his majeſty conſiderable ſervice. The king having a great opinion of his valour and conduct, made him governor of the garriſon of Reading in Berkſhire, and commiſſary-general of the horſe; in which poſt he three times repulſed the earl of Eſſex, who, at the head of the parliament army, laid ſiege to that place; but Sir Arthur being dangerouſly wounded, the command devolved on Colonel Richard Fielding, the eldeſt colonel in the garriſon. Sir Arthur was ſuſpected of taking this opportunity to get rid of a dangerous command. Some time after he was appointed governor of the garriſon of Oxford, in the room of Sir William Pennyman, deceaſed. In September following, he had the misfortune to break his leg by a fall from his horſe, and was obliged to have it cut off; whereupon, on the 25th of December, he was diſcharged from his command, which was conferred on Colonel Gage. After the king's death, Sir Arthur was employed in the ſervice of King Charles II. and went with the flower of the Engliſh veterans into Ireland, where he was appointed governor of Drogheda. At length Cromwell having taken the town, about the 10th of Auguſt, 1649, and put the inhabitants to the ſword, Sir Arthur, the governor, was cut to pieces, and his brains beaten out with his wooden leg.

ASTRABAD, a town of Perſia, capital of a province of the ſame name, on the Caſpian Sea, 200 miles N. of Iſpahan. Long. 55. 35. E. Lat. 36. 50. N.

ASTROP-WELLS, near Banbury in Oxfordſhire, much reſorted to on account of the virtues of their waters.

ASTYAGES, ſon of Cyaxares, the laſt king of the Medes. He dreamed that from the womb of his daughter Mandane, married to Cambyſes king of Perſia, there ſprang a vine that ſpread itſelf over all Aſia. She being with child, he reſolved to kill the infant as ſoon as born. Its name was Cyrus; and Harpagus, being ſent to deſtroy it, preſerved it: which Aſtyages after a long time hearing of, he cauſed Harpagus to eat his own ſon. Harpagus called in Cyrus, who dethroned his grandfather, and thereby ended the monarchy of the Medes. See MEDIA and PERSIA.

ASTYANAX, the only ſon of Hector and Andromache; after the taking of Troy, he was thrown from the top of a tower by Ulyſſes's orders.

ATABYRIS, a very high mountain in the iſland of Rhodes,

on which, according to Strabo and Diodorus Siculus, there ſtood a temple of Jupiter Atrabyrius, whoſe worſhip a colony of Rhodians carried into Sicily, where a temple was built to the ſame deity at Agrigentum.

ATACAMA, a harbour of South America, in Peru. There is a great deſert of the ſame name, and a chain of mountains which ſeparate Peru from Quito. On the mountains the cold is ſo violent, that paſſengers are ſometimes frozen to death. Long. 80. 20. W. Lat. 0. 22. S.

ATALAUA, a town of Portugal, in Eſtramadura, on an eminence, with a fort, five miles S. of Tomer, and as near the Trajo. Long. 7. 56. W. Lat. 39. 25. N.

ATE (*Encycl.*), the goddeſs of miſchief, was daughter of Jupiter, and caſt down from heaven at the birth of Hercules. For Juno having deceived Jupiter, in cauſing Euriſtheus to be born before Hercules, Jupiter expreſſed his reſentment on Ate, as the author of that miſchief; and threw her headlong from heaven to earth, ſwearing ſhe ſhould never return thither again (*Homeri Il.* xix. 125). The name of this goddeſs comes from *ατaω*, *noceo*, to *hurt*. Her being the daughter of Jupiter means, according to mythologiſts, that no evil happens to us but by the permiſſion of Providence; and her baniſhment to earth denotes the terrible effects of divine juſtice among men.

ATENA, a town of Italy, in Naples, near the river Negro twenty-two miles N. of Policaſtro. Long. 15. 58. E. Lat. 40. 36. N.

ATERNUM, a town of Lucania in Italy; now *Aterni* (Cluvenus): alſo a town in the territory of the Piceni; now *Peſcara;* a port-town of Naples, ſituated on the Adriatic. E. long. 15. 25. N. lat. 42. 30.

ATESTE, a town in the territory of Venice in Italy, now called *Eſte*. E. long. 12. 6. N. lat. 45. 25.

ATH, a ſmall, handſome, and ſtrong town in Hainault. It was taken by the French in 1745, but reſtored to the Auſtrians. It is ſeated on the Dender, twelve miles N. W. of Mons. Long. 3. 44. E. Lat. 50. 35. N.

ATHANASIA (*Encycl.*), GOLDILOCKS. Of this genus of plants Linnæus mentions eleven *ſpecies;* of which the following ſix are, by Mr. Miller, reckoned worthy of a place in thoſe gardens where there are conveniences for preſerving tender plants, as none of theſe ſpecies will outlive the winters of this country. 1. The *dentata* grows naturally at the Cape of Good Hope. It riſes three or four feet high, ſending out many ſide-branches, garniſhed with pretty long narrow leaves, having ſome reſemblance to thoſe of buckthorn plantain. The branches are generally terminated by yellow flowers formed into a kind of umbel. Theſe flowers appear early in ſummer, and the ſeeds ripen in autumn. 2. The *trifurcata,* is alſo a native of Africa, as are the three following ſorts. It is a ſhrubby plant, about the height of the former, ſending out ſeveral weak ſhoots, garniſhed with awl-ſhaped trifid leaves ſet cloſe to them, of a pale ſilvery colour. The flowers are yellow, and terminate the branches in a corymbus. They appear in Auguſt, and the ſeeds ripen in October. 3. The *crithmifolia* riſes with a ſtrong ſhrubby ſtalk to the height of ſix or eight feet, ſending out many ligneous branches garniſhed with long narrow leaves terminating in four or five parts like thoſe of ſamphire. The flowers are like thoſe of the former, and appear in July and Auguſt, being ſucceeded by ſeeds which ripen in October. 4. The *pubeſcens* hath ſtrong woody ſtalks four or five feet high, covered with a woolly bark, as are alſo the branches, which are cloſely garniſhed with entire, ſpear-ſhaped, woolly leaves, and are terminated by yellow flowers having a long foot-ſtalk, and are ſometimes ſucceeded by ſeeds that ripen in the autumn. 5. The *annua* is a low annual plant, ſeldom riſing above a foot high, and ſending forth two or three ſlender branches garniſhed with wing-pointed leaves: the ſtalks are terminated by bright yellow flowers growing in umbels, which appear in Auguſt and September; but unleſs the ſeaſon is very favourable, the ſeeds do not ripen in this country. 6. The *maritima,* or ſea cudweed, grows naturally on the coaſts of the Mediterranean, as alſo in Wales, and ſome other parts of Britain; notwithſtanding which, Mr. Miller ſays it muſt be put under a glaſs-frame in winter, and rarely perfects good ſeeds in Britain. It riſes two or three feet high, ſending out a few weak branches, garniſhed with white ſpear-ſhaped leaves terminated by a ſingle flower upon each foot-ſtalk. The firſt four of theſe ſorts may be propagated either by ſeeds or cuttings; and their culture is not materially different from that of the common hot-bed plants.

ATHANASIUS (St.), biſhop of Alexandria, and one of the greateſt defenders of the faith againſt the Arians, was born in Egypt. He followed St. Alexander to the council of Nice, in 325, where he diſputed againſt Arius, and the following year was made biſhop of Alexandria; but, in 335, was depoſed by the council of Tyre: when, having recourſe to the Emperor Conſtantine, the Arian deputies accuſed him of having hindered the exportation of corn from Alexandria to Conſtantinople; on which the emperor, without ſuffering him to make his defence, baniſhed him to Treves. The emperor, two years after, gave orders that he ſhould be reſtored to his biſhopric: but, on his return to Alexandria, his enemies brought freſh accuſations againſt him, and choſe Gregory of Cappadocia to his ſee; which obliged Athanaſius to go to Rome to reclaim it of Pope Julius. He was there declared innocent, in a council held in 342, and in that of Sardica in 347, and two years after was reſtored to his ſee by order of the Emperor Conſtans: but after the death of that prince, he was again baniſhed by the Emperor Conſtantius, which obliged him to retire into the deſerts. The Arians then elected one George in his room; who being killed in a popular ſedition under Julian, in 360, St. Athanaſius returned to Alexandria, but was again baniſhed under Julian, and reſtored to his ſee under Jovian. He addreſſed to that emperor a letter, in which he propoſed that the Nicene creed ſhould be the ſtandard of the orthodox faith, and condemned thoſe who denied the divinity of the Holy Ghoſt. He was alſo baniſhed by Valen in 367, and afterwards recalled. St. Athanaſius died on the 2d of May, 373.

His works principally contain a defence of the myſtery of the Trinity, and of the incarnation and divinity of the Word and Holy Spirit. There are three editions of his works which are eſteemed; that of Commelin, printed in 1600; that of Peter Nannius, in 1627; and that of Father Montfaucon. As to the creed which bears his name, ſee the church Liturgy.

ATHELNEY, a river-iſland of Somerſetſhire, at the confluence of the Thone and Parret, memorable for having afforded ſhelter, amid its inacceſſible moraſſes, to the illuſtrious King Alfred. Here he collected ſome of his retainers; on which account, he called it Æthelingay, or the Iſle of Nobles; and hence he made frequent and unexpected ſallies upon the Danes.

ATHENÆUS, a phyſician, born in Cilicia, contemporary with Pliny, and founder of the pneumatic ſect. He taught that the fire, air, water, and earth, are not the true elements, but that their qualities are, *viz.* heat, cold, moiſture, and dryneſs; and to theſe he added a fifth element, which he called *ſpirit,* whence his ſect had its name.

ATHENÆUS, a Greek grammarian, born at Naucratis in Egypt, in the 3d century, one of the moſt learned men of his time. Of all his works we have none extant but his Deipnoſophis, i. e. the Sophiſts at Table; there is an infinity of facts

and quotations in this work which render it very agreeable to admirers of antiquity.

There was alſo a mathematician of this name, who wrote a treatiſe onmechanics, which is inſerting in the works of the ancient mathematicians, printed at Paris in 1693, in folio, in Greek and Latin.

ATHENAGORAS, an Athenian philoſopher, flouriſhed about the middle of the 2d century; and was remarkable for his zeal for Chriſtianity, and his great learning, as appears from the apology which he addreſſed to the emperors Marcus Aurelius Antoninus and Lucius Commodus.

ATHENODORUS, a famous ſtoic philoſopher, born at Tarſus, went to the court of Auguſtus, and was made by him tutor to Tiberius. Auguſtus had a great eſteem for him, and found him by experience a man of virtue and probity. He uſed to ſpeak very freely to the emperor. He, before he left the court to return home, warned the emperor not to give himſelf up to anger, but, whenever he ſhould be in a paſſion, to rehearſe the 24 letters of the alphabet before he reſolved to ſay or do any thing. He did not live to ſee his bad ſucceſs in the education of Tiberius.

ATHENOPOLIS, a town of the Maſſilienſes, an ancient nation of Gaul. It is conjectured by Harduin to be the ſame with *Telo Martius*, now *Toulon*; by others to be the ſame with *Antipolis* or *Antibes*.

ATIGNY, an ancient town of Champagne in France, where ſeveral of the kings of France had their reſidence. It is ſeated on the river Arſne, in E. long. 4. 47. N. lat. 49. 30.

ATKINS (Sir Robert), lord chief-baron of the Exchequer, was born in 1621, and educated at the univerſity of Oxford, from whence he removed to the inns of court, and became eminent in the law. He was made knight of the Bath, with many other perſons of the firſt diſtinction, at the coronation of King Charles II. In 1672 he was appointed one of the judges of Common Pleas; in which honourable ſtation he continued till 1679, when forſeeing the troubles that ſoon after enſued, he thought fit to reſign, and retire into the country. In 1689 he was made by King William, lord chief-baron of the Exchequer; and about the ſame time executed the office of ſpeaker to the Houſe of Lords, which had been previouſly refuſed by the Marquis of Halifax. He diſtinguiſhed himſelf by an unſhaken zeal for the laws and liberties of his country. He wrote ſeveral pieces, which have been collected into one volume 8vo, under the title of *Parliamentary and Political Tracts*. The authors of the Biographia Britannica remark, that whoever inclines to be thoroughly informed of the true conſtitution of his country, of the grounds and reaſons of the revolution, and of the danger of ſuffering prerogative to joſtle law, cannot read a better or plainer book than thoſe tracts of Sir Robert Atkins. He died in 1709, aged 88.

ATKINS (Sir Robert), ſon of the preceding, was born in 1646, and was eminent for all the virtues that could adorn an Engliſh gentleman. He wrote the ancient and preſent ſtate of Glouceſter, in one large volume in folio; and died October 29, 1711.

ATKYNS (Richard), was deſcended from a good family, and was born at Tuſſleigh in Glouceſterſhire, in the year 1615. He was educated at Oxford, from whence he removed to Lincoln's Inn, and afterwards diſtinguiſhed himſelf by his loyalty to King Charles I. for whom he raiſed a troop of horſe at his own expence. At the reſtoration he was made one of the deputy lieutenants of Glouceſterſhire, and diſtinguiſhed himſelf by his attachment to the government. But at length being committed priſoner to the Marſhalſea in Southwark for debt, he died there on the 14th of September, 1677. He wrote ſeveral pieces, particularly a treatiſe on the origin of Printing.

ATLAS, king of Mauritania, a great aſtronomer, contemporary with Moſes. From his taking obſervations of the ſtars from a mountain, the poets feigned him to have been turned into a mountain, and to ſuſtain the heavens on his ſhoulders. Being an excellent aſtronomer, and the firſt who taught the doctrine of the ſphere, they tell us that his daughters were turned into ſtars: ſeven of them forming the Pleiades, and other ſeven the Hyades.

ATREUS, in fabulous hiſtory, the ſon of Pelops and Hippodamia, and the father of Agamemnon and Menelaus, is ſuppoſed to have been king of Mycenæ and Argos about 1228 years before the Chriſtian æra. He drove his brother Thyeſtes from court, for having a criminal commerce with Ærope his wife: but underſtanding that he had had two children by her, he ſent for him again, and made him eat them; at which horrid action, the ſun, it is ſaid, withdrew his light.

ATTENTION, is that ſtate of mind which prepares one to receive impreſſions. According to the degree of attention, objects make a ſtronger or weaker impreſſion. Attention is requiſite even to the ſimple act of ſeeing: the eye can take in a conſiderable field at one look; but no object in the field is ſeen diſtinctly, but that ſingly which fixes the attention: in a profound reverie that totally occupies the attention, we ſcarce ſee what is directly before us. In a train of perceptions, no particular object makes ſuch a figure as it would do ſingly and a part; for when the attention is divided among many objects, no particular object is entitled to a large ſhare. Hence, the ſtillneſs of night contributes to terror, there being nothing to divert the attention:

Horror ubique animos, ſimul ipſa ſilentia terrent. *Æneid.* ii.

Zara. Silence and ſolitude are ev'ry-where!
Through all the gloomy ways and iron doors
That hither lead, nor human face nor voice
Is ſeen or heard. A dreadful din was wont
To grate the ſenſe, when enter'd here, from groans
And howls of ſlaves condemn'd, from clink of chains,
And craſh of ruſty bars and creaking hinges;
And ever and anon the ſight was daſh'd
With frightful faces, and the meagre looks
Of grim and ghaſtly executioners.
Yet more this ſtillneſs terrifies my ſoul
Than did that ſcene of complicated horrors.
Mourning Bride, act 5. ſc. 8.

In matters of ſlight importance, attention is moſtly directed by will; and for that reaſon, it is our own fault if trifling objects make any deep impreſſion. Had we power equally to withhold our attention from matters of importance, we might be proof againſt any deep impreſſion. But our power fails us here: an intereſting object ſeizes and fixes the attention beyond the poſſibility of control; and while our attention is thus forcibly attached to one object, others may ſolicit for admittance; but in vain, for they will not be regarded. Thus a ſmall misfortune is ſcarce felt in preſence of a greater:

Lear. Thou think'ſt 'tis much, that this contentious ſtorm
Invades us to the ſkin; ſo 'tis to thee;
But where the greater malady is fix'd,
The leſſer is ſcarce felt. Thou'dſt ſhun a bear;
But if thy flight lay tow'rd the roaring ſea,
Thou'dſt meet the bear i' the mouth. When the mind's free,
The body's delicate: the tempeſt in my mind
Doth from my ſenſes take all feeling elſe,
Save what beats there. *King Lear, act 3. ſc. 5.*

ATTERBURY (Lewis), father of the celebrated Dr. Atterbury, biſhop of Rocheſter, was born about the year 1631. He was the ſon of Francis Atterbury, rector of Middleton-Malſor, or Milton, in Northamptonſhire, who, among other miniſters, ſubſcribed the Solemn League and Covenant, in 1648. Lewis was entered a ſtudent of Chriſt-church, Oxford, in 1647, took the degree of bachelor of arts on the 23d of February, 1649, and was created maſter of arts by virtue of a diſpenſation from Oliver Cromwell the chancellor, March 1, 1651. He was one of thoſe who had ſubmitted to the authority of the viſitors appointed by the parliament. In 1654 he became rector of Great or Broad-Riſſington in Glouceſterſhire; and after the reſtoration, took a preſentation for that benefice under the great ſeal, and was inſtituted again to confirm his title to it. On the 11th of September, 1657, he was admitted rector of Milton, or Middleton Keynes, in Bucks; and at the return of Charles II. took the ſame prudent method to corroborate his title to this living. July 25, 1660, he was made chaplain extraordinary to Henry duke of Glouceſter; and on the 1ſt of December, in the ſame year, was created doctor in divinity. Returning from London, whither the law-ſuits he was frequently involved in had brought him, he had the misfortune to be drowned near his own houſe, in the beginning of December, 1693.

ATTERBURY (Lewis), eldeſt ſon of the preceding, was born at Caldecot, in the pariſh of Newport-Pagnel, in Bucks, on the 2d day of May, 1656. He was educated at Weſtminſter-ſchool under Dr. Buſby, and ſent to Chriſt-church, Oxford, at the age of eighteen. He was ordained deacon in September, 1679, being then bachelor of arts; and prieſt the year following, when alſo he commenced maſter of arts. In 1683 he ſerved the office of chaplain to Sir William Pritchard, lord mayor of London. In February, 1684, he was inſtituted the rector of Symel in Northamptonſhire, which living he afterwards reſigned upon his accepting of other preferments. July 8, 1687, he accumulated the degrees of bachelor and doctor of civil-law. In 1691 we find him lecturer of St. Mary Hill in London. Soon after his marriage he ſettled at Highgate, where he ſupplied the pulpit of the reverend Mr. Daniel Lathom, who was very old and infirm, and had loſt his ſight: and, upon the death of this gentleman, was, in June 1695, elected by the truſtees of Highgate chapel to be their preacher. He had a little before been appointed one of the ſix preaching chaplains to the Princeſs Anne of Denmark, at Whitchall and St. James's, which place he continued to ſupply after ſhe came to the crown, and likewiſe during part of the reign of George I. When he firſt reſided at Highgate, obſerving what difficulties the poor in the neighbourhood underwent for want of a good phyſician or apothecary, he ſet himſelf to the ſtudy of phyſic: and after acquiring conſiderable ſkill, practiſed it gratis occaſionally among his poor neighbours. In 1707 the queen preſented him to the rectory of Shepperton in Middleſex; and in March 1719 the Biſhop of London collated him to the rectory of Hornſey, which was the more agreeable to him, becauſe the chapel of Highgate being ſituate in that pariſh, many of his conſtant hearers became now his pariſhioners.

In 1720, on a report of the death of Dr. Sprat, archdeacon of Rocheſter, he applied to his brother, in whoſe gift this preferment was, to be appointed to ſucceed him: but the biſhop refuſed.

Dr. Lewis Atterbury died at Bath, whither he went for a paralytic diſorder, October 20th, 1731. He publiſhed in his life-time two volumes of ſermons, and four occaſional ones, beſides ſome other pieces. In his will he gave ſome few books to the libraries of Bedford and Newport, and his whole collection of pamphlets, amounting to upwards of two hundred volumes, to the library of Chriſt-church, Oxford. He charged his eſtate for ever with the payment of ten pounds yearly to a ſchool-miſtreſs to inſtruct girls at Newport-Pagnel, which ſalary he had himſelf in his life-time paid for many years.

ATTICUS (Titus Pomponius), one of the moſt honourable men of ancient Rome. He underſtood the art of managing himſelf with ſuch addreſs, that, without leaving his ſtate of neutrality, he preſerved the eſteem and affection of all parties. His ſtrict friendſhip with Cicero did not hinder him from having great intimacy with Hortenſius. The conteſts at Rome between Cinna's party and that of Marius induced him to go to Athens, where he continued for a long time. He was very fond of polite learning, and kept at his houſe ſeveral librarians and readers. He might have obtained the moſt conſiderable poſts in the government; but choſe rather not to meddle, becauſe in the corruption and faction which then prevailed he could not diſcharge them according to the laws. He wrote Annals. He married his daughter to Agrippa; and attained to the age of 77.

ATTILA, king of the Huns, ſurnamed *the ſcourge of God*, lived in the 5th century. He may be ranked among the greateſt conquerors, ſince there was ſcarcely any province in Europe which did not feel the weight of his victorious arms. See HUNS

ATTOCK, a city and fortreſs of Hindooſtan Proper, on the E. bank of the Indus; ſuppoſed to ſtand on the ſite of the Taxila of Alexander, where he croſſed that river. It was built by the Emperor Acbar, in 1581; and is 180 miles N.W. of Lahore. Long. 70. 36. E. Lat. 32. 27. N.

ATTOCK, a river, which riſes in the Tartarian mountains, N. of Hindooſtan, and paſſing by Cabul, flows into the Indus, above Attock.

ATURÆ, an ancient town in the diſtrict of Novempopulana in Aquitania, on the river Aturus; now Aire in Gaſcony, on the Adour. E. long. 0. 3. N. lat. 43. 40.

AVA, a large river of Aſia, which riſes in Thibet, and croſſing the kingdoms of Burmah and Pegu, falls into the bay of Bengal, by ſeveral mouths.

AVA (*Encycl.*), a kingdom Aſia, in the peninſula beyond the Ganges. The king is very powerful, his dominions being bounded by Mogulſtan on the weſt, Siam on the ſouth, Tonquin and Cochin-China on the eaſt, and by Tibet and China on the north. Several large rivers run through this country, which annually overflow their banks like the Nile, and thus render it extremely fertile. Here are mines of lead and copper, together with ſome of gold and ſilver, beſides large quantities of the fineſt oriental rubies, ſapphires, emeralds, &c.

AVA, the metropolis of the kingdom of the ſame name, is ſituated in E. long. 96. 30. N. lat. 21. 0. It is pretty large; the houſes built with timber or bamboo canes, with thatched roofs, and floors made of teak plank or ſplit bamboo. The ſtreets are very ſtraight, with rows of trees planted on each ſide. The king's palace is an exact quadrangle, each ſide of which is 800 paces, and is ſurrounded with a brick wall; but the palace itſelf is of ſtone. It has four gates; the golden gate, through which all ambaſſadors enter; the gate of juſtice, through which the people bring petitions, accuſations, or complaints; the gate of grace, through which thoſe paſs who have received any favours, or have been acquitted of crimes laid to their charge; and the gate of ſtate, through which his majeſty himſelf paſſes when he ſhews himſelf to the people.

AVARICUM, an ancient town of the Bituriges in Gallia Celtica, ſituated on the rivulet Avara, in a very fertile ſoil (Cæſar). Now Bourges in Berry. E. long. 2. 30. N. lat. 47. 10.

AUBE, a department of France, containing part of the

late province of Champagne. It takes its name from a conſiderable river, which paſſing by Bar-ſur-Aube, and Arcis falls into the Seine near Nogent.

AUBIGNE (Theodore Agrippa d'), a very illuſtrious Frenchman, and grandfather of the no leſs illuſtrious madam de Maintenon, was born about the year 1550. His parts were ſo uncommon, and his progreſs in letters ſo very rapid, that he is ſaid to have tranſlated the "Crito" of Plato from the Greek into French, when no more than eight years old. His father dying when he was thirteen, and leaving him nothing but his name and his debts, he attached himſelf to the perſon and cauſe of King Henry IV. imagining that his ſword would provide for him better than his pen. Henry made him gentleman of his bedchamber, and raiſed him ſucceſſively to ſeveral high offices and commands; and Aubigné was abſolutely a favourite with him: but he loſt at length his favour, partly by refuſing to comply with the paſſions of his maſter, but chiefly by a certain hardneſs and inflexibility of temper, which is not agreeable to any body, but is particularly diſguſting to kings, and all who think that ſome homage is due to ſuperiority of ſtation. He quitted therefore the court of Henry, and afterwards the kingdom, and took refuge at Geneva, where he met with the moſt welcome reception, and was diſtinguiſhed with the higheſt honours. Here he ſpent a good portion of his time in writing, and is the author of ſeveral productions. His principal work is Hiſtoire Univerſelle, from 1550 to 1601, with a ſhort account of the death of Henry IV. in three volumes folio. The firſt volume was ſcarcely publiſhed, when the parliament of Paris cauſed it to be burnt, as a production wherein kings are not only treated with little reſpect, but ſometimes outraged. Aubigné died at Geneva in 1630, aged eighty.

AUBIN, a town of the iſland of Jerſey. It has a good harbour defended by a fort.

AUCKLAND, Bishop's, a town in the biſhopric of Durham, with a market on Thurſday. It is pleaſantly ſeated on the ſide of a hill, and noted for its caſtle, beautifully repaired about one hundred years ago; for its chapel, whoſe architecture is very curious; and for its bridge. It is eight miles S. by W. of Durham, and 251 N.N.W. of London. Long. 1. 31. W. Lat. 54 43. N.

AUDE, a department of France, part of the late province of Languedoc. It receives its name from a river, which riſes in the Pyrenées, and flowing by Quillan and Limoux, falls into the Mediterranean below Narbonne.

AUDEUS, the chief of the Audeans, obtained the name of an heretic, and the puniſhment of baniſhment, for celebrating Eaſter in the manner of the Jews, and attributing an human form to the Deity. He died in the country of the Goths, about the year 370.

AUDLEY (James), Lord Audley, of Heleigh, in the county of Stafford, was born about the year 1314, being the 7th of Edward II. By the ſpecial favour of Edward III. he had livery of all the lands of his inheritance, in the third year of that prince's reign, though he was not then of full age. This prince ſoon after did him a great favour: Roger Mortimer, earl of March, who was this lord's guardian, had in his minority exacted from him a recognizance for ten thouſand marks, which debt, on the attainder of Mortimer, becoming due to the king, he totally diſcharged Lord Audley therefrom. In 1343 the ſame prince made him governor of Berwick-upon-Tweed, and the two next years he ſerved in France. In 1348 he was elected into the noble order of the Garter, then firſt founded, and in 1353 he reduced a great part of the country of Valois. In 1356, and thirtieth of Edward III. he was preſent at the famous battle of Poictiers; where, having demanded of the Black Prince leave to charge in the front, it was, on account of a vow he had made, given him. There, with four eſquires who attended him, he performed ſuch extraordinary feats of arms, as diſtinguiſhed him from all the gallant noblemen who that day engaged. At length, however, he was ſo grievouſly wounded, that his eſquires were conſtrained to bear him out of the field of battle. In 1390 he attended King Edward III. and his three ſons, in their wars in France; and in the year following, ſwore to the peace then concluded in the name of King Edward. For theſe ſervices he was appointed conſtable of the caſtle of Glouceſter for life; and was alſo governor of Aquitain, and ſeneſchal of Poicton. He died April 1, 1386.

AUDLEY (Edmund), ſon of James lord Audley, was educated in Lincoln College, in Oxford, and in the year 1463 took the degree of bachelor of arts in that univerſity. In 1471 he became prebendary of Farendon, in the church of Lincoln; and in October 1475 attained the like preferment in the church of Wells. On Chriſtmas-day, the ſame year, he became archdeacon of the Eaſt Riding of Yorkſhire, and had other conſiderable preferments. Theſe preferments he quitted, on his being promoted to the biſhopric of Rocheſter, in 1480, being the twentieth of Edward IV. in which ſee he ſucceeded John Ruſſel, who was tranſlated into Lincoln, and who was tutor to Edward prince of Wales. In 1492, being the eighth of Henry VII. our Biſhop Audley was tranſlated to Hereford, and thence, in 1502, being the eighteenth of the ſame king, to Saliſbury, and about that time was made chancellor of the moſt noble order of the Garter. He was a man of learning, and of a generous ſpirit. In 1518, he gave four hundred pounds to Lincoln College, to purchaſe lands; and beſtowed upon the ſame houſe the patronage of a chantry, which he had founded in the cathedral church of Saliſbury. He was a benefactor, likewiſe, to St. Mary's church, in Oxford. He died Auguſt 23, 1524.

AUDLEY (Sir Thomas), was deſcended of an ancient and honourable family in Eſſex, and born in 1488. He had the advantage of an univerſity education, and afterwards ſtudied the law in one of the inns of court. In 1526 he was autumn-reader of the Inner-Temple. On the recommendation of the Duke of Suffolk, the king took notice of him, and finding him to be a man of great parts and good addreſs, procured him to be choſen ſpeaker of that parliament which met on the 3d of November, 1529. Audley's conduct on this ſtation, fully anſwered the king's expectations. The next year he was made attorney of the duchy of Lancaſter; and May 20, 1532, upon the reſignation of Sir Thomas More, the king delivered to him the great ſeal, with the title of lord-keeper, and at the ſame time conferred on him the honour of knighthood. In January following the king appointed him lord-chancellor; and ſoon after granted him the ſcite of the priory of Chriſt-church, near Aldgate, now called Duke's-Place, with all the church plate and lands belonging to that houſe. In this high office he was as diligent in the king's buſineſs, as he had been when ſpeaker of the Houſe of Commons; for in July 1535 he ſat in judgment, and pronounced ſentence of death, upon Sir Thomas More, indicted of high treaſon, for refuſing to acknowledge the king's ſupremacy in the church. When ſentence was paſt, Sir Thomas ſaid, that he had for ſeven years bent his mind and ſtudy upon this cauſe, but as yet he found it no where writ, by any approved doctor of the church, that a layman could be head of the eccleſiaſtical ſtate. To which Audley returned, "Sir, will you be reckoned wiſer, or of a better conſcience, than all the biſhops, the nobility, and the whole kingdom?"

On the 29th of November, 1538, he was created Baron Audley, of Walden in Eſſex, and inſtalled knight of the Garter. A little before his death, he obtained from the king a licence to change the name of Buckingham College, in Cambridge, into that of Magdalen, or Maudlin. To this college he was a great benefactor, beſtowed on it his own arms, and is generally reputed its founder. He died on the laſt of April, 1544, having held the ſeals upwards of twelve years, and in the fifty-ſixth year of his life.

AVEIRON, a department of France, including the late province of Rouergue. It is named from a river, which riſes near Severac-le-Chateau, and flowing by Rhodez and Villefranche, falls into the Garonne, below Montauban.

AVELLINO, a city in Italy, in the kingdom of Naples, with a biſhop's ſee. It was almoſt ruined by an earthquake in 1694. E. long. 15. 13. N. lat. 40. 53.

AVENACEOUS, ſomething belonging to or partaking of the nature of oats.

AVENIO, an ancient town of the Cavares, and one of the moſt opulent in Gallia Narbonenſis; now *Avignon*, in Provence. See AVIGNON.

AVENTINE (John), author of the annals of Bavaria, was born of mean parentage, in the year 1466, at Abenſperg, in the country juſt named. He ſtudied firſt at Ingolſtadt, and afterwards in the univerſity of Paris. In 1503 he privately taught eloquence and poetry at Vienna; and in 1507 he publicly taught Greek at Cracow in Poland. In 1509 he read lectures on ſome of Cicero's pieces at Ingolſtadt; and in 1512 was appointed to be preceptor to Prince Lewis and Prince Erneſt, ſons of Albert the Wiſe, duke of Bavaria; and travelled with the latter of thoſe two princes. After this he undertook to write the annals of Bavaria, being encouraged by the dukes of that name, who ſettled a penſion upon him, and gave him hopes that they would defray the charges of the book. This work, which gained its author great reputation, was firſt publiſhed in 1554, by Jerome Zieglerus, profeſſor of poetry in the univerſity of Ingolſtadt; and afterwards at Baſil in 1580, by Nicholas Ciſner. An affront which Aventine received in the year 1529, ſtuck by him all the reſt of his life: he was forcibly taken out of his ſiſter's houſe at Abenſperg, and hurried to a gaol; the true cauſe of which violence was never known: but it would probably have been carried to a much greater length, had not the Duke of Bavaria interpoſed, and taken this learned man into his protection. Mr. Bayle remarks, that the incurable melancholy which from this time poſſeſſed Aventine, was ſo far from determining him to lead a life of celibacy, as he had done till he was 64, that it induced him perhaps to think of marrying. The violence of his new paſſion was not however ſo great, but that it ſuffered him to adviſe with two of his friends, and conſult certain paſſages of the bible relating to marriage. The reſult was, that it was beſt for him to marry; and having already loſt too much time, conſidering his age, he took the firſt woman he met with, who happened to be his own maid, ill-tempered, ugly, and extremely poor. He died the 9th of January, 1534, aged 68; leaving one daughter, who was then but two months old. He had a ſon, who died before.

AVERNO (*Encycl.*), alſo called AVERNUS. See AVERNUS.

AVERRHOA (*Encycl.*). Correct an obvious botanical miſtake in that article; the *claſs* being put for the *order*, and vice verſa.

AVERROES, an Arabian philoſopher, was a native of Corduba, and flouriſhed in the twelfth century. He was inſtructed in the laws and the religion of the country by his father, who was high prieſt and chief judge (under the emperor of Morocco) of the kingdom of Corduba, his authority extending over all Andaluſia and Valencia. Averroes was profeſſor in the univerſity of Morocco, and after the death of his father ſucceeded to his places, the duties whereof he diſcharged with great approbation, being eminently ſkilled in law and divinity. He had alſo ſtudied natural philoſophy, medicine, aſtrology, and mathematics; but underſtood the theory of medicine much better than the practice. The king of Morocco making him an offer of the place of judge of Morocco and Mauritania, with leave to keep thoſe he held at Corduba, he accepted it, went over to Morocco, and having ſettled judges as his ſubdelegates, returned to Corduba.

He referred all criminal cauſes to his deputy, never giving his own opinion. One Abraham Ibnu Sahal, a philoſopher, phyſician, and aſtrologer, at Corduba, in an unlucky hour fell in love, and began to write verſes, without any regard to his character as a doctor. The Jews, his brethren in religion, adviſing him not to publiſh them, he returned them a profane anſwer in verſe. This obliged them to apply to the civil magiſtrate. They repreſented to Averroes, that Sahal had debauched the whole city, and eſpecially the youth of both ſexes, by his poems; and that nothing elſe was ſung at the marriage feaſts. Averroes forbad him to write any more, under a penalty; but being afterwards informed that his prohibition could not ſtop the poetical humour of the Jew, he reſolved to be aſſured of the truth of it, and ſent to him a truſty perſon, who reported at his return, that he found nobody at his houſe but Averroes's eldeſt ſon, writing verſes; and that there was neither man, woman, nor child, at Corduba, who had not got by heart Abraham Ibnu Sahal's verſes. Upon this Averroes dropped the proſecution, ſaying, "Can one ſingle hand ſtop a thouſand mouths?"

Surpriſing things are related of his patience, liberality, and meekneſs. Once, when he was reading a lecture in the civil law, the ſervant of one of his enemies came and whiſpered ſomething in his ear: Averroes changed countenance, and anſwered only, "Yes, yes." The next day the ſame ſervant returned, and publicly aſked pardon, confeſſing that he had ſaid a rude thing to Averroes the day before, when he whiſpered him in the ear. "God bleſs you," replied Averroes, "for declaring that I am endued with patience." He gave him afterwards a ſum of money, and bid him not to do to others as he had done to him. Though Averroes was rich both by marriage and his poſts, he was always in debt, becauſe he was very liberal to men of letters in neceſſity, whether they were his friends or enemies. He would not conſent to his youngeſt ſon's accepting of the honours offered him at the court of Morocco; and was ſo far from ſhewing any peculiar ſatisfaction at the deference paid to this young man, which was intended to do a pleaſure to his father, that he was abſolutely uneaſy at it. He explained Ariſtotle's doctrine of the unity of the intellect in ſuch a manner, as to overturn the immortality of the ſoul, and conſequently future rewards and puniſhments. Obſerving the people to eat the ſacrament they had juſt worſhipped, "Let my ſoul," ſaid he, "be with thoſe of the philoſophers, ſince the Chriſtians worſhip what they eat." His good qualities did not hinder him from having a great many enemies among the nobility and doctors of Corduba; who repreſenting to Manſor king of Morocco that the philoſophical tenets he had maintained in a lecture to his pupils were groſs hereſy, that prince fell into a paſſion, ordered his eſtate to be confiſcated, and confined him to the Jews' quarter. After this, Averroes being pelted with ſtones by the children as he went to moſque to perform his devotions, removed from Corduba to Fez, and lay concealed there for ſome days; but being diſcovered, was ſent to gaol. Manſor aſſembled a great many doctors in divinity and law, to conſider what puniſhment he deſerved.

The greateſt part of them replied, that as an heretic, he merited capital puniſhment; but others were of opinion, that a man of his eminence ought not to be put to death, but be obliged to retract. Manſor approving of this advice, our philoſopher was conducted, one Friday, at the hour of prayer, to the gate of the moſque, and placed bare-headed upon the higheſt ſtep, and all who entered into the moſque ſpat in his face. Prayers being ended, the doctors, with notaries, and the judge with his aſſeſſors, came thither, and aſked this unhappy man, whether he repented of his hereſy? He anſwered, "Yes;" upon which he was diſcharged. He ſtaid at Fez, and read lectures in law. Some time after, Manſor gave him leave to return to Corduba, where he lived very unhappily, being deprived of his eſtate and books. In the mean time, the judge who had ſucceeded him, behaved in ſuch a manner, and juſtice was ſo badly adminiſtered, that the people groaned under heavy oppreſſion: wherefore Manſor aſſembled his council, and propoſed the reſtoring of Averroes. This motion being approved of by the majority, Averroes was brought back to Morocco, and inveſted with his former office. Being aſked in what ſituation his mind was whilſt under proſecution, "I was pleaſed," ſaid he, "and diſpleaſed. I was glad to be diſcharged from the troubleſome office of a judge, but I was uneaſy to be oppreſſed by falſe witneſſes. I did not wiſh to be reſtored to my poſt as a magiſtrate, and have not accepted it again till my innocence has been made to appear."

He died at Morocco in 1206. He was exceſſively fat, though he ate but once a day. He ſpent all his nights in the ſtudy of philoſophy; and when he was fatigued, amuſed himſelf with reading poetry or hiſtory. Of Averroes's medicinal works himſelf gives the following account in the preface to them: "At the deſire of the noble lord Audelach Sempſe, who by the advice of his philoſophers, Avoſait and Avenchlit, enjoined me to write a book in Arabic, which ſhould contain the whole art of phyſic, in order to aſſiſt them in forming a judgment of the opinions of the ancients, I compiled this work Colliget, that is, Univerſal; ſo entitled on account of the order to be obſerved in this ſcience, which deſcends from univerſals to particulars: for in this book I have begun with general rules, and hereafter, with God's aſſiſtance, ſhall undertake another treatiſe upon particulars," &c. He wrote a great many amorous verſes, but when he grew old he caſt them into the fire. His other poems are all loſt, except a ſmall piece, in which he declares that when he was young he acted againſt his reaſon, but that when he was in years he followed the dictates of it: upon which he utters this wiſh; "Would to God I had been born old, and that in my youth I had been in a ſtate of perfection."

AVESBURY (Robert), an Engliſh hiſtorian, of whom little more is known, than that he was keeper of the regiſtry of the Court of Canterbury in the reign of Edward III. and conſequently that he lived in the 14th century. He wrote *Memorabilia geſta magnifici regis Angliæ domini Edwardi tertii poſt conqueſtum, proceruinque; tactis primitus quibuſdam geſtis de tempore patris ſui domini Edwardi ſecundi, quæ in regnis Angliæ, Scotiæ, et Franciæ, ac in Aquitannia et Britannia, non humana ſed Dei potentia, contigerunt, per Robertum de Aveſbury.* This hiſtory ends with the battle of Poictiers, about the year 1356. It continued in manuſcript till the year 1720, when it was printed by the induſtrious Thomas Hearne, at Oxford, from a manuſcript belonging to Sir Thomas Seabright. It is now become very ſcarce.

AUGUSTA *Auſciorum*, a town of Aquitania, ſo named out of compliment to Auguſtus, being originally called *Climberrum*, which name it afterwards reſumed. In the middle age, it took the name of the people, *Auſci*; and is now called *Auch*, the capital of Gaſcony.

AUGUSTA *Emerita*, a town of Luſitania on the river Anas, the capital of the province; a colony of the Emeriti, or ſuch ſoldiers as had ſerved out their legal time, were men of experience, or had received marks of favour. The colony was founded by Auguſtus; and is now called *Merida*, a city of Spain, in Eſtremadura, on the river Guadiana. See MERIDAN.

AUGUSTA *Prætoria*, a town and colony of Gallia Ciſalpina, and capital of the Salaſſii; ſeated at the foot of the Alps Graiæ on the Duria. Now *Aouſte* in Piedmont. See AOUSTE.

AUGUSTA *Rauracorum*, a town of Gallia Belgica: now a ſmall village called *Auguſt*, at the bend of the Rhine northwards, but from the ruins, which are ſtill to be ſeen, appears to have been a conſiderable colony, at the diſtance of ſix miles from Baſil to the Eaſt.

AUGUSTA *Sueſſonum*, a town of Gallia Belgica on the Axona; ſo called from Auguſtus, and with great probability ſuppoſed to be the Noviodunum Sueſſonum of Cæſar.—Now *Soiſſons*, on the river Aiſne, in the Iſle of France. See SOISSONS.

AUGUSTA *Taurinorum*, a town of the Taurini, at the foot of the Alps, where the Duria Minor falls into the Po; now *Turin*, the capital of Piedmont.

AUGUSTA *Tieba*, a town of the Æqui, near the ſprings of the river Anio, in Italy; now *Trevi* in Umbria, or in the eaſt of the Campagna di Roma.

AUGUSTA *Trevirorum*, a town of the Treviri, a people inhabiting between the Rhine and the Meuſe, but eſpecially about the Moſelle; now *Trier*, or *Treves*, in the circle of the Lower Rhine on the Moſelle.

AUGUSTA *Vindelicorum*, a town of the Licates on the Licus; called by Tacitus a noble colony of *Rhætia*; now *Augſburg*, the capital of Suabia.

AUGUSTIN, or AUSTIN (St.), the firſt archbiſhop of Canterbury, was originally a monk in the convent of St. Andrew, at Rome, and educated under St. Gregory, afterwards Pope Gregory I. by whom he was diſpatched into Britain with 40 other monks of the ſame order, about the year 596, to convert the Engliſh Saxons to Chriſtianity.—They landed in the iſle of Thanet; and having ſent ſome French interpreters to King Ethelbert, with an account of their errand, the king gave them leave to convert as many of his ſubjects as they could, and aſſigned their place of reſidence at Dorovernum, ſince called *Canterbury*; to which they were confined till the king himſelf was converted, whoſe example had a powerful influence in promoting the converſion of his ſubjects; but though he was extremely pleaſed at their becoming Chriſtians, he never attempted to compel them. He diſpatched a prieſt and a monk to Rome, to acquaint the pope with the ſucceſs of his miſſion, and to deſire his reſolution of certain queſtions. Theſe men brought back with them a pall, and ſeveral books, veſtments, utenſils, and ornaments for the churches. His holineſs, by the ſame meſſengers, gave Auguſtin directions concerning the ſettling of epiſcopal ſees in Britain; and ordered him not to pull down the idol-temples, but to convert them into Chriſtian churches; only deſtroying the idols, and ſprinkling the place with holy water, that the natives, by frequenting the temples they had been always accuſtomed to, might be the leſs ſhocked at their entrance into Chriſtianity. Auguſtin reſided principally at Canterbury, which thus became the metropolitan church of England; and having eſtabliſhed biſhops in ſeveral of the cities, he died on the 26th of May, 607. The Popiſh writers aſcribe ſeveral miracles to him. The obſervation of the feſtival of St. Auguſtin was firſt injoined in a ſynod held under Cuthbert archbiſhop of Canterbury, and afterwards by the pope's bull, in the reign of King Edward III.

AUGUSTINE (St.), an illuſtrious father of the church, was born at Thagaſte, a city of Numidia, on the 13th of November, 354. His father, a burgeſs of that city, was called *Patricius;* and his mother *Monica*, who, being a woman of great virtue, inſtructed him in the principles of the Chriſtian religion. In his early youth he was in the rank of the catechumens; and falling dangerouſly ill, earneſtly deſired to be baptized; but the violence of the diſtemper ceaſing, his baptiſm was delayed. His father, who was not yet baptized, made him ſtudy at Thagaſte, Madaura, and afterwards at Carthage. Auguſtine, having read Cicero's books of philoſophy, began to entertain a love for wiſdom, and applied himſelf to the ſtudy of the holy ſcriptures; nevertheleſs, he ſuffered himſelf to be ſeduced by the Manicheans. At the age of 19, he returned to Thagaſte, and taught grammar, and alſo frequented the bar: he afterwards taught rhetoric at Carthage with applauſe. The inſolence of the ſcholars at Carthage made him take a reſolution to go to Rome, though againſt his mother's will. Here alſo he had many ſcholars; but diſliking them, he quitted Rome, and ſettled at Milan, and was choſen public profeſſor of rhetoric in that city. Here he had opportunities of hearing the ſermons of St. Ambroſe, which, together with the ſtudy of St. Paul's epiſtles, and the converſion of two of his friends, determined him to retract his errors, and quit the ſect of the Manicheans: this was in the 32d year of his age. In the vacation of the year 386 he retired to the houſe of a friend of his, named *Verecundus*, where he ſeriouſly applied himſelf to the ſtudy of the Chriſtian religion, in order to prepare himſelf for baptiſm, which he received at Eaſter, in the year 387. Soon after this, his mother came to ſee him at Milan, and invite him back to Carthage; but at Oſtia, whither he went to embark in order to his return, ſhe died. He arrived in Africa about the end of the year 388; and having obtained a garden-plot without the walls of the city of Hippo, he aſſociated himſelf with eleven other perſons of eminent ſanctity, who diſtinguiſhed themſelves by wearing leathern girdles, and lived there in a monaſtic way for the ſpace of three years, exerciſing themſelves in faſting, prayer, ſtudy, and meditation, day and night: from hence ſprung up the Auguſtine friars, or eremites of St. Auguſtine, being the firſt order of mendicants; thoſe of St. Jerome, the Carmelites, and others, being but branches of this of St. Auguſtine.—About this time, or before, Valerius biſhop of Hippo, againſt his will, ordained him prieſt: nevertheleſs, he continued to reſide in his little monaſtery, with his brethren, who, renouncing all property, poſſeſſed their goods in common. Valerius, who had appointed St. Auguſtine to preach in his place, allowed him to do it in his preſence, contrary to the cuſtom of the churches in Africa. He explained the creed, in a general council of Africa, held in 393. Two years after, Valerius, fearing he might be preferred to be biſhop of another church, appointed him his coadjutor or colleague, and cauſed him to be ordained biſhop of Hippo, by Megalus biſhop of Calame, then primate of Numidia. St. Auguſtine died the 28th day of Auguſt, 430, aged 76 years, having had the misfortune to ſee his country invaded by the Vandals, and the city where he was biſhop beſieged for ſeven months.

The works of St. Auguſtine make ten volumes; the beſt edition of them is that of Maurin, printed at Antwerp, in 1700. They are but little read at this time, except by the clergy of the Greek church, and in the Spaniſh univerſities. The bookſellers of London receive frequent commiſſions for them, and indeed for the moſt of the fathers, from Ruſſia, and alſo from Spain.

AUGUSTOBONA, a city of the Tricaſſers in ancient Gaul, from whom it was afterwards called *Tricaſſes*, and *Trecaſſæ;* and ſtill farther corrupted to *Tracæ*, or *Treci;* whence the modern name *Troyes*, in Champagne on the Seyne. See TROYES.

AUGUSTODUNUM, the capital of the Ædui, where there was a famous academy or ſchool for the education of youth; now Auſtun, or *Autun*, in the duchy of Burgundy, on the Arroux. See AUTUN.

AUGUSTOMAGUS, an ancient town of Gallia Belgica; now *Sentis* in the Iſle of France. E. long. 2. 30. N. lat. 49. 10.

AUGUSTUS (Caius Julius Cæſar Octavianus), the nephew of Julius Cæſar, was born at Rome 63 years before Jeſus Chriſt. When he underſtood that his uncle had adopted him for his heir, he went to Italy and attached himſelf to his party. He quarrelled with M. Antonius; but afterwards entering into a treaty with him and Lepidus, theſe three formed the ſecond triumvirate, agreed to a proſcription of their reſpective enemies, and divided the empire among them. Lepidus being abandoned by his army, was ſent into exile; and Antonius being reduced to deſtroy himſelf, Octavius aſſumed the title of Emperor, and the appellation of *Auguſtus*. He was cruel in his triumvirate, but ſeemed to have adopted new virtues with his imperial dignity; ſince he now appeared juſt, affable, moderate, and liberal: he maintained peace; advanced men of merit; and patroniſed arts and ſciences, which under his reign were brought to the greateſt perfection. He died at the age of 75. See ROME.

AVICENNA, a celebrated philoſopher and phyſician among the Mohammedans, was born in the year 980. By the time he was ten years old, he had learned the Koran, and made a great progreſs in claſſical literature. He was next ſent to a man who dealt in herbs, and was ſkilled in the Indian method of accounts, to learn arithmetic. After this, the rudiments of logic and the firſt five or ſix propoſitions of Euclid were explained to him by a private tutor. He went through the reſt of Euclid by himſelf, conſulting the commentaries: when he entered on the Almageſt, his tutor left him. He next applied himſelf to the ſtudy of phyſic, and to gain experience, viſited patients, being then about ſixteen. The following year and a half he employed with incredible application in reading; and when any difficulty occurred, he had recourſe to Heaven. Having attained to a perfect knowledge of logic, natural philoſophy, and mathematics, he proceeded to divinity, and as a proper preparation for this ſtudy, he was deſirous to make himſelf maſter of Ariſtotle's Metaphyſics; but having read the book over forty times, and even got it by heart, without being able to comprehend the author's meaning, he laid it by as unintelligible. —One day whilſt he was in a bookſeller's ſhop, a broker offered him a book of metaphyſics to ſell, which he rejected with ſcorn, ſaying it was an uſeleſs ſcience: the broker, however, telling him he might have it cheap, the owner being under the neceſſity of ſelling it, he purchaſed it. The book proved to be a treatiſe of Al Farabius, "concerning the objects of metaphyſics;" which Avicenna had no ſooner run over, than he plainly perceived the ſenſe of Ariſtotle, whoſe words he retained in his memory, and out of joy gave a conſiderable alms to the poor. Having recovered the King of Khoraſan, who during a fit of illneſs had ſent for Avicenna, though a very young man, that prince kept him near his perſon, and allowed him free acceſs to his large and valuable library; which happening to be burnt ſoon after, Avicenna's enemies accuſed him of having ſet it on fire, that nobody elſe might enjoy the fame advantage, and that what he had learned there might be taken for his own.

A very remarkable ſtory is told of Avicenna's ſagacity. When he was at Jorgân Kabûs, the ſovereign of the country ſent for him to viſit his nephew, who was confined to his bed by a diſorder, which baffled all the phyſicians of that country. Avicenna, having felt the young man's pulſe and ſeen his urine, judged his illneſs to proceed from concealed love. He ſent for the chief eunuch of the palace, and whilſt he kept his finger on the patient's pulſe, deſired him to call over the names of the ſeveral apartments: obſerving great emotions in the ſick man at the naming of one particular apartment, he made the eunuch name all the women in that apartment; and finding his patient's pulſe to beat extremely high at the mention of one perſon, he no longer doubted but that ſhe was the object of his paſſion, and declared that his cure was only to be expected from the enjoyment of that lady. Avicenna died in the year 1036. He had a good conſtitution, which he greatly impaired by a too free uſe of women and wine. The number of his books, including his ſmaller tracts, is computed at near 100, the greateſt part of which is either loſt, or not known in Europe.

AVILES, a town of Spain, in the principality of Aſturias, on the bay of Biſcay, 25 miles N. of Oveido. Long. 6. 5. W. Lat. 43. 27. N.

AVISON (Charles), organiſt of Newcaſtle, and a diſciple of Geminiani, was the author of an eſſay on muſical expreſſion, publiſhed in the year 1752, in which are ſome judicious reflections on muſic in general, but his diviſion of the modern authors into claſſes is rather fanciful than juſt. Throughout his book he celebrates Marcello and Geminiani; the latter frequently in prejudice to Mr. Handel. In the year 1753 came out remarks on Mr. Aviſon's eſſay on muſical expreſſion, the author whereof firſt points out ſundry errors againſt the rules of compoſition in the works of Aviſon. In the ſame year Aviſon republiſhed his eſſay, with a reply to the author of the remarks; and a letter, containing a number of looſe particulars relating to muſic collected in a courſe of various reading, unqueſtionably written by Dr. Jortin. Aviſon promoted and aſſiſted in the publication of Marcello's muſic to the pſalms adapted to Engliſh words. Of his own compoſition there are extant five collections of concertos for violins, forty-four in number; and two ſets of ſonatas for the harpſichord and two violins, a ſpecies of compoſition little known in England till his time. The muſic of Aviſon is light and elegant, but it wants originality; a neceſſary conſequence of his too cloſe attachment to the ſtyle of Geminiani, which in a few particulars only he was able to imitate. *Hawkins's Hiſt. of Muſic.*

AUNGERVYLE (Richard), commonly known by the name of *Richard de Bury*, was born in 1281, at St. Edmund's Bury, in Suffolk, and educated at the univerſity of Oxford. —After this he entered into the order of Benedictine monks, and became tutor to Edward prince of Wales, afterwards King Edward III. Upon the acceſſion of his royal pupil to the throne he was appointed cofferer, then treaſurer of the wardrobe, archdeacon of Northampton, prebendary of Lincoln, Sarum, and Litchfield, keeper of the privy ſeal, dean of Wells, and laſt of all was promoted to the biſhopric of Durham. He likewiſe enjoyed the offices of lord high-chancellor, and treaſurer of England; and diſcharged two important embaſſies at the court of France. Learned himſelf, and a patron of the learned, he maintained a correſpondence with ſome of the greateſt geniuſes of the age, particularly with the celebrated Italian poet Petrarch. He was alſo of a moſt humane and benevolent temper, and performed many ſignal acts of charity. Every week he made eight quarters of wheat into bread, and gave it to the poor. Whenever he travelled between Durham and Newcaſtle, he diſtributed eight pounds ſterling in alms; between Durham and Stockton, five pounds; between Durham and Aukland, five marks; and between Durham and Middleham, five pounds. He founded a public library at Oxford, for the uſe of the ſtudents, which he furniſhed with the beſt collection of books then in England; and appointed five keepers, to whom he granted yearly ſalaries. At the diſſolution of religious houſes in the reign of Henry VIII. Durham College, where he fixed the library, being diſſolved among the reſt, ſome of the books were removed to the public library, ſome to Baliol College, and ſome came into the hands of Dr. George Owen, a phyſician of Godſtow, who bought that college of King Edward VI. Biſhop Aungervyle died at his manor of Aukland, April 24, 1345, and was buried in the ſouth part of the croſs iſle of the cathedral church of Durham, to which he had been a benefactor. He wrote, 1. *Philobiblos*, containing directions for the management of his library at Oxford, and a great deal in praiſe of learning, in bad Latin. 2. *Epiſtolæ familiarium*; ſome of which are written to the famous Petrarch. 3. *Orationes ad principes*; mentioned by Bale and Pitts.

AVON, a river which riſes in Wilts, coaſts the edge of the New Foreſt, and enters the Engliſh Channel at Chriſtchurch-bay, in Hampſhire.

AVON, a river that riſes in Leiceſterſhire, and running S.W. by Warwick, continues its courſe by Eveſham, and falls into the Severn at Tewkſbury.

AVON, LOWER, a river that riſes in Wiltſhire, and running W. to Bath, becomes navigable there, continues its courſe to Briſtol, and falls into the Severn N.W. of that city.

AURELIANUS (Lucius Domitius), emperor of Rome, was one of the greateſt generals of antiquity, and commanded the armies of the Emperor Claudius with ſuch glory, that after the death of that emperor all the legions agreed to place him on the throne; this happened in the year 270. He carried the war from the eaſt to the weſt, with as much facility, ſays a modern writer, as a body of troops marches from Alſace into Flanders. He defeated the Goths, Sarmatians, Marcomanni, the Perſians, Egyptians, and Vandals; conquered Zenobia, queen of the Palmyrenians, and Tetricus, general of the Gauls; both of whom were made to grace his triumph, in the year 274. He was killed by one of his generals in Thrace, in the year 275, when he was preparing to enter Perſia with a great army. See ROME.

AURICULAR, whatever belongs or relates to the ear.

AURICULAR *Tube*, an inſtrument to facilitate hearing. See ACOUSTICS and TRUMPET.

AURUNGABAD, a conſiderable city of Aſia, in the Decan of Hindooſtan. It is but a modern city; owing its riſe, from a ſmall town, to the capital of Dowlatabad, to the great Aurungzebe, from whom it had its name. It is 260 miles N.E. of Bombay. Long. 76. 2. E. Lat. 19. 45. North.

AUSONIUS (in Latin *Decius*, or rather *Decimus*, Magnus Auſonius), one of the beſt poets of the fourth century, was the ſon of an eminent phyſician, and born at Bourdeaux. Great care was taken of his education, the whole family intereſting themſelves in it, either becauſe his genius was very promiſing, or that the ſcheme of his nativity, which had been caſt by his grandfather on the mother's ſide, made them imagine that he would riſe to great honour. He made an uncommon progreſs in claſſical learning, and at the age of 30 was choſen to teach grammar at Bourdeaux. He was promoted ſome time after to be profeſſor of rhetoric,

in which office he acquired ſo great a reputation, that he was ſent for to court to be preceptor to Gratian, the Emperor Valentinian's ſon. The rewards and honours conferred on him for the faithful diſcharge of his office prove the truth of Juvenal's maxim, that when fortune pleaſes ſhe can raiſe a man from a rhetorician to the dignity of a conſul. He was actually appointed conſul by the Emperor Gratian, in the year 379, after having filled other conſiderable poſts; for beſides the dignity of quæſtor, to which he had been nominated by Valentinian, he was made prefect of the Prætorium in Italy and Gaul, after that prince's death. His ſpeech, returning thanks to Gratian on his promotion to the conſulſhip, is highly commended. The time of his death is uncertain; he was ſtill living in 392, and lived to a great age. The Emperor Theodoſius had a great eſteem for Auſonius, and preſſed him to publiſh his poems. There is a great inequality in his works; and in his manners and his ſtyle there is a harſhneſs which was perhaps rather the defect of the times he lived in, than of his genius. Had he lived in Auguſtus's reign, his verſes, according to good judges, would have equalled the moſt finiſhed of that age. He is generally ſuppoſed to have been a Chriſtian: ſome ingenious authors indeed think otherwiſe, but, according to Mr. Bayle, without juſt reaſon.—The beſt edition of his poems is that of Amſterdam, in 1671.

AUSTIN (St.). See St. AUGUSTIN.

AUTRE-EGLISE, a village of Brabant, in the Auſtrian Netherlands; to which the left wing of the French army extended, when the confederates obtained the victory at Ramillies, in 1706. E. long. 4 50. N. lat. 50. 40.

AUTRICUM, the capital of the Carnutas, a people of Gallia Celtica; afterwards called *Carnotena, Carnotenus,* and *Civitas Carnotenum;* now *Chartres,* in the Orleanois on the Eure. E. long. 1. 32. N. lat. 48. 47.

AWATSKA-BAY, a harbour of Kamtſchatka, ſaid to be the ſafeſt and moſt extenſive that has been diſcovered, and the only one, in that part of the world, that can admit veſſels of a conſiderable burden. The entrance into it is in 52. 51. N. lat. 158. 48. E. long.

AWE, LOCH, one of the moſt beautiful lakes of Scotland, in Argyleſhire, about thirty miles long, and, in ſome parts, above two broad. It contains many fine little iſlands, tufted with trees. The river Awe, the outlet of this lake, is diſcharged into Loch Etive, at the village of Bunawe.

AXATI, a town of ancient Bætica, in the Bœtis; now *Lora,* a ſmall city of Andaluſia in Spain, ſeated on the Guadalquivir. W. long. 5. 20. N. lat. 37. 20.

AXIOPOLIS, a town of the Triballi, in Mæſia Inferior; now *Axiopoli* in Bulgaria. E. long. 34. 0. N. lat. 45. 40.

AXTEL (Daniel), a colonel in the ſervice of the long parliament, and executed for the ſhare he had in the murder of King Charles I. He was of a good family, and had a tolerable education, that is to ſay, ſuch a one as might fit him for the courſe of life it was intended he ſhould lead, being placed by his relations as an apprentice to a grocer in Watling-ſtreet. As he was of a very ſerious diſpoſition, and had been very early tinctured with thoſe principles which were in that age ſtyled puritanical, he became an eager follower of ſuch miniſters as diſtinguiſhed themſelves by their zealous preaching. His great attachment to theſe ſort of people, and the natural warmth of his own temper, were the occaſions of his quitting his own calling, and going into the army, in which he behaved with ſo much zeal, courage, and conduct, that he roſe by degrees to the ſeveral commands of captain, major, and lieutenant-colonel, in a regiment of foot. It was in this laſt capacity, that he acted with great vehemence againſt all endeavours for a reconciliation with the king.

On the twentieth of January, when the king was brought before the high court of juſtice, Colonel Stubberd, and Colonel Axtel, had the command of the ſoldiers below ſtairs. The king demanded of Serjeant Bradſhaw, who was the preſident, by what authority they brought him there? And the preſident appealing to the charge, which was in the name of the Commons and People of England, Lady Fairfax, the general's wife, cried out, "It is a lie, it is falſe, not a half, not a quarter of the people; Oliver Cromwell is a rogue and a traitor;" which words were repeated by Mrs. Nelſon. Upon this Colonel Axtel cried out, "Down with the whores, ſhoot them;" which vehemence of his made him be taken notice of. After the ſentence was paſſed, the king was carried through the middle of King-ſtreet, in a common ſedan, by two porters, who, out of reverence to his perſon, went bare headed, till the ſoldiers, under Colonel Axtel's command, beat them, and forced them to put on their hats. After the murder of the king, when Cromwell was ſent into Ireland, the regiment in which Colonel Axtel ſerved was drawn out by lot for that expedition, which occaſioned his going over into that kingdom, where he made a conſiderable figure, was much eſteemed and truſted by Cromwell, and raiſed, for his fidelity, courage, and conduct, to the command of a regiment, and the government of Kilkenny and the adjacent precinct.

After the death of the protector, Oliver, which happened on the third of September, 1658, things took a new turn, and Axtel uſed his utmoſt induſtry to conceal himſelf, as foreſeeing that it would not be long before he might be called to an account for the large ſhare he had taken in the trial of the king: but his care in this reſpect was to very little purpoſe, for before the cloſe of the month, he was diſcovered and committed to priſon. On the 10th of October following, the grand jury for the county of Middleſex, having found bills againſt twenty-eight perſons, for their concern in the king's murder, of which Mr. Axtel was the laſt, they were brought to the ſeſſions-houſe, in the Old Bailey, where Colonel Axtel was the ſame day arraigned, upon an indictment for compaſſing and imagining the death of the late king. The trial laſted, on account of the priſoner's long and large defence, for upwards of three hours; but the jury, without going from the bar, found him guilty, and on the 19th of October he was executed at Tyburn.

AXUM, a village, ſuppoſed to have been once the capital of Abyſſinia. Its ruins are very extenſive, but, like the cities of ancient times, conſiſt altogether of public buildings. In one ſquare there are forty obeliſks, none of which have any hieroglyphics on them. They are all of one piece of granite, and on the top of that which is ſtanding, is a *patera* exceedingly well carved in the Greek taſte. It is 125 miles W. of the Red Sea. Long. 36. 4. E. Lat. 14. 6. N.

AYLESBURY (Thomas), the ſecond ſon of William Ayleſbury, was born in London, in the year 1576. He received his education in Weſtminſter-ſchool, from whence he went to Oxford, and in 1598 became a ſtudent of Chriſt-church. He diſtinguiſhed himſelf there by his aſſiduous application to his ſtudies, and eſpecially affected the mathematics. This made him known to perſons of the greateſt parts in the univerſity, and was the reaſon of his being careſſed by ſome of the greateſt quality in the kingdom. On the 19th of June, 1605, he took his degree of maſter of arts. After he quitted the univerſity, he became ſecretary to Charles,

earl of Nottingham, then lord high-admiral of England; in which poſt he had an opportunity of improving his mathematical knowledge, as alſo of giving many and ſhining proofs of it. On this account, when George Villiers, duke of Bucks, ſucceeded the Earl of Nottingham as high-admiral, Mr. Ayleſbury not only kept his employment, but was alſo, by the favour of that powerful duke, created a baronet, the 19th of April, 1627, having been before made maſter of requeſts, and maſter of the mint. Theſe great employments, as they furniſhed him with the means of expreſſing his regard for learned men, ſo in him they met a perſon who put them to their right uſe. He not only made all men of ſcience welcome at his table, and afforded them all the countenance he could, but likewiſe gave to ſuch of them as were in narrow circumſtances, regular penſions out of his pocket, and carried them with him to his houſe in Windſor-park, where he uſually ſpent the ſummer. In 1642, adhering ſteadily to the king, he was of conſequence ſtripped of his places, and plundered of his eſtate However, he bore up chearfully under his misfortunes till 1649, when, having ſeen the bloody murder of his ſovereign, he grew ſick of his country, and retiring with his family into Flanders, lived for ſome time at Bruſſels. In 1652 he removed to Breda, where he led a very private life, his loyalty having left him very little to live on; and in 1657, being then eighty-one years of age, he ended his days with honour.

AYLESBURY (William), ſon of the before-mentioned Sir Thomas Ayleſbury, became very early a gentleman-commoner of Chriſt-church, and took a degree in arts at ſixteen years of age. Though he had at that time the proſpect of a very plentiful fortune, yet he purſued his ſtudies with ſuch diligence, and behaved with ſo much modeſty and prudence, that King Charles I. made choice of him to be governor to George Villiers, duke of Bucks, and his brother Lord Francis, with whom he went to travel. He met in Italy with a very extraordinary misfortune. Walking one evening in the garden of the houſe where they lodged, he was ſhot, through a hole in the wall, and a couple of bullets lodged in his thigh: thoſe who did it leaped over the wall, came up, and looked upon him, begged his pardon, told him they were miſtaken, and that they intended to have ſhot another perſon, which was all the ſatisfaction he ever received. He returned into England with his pupils a little after the civil war commenced, and carried them with him to Oxford, where he preſented them to the king. His majeſty expreſſed his great ſatisfaction in regard to Mr. Ayleſbury's conduct, and promiſed on the firſt vacancy, to make him groom of his bed-chamber; which promiſe, however, he lived not to perform. After the king's murder, he retired with his father to Antwerp, and dwelt there as long as his circumſtances would afford it: but at length, through very want, returned into England in the year 1650; ſpending his time here, as moſt of the Royaliſts did, in ſeeking ſhelter and a meal of meat where it was to be had. Living ſometimes in one place, ſometimes in another, chiefly at Oxford, which was always loyal, till the year 1657, when the protector fitted out a fleet to go on ſome expedition to the Weſt Indies, as alſo to carry a ſupply to the iſland of Jamaica, our author, from pure neceſſity, engaged himſelf as ſecretary to the governor; which poſt he enjoyed not long, death removing him when he had been but a ſhort time in the iſland.

AYLMER (John), was born of a good family at Aylmer-hall in Norfolk, about the year 1521. Grey marquis of Dorſet, and afterwards duke of Suffolk, taking a liking to him when he was very young, entertained him as his ſcholar, and gave him an exhibition at the univerſity of Cambridge, where Mr. Wood ſuppoſes he took his degrees in arts; after which the marquis made him tutor to his children, among whom was the Lady Jane Grey, afterwards queen. He early adopted the opinions of the reformers; and under the patronage of the Duke of Suffolk and the Earl of Huntingdon, in the reign of Edward VI. was for ſome time the only preacher in Leiceſterſhire, and was highly inſtrumental in bringing over the people of that county to the Proteſtant religion. In 1553 he was made archdeacon of Stow in the dioceſe of Lincoln. In the convocation which ſat in the firſt year of Queen Mary, he diſtinguiſhed himſelf by his warmth againſt popery. The violent meaſures of that queen's miniſtry rendered his ſtay in England unſafe; he retired beyond ſea, and reſided firſt at Straſburg, and afterwards at Zurich in Switzerland, where he undertook the inſtruction of ſeveral young gentlemen in claſſical learning and religion. During his exile he alſo viſited the univerſities of Italy and Germany. At that of Jena in Saxony he was offered the Hebrew profeſſorſhip; but, having a near proſpect of returning home, he declined it. After the acceſſion of Queen Elizabeth, he came back to England; and in the beginning of that princeſs's reign, was one of the eight divines appointed to diſpute at Weſtminſter, before many perſons of diſtinction, againſt an equal number of popiſh biſhops. In 1562, by the intereſt of Secretary Cecil, he was made archdeacon of Lincoln; and aſſiſted at the ſynod held this year, wherein the doctrine and diſcipline of the church, and the reformation from popery, were eſtabliſhed. He continued long without any other conſiderable preferment, though often nominated by the Archbiſhop of Canterbury to ſome vacant biſhopric. However, he was appointed one of the queen's juſtices of the peace for the county, and one of her eccleſiaſtical commiſſioners. In 1573 he accumulated the degree of bachelor and doctor in divinity in the univerſity of Oxford. In 1576 on the tranſlation of his friend and fellow exile, Dr. Edwin Sandys, to the archbiſhopric of York, he was made biſhop of London; and though Sandys had been very inſtrumental in his promotion, recommending him to the queen as a proper perſon for his ſucceſſor, he ſued him for dilapidations, and after ſome years' proſecution recovered 900 or 1000*l.*

When the plague raged in London in 1578, his principal attention was directed to preſerve the lives of his clergy; and yet to make proviſion that the infected might be viſited, and have proper aſſiſtance with reſpect to religion. He ſummoned the London clergy before him, in order to elect and appoint out of their body viſitors of the ſick, purpoſing to ſpare the reſt by reaſon of the danger of the infection. Strype tell us, that the forwardneſs of many miniſters to undertake this office was remarkable; ſome from covetouſneſs, others from vain glory, and others to ſupply their wants. The biſhop likewiſe ordered books, containing directions for preventing the rage of the peſtilence, to be printed and diſperſed.

In 1581 he propoſed that a number of learned and ſound divines ſhould be appointed to preach at ſet times before great aſſemblies, particularly at St. Paul's Croſs, for confirming the people's judgments in the doctrine and diſcipline of the eſtabliſhed church, which was then ſtruck at and undermined by many; and that for the ſupport of it, contributions ſhould be made and ſettled on the preachers by the city. But Sir John Branch, lord mayor, and the aldermen, did not much like this motion, on account of the ſtanding charge to which it muſt put the city; ſo the deſign was dropped.

Beginning now to be uneaſy in his dioceſe of London, he uſed all his endeavour to obtain a removal to the ſee of Ely, or that of Wincheſter, but without ſucceſs. When he came to be broken with age, he was deſirous to reſign his biſhopric to Dr. Bancroft, but the latter refuſed it. He died at Fulham, the 3d of June, 1594, aged ſeventy-three. He was an excel-

lent logician and hiſtorian, and well ſkilled in the Hebrew tongue: he underſtood the civil law, divinity, and the ancient writers; and was a rhetorical, bold, and pathetic preacher.

AYLOFFE (Sir Joſeph), of Framfield in Suſſex, was deſcended from a Saxon family, anciently ſeated at Bocton Aloſ near Wye, in the county of Kent, in the reign of Henry III. who removed to Horn-church in the county of Eſſex in that of Henry IV. and to Sudbury in that of Edward IV. Sir William Ayloffe of Great Braxtead in the county of Eſſex was knighted by James I. May 1, 1603, and created a baronet November 25, 1612; and from his eldeſt ſon by his third wife, the late baronet was the fourth in deſcent and fifth in title. His father and grandfather were both of Gray's Inn. He was born about the year 1708; received the early part of his education at Weſtminſter-ſchool; admitted of Lincoln's Inn 1724, and in the ſame year was entered a gentleman-commoner at St. John's College, Oxford, which college he quitted about 1728; elected F.A.S. February 10, 1731; one of the firſt council under their charter, 1751; vice-preſident, and F.R.S. June 3, 1731. He prevailed on Mr. Kirby, painter in Ipſwich, to make drawings of a great number of monuments and buildings in Suffolk, of which twelve were engraved, with a deſcription, 1748; and others remain unpubliſhed. He had at that time an intention to write a hiſtory of the county; but, being diſappointed of the materials which he had reaſon to expect for ſo laborious a work, they were never publiſhed. On the building of Weſtminſter-bridge, he was appointed ſecretary to the commiſſioners 1736-7; and on the eſtabliſhment of the Paper-office, on the reſpectable footing it at preſent is, by the removal of the ſtate-papers from the old gate at Whitehall to new apartments at the Treaſury, he was nominated the firſt in the commiſſion for the care and preſervation of them. In 1757 he circulated propoſals for printing, by ſubſcription, *Encyclopædia;* or, a rational Dictionary of Arts and Sciences, and Trade. In 1772 he publiſhed, in 4to. Calendars of the Ancient Charters, &c. and of the Welſh and Scottiſh Rolls now remaining in the Tower of London, &c. and in the introduction gives a moſt judicious and exact account of our public records. He drew up the account of the chapel of London-bridge, of which an engraving was publiſhed by Vertue, 1748, and again by the Society of Antiquaries, 1777. His hiſtorical deſcription of the interview between Henry VIII. and Francis I. on the Champ de Drap d'Or, from an original painting at Windſor, and his account of the paintings of the ſame age at Cowdray, were inſerted in the third volume of the Archæologia, and printed ſeparately to accompany engravings of two of theſe pictures by the Society of Antiquaries, 1775. His account of the body of Edward I. as it appeared on opening his tomb, 1774, was printed in the ſame volume, p. 376. Having been educated, as has been obſerved, at Weſtminſter, he acquired an early affection for that venerable cathedral; and his intimate acquaintance with every part of it diſplayed itſelf in his accurate deſcription of five monuments in the choir, engraved in 1779 by the ſame Society, who muſt reckon, among the many obligations which they owe to his zeal and attention to their intereſts, the laſt exertions of his life to put their affairs on the moſt reſpectable and advantageous footing, on their removal to their new apartments in Somerſet-Place. He ſuperintended the new edition of Leland's Collectanea, in nine volumes 8vo. and alſo of the Liber Niger Scaccarii, in two volumes 8vo. to each of which he added a valuable appendix. He alſo reviſed through the preſs a new edition of Hearne's Curious Diſcourſes, 1771, two volumes 8vo; and likewiſe the Regiſtrum Roſſenſe, publiſhed by Mr. Thorpe in 1769, folio. At the beginning of the ſeventh volume of Somers's Tracts is advertiſed, A Collection of Debates in Parliament before the Reſtoration, from MSS. by Sir Joſeph Ayloffe, bart. which is ſuppoſed never to have appeared. Sir Joſeph died at his houſe at Kennington-lane, Lambeth, April 19, 1781, aged ſeventy-two.

AYRMIN, or AYERMIN (William), biſhop of Norwich in the reigns of Edward II. and III. was deſcended of an ancient and wealthy family, ſeated at Oſgodby in Lincolnſhire. He was a canon in the cathedral church of York, and afterwards in that of Wells; and was for ſome time keeper of the ſeal, and vice-chancellor to King Edward II. under the chancellor John biſhop of Norwich, who could not diſcharge his office by reaſon of ſickneſs. About this time, ann. 1319, a war having broken out between England and Scotland, Ayrmin had the misfortune to be taken priſoner, in a battle between the Scotch and Yorkiſts. Afterwards recovering his liberty, he was made chancellor of England under King Edward III. and afterwards treaſurer. Being ſent ambaſſador to the court of Rome, he is ſaid to have neglected the buſineſs of his embaſſy, and to have employed his time and intereſt in obtaining the biſhopric of Norwich, which was then vacant. In which application meeting with ſucceſs, he returned to take poſſeſſion of that ſee: which the king hearing, and being diſguſted at his proceedings, ſent ſoldiers to Norwich to apprehend him; but Ayrmin lay hid in the cathedral church, till, by the interpoſition of friends, the king was reconciled to him, and conſented to his conſecration.

AYSCOUGH (George Edward), eſq. a lieutenant in the firſt regiment of foot-guards, was only ſon of the Rev. Dr. Franſcis Ayſcough, who was tutor to Lord Lyttleton at Oxford, and at length dean of Briſtol. In September 1777 he went to the Continent for the recovery of his health. While on his travels, he wrote an account of his journey, which, on his return, he publiſhed under the title of Letters from an Officer in the Guards to his Friend in England; containing ſome Accounts of France and Italy, 1778, 8vo. He received however but a temporary relief from the air of the Continent. After lingering for a ſhort time, he died October 14, 1779.

AYSCUE, AYSCOUGH, ASKEW (Sir George), an eminent Engliſh admiral in the laſt century. He was deſcended from a very good family in Lincolnſhire, and entered early into the ſea ſervice, where he obtained the character of an able and experienced officer, and the honour of knighthood from King Charles I. This, however, did not prevent him from adhering to the parliament, when, by a very ſingular intrigue, they got poſſeſſion of the fleet; and ſo zealous he was in the ſervice of his maſters, that when, in 1648, the greateſt part of the navy went over to the Prince of Wales, he, who then commanded the Lion, ſecured that ſhip for the parliament, which was by them eſteemed an acceptable ſervice, and an action of great importance. As this was a ſufficient proof of his fidelity, he had the command given him in a ſquadron, that was employed to watch the motions of the Prince of Wales; and accordingly ſailed therewith to the coaſt of Ireland, where, by his vigilance, he prevented his highneſs from doing what he would otherwiſe have done, and by his great intereſt with the ſeamen he drew many of them back to that ſervice from which they had deſerted. This recommended him ſtrongly to the parliament, who, the next year, ſent him with a conſiderable number of ſhips, and the honourable title of admiral in thoſe ſeas, to the coaſt of Ireland, which commiſſion he diſcharged with equal vigour and vigilance. After the war was finiſhed in Ireland, and the parliament had thereby time and opportunity to think of the proper means of ſubduing the reſt of the dominions of the crown of England to their obedience, Sir George Ayſcue had orders to ſail with a ſmall ſquadron to reduce the iſland of Barbadoes, which he effected.

On the 21ſt of June, 1652, Sir George Ayſcue, in obedience to the orders he had received from London, came to Dover,

with his eleven ſail, and there joined his old friend Admiral Blake, on board whoſe ſhip he dined, and was received with all imaginable marks of reſpect and kindneſs by that famous commander. In the beginning of the next month, Blake having received orders to ſail northward, and deſtroy the Dutch herring fiſhery, Sir George Ayſcue was left to command the fleet in the Downs. Within a few days after Blake's departure, he took five ſail of Dutch merchantmen, and had ſcarcely brought them in, before he received advice, that a fleet of forty ſail had been ſeen not far from the coaſt, upon which he gave chace, fell in amongſt them, took ſeven, ſunk four, and ran twenty-four upon the French ſhore, all the reſt being ſeparated from their convoy, which, conſidering that Sir George had with him only the ſquadron he brought with him from Barbadoes, was very gallantly performed. After various other ſucceſsful engagements with the Dutch, Sir George at length laid down his commiſſion. He retired after this to his country ſeat in the county of Surrey, and lived there in great honour and ſplendor till the death of the Protector. On the reſtoration of Charles II. Sir George Ayſcue had the honour to be introduced to his majeſty, and to kiſs his hand. Soon after the Dutch war breaking out, he was immediately put into commiſſion by the direction of the Duke of York, who then commanded the Engliſh fleet. In the ſpring of the year 1665, Sir George Ayſcue hoiſted his flag as rear-admiral of the blue, under the right honourable the Earl of Sandwich, and in the great battle that was fought the 3d of June in the ſame year, that ſquadron had the honour to break through the Dutch fleet, and thereby made way for one of the moſt glorious victories ever obtained by this nation at ſea: for, in this battle, the Dutch had ten of their largeſt ſhips ſunk or burned, beſides their Admiral Opdam's, which blew up in the midſt of the engagement, by which the admiral himſelf, and upwards of five hundred men, periſhed. Eighteen men-of-war were taken, four fire-ſhips deſtroyed, thirteen captains, and two thouſand and fifty private men, made priſoners; and this with ſo inconſiderable a loſs, as that of one ſhip only, and three hundred private men.

On the 1ſt of June, 1666, the Dutch and Engliſh fleets again met. This day's fight was very fierce and bloody; for the Dutch, confiding in their numbers, preſſed furiouſly upon the Engliſh fleet, while the Engliſh officers, being men of determined reſolution, fought with ſuch courage and conſtancy, that they not only repulſed the Dutch, but renewed the attack, and forced the enemy to maintain the fight longer than they were inclined to do, ſo that it was ten in the evening before their cannon were ſilent. The following night was ſpent in repairing the damages ſuffered on both ſides, and next morning the fight was renewed by the Engliſh with freſh vigour. On the third day Sir George Ayſcue, who commanded the Royal Prince (being the largeſt and heavieſt ſhip of the whole fleet), unfortunately ſtruck upon the ſand called the Galloper, where, being threatened by the enemy's fire-ſhips, and hopeleſs of aſſiſtance from his friends (whoſe timely return, the near approach of the enemy, and the tide, had abſolutely rendered impoſſible), he was forced to ſurrender, and was carried to the Hague. It is ſaid, that he afterwards returned to England, and ſpent the remainder of his days in peace.

AYR, a borough and ſea-port of Ayrſhire, ſituated on a ſandy plain, and built on both ſides of the river Ayr, over which is a bridge of four arches. Its chief trade is in coal and grain; the fiſhery being in a manner given up. In the New-Town are many good houſes, and the ruins of a Dominician monaſtery, founded by Alexander II. in 1230. A mile north from the town, is a houſe called King's Chapel, founded for lepers by Robert Bruce. The leproſy was a diſeaſe ſo common in thoſe days, as to be the ſubject of ſeveral parliamentary ſtatutes; but it is now ſcarcely known in Europe. Ayr is 65 miles S. W. of Edinburgh. Long. 4. 39. E. Lat. 55. 30. N.

AYRSHIRE, a county of Scotland, bounded on the weſt, north-weſt, and north, by the frith of Clyde and Renfrewſhire; on the eaſt by the counties of Lanerk and Dumfries; and on the ſouth-eaſt and ſouth by the ſhires of Kirkcudbright and Wigton. It exhibits the ſhape of two wings, extending to the north-weſt and ſouth-weſt, and forming a vaſt bay at the mouth of the frith of Clyde. Between its extreme points, it meaſures about 50 miles; its greateſt breadth is not quite 27. Its moſt northerly diviſion is Cunningham, the north-weſt angle of which, though mountainous, is rich in paſture.

AYTONIA (*Encycl.*). In that article the *claſs* is erroneouſly put for the *order*; and *vice verſa*.

AZARIAH, or UZZIAH, king of Judah, ſucceeded his father Amaziah, 810 years before Chriſt. He aſſembled an army of above 300.000 men, with which he conquered the Philiſtines, and demoliſhed the walls of Gath, Jabniel, and Aſhdod; built up the walls of Jeruſalem; furniſhed the city with conduits; and planted gardens and vineyards: but at laſt being elated with his proſperity, and reſolving to uſurp the office of high-prieſt, he was ſtruck with a leproſy, which obliged him to remain ſhut up in his palace for the reſt of his days. He died about 759 years before the Chriſtian æra, and was ſucceeded by Jonathan his ſon.—There are ſeveral other perſons of this name mentioned in the ſacred Scriptures.

B

BABINGTON (Gervaſe), biſhop of Worceſter, was born, according to Fuller, in Nottinghamſhire; but in what year is uncertain. He was ſent to Trinity College, Cambridge, of which he was made fellow; and, in 1578, was incorporated maſter of arts at Oxford. He appears, however, to have made Cambridge the place of his reſidence, where he became an eminent preacher; and, being now doctor in divinity, was made domeſtic chaplain to Henry earl of Pembroke. In this ſtation he is ſuppoſed to have aſſiſted the counteſs in her tranſlation of the Pſalms. In 1581 he was inſtalled prebend of Hereford, and, in 1591, conſecrated biſhop of Landaff. In 1594 he was tranſlated to the ſee of Exeter, and thence to Worceſter in 1597. About this time, or ſoon after, he was made queen's counſel for the marches of Wales. He was a

conſiderable benefactor to the library belonging to the cathedral of Worceſter, where he was buried, in May 1610, without a monument. The ſeveral hiſtorians, who have mentioned this prelate, agree in giving him the character of a learned and pious man. His writings, like thoſe of moſt of his contemporaries, abound with puns and quaint expreſſions. His works were printed both in folio and quarto in 1615, and again in folio in 1637, under this title: *The works of the right reverend father in God Gervaſe Babington, late Biſhop of Worceſter, containing comfortable notes upon the five books of Moſes, viz. Geneſis, &c. As alſo an expoſition upon the Creed, the Ten Commandments, the Lord's Prayer; with a conference betwixt man's frailty and faith, and three ſermons, &c.*

BABOLITZA CARETHNA, or BABOLIZA, a town of Sclavonia, ſeated near the river Drave, between Poſſega and Zygeth.

BABYLON (*Encycl.*). This capital was ſurrounded with walls, in thickneſs 87 feet, in height 350 feet, and in compaſs 480 furlongs, or 60 of our miles. Thus Herodotus, who was himſelf at Babylon; and though ſome diſagree with him in theſe dimenſions, yet moſt writers give us the ſame, or near the ſame, as he does. Diodorus Siculus diminiſhes the circumference of theſe walls very conſiderably, and takes ſomewhat from the height of them, as in Herodotus; though he ſeems to add to their breadth, by ſaying, that ſix chariots might drive a-breaſt thereon; while the former writes, that one chariot only might turn upon them; but then he places buildings on each ſide of the top of theſe walls, which, according to him, were but one ſtory high: which may pretty well reconcile them together in this reſpect. It is obſerved, that thoſe who give the height of theſe walls but at 50 cubits, ſpeak of them only as they were after the time of Darius Hyſtaſpis, who had cauſed them to be beaten down to that level. Theſe walls formed an exact ſquare, each ſide of which was 120 furlongs, or 15 miles, in length; and were all built of large bricks cemented together with bitumen, which in a ſhort time grows harder than the very brick and ſtone which it cements. The city was encompaſſed, without the walls, with a vaſt ditch filled with water, and lined with bricks on both ſides; and, as the earth that was dug out of it ſerved to make the bricks, we may judge of the depth and largeneſs of the ditch from the height and thickneſs of the walls. In the whole compaſs of the wall there were 100 gates, that is, 25 on each of the four ſides, all made of ſolid braſs. Between every two of theſe gates, at proper diſtances, were three towers, and four more at the four corners of this great ſquare, and three between each of theſe corners and the next gate on either ſide, and each of theſe towers was ten feet higher than the walls. But this is to be underſtood only of thoſe parts of the walls where towers were needful for defence. For ſome parts of them being upon a moraſs, and inacceſſible by an enemy, there the labour and coſt was ſpared, which, though it muſt have ſpoiled the ſymmetry of the whole, muſt be allowed to have favoured of good œconomy; though that is what one would not have expected from a prince who had been ſo determined, as Nebuchadnezzar muſt have been, to make the city complete both for ſtrength and beauty. The whole number, then, of theſe towers amounted to no more than 250; whereas a much greater number would have been neceſſary to have made the uniformity complete all round. From the 25 gates in each ſide of this ſquare, there was a ſtraight ſtreet, extending to the correſponding gate in the oppoſite wall; whence the whole number of the ſtreets muſt have been but 50; but then they were each about 15 miles long, 25 of them croſſing the other 25 exactly at right angles. Beſides theſe whole ſtreets, we muſt reckon four half ſtreets, which were but rows of houſes facing the four inner ſides of the walls. Theſe four half ſtreets were properly the four ſides of the city within the walls, and were each of them 200 feet broad, the whole ſtreets being about 150 of the ſame. By this interſection of the 50 ſtreets, the city was divided into 676 ſquares, each of four furlongs and an half on each ſide, or two miles and a quarter in compaſs. Round theſe ſquares on every ſide towards the ſtreets ſtood the houſes, all of three or four ſtories in height, and beautified with all manner of ornaments; and the ſpace within each of theſe ſquares was all void, and taken up by yards, or gardens, and the like, either for pleaſure or convenience.

A branch of the Euphrates divided the city into two, running through the midſt of it, from north to ſouth; over which, in the very middle of the city, was a bridge, a furlong in length, or rather more, and indeed much more, if we hearken to others, who ſay it was no leſs than five ſtades or furlongs in length, though but 30 feet broad, a difference we ſhall never be able to decide: this bridge, however, is ſaid to have been built with wonderful art, to ſupply a defect in the bottom of the river, which was all ſandy. At each end of this bridge were two palaces; the old palace on the eaſt ſide, the new one on the weſt ſide of the river; the former of which took up four of the ſquares above mentioned, and the latter nine. The temple of Belus, which ſtood next to the old palace, took up another of the ſame ſquares.

The whole city ſtood in a large flat or plain, in a very fat and deep ſoil; that part or half of it on the eaſt ſide of the river was the old city, and the other on the weſt was added by Nebuchadnezzar, both being included within the vaſt ſquare bounded by the walls aforeſaid. The form of the whole was ſeemingly borrowed from Nineveh, which was alſo 480 furlongs; but, though it was equal in dimenſions to this city, it was leſs with reſpect to its form, which was a parallelogram, whereas that of Babylon was an exact ſquare. It is ſuppoſed that Nebuchadnezzar, who had deſtroyed that old ſeat of the Aſſyrian empire, propoſed that this new one ſhould rather exceed it; and that it was in order to fill it with inhabitants, that he tranſported ſuch numbers of the captives from other countries hither; though that is what may be diſputed, ſeeing he therein only followed the conſtant practice of the kings of Aſſyria, who thought this the moſt certain means of aſſuring their conqueſts either to themſelves, or their poſterity.

But it plainly appears, that it was never wholly inhabited; ſo that, even in the meridian of its glory, it may be compared with the flower of the field, which flouriſhes to-day, and to-morrow is no more. It never had time to grow up to what Nebuchadnezzar viſibly intended to have made it; for, Cyrus removing the ſeat of the empire ſoon after to Shuſhan, Babylon fell by degrees to utter decay; yet it muſt be owned, that no country was better able to ſupport ſo vaſt and populous a city, had it been completed up to its firſt deſign. But ſo far was it from being finiſhed according to its original deſign, that, when Alexander came to Babylon, Q. Curtius tells us, "No more than 90 furlongs of it were then built:" which can be no otherwiſe underſtood than of ſo much in length; and, if we allow the breadth to be as much as the length (which is the utmoſt that can be allowed), it will follow, that no more than 8100 ſquare furlongs were then built upon: but the whole ſpace within the walls contained 14,400 ſquare furlongs; and therefore there muſt have been 6300 ſquare furlongs remaining unbuilt, which, Curtius tells us, were plowed and ſown. And, beſides this, the houſes were not contignous, but all built with a void ſpace on each ſide, between houſe and houſe.

The next great work of Nebuchadnezzar was the temple of Belus. The wonderful tower, however, that ſtood in the mid-

dle of it, was not his work, but was built many ages before; that, and the famous tower of Babel, being, as is commonly ſuppoſed, one and the ſame ſtructure. This tower is ſaid to have been compoſed of eight pyramidal ones raiſed above one another, and by Herodotus ſaid to have been a furlong in height; but as there is an ambiguity in his expreſſion, it has been diſputed whether each of the towers was a furlong in length, or the whole of them taken together. On the latter ſuppoſition, which is the moſt probable, this tower muſt have exceeded the higheſt of the Egyptian pyramids by 179 feet, though it fell ſhort of its breadth at the baſis by 33. The way to go up was by ſtairs on the outſide round it; whence it ſeems moſt likely, that the whole aſcent was, by the benching in, drawn in a ſloping line from the bottom to the top eight times round it; and that this made the appearance of eight towers, one above the other. Till the times of Nebuchadnezzar, it is thought this tower was all the temple of Belus: but as he did by the other ancient buildings of the city, ſo he did by this, making great additions thereto, by vaſt edifices erected round it, in a ſquare of two furlongs on every ſide, and juſt a mile in circumference, which exceeded the ſquare at the temple of Jeruſalem by 1800 feet. On the outſide of theſe buildings was a wall, which incloſed the whole; and, in conſideration of the regularity wherewith this city was to all appearance marked out, it is ſuppoſed that this wall was equal to the ſquare of the city wherein it ſtood, and ſo is concluded to have been two miles and a half in circumference. In this wall were ſeveral gates leading into the temple, and all of ſolid braſs; which it is thought may have been made out of the braſen ſea, and braſen pillars, and other veſſels and ornaments of the kind, which Nebuchadnezzar had tranſported from Jeruſalem; for in this temple he is ſaid to have dedicated his ſpoils from that of Jeruſalem.

In this temple were ſeveral images or idols of maſſy gold, and one of them, as we have ſeen, 40 feet in height; the ſame, as ſuppoſed, with that which Nebuchadnezzar conſecrated in the plains of Dura. For though this laſt is ſaid to have been 60 cubits, or 90 feet high, theſe dimenſions appear ſo incredible, that it has been attempted to reconcile them into one, by ſuppoſing, that in the 90 feet the height of the pedeſtal is included, and that the 40 feet are for the height of the ſtatue without the pedeſtal; and, being ſaid to have weighed 1000 talents of Babylon, it is thence computed, that it was worth three millions and a half of our money. In a word, the whole weight of the ſtatues and decorations, in Diodorus Siculus, amounting to 5000 and odd talents in gold, the whole is eſtimated at above one-and-twenty millions of our money; and a ſum about equal to the ſame, in treaſure, utenſils, and ornaments, not mentioned, is allowed for.

Next to this temple, on the eaſt ſide of the river, ſtood the old palace of the kings of Babylon, being four miles in circumference. Exactly oppoſite to it, on the other ſide of the river, was the new palace built by Nebuchadnezzar, eight miles in circumference, and conſequently four times as big as the old one.

But nothing was more wonderful at Babylon than the hanging-gardens, which Nebuchadnezzar made in complaiſance to his wife Amyte; who, being a Mede, and retaining a ſtrong inclination for the mountains and foreſts of her own country, was deſirous of having ſomething like them at Babylon. They are ſaid to have contained a ſquare of four plethra, or 400 feet, on each ſide; and to have conſiſted of terraces one above another, carried up to the height of the wall of the city, the aſcent from terrace to terrace being by ſteps ten feet wide. The whole pile conſiſted of ſubſtantial arches upon arches, and was ſtrengthened by a wall ſurrounding it on every ſide, 22 feet thick; and the floors on each of them were laid in this order: firſt, on the tops of the arches was laid a bed or pavement of ſtones 16 feet long, and four feet broad; over this was a layer of reed mixed with a great quantity of bitumen; and over this two courſes of brick, cloſely cemented together with plaſter; and over all theſe were thick ſheets of lead, and on theſe the earth or mould of the garden. This floorage was deſigned to retain the moiſture of the mould; which was ſo deep, as to give root to the greateſt trees which were planted upon every terrace, together with great variety of other vegetables pleaſing to the eye. Upon the uppermoſt of theſe terraces was a reſervoir, ſupplied by a certain engine with water from the river, from whence the gardens on the other terraces were ſupplied.

The other works attributed to Nebuchadnezzar by Beroſus and Abydenus, were the banks of the river, the artificial canals, and the great artificial lake ſaid to have been ſunk by Semiramis. The canals were cut out on the eaſt ſide of the Euphrates, to convey the waters of that river, when it overflowed its banks, into the Tigris, before they reached Babylon. The lake was on the weſt ſide of Babylon; and, according to the loweſt computation, 40 miles ſquare, 160 in compaſs, and in depth 35 feet, as we read in Herodotus, or 75, as Megaſthenes will have it; the former, perhaps, meaſured from the ſurface of the ſides, and the latter from the tops of the banks that were caſt upon them. This lake was dug to receive the waters of the river, while the banks were building on each ſide of it. But both the lake, and the canal which led to it, were preſerved after that work was completed, being found of great uſe, not only to prevent all overflowings, but to keep water all the year, as in a common reſervoir, to be let out, on proper occaſions, by ſluices, for the improvement of the land.

The banks were built of brick and bitumen, on both ſides of the river, to keep it within its channel; and extended on each ſide throughout the whole length of the city, and even farther, according to ſome, who reckon they extended 160 furlongs, or twenty miles; whence it is concluded they muſt have begun two miles and a half above the city, and have been continued an equal diſtance below it, the length of the city being no more than 15 miles. Within the city they were built from the bottom of the river, and of the ſame thickneſs with the walls of the city itſelf. Oppoſite to each ſtreet, on either ſide of the river, was a brazen gate in the ſaid wall, with ſtairs leading down from it to the river: theſe gates were open by day, and ſhut by night.

Beroſus, Megaſthenes, and Abydenus, attribute all theſe works to Nebuchadnezzar; but Herodotus tells us, the bridge, the banks, and the lake, were the work of a queen after him, called Nitocris, who may have finiſhed what Nebuchadnezzar left imperfect, and thence have had the honour this hiſtorian gives her of the whole.

The tower or temple ſtood till the time of Xerxes. But that prince, on his return from the Grecian expedition, having firſt plundered it of its immenſe wealth, demoliſhed the whole, and laid it in ruins. Alexander, on his return to Babylon from his Indian expedition, propoſed to rebuild it, and accordingly ſet 10,000 men on work to clear away the rubbiſh. But his death happening ſoon after, a ſtop was put to all further proceedings in that deſign. After the death of that conqueror, the city of Babylon began to decline apace; which was chiefly owing to the neighbourhood of Seleucia, built by Seleucus Nicator, as is ſaid, out of ſpite to the Babylonians, and peopled with 500,000 perſons drawn from Babylon, which by that means continued declining till the very people of the country were at a loſs to tell where it had ſtood.

Such is the deſcription we have by ancient hiſtorians of the grandeur of this city; which, if theſe accounts are not exaggerated, muſt have exceeded every piece of human grandeur

that hath yet appeared. Many of the moderns, however, are of opinion that theſe magnificent deſcriptions are very far from being true; although it is certain that few other arguments can be brought againſt the reality of them, than that we do not ſee things of a ſimilar kind executed in our own days.

BABYLONIA (*Encycl.*). Concerning the nature of the country, manners, cuſtoms, &c. of the ancient Babylonians, the following account is collected by M. Sabbathier.

"As all the nations under the dominion of Cyrus, beſide the ordinary tributes, were obliged to maintain him and his army, the monarch and his troops were ſupported by all Aſia. The country of Babylon alone was obliged to maintain him four months of the year; its fertility, therefore, yielded a third of the produce of Aſia. The government of this country, which the Perſians termed *ſatrapy*, was richer and more extenſive, than any of the reſt. It maintained for the king, beſides the war-horſes, a ſtud of 800 ſtallions, and 16,000 mares. So great a number of Indian dogs were likewiſe bred in this province for the king, that four of its cities kept thoſe animals; and, in return, they were exempted from all taxes and tributes.

"It rained very ſeldom in this country, according to Herodotus. The earth was watered by the river, which was here diffuſed by human induſtry, as the Nile is over Egypt by nature: for all the country of Babylon was divided by canals, the greateſt of which was navigable, and flowed from ſouth to north, from the Euphrates to the Tigris. In ſhort, it was one of the fineſt countries for corn in the world; but for producing trees, the fig-tree, the vine, and the olive, it was not famous. It was ſo luxuriant in grain, that it commonly yielded a hundred times more than what was ſown; and in its good years it yielded three hundred times more than it received. The leaves of its wheat and barley were four inches broad. "Though I know," ſays Herodotus, "that the millet and the ſeſame of that country grow to the ſize of trees, I will not deſcribe them particularly; leſt thoſe who have not been in Babylonia ſhould think my account fabulous."

"They had no oil but what they made from Indian corn. The country abounded with palm-trees, which grew ſpontaneouſly; and moſt of them bore fruit, of which the inhabitants made bread, wine, and honey. They cultivated theſe trees and their fig-trees in the ſame manner. Some of them, as of other trees, the Greeks called *male ones*. They tied the fruit of the male to the trees which bore dates; that the moſquito, leaving the male, might cauſe the date to ripen, by penetrating it; for without that aſſiſtance it came not to maturity. Moſquitos bred in the male palms, as in the wild fig-trees.

"But we muſt not here omit to give an account of the peculiar and ſurpriſing conſtruction of their boats of ſkins, in which they ſailed along the river to Babylon. Theſe boats were invented by the Armenians, whoſe country lay north from Babylonia. They made them with poles of willow, which they bent, and covered with ſkins: the bare ſide of the ſkins they put outwards; and they made them ſo tight, that they reſembled boards. The boats had neither prow nor ſtern, but were of a round form, like a buckler. They put ſtraw on the bottom. Two men, each with an oar, rowed them down the river, laden with different wares, but chiefly with palm-wine. Of theſe boats ſome were very large, and ſome very ſmall. The largeſt carried the weight of 500 talents. There was room for an aſs in one of their ſmall boats; they put many into a large one. When they had unloaded, after their arrival at Babylon, they ſold the poles of their boats, and the ſtraw; and loading their aſſes with the ſkins, returned to Armenia: for they could not ſail up the river, its current was ſo rapid. For this reaſon they made their boats of ſkins, inſtead of wood; and on their return to Armenia with their aſſes, they applied the ſkins to their former uſe.

"As to their dreſs, they wore a linen ſhirt, which came down to their feet. Over it they wore a woollen robe; their outer garment was a white veſt. Their ſhoes reſembled thoſe of the Thebans. They let their hair grow. On their heads they wore a turban. They rubbed their bodies all over with fragrant liquors. Each man had a ring on his finger; and an elegant cane in his hand, with an apple at the top, or a roſe, a lily, or an eagle, or ſome other figure; for they were not ſuffered to uſe canes without devices.

"With regard to their policy, Herodotus thinks that their beſt law was one which the Heneti, an Illyrian people, likewiſe obſerved in every town and village. When the girls were marriageable, they were ordered to meet in a certain place, where the young men likewiſe aſſembled. They were then ſold by the public crier; but he firſt ſold the moſt beautiful one. When he had ſold her at an immenſe price, he put up others to ſale, according to their degrees of beauty. The rich Babylonians were emulous to carry off the fineſt women, who were ſold to the higheſt bidders. But as the young men who were poor could not aſpire to have fine women, they were content to take the uglieſt with the money which was given them: for when the crier had ſold the handſomeſt, he ordered the ugliſt of all the women to be brought; and aſked, if any one was willing to take her with a ſmall ſum of money. Thus ſhe became the wife of him who was moſt eaſily ſatisfied; and thus the fineſt women were ſold; and from the money which they brought, ſmall fortunes were given to the ugliſt, and to thoſe who had any bodily infirmity. A father could not marry his daughter as he pleaſed; nor was he who bought her allowed to take her home, without giving ſecurity that he would marry her. But, after the ſale, if the parties were not agreeable to each other, the law enjoined that the purchaſe money ſhould be reſtored. The inhabitants of any of their towns were permitted to buy wives at theſe auctions. Such were the early cuſtoms of the Babylonians.

"But they afterwards made a law, which prohibited the inhabitants of different towns to intermarry, and by which huſbands were puniſhed for treating their wives ill. When they had become poor by the ruin of their metropolis, fathers uſed to proſtitute their daughters for gain. There was a ſenſible cuſtom among the Babylonians, worthy to be related. They brought their ſick into the forum, to conſult thoſe who paſſed, on their diſeaſes; for they had no phyſicians. They aſked thoſe who approached the ſick, if they ever had the ſame diſtemper? if they knew any one who had had it? and how he was cured? Hence, in this country, every one who ſaw a ſick perſon was obliged to go to him, and enquire into his diſtemper.

"They embalmed their dead with honey; and their mourning was like that of the Egyptians.

"There were three Babylonian tribes, who lived only upon fiſh, and who prepared them in the following manner: they dried them in the ſun, and then beat them in a mortar to a kind of flour, which after they had ſifted through linen, they baked it in rolls.

"The Babylonians at firſt worſhipped only the ſun and the moon; but they ſoon multiplied their divinities. They deified Baal, Bel, or Belus, one of their kings, and Merodach-Baladan. They alſo worſhipped Venus, under the name of *Mylita*. She and Belus were the principal deities of the Babylonians. They counted their day from ſun-riſe to ſun-riſe. They ſolemnized five days of the year with great magnificence, and almoſt the ſame ceremonies with which the Romans celebrated their Saturnalia.

"The Babylonians were very much addicted to judicial

aſtrology. Their prieſts, who openly profeſſed that art, were obliged to commit to writing all the events of the lives of their illuſtrious men; and on a fancied connection between them and the motions of the heavenly bodies, the principles of their art were founded. They pretended that ſome of their books, in which their hiſtorical tranſactions and revolutions were accurately compared with the courſes of the ſtars, were thouſands of years old. This aſſertion of their judicial aſtrologers we may reaſonably diſpute; but that their aſtronomers had made a long ſeries of obſervations is inconteſtably true. It is certain that ſome of thoſe obſervations were extant in the days of Ariſtotle, and that they were older than the empire of the Babylonians.

BACACUM, a town of the Nervii in Gallia Belgica; now *Bavay*, in Hainault. E long. 3. 40. N. lat. 19. 0.

BACANO, a village of Italy, in the patrimony of St. Peter: on a ſmall lake, near a river of the ſame name; well known on account of the defeat of the Fabii, in the 277th year of Rome.

BACCHINI (Benedict), a Benedictine monk, and one of the moſt learned men in his time, was born at Borgo San Domino, in 1651; and wrote a great number of books, in Latin and Italian, the moſt conſiderable of which is a Literary Journal. He died at Bologna, in 1721, aged 70.

BACCHIUS, a follower of Ariſtoxenus, ſuppoſed by Fabricius to have been tutor to the Emperor Marcus Antoninus, and conſequently to have lived about A. C. 140 He wrote in Greek a very ſhort introduction to muſic in dialogue, which, with a Latin tranſlation thereof, Meibomius has publiſhed. It ſeems it was firſt publiſhed in the original by Merſennus, in his Commentary on the firſt ſix chapters of Geneſis; and that afterwards he publiſhed a tranſlation of it in French, which Meibomius, in the preface to his edition of the ancient muſical authors, cenſures as being groſsly erroneous.

BACCHUS (*Encycl.*). This perſonage is ſeldom named in modern times but as a ſenſual encourager of feaſt and jollity; but he was regarded in a more reſpectable light by the ancients, who worſhipped him in different countries under the following appellations: in Egypt, he was called *Oſiris*; in Myſia, *Panaces*; in India, *Dionyſius*; *Liber*, throughout the Roman dominions; *Adoneus*, in Arabia; and *Pentheus*, by the Lucanians. Mythologiſts furniſh reaſons for all theſe different names given to the ſame God, which may be ſeen in the ſecond volume of Banier's Mythology.

It is natural to ſuppoſe that the Greeks and Romans, as uſual, beſtowed upon the one Bacchus which they worſhipped, the ſeveral actions and attributes of the many divinities known by that name, and by other equivalent denominations in different countries. However, antiquity chiefly diſtinguiſhed two gods under the title of *Bacchus:* that of Egypt, the ſon of Ammon, and the ſame as Oſiris; and that of Thebes in Bœotia, the ſon of Jupiter and Semele.

The Egyptian Bacchus was brought up at Nyſa, a city of Arabia Felix, whence he acquired the name of *Dionyſius*, or the God of Nyſa; and this was the conqueror of India. Though this Bacchus of the Egyptians was one of the elder gods of Egypt, yet the ſon of Semele was the youngeſt of the Grecian deities. Diodorus Siculus tells us, that Orpheus firſt deified the ſon of Semele by the name of Bacchus, and appointed his ceremonies in Greece, in order to render the family of Cadmus, the grandfather of the Grecian Bacchus, illuſtrious.

The great Bacchus, according to Sir Iſaac Newton, flouriſhed but one generation before the Argonautic expedition. This Bacchus, ſays Hermippus, was potent at ſea, conquered eaſtward as far as India, returned in triumph, brought his army over the Helleſpont, conquered Thrace, and left muſic, dancing, and poetry, there. And, according to Diodorus Siculus, it was the ſon of Semele who invented farces and theatres, and who firſt eſtabliſhed a muſic-ſchool, exempting from all military functions ſuch muſicians as diſcovered great abilities in their art; on which account, ſays the ſame author, muſicians formed into companies have ſince frequently enjoyed great privileges.

Dr. Burney obſerves, that the dithyrambics which gave birth to dramatic repreſentations, are as ancient as the worſhip of Bacchus in Greece; and there is little doubt but that the ceremonies of his myſteries gave riſe to the pomp and illuſions of the theatre. Many of the moſt ſplendid exhibitions upon the ſtage for the entertainment of the people of Athens and Rome, being performed upon the feſtivals of Bacchus, gave occaſion to the calling all thoſe that were employed in them, whether for ſinging, dancing, or reciting, *ſervants of Bacchus.*

BACCHYLIDES, a famous Greek poet, was the nephew of Simonides, and the contemporary and rival of Pindar. Both ſung the victories of Hiero at the public games. Beſides odes to athletic victors, he was author of *Love Verſes*; *Proſodies*; *Dithyrambics*; *Hymns*; *Pæans*; *Hyporchemes*; *Parthenia*, or ſongs to be ſung by a chorus of virgins at feſtivals. The chronology of Euſebius places the birth of Bacchylides in the 82d Olympiad, about 450 B.C.

BACCIO, or BACCIUS (Andrew), a celebrated phyſician of the 16th century, born at St. Elpideo. He practiſed phyſic at Rome with great reputation, and was firſt phyſician to pope Sextus V. The moſt ſcarce and valuable of his works are, 1. *De thermis.* 2. *De naturali vinorum hiſtoria.* 3. *De venenis et antidotis.* 4. *De gemmis ac lapidibus pretioſis.*

BACON (Sir Nicholas), lord keeper of the great ſeal in the reign of Queen Elizabeth, was born at Chiſlehurſt in Kent, in 1510, and educated at the univerſity of Cambridge; after which he travelled into France, and made ſome ſtay at Paris. On his return, he ſettled in Gray's-Inn, and applied himſelf with ſuch aſſiduity to the ſtudy of the law, that he quickly diſtinguiſhed himſelf ſo, that on the diſſolution of the monaſtery of St. Edmund's Bury, in Suffolk, he had a grant from King Henry VIII. in the 36th year of his reign, of ſeveral manors. In the 38th of the ſame king he was promoted to the office of attorney in the court of Wards, which was a place both of honour and profit. In this office he was continued by King Edward VI.; and in 1552 he was elected treaſurer of Gray's-Inn. His great moderation and conſummate prudence preſerved him through the dangerous reign of Queen Mary. In the very dawn of that of Elizabeth he was knighted; and on the 22d of December, 1558, the great ſeal of England, being taken from Nicholas Heath, archbiſhop of York, was delivered to him with the title of *lord keeper*, and he was alſo made one of the Queen's privy-council. He had a conſiderable ſhare in the ſettling of religion: as a ſtateſman, he was remarkable for a clear head and deep counſels: but his great parts and high preferment were far from raiſing him in his own opinion, as appears from the modeſt anſwer he gave Queen Elizabeth, when ſhe told him his houſe at Redgrave was too little for him; "Not ſo, madam (returned he), but your majeſty has made me too great for my houſe." After having had the great ſeal more than twenty years, this able ſtateſman and faithful counſellor was ſuddenly removed from this life, as Mr. Mallet informs us, by the following accident: he was under the hands of the barber, and thinking the weather warm, had ordered a window before him to be thrown open, but fell aſleep as the current of freſh air was blowing in upon him, and awaked ſome time after diſtempered all over. He was immediately removed into his bed chamber, where he died a few days after, on the 26th of February, 1578-9, equally lamented by the queen and her ſubjects. He was

buried in St. Paul's, where a monument was erected to him, which was deſtroyed by the fire of London in 1666. Mr. Granger obſerves, that he was the firſt lord keeper that ranked as lord chancellor; and that he had much of that penétrating genius, ſolidity, and judgment, perſuaſive eloquence, and comprehenſive knowledge of law and equity, which afterwards ſhone forth with ſo great a luſtre in his ſon, who was as much inferior to his father in point of prudence and integrity as his father was to him in literary accompliſhments.

Bacon (Sir Nathaniel), knight of the Bath, and an excellent painter, was a younger ſon of the lord keeper, and half brother to the great Sir Francis. He travelled into Italy, and ſtudied painting there; but his manner and colouring approaches nearer to the ſtyle of the Flemiſh ſchool. Mr. Walpole obſerves, that at Culford, where he lived, are preſerved ſome of his works; and at Gorhambury, his father's ſeat, is a large picture by him in oil, of a cook-maid with a dead fowl, admirably painted, with great nature, neatneſs, and luſtre of colouring. In the ſame houſe is a whole length of him, by himſelf, drawing on a paper, his ſword and pallet hung up, and a half length of his mother by him.

Bacon (Anthony), elder brother to the chancellor, and eldeſt ſon to the lord keeper Bacon, by his ſecond wife Anne, was born in the year 1558. He received his education at Trinity College in Cambridge. Mr. Anthony Bacon began his travels in 1579, at the age of twenty-one, and reſided for ſome time at Paris, from whence he removed to Bourges, and thence to Geneva, where he lodged at the houſe of Theodore Beza. From Geneva he ſucceſſively removed to Montpellier, to Marſeilles, to Bourdeaux, to Montaubon, and again to Bourdeaux, where he reſided the longeſt. During his ſtay abroad, he correſponded with ſeveral eminent perſons in England, and ſometimes communicated intelligence of importance to the public ſervice. In the year 1585 he paid a viſit to Henry king of Navarre, at Bearn, where he became acquainted with the learned Lambert Danæus, who had ſo high an eſteem for him, that he dedicated to him ſeveral of his works. While Mr. Bacon was at Montaubon, in 1586, he contracted an intimacy with the famous Philip Pleſſis du Mornay, and his family. He returned to England in a very ill ſtate of health, in the beginning of February, 1591-2. It was not till the latter end of the year 1595, that he took up his reſidence in Eſſex-houſe; in which ſituation he carried on a moſt extenſive correſpondence. In 1596 Mr. Bacon received a letter from Henry the Fourth, king of France; in which that illuſtrious monarch aſſured him of his high eſteem, and requeſted his intereſt with the Earl of Eſſex. In the ſame year he was viſited by the Duke de Bouillon, then in England. He quitted Eſſex-houſe by the queen's command, in March 1599-1600. The time and place of his death cannot be aſcertained. It is certain that he ſurvived the Earl of Eſſex, and that he did not live till the acceſſion of King James the Firſt.

Bacon (Phanuel), rector of Balden in Oxfordſhire, and vicar of Bramber in Suſſex, was of Magdalen College, Oxford, where he took the degree of M.A. April 17th, 1722; B.D. April 29th, 1731; D.D. December 7, 1735. He poſſeſſed an exquiſite fund of humour, was a famous punſter, and wrote an admirable poem, called, The Artificial Kite. In the year 1757 he publiſhed no leſs than five dramatic performances; viz. 1. The Taxes. 2. The Inſignificants. 3. The Trial of the Twin-killers. 4. The Naval Quack. 5. The Oculiſt. He died at Balden, January 2, 1783.

Bacon (Robert), an eminent divine, in the thirteenth century, was born about the year 1168. He ſtudied in his youth at Oxford, where he diſtinguiſhed himſelf by the quickneſs of his parts, and his aſſiduous application to his ſtudies. Thence, according to the cuſtom of that age, he removed to Paris, where he perfected himſelf in all the branches of learning which were in repute in thoſe times. We are not told at what time he returned into England, but it appears clearly, that after his return he ſettled at Oxford, and read divinity lectures there. In 1233 he was made treaſurer of the cathedral church of Saliſbury. The ſame year he diſtinguiſhed himſelf by a ſermon before his royal maſter King Henry III. at Oxford, whither his majeſty came, in order to have held a great council of his lords. In 1240 Bacon loſt his great patron and intimate friend, Edmund archbiſhop of Canterbury; and very poſſibly this accident, joined to his fervent piety, and great love of a retired life, might induce Bacon, though he was very old, to enter into the order of Friars Preachers. In gratitude to the memory of the archbiſhop, Bacon wrote his life, notwithſtanding that prelate had for ſome years lived, and was even ſo unfortunate as to die, under the king's diſpleaſure: which work of his was highly eſteemed. He wrote alſo many other learned pieces, ſufficient to have eſtabliſhed his reputation. At length, worn out with ſo long a courſe of ſtudious application, he yielded to fate in the year 1248, and was interred at Oxford.

BACONTHORP (John), called the *reſolute doctor*, a learned monk, was born towards the end of the 13th century, at Baconthorp, a village in Norfolk. He ſpent the early part of his life in the convent of Blackney, near Walſingham, in the ſame country; whence he removed to Oxford, and from thence to Paris; where being diſtinguiſhed for his learning, he obtained degrees in divinity and laws, and was eſteemed the principal of Averroiſts. In 1329 he returned to England, and was immediately choſen twelfth provincial of the Engliſh Carmelites. In 1333 he was ſent for to Rome; where, we are told, he firſt maintained the pope's ſovereign authority in caſes of divorce, but that he afterwards retracted his opinion. He died in London in the year 1346. Leland, Bale, and Pits, unanimouſly give him the character of a monk of genius and learning. He wrote, 1. *Commentaria ſeu quæſtiones ſuper quatuor libros ſententiarum*; and, 2. *Compendium legis Chriſti, et quodlibeta:* both which underwent ſeveral editions at Paris, Milan, and Cremona. Leland, Bale, and Pits, mention a number of his works never publiſhed.

BACTRIA, or Bactriana, now *Choraſſan* or *Khoraſan*, an ancient kingdom of Aſia, bounded on the weſt by Margiana, on the north by the river Oxus, on the ſouth by Mount Paropiſmus, and on the eaſt by the Aſiatic Scythia and the country of the Maſſagetæ. It was a large, fruitful, and well-peopled country, containing according to Ammianus Marcellinus 1000 cities, though of theſe only a few are particularly mentioned by hiſtorians, of which that commonly called *Maracanda*, now *Samarcand*, is the moſt conſiderable.

Of the hiſtory of this country we know but little. Authors agree that it was ſubdued firſt by the Aſſyrians, afterwards by Cyrus, and then by Alexander the Great. Afterwards it remained ſubject to Seleucus Nicator and his ſucceſſors till the time of Antiochus Theos; when Theodotus, from governor of that province, became king, and ſtrengthened himſelf ſo effectually in his kingdom, while Antiochus was engaged in a war with Ptolemy Philadelphus king of Egypt, that he could never afterwards diſpoſſeſs him of his acquiſitions. His poſterity continued to enjoy the kingdom for ſome time, till they were driven out by the Scythians, who reigned in Bactria in the time of Adrian, Antoninus Pius, &c. The Scythians were in their turn driven out by the Huns or Turks, and theſe often conquered by the Saracens and Tartars; nevertheleſs they continued in poſſeſſion of this country in the time of Ladiſlaus IV. king of Hungary.

In early times the Bactrians differed little in their manners from the Nomades; and being near neighbours of the

Scythians, who were a very warlike people, the Bactrian ſoldiers were reckoned the beſt in the world. Their appearance was very ſavage; being of an enormous ſtature, having a terrible aſpect, rough beards, and long hair hanging down their ſhoulders. Some authors aſſert that they kept dogs on purpoſe to devour ſuch as arrived at extreme old age, or who were exhauſted by long ſickneſs. They add, that for all their fierceneſs, the Bactrian huſbands were ſuch dupes to their wives, that they durſt not complain of them even for conjugal infidelity, to which it ſeems the latter were very much addicted.

BACURIUS, or BATURIUS, king of the Iberians, a people on the ſide of the Caſpian ſea. One day being a-hunting, he loſt ſight of his company, through a great ſtorm and ſudden darkneſs; upon which he vowed to the God of his Chriſtian ſlave, that if he were delivered he would worſhip him alone: the day breaking up immediately, he made good his promiſe, and became the apoſtle of his country.

BADCOCK (Samuel), was the ſon of a creditable butcher at South Molton in Devonſhire, where he was born about the year 1747. All his friends being diſſenters, he was deſigned by them for the miniſterial function, and after receiving the rudiments of education at his native town, was placed in an academy ſet apart for the training up candidates for the diſſenting miniſtry, we believe at St. Mary's Ottery, in the ſame county; and from thence he was tranſplanted to an higher ſeminary, at Taunton. On leaving the academy, he preached occaſionally as a probationer, and after ſome ſmall time was ordained paſtor to a congregation of diſſenters of the Independent perſuaſion, at Bere Regis in Dorſetſhire. From thence he was invited to Barnſtaple in Devon, whither he removed about 1767, and continued there nine or ten years.

While at Barnſtaple, he met with ſome of Dr. Prieſtley's theological productions, which ſo mightily charmed him, that he paid a viſit to the doctor at Caln in Wiltſhire, and eſtabliſhed an intimacy and correſpondence with him. Unfortunately, however, for the cauſe of Socinianiſm, Mr. Badcock had a mind too deep and penetrating to be long ſatisfied with mere empty ſounds and ſhewy pretences. He read much, and he read with judgment; and as his reading was confined pretty much to eccleſiaſtical hiſtory, and the writings of the more ancient fathers, he ſoon diſcovered the ſource of Socinianiſm to be ſo far from commencing at the primitive ages of Chriſtianity, that it was nothing more than a poliſhed aſſemblage of almoſt every hereſy that has peſtered the church. From Barnſtaple he removed to South Molton, the diſſenting congregation of which place readily accepted his miniſtry. This was about 1777. The number of diſſenters there being but few, his ſtipend was conſequently but very ſmall; and had it not been for the kindneſs of friends, many of them perſons of diſtinguiſhed rank, who properly valued his great merit and eminent talents, his ſituation muſt have been exceedingly irkſome. About 1780 he engaged as a writer in the Monthly Review, though he had before been a contributor to periodical publications. In the year 1780, when the great controverſy concerning the materiality or immateriality of the human ſoul was warmly agitated by Dr. Prieſtley, Dr. Price, and other metaphyſicians, Mr. Badcock alſo publiſhed a pamphlet upon the ſubject; one of the leaſt, indeed, in ſize, though one of the firſt in merit. It was entitled, A ſlight Sketch of the Controverſy between Dr. Prieſtley and his Opponents, 8vo. This tract was ſhrewd, and diſcovered the author to be deeply acquainted with his ſubject; and it was quoted by very reſpectable writers, with marks of high approbation.

In 1781 he diſtinguiſhed himſelf as the reviewer and opponent of the late Mr. Martin Madan's weak but popular Thelyphthora. In this controverſy Mr. Badcock evinced a remarkable force of genius, ſkill of argument, and diſplay of learning; and juſtly engaged the attention and admiration of the public upon his criticiſms. In the ſame year he alſo wrote a poem entitled, The Hermitage.

In the Chattertonian controverſy, or rather the controverſy concerning the authenticity of Rowley's poems, Mr. Badcock took a conſiderable part in his capacity of reviewer. Whether he was on the right ſide of the queſtion, he being an Anti-Rowleian, is not for us to determine; certain it is, however, that his elucidations were ingenious, and that he was far from being the leaſt of the formidable group who aſſailed the pretenſions of the Briſtol prieſt.

On the publication of Dr. Prieſtley's Hiſtory of the Corruptions of Chriſtianity, Mr. Badcock undertook the refutation of that part which was the moſt laboured and important of the whole work, viz. The Hiſtory of Opinions relative to Jeſus Chriſt. This he accordingly did in the Monthly Review for 1783. His critique was long, but ſmart, and ſhewed an uncommon extent of reading in the ancient fathers, eccleſiaſtical hiſtory, and the Socinian writers. Dr. Prieſtley felt this attack ſo ſeverely, and eſpecially as it was made from a quarter ſo unexpected as the Monthly Review, that with his uſual celerity, in leſs than a month, he publiſhed, A Reply to the Animadverſions, though the remainder of the critique upon his work had not yet appeared. When he publiſhed this Reply he did not know who his antagoniſt was, and therefore, unbiaſſed by prejudice, and untouched with reſentment, he beſtowed this eulogium on him: "The knowledge and ability of the preſent reviewer makes him a much more formidable, and therefore a more reſpectable, antagoniſt."

In the Review for September, 1783, Mr. Badcock gave a complete examination, and, as hath been generally thought, a complete refutation, both of the doctor's hiſtory, and the above-mentioned defence of it. This critique is, indeed, a maſterly performance, and ſearches all the doctor's arguments for his favourite cauſe to the very bottom.

When Dr. White was appointed Bampton lecturer in Eaſter term, 1783, in order to complete the lectures on the plan he had formed, he found it expedient to avail himſelf of the beſt aid he could procure. This made him turn his attention to Mr. Badcock, and about November following he paid him a viſit at South Molton, for the purpoſe of ſoliciting his aſſiſtance in the formation of a work that ſhould be worthy the attention of the public. Mr. Badcock undertook his part with alacrity, executed it ſpeedily, and in a manner that will immortaliſe his name. The parts allotted to, and written by Mr. Badcock, are, the greateſt ſhare of Lecture the Firſt, the beſt part of Lecture the Third, about a fourth of Lecture the Fifth, almoſt the whole of Lecture the Seventh, and a ſmall part of Lecture the Eight. Of the notes appended to the lectures, Mr. Badcock is acknowledged to have furniſhed about one fourth.

Mr. Badcock quitted the diſſenting miniſtry ſome time toward the end of the year 1786, having an intention of conforming to the eſtabliſhed church, to which he was reconciled, as he declared, by obſerving the parity between it and the primitive ages of Chriſtianity.

In the ſpring of 1787 he was ordained in Exeter cathedral by Biſhop Roſs; and it is certain that his ordination was diſtinguiſhed by the following particulars:—He was not examined; he received the order of deacon one Sunday, and that of prieſt the Sunday following. When Mr. Badcock intimated that he neither expected nor deſired ſuch marks of diſtinction, the biſhop's reply was, "I chooſe to diſtinguiſh you." The title upon which he was ordained was the curacy of Broad Clyſt, near Exeter.

On account of his repeated and violent head-achs, he was

obliged ſhortly after to reſign the curacy upon which he was ordained, and then engaged himſelf as aſſiſtant to Dr. Gabriel, of the Octagon Chapel, Bath. He there preached a charity ſermon, which was afterwards printed, but not publiſhed. At the lent aſſize, 1788, he preached in the cathedral of Exeter, before the judges, a ſermon which was much admired by thoſe who heard it. May the 19th following he died of a bilious complaint, at the houſe of his affectionate and worthy friend, Sir John Chicheſter, baronet, in Queen-ſtreet, May-fair.

His diſpoſition was gentle, humane, and lively; his judgment acute and comprehenſive. His ſchool education was very confined, but his own attainments were wonderfully great and various. There was ſcarcely a ſubject but he was in ſome degree acquainted with, nor any branch of literature that he had entirely neglected. As a writer, the public have borne the moſt honourable teſtimony to his excellence; as a preacher, it was an unhappineſs not to have heard him.

Beſides the pieces already noticed of Mr. Badcock's compoſition, he was the author of ſome curious memoirs of the family of the celebrated Mr. John Weſley, and ſeveral other fugitive pieces. He had alſo engaged in, and began, the hiſtory of his native country; but did not live to complete it.

BADEN (*Encycl.*), the capital of the diſtrict of that name, is an agreeable city, moderately large, ſeated on the ſide of the Limmet, in a plain flanked by two high hills, between which the river runs. This city owes its riſe to its baths, which were famous before the Chriſtian æra. Several monuments of antiquity have been found here from time to time, particularly in 1420. When they were opening the large ſpring of the baths, they found ſtatues of ſeveral heathen gods, made of alabaſter; Roman coins, made of bronze, of Auguſtus, Veſpaſian, Decius, &c.; and ſeveral medals of the Roman emperors, of gold, ſilver, copper, and bronze. There are two churches in Baden; one of which is collegiate, and makes a good appearance; the other is a monaſtery of the Capuchins, near the town-houſe. This laſt building ſerves not only for the aſſemblies of their own council, but alſo for thoſe of the cantons. The diet aſſembles there in a handſome room made for that purpoſe; the deputies of Zurich ſit at the bottom behind a table, as the moſt honourable place; the ambaſſadors of foreign powers are ſeated on one ſide to the right, and the deputies of the other cantons are ranged on each ſide the room. The bailiff of Baden reſides in a caſtle at the end of a handſome wooden bridge, which is covered in. Before this caſtle there is a ſtone pillar, erected in honour of the Emperor Trajan, who paved a road in this country eighty-five Italian miles in length. The inhabitants are rigid Roman-catholics, and formerly behaved in a moſt inſolent manner to the Proteſtants, but they are now obliged by their maſters to be more ſubmiſſive. The baths which are on each ſide the river are a quarter of a league from the city. Joining to the ſmall baths there is a village, and to the large a town which may paſs for a ſecond Baden. It is ſeated on a hill, whoſe aſcent is ſteep. There the baths are brought into inns and private houſes, by means of pipes, which are about ſixty in all. There are alſo public baths in the middle of the town, from a ſpring which riſes in the ſtreet, where the poor bathe *gratis*, but they are expoſed quite naked to all that paſs by. All the baths are hot, and one to ſo great a degree as to ſcald the hand; and they are impregnated with a great deal of ſulphur, with ſome alum and nitre. They are uſeful for drinking as well as bathing; and are ſaid to cure all diſeaſes from a cold cauſe, head-achs, vertigos, &c. They ſtrengthen the ſenſes, cure diſeaſes of the breaſt and bowels, aſthmas, and obſtructions. They are peculiarly excellent for women's diſeaſes. E. long. 8. 25. N. lat. 47. 27.

BADENOCH, the moſt northerly part of Inverneſsſhire, in Scotland, extending about thirty-three miles in length from eaſt to weſt, and twenty-ſeven from north-eaſt to ſouth-weſt where broadeſt. It has no conſiderable town, and is very barren and hilly, but abounds with deer, and other kinds of game.

BADEW (Richard de), the firſt and original founder of Clare-hall, in Cambridge, was deſcended from a knightly family ſeated at Great Badew, or Badow, near Chelmsford, in the county of Eſſex. From this place of their reſidence they took their ſurname; and here, probably, Richard de Badew was born. In 1326 he was chancellor of the univerſity of Cambridge; and having purchaſed two tenements in Miln-ſtreet, of Nigel Thornton, a phyſician, he laid there, in the year above mentioned, the foundation of a building, to which was given the name of Univerſity-hall. In it he placed a principal, who was to take care of the penſioners that came to live there. It continued in this condition for the ſpace of ſixteen years, and then by an accidental fire was burnt down. Richard de Badew being unable to rebuild it, it lay for a few years in ruins; but one of the late penſioners having a great intereſt with Elizabeth, daughter of Sir Gilbert de Clare, earl of Glouceſter, and third ſiſter and coheir of Sir Gilbert de Clare, the laſt earl of Glouceſter and Hertford, he prevailed upon her to undertake what de Badew was not able to perform. Whereupon this charitable lady, after the reſignation of Walter Thaxtead, the principal, and with the conſent of Richard de Badew, new built that hall, and endowed it, in the year 1347, with revenues for one maſter, ten fellows, and ten ſcholars. At the ſame time ſhe named it Clare-hall, from her own family ſurname.

BADGEWORTH, a village of Glouceſterſhire, noted for a ſpring of mineral water, called Cold Pool, nearly the ſame in property as thoſe of Cheltenham. From the hill, above Crickly, is a very extenſive proſpect. It is three miles from Cheltenham.

BADIA, an ancient town of Bætica on the Anas; now ſuppoſed to be *Badajoz* on the Guadiana.

BADIUS (Conrad), and (Stephen Robert), his brother; French refugees; celebrated as printers at Geneva, and Conrad as an author. The latter died in 1566.

BÆCKEA (*Encycl.*). Correct a botanical error, by ſubſtituting the claſs for the order, and vice verſa.

BÆTERRÆ, an ancient town of the Tertoſages in Gallia Narbonenſis; now *Beſiers*, on the eaſt bank of the Obris, now *Orbis*, or *Orbe*, in Lower Languedoc.

BÆTICA, a province of ancient Spain, ſo called from the famed river Bætis, afterwards *Tarteſſus*, now *Guadalquiver*, or the great river. It was bounded on the weſt by Luſitania; on the ſouth, by the Mediterranean, and Sinus Gaditanus; on the north, by the Cantabric ſea, now the Bay of Biſcay. On the eaſt and north-eaſt, its limits cannot be ſo well aſcertained, as they are very reaſonably thought to have been in a continual ſtate of fluctuation, as each petty monarch had an opportunity of encroaching upon his neighbour. The province was divided in two by the river Bætis already mentioned. On the one ſide of which, towards the Anas, were ſituated the Turdetani, from whence the kingdom was called *Turdetania*, though more generally known by the name of *Bæturia*. On the other ſide were ſituated the Baſtuli, Baſtetani, and Conteſtani, along the Mediterranean coaſts. The Baſtuli were ſuppoſed to be of Phœnician extract, and dwelt along the coaſts of the Mediterranean, till, driven from thence by the Moors, they fled into the mountainous parts of Galicia, which they then called from their own name *Baſtulia*. The Baſtetani were ſeated higher up, on the ſame coaſts. The territories of both theſe made part of what has ſince become the kingdom

of *Granada*; in which there is a ridge of very high mountains, called, from the above-mentioned people, the *Baſtetanian mountains*. Mention is alſo made of their capital *Baſtetana*; a place of ſuch ſtrength, that King Ferdinand was ſix months beſieging it before he could take it from the Moors.—The whole province of Bætica, according to the moſt probable account, contained what is now called *Andaluſia*, part of the kingdom of Grenada, and the outward boundaries of Eſtremadura.

BÆTIS. See BÆTICA.

BÆTULO, a town of ancient Spain, in the Terraconenſis; now *Badelona* in Catalonia.

BAGAMADER, or BAGAMEDRI, a province of the kingdom of Abyſſinia in Africa. It is ſaid to receive its name from the great number of ſheep bred in it; *meder* ſignifying land or earth, and *bag* a ſheep. Its length is eſtimated about ſixty leagues, and its breadth twenty: but formerly it was much more extenſive; ſeveral of its provinces having been diſmembered from it, and joined to that of Tigre. A great part of it, eſpecially towards the eaſt, is inhabited by wandering Gallas and Caffres.

BAGFORD (John), the antiquary, and great collector of old Engliſh books, prints, &c. was born in London. He had been in his younger days a ſhoemaker, afterwards a bookſeller; and laſtly, for the many curioſities wherewith he enriched the famous library of Dr. John Moore, biſhop of Ely, his lordſhip got him admitted into the Charter-houſe. He was ſeveral times in Holland, and in other foreign parts, where he procured many valuable old books, prints, &c. ſome of which he diſpoſed of to the late earl of Oxford, who, after his death, purchaſed all his collections, papers, &c. for his library. In 1707 were publiſhed, in the Philoſophical Tranſactions, his propoſals for a General Hiſtory of Printing. He died at Iſlington, a little before ſix in the morning, May 15, 1716, aged ſixty-five years; and was buried the Monday following, in the cemetary belonging to the Charter-houſe. In 1728 a print was engraved of him, from a painting of Mr. Howard, by George Vertue. An account of his entries, which were deſigned for a General Hiſtory of Printing, is in the Catalogue of the Harleian Collection of MSS. vol. II. fol. London, 1759, from No. 5892 to No. 5910. His MSS. may be of uſe to ſuch as will take pains to extract good matter from a bad hand, and worſe orthography. This may be eaſily forgiven to his education, far from learned, and all his improvements owing to the ſtrength of genius, ſeconded by unuſual diligence and induſtry. A number of his letters to Humphry Wanley may be ſeen in the Britiſh Muſeum; and a large part of his collections is in the public library at Cambridge, where they are locked up in a large cubical deal box, and probably have never been opened ſince they were placed there

BAHAR, a country of Hindooſtan Proper, bounded on the W. by Allahabad and Oude, on the N. by Napaul, on the E. by Bengal, and on the S. by Oriſſa. It is ſubject to the Engliſh Eaſt-India Company; and moſt of the ſaltpetre they export is manufactured in this province, of which Patna is the capital.

BAJAZET I. Sultan of the Turks, a renowned warrior, but a tyrant, was conquered by Tamerlane, and expoſed by him in an iron cage; the fate he had deſtined for his adverſary if he had been the victor. He daſhed his head againſt the bars of this priſon, and killed himſelf, in 1413. See the article TURKS.

BAILLET (Adrian), a very learned French writer and critic, born in 1649, at the village of Neuville near Beauvais in Picardy. His parents were too poor to give him a proper education, which however he obtained by the favour of the biſhop of Beauvais, who afterward preſented him with a ſmall vicarage. In 1680 he was appointed librarian to M. de Lamoignon, advocate general to the parliament of Paris; of whoſe library he made a copious index in 35 vols. folio, all written with his own hand. He died in 1706, after writing many works, the principal of which are, *A Hiſtory of Holland from 1609, to the Peace of Nimeguen in 1679*, 4 vols. 12mo; *Lives of the Saints*, 3 vols. folio, which he profeſſed to have purged from fables; *Judgemens des Savans*, which he extended to 9 vols. 12mo; and *The Life of Des Cartes*, 2 vols. 4to. which he abridged, and reduced to 1 vol. 12mo.

BAILLIE (Robert), a preſbyterian divine in the church of Scotland during the laſt century, was born at Glaſgow, in the year 1599. He was educated in the univerſity of his native city, under the direction of Mr. Sharp, who was at that time the head of the college there. After Mr. Baillie had taken his degrees in arts, he turned his thoughts to the ſtudy of divinity, to which he applied with uncommon diligence. Having about the year 1622 received orders from Archbiſhop Law, he was choſen a regent of philoſophy in the univerſity of Glaſgow. While he was in this ſtation, he had, for ſome years, the care of the education of Lord Montgomery, who, at length, carried him with him to Kilwinning; to which church he was preſented by the Earl of Eglinton. Here he lived in the ſtricteſt friendſhip with that noble family, and the people connected with it; as he did, alſo, with his ordinary the Archbiſhop of Glaſgow, with whom he kept up an epiſtolary correſpondence. In 1633 he declined, from a principle of modeſty, an offer which was made him of a church in Edinburgh. In 1638 he was choſen, by the preſbytery of Irvine, a member of the famous aſſembly at Glaſgow, which was a prelude to the civil war. Though Mr. Baillie is ſaid to have behaved in this aſſembly with great moderation, it is evident that he was by no means deficient in his zeal againſt prelacy and arminianiſm. He was a member of all the following general aſſemblies, till 1653, excepting the time in which he attended the Weſtminſter aſſembly. In 1640 he was ſent by the covenanting lords to London, to draw up an accuſation againſt Dr. Laud, archbiſhop of Canterbury, for the innovations he had obtruded upon the church of Scotland. While Mr. Baillie was in England upon this occaſion, he wrote to the preſbytery of Irvine a regular account of the ſtate of public affairs; and ſent them, among other things, a large journal of the proceedings in the trial of the Earl of Stafford. Not long after his return to his own country (in 1642), he was appointed joint profeſſor of divinity, with Mr. David Dickſon, in the univerſity of Glaſgow. And his reputation was become ſo great, that he had before this received invitations from the other three univerſities, all of which he refuſed. He continued in his profeſſorſhip till the Reſtoration: but his diſcharge of the duties of it was interrupted, for a conſiderable time, by his reſidence in England; for in 1643 he was choſen one of the commiſſioners of the church of Scotland to the aſſembly of divines at Weſtminſter. Mr. Baillie returned again to his own country in the latter end of the year 1646. When, after the execution of Charles the Firſt, Charles the Second was proclaimed in Scotland, our profeſſor was one of the divines appointed by the general aſſembly to wait upon his majeſty at the Hague; upon which occaſion, on the 27th of March, 1649, he made a ſpeech in the royal preſence, wherein he expreſſed, in the ſtrongeſt terms, his abhorrence of the murder of the late king; and, in his ſentiments upon this event, it appears, that the preſbyterian divines of that period, both at home and abroad, almoſt univerſally agreed. After the reſtoration of King Charles the Second, Mr. Baillie, on the 23d of January, 1661, by the intereſt of the Earl of

Lauderdale, with whom he was a great favourite, was made principal of the univerſity of Glaſgow, upon the removal of Mr. Patrick Galleſpie, who had been patronized by Cromwell. It is ſaid, by ſeveral writers, that Mr. Baillie had the offer of a biſhopric, which he abſolutely refuſed. Though he was very loyal, and moſt ſincerely rejoiced in his majeſty's reſtoration, he began, a little before his death, to be extremely anxious for the fate of his beloved preſbytery. His health failed him in the ſpring of the year 1662, and he died in July, the ſame year, aged ſixty-three.

BAINBRIDGE (Dr. John), an eminent phyſician and aſtronomer, born at Aſhby de la Zouch in Leiceſterſhire, in 1582. He taught a grammar-ſchool for ſome years, and practiſed phyſic, employing his leiſure hours in aſtronomy, which was his favourite ſtudy: at length he removed to London, was admitted a fellow of the college of phyſicians, and raiſed his character by his deſcription of the comet in 1618. The next year Sir Henry Savile appointed him his firſt profeſſor of aſtronomy at Oxford; and the maſters and fellows of Merton College made him firſt junior, and then ſuperior, reader of Linacre's lecture. He died in 1643, having written many works, ſome of which have never been publiſhed: but the MSS. are preſerved in the library of Trinity College, Dublin.

BAIN GONGA, or Bain River, a large river of Hindooſtan, which riſes near the S. bank of the Nerbudda, runs ſouthward through the heart of Berar, and, after a courſe of near 400 miles, unites with the Godavery, within the hills that bound the Britiſh Northern Circars.

BAKER (Thomas), an eminent mathematician, was born at Ilton in Somerſetſhire, about the year 1625, and entered at Magdalen-hall, Oxon, in 1640; after which he was vicar of Biſhop's-Nymmet in Devonſhire, where he wrote The Geometrical Key, or the Gate of Equations unlocked; by which he gained a conſiderable reputation. A little before his death, the members of the Royal Society ſent him ſome mathematical queries, to which he returned ſo ſatisfactory an anſwer, that they preſented him a medal, with an inſcription full of honour and reſpect. He died at Biſhop's-Nymmet, on the 5th of June, 1690.

Baker (Thomas), a dramatic writer, was the ſon of an eminent attorney in the city of London. His turn was entirely to comedy, and his plays are five in number, viz. 1. Act at Oxford. 2. Fine Ladies' Airs. 3. Hampſtead Heath. 4. Humours of the Age. 5. Tunbridge Walks. All of them have a conſiderable ſhare of merit; yet only one among the number ſtands on the preſent liſt of acting plays, viz. Tunbridge Walks. It is ſaid that the character of Maiden in this play, which is perhaps the original of almoſt all the Fribbles, beau Mizens, &c. that have been drawn ſince, and in which effeminacy is carried to an height beyond what any one could conceive to exiſt in any man in real life, was abſolutely and without exaggeration, a portrait of the author's own former character; whoſe underſtanding having at length pointed out to him the folly he had ſo long been guilty of, he reformed it altogether in his ſubſequent behaviour, and wrote this character, in order to ſet it forth in the moſt ridiculous light, and warn others from that rock of contempt which he had himſelf for ſome time been wrecked upon. Whether this gentleman's attachment to the muſes drew him from any application to buſineſs, or from what other cauſe, is not known; but during the latter part of his life he ſtood on indifferent terms with his father, who allowing him a very ſcanty income, he was obliged to retire into Worceſterſhire, where he is reported to have died of that loathſome diſorder the *morbus pediculoſus*.

Baker (Henry), an ingenious and diligent naturaliſt, was born in Fleet-ſtreet, London, either near the end of the laſt, or very early in the beginning of the preſent, century. His father's profeſſion is not known; but his mother was, in her time, a midwife of great practice. He was brought up, under an eminent bookſeller who preceded the elder Dodſley, to the buſineſs of a bookſeller, in which, however, he appears not to have engaged at all after his apprenticeſhip; or, if he did, it was ſoon relinquiſhed by him: for though it was in his power to have drawn away all his maſter's beſt cuſtomers, he would not ſet up againſt him. Mr. Baker being of a philoſophical turn of mind, and having diligently attended to the methods which might be practicable and uſeful in the cure of ſtammering, and eſpecially in teaching deaf and dumb perſons to ſpeak, he made this the employment of his life. In the proſecution of ſo valuable and difficult an undertaking, he was very ſucceſsful; and ſeveral of his pupils, who are ſtill living, bear teſtimony to the ability and good effect of his inſtructions. He married Sophia, youngeſt daughter of the famous Daniel Defoe, who brought him two ſons, both of whom he ſurvived. On the 29th of January, 1740, Mr. Baker was elected a fellow of the Society of Antiquaries; and, on the 12th of March following, the ſame honour was conferred upon him by the Royal Society. In 1744 Sir Godfrey Copley's gold medal was beſtowed upon him, for having, by his microſcopical experiments on the cryſtallizations and configurations of ſaline particles, produced the moſt extraordinary diſcovery during that year. This medal was preſented to him by Sir Hans Sloane, late preſident of the Royal Society, and only ſurviving truſtee of Sir Godfrey Copley's donation, at the recommendation of Sir Hans's worthy ſucceſſor, Martin Folkes, eſq. and of the council of the ſaid ſociety. Having led a very uſeful and honourable life, he died at his apartments in the Strand, on the 25th of November, 1774, being then about ſeventy years of age.

Several of Mr. Baker's communications are printed in the Philoſophical Tranſactions; and, beſides the papers written by himſelf, he was the means, by his extenſive correſpondence, of conveying to the ſociety the intelligence and obſervations of other inquiſitive and philoſophical men. Mr. Baker was a poetical writer in the early part of his life. His Invocation of Health got abroad without his knowledge: but was reprinted by himſelf in his Original Poems, Serious and Humorous, part the firſt, 8vo. 1725. The ſecond part came out in 1726. Among theſe poems are ſome tales as witty and as looſe as Prior's. He was the author, likewiſe, of The Univerſe, a Poem, intended to reſtrain the Pride of Man; which has been ſeveral times reprinted. His account of the water polype, which was originally publiſhed in the Philoſophical Tranſactions, was afterwards enlarged into a ſeparate treatiſe, and hath gone through ſeveral editions. But his principal publications are, The Microſcope made Eaſy, and Employment for the Microſcope.

His eldeſt ſon, David Erſkine Baker, was a young man of genius and learning. Having been adopted by an uncle, who was a ſilk-throwſter in Spital-fields, he ſucceeded him in the buſineſs; but wanted the prudence and attention which are neceſſary to ſecure proſperity in trade. Like his father, he was both a philoſopher and a poet; and wrote ſeveral occaſional poems in the periodical collections. The public was indebted to him for The Companion to the Playhouſe, in two volumes, 1764, 12mo; a work which, though imperfect, had conſiderable merit, and ſhewed that he poſſeſſed a very extenſive knowledge of our dramatic authors.

BALAMIO (Ferdinand), of Sicily, was phyſician to Pope Leo X.; who greatly regarded him. He was no leſs ſkilled in the belles lettres than in medicine; and he cultivated poetry

and the Greek learning with much ſucceſs. He tranſlated from the Greek into Latin, ſeveral pieces of Galen; which were firſt printed ſeparately, and afterwards inſerted in the works of that ancient phyſician, publiſhed at Venice, 1536, in folio. He flouriſhed at Rome about the year 1555.

BALARUC, a town of France, near the road from Montpellier to Toulouſe; famous for its baths.

BALANUS, in zoology, the trivial name of a ſpecies of lepas. See LEPAS.

BALASORE, a ſeaport to the N.W. of the bay of Bengal, four miles from the ſea by land, but by the rivers twenty. The inhabitants make ſtuffs of ſilk, cotton, and a ſort of graſs. It is 180 miles S.W. of Hoogly. Long 87. 1. E. Lat. 21. 20 N.

BALBUS (Lucius Cornelius Theophanes), was born at Cadiz, and diſtinguiſhed himſelf by his valour in the war carried on by the Romans in Spain againſt Sertorius and the Luſitanians, on which account Pompey gave him the privileges of a Roman citizen. He was conſul in the 714th year of Rome, and was the firſt foreigner on whom that dignity was conferred. He was the friend of Pompey, Caſar, Craſſus, and Cicero.—There were many other illuſtrious Romans of the name of *Balbus*.

BALCH, a town of Uſbec Tartary, in Aſia, on the frontiers of Perſia, 200 miles S. of Bokhara. Long. 69. 0. E. Lat. 37. 20. N

BALDINUCCI (Philip), of Florence; a connoiſſeur in the polite arts, and the continuator of Vaſari's lives of the painters. He died in 1696, aged ſeventy-two.

BALDOCK (Ralph de), biſhop of London in the reigns of Edward I. and II. was educated at Moreton College, in Oxford; became dean of St. Paul's; was afterwards promoted to the ſee of London; and at laſt was made lord high-chancellor of England. He had a very amiable character both for morals and learning; and wrote *Hiſtoria Anglica*, or An Hiſtory of the Britiſh Affairs down to his own Time; and, A Collection of the Statutes and Conſtitutions of the church of St. Paul. Biſhop Baldock died at Stepney, July 24th, 1313.

About the ſame time there was a ROBERT DE BALDOCK, a canon of London, and archdeacon of Middleſex, who, upon the vacancy of the ſee of London by the death of Biſhop Baldock, was (together with John Colcheſter, another canon) preſented by the chapter of London to the chapter of Canterbury, that ſee being likewiſe vacant, for the choice of one of them to be official for the dioceſe of London. This Robert Baldock was in great favour with King Edward II. who made him his chancellor, and nominated him to the biſhopric of Norwich, into which he was elected about the middle of the year 1325, and confirmed by the archbiſhop in the month of Auguſt; but he could not obtain the ſee, by reaſon of a papal proviſion in favour of William de Ayremin. Soon after, he loſt his liberty and life by the national commotions, which deprived King Edward of his crown; for, being ſeized by the enraged populace, he was dragged to the priſon of Newgate, where he died in a moſt wretched condition.

BALDWIN, archbiſhop of Canterbury, was born of obſcure parents at Exeter, where, in the early part of his life, he taught a grammar-ſchool; after which he took orders, and was made archdeacon of Exeter: but he reſigned that dignity, and became a Ciſtertian monk in the monaſtery of Ford in Devonſhire, of which in a few years he was made abbot. In the year 1180 he was conſecrated biſhop of Worceſter. In 1184 he was promoted to the ſee of Canterbury by Pope Lucius III. and by his ſucceſſor Urban III. was appointed legate for that dioceſe. He laid the foundation of a church and monaſtery in honour of Thomas Becket, at Hackington, near Canterbury, for ſecular prieſts; but, being oppoſed by the monks of Canterbury and the pope, was obliged to deſiſt. In 1190 he crowned King Richard I. at Weſtminſter; and ſoon after followed that prince to the Holy Land, where he died at the ſiege of Ptolemais. Giraldus Cambrenſis, who accompanied him in this expedition, ſays he was of a mild diſpoſition, and of great abſtinence. He wrote various tracts on religious ſubjects, which were collected and publiſhed by Bertrand Tiſſier in 1662.

BALE (John), biſhop of Oſſory in Ireland, was born at Cove, near Dunwich, in Suffolk, in the year 1495. At twelve years of age he was entered in the monaſtery of Carmelites at Norwich, and was thence ſent to Jeſus College in Oxford. He was educated a Roman-catholic, but was converted to the Proteſtant religion by Thomas lord Wentworth. On the death of Lord Cromwell, favourite of Henry VIII. who protected him from the perſecutions of the Romiſh clergy, he was obliged to retire into the Low-countries, where he continued eight years. Soon after the acceſſion of Edward VI. he was recalled; and being firſt preſented to the living of Biſhop's-Stocke in Hampſhire, in 1552, he was nominated to the ſee of Oſſory. During his reſidence in Ireland he was remarkably aſſiduous in propagating the Proteſtant doctrines; but to very little purpoſe, and frequently at the hazard of his life. Once, in particular, they murdered five of his domeſtics, who were making hay in a meadow near his houſe; and would probably have done the ſame by him, if the ſovereign of Kilkenny had not come to his aſſiſtance with 100 horſe and 300 foot. On the acceſſion of Queen Mary, the tide of oppoſition became ſo powerful, that, to avoid aſſaſſination, he embarked for Holland, but was very unfortunate in his eſcape. Firſt he was taken by a Dutch man-of-war, and robbed by the captain of all his effects. Then, being forced by ſtreſs of weather into St. Ive's in Cornwall, he was confined on ſuſpicion of treaſon. Being however releaſed after a few days' confinement, the ſhip anchored in Dover road, where he was again ſeized on a falſe accuſation. After his arrival in Holland, he was kept priſoner for three weeks, and at length obtained his liberty on paying 30l. From Holland he travelled to Baſil in Switzerland, where he continued till Queen Elizabeth aſcended the throne. After his return to England, he was, in 1560, made prebendary of Canterbury, probably not chooſing to return to his former flock of wolves. He died in November 1563, at Canterbury, in the 68th year of his age. He was ſo ſevere a writer againſt the church of Rome, that his books are particularly prohibited in the expurgatory index publiſhed at Madrid, in folio, in the year 1667. He is the earlieſt dramatic writer in the Engliſh language, or at leaſt author of the firſt pieces of that kind that we find in print. Of his writings in that way, no fewer than twenty-one have been enumerated; only three of them, however, have been ſeen in print, *viz.* 1. God's Promiſes, an interlude; 2. St. John Baptiſt, an interlude; 3. Concerning the Laws of Nature corrupted: the firſt of which has been reprinted by Dodſley in the firſt volume of his collection of old plays, and the only copy extant of the laſt is preſerved in St. Sepulchre's library in Dublin. As to the reſt, they are mentioned by himſelf, as his own, in his account of the writers of Britain before mentioned.—He alſo tranſlated the tragedies of Pammachius.—His other works are very numerous; but the chief is his Catalogue of Britiſh authors: a book of ſome merit, as it contains ſome information which is not elſewhere to be found; but he has deſtroyed his credit by his intemperate Billingſgate abuſe of all thoſe who differed from him in religion. The authentic part of his work is tranſcribed from Leland. The title of it is, *Illuſtrium Majoris Britanniæ ſcriptorum Catalogus, a Japheto ſanctiſſimi Noah filio ad an. Dom.* 1557.

BALEARIC ISLANDS, the ancient name of the iſlands Majorca, Minorca, and Ivica, in the Mediterranean. See MAJORCA, &c.

BALES (Peter), was a moſt famous maſter in the art of penmanſhip, or fair writing, and one of the firſt inventors of ſhort-hand. He was born in 1547, and is ſtyled by Anthony Wood "a moſt dexterous perſon in his profeſſion, to the great wonder of ſcholars and others." He is recorded for his ſkill in micrography, or miniature writing, in Hollinſhed's chronicle, anno 1575; and Mr. Evelyn alſo hath celebrated his wonderful ſkill in this delicate operation of the hand. "Hadrian Junius ſpeaking as a miracle of ſomebody who wrote the Apoſtle's Creed, and the beginning of St. John's Goſpel, within the compaſs of a farthing; what would he have ſaid," ſays Mr. Evelyn, "of our famous Peter Bales, who, in the year 1575, wrote the Lord's Prayer, the Creed, Decalogue, with two ſhort prayers in Latin, his own name, motto, day of the month, year of the Lord, and reign of the queen, to whom he preſented it at Hampton Court, all of it written within the circle of a ſingle penny, inchaſed in a ring and borders of gold, and covered with a cryſtal ſo accurately wrought, as to be very plainly legible, to the great admiration of her majeſty, the whole privy-council, and ſeveral ambaſſadors then at court?" He was farther very dexterous in imitating hand-writing, and about 1586 was employed by Secretary Walſingham in certain political manœuvres. We find him at the head of a ſchool, near the Old Bailey, London, in 1590; in which year he publiſhed his Writing Schoolmaſter, in three parts; the firſt teaching ſwift writing, the ſecond true writing, the third fair writing. In 1595 he had a great trial of ſkill, in the Black Friars, with one Daniel Johnſon, for a golden pen of 20 l. value, and won it; and a contemporary author farther relates, that he had alſo the arms of calligraphy given him, which are, Azure, a Pen, Or, as a prize, at a trial of ſkill in this art among the beſt penmen in London. In 1597 he republiſhed his Writing Schoolmaſter, which was in ſuch high reputation, that no leſs than eighteen copies of commendatory verſes, compoſed by learned and ingenious men of that time, were printed before it.

BALEY (Walter), the ſon of Henry Baley of Warnwell in Dorſetſhire, was born at Potſham in the ſame county, and educated at Wincheſter ſchool. From thence he was ſent to Oxford; and, after two years' probation, was admitted perpetual fellow of New College in the year 1550. Having taken his degrees in arts, he practiſed phyſic, and in 1558 was proctor of the univerſity. About this time he obtained a prebend of Wells, which he reſigned in 1579. In the year 1561 he was appointed queen's profeſſor of phyſic, in 1563 proceeded doctor in that faculty, and afterwards became one of her majeſty's phyſicians in ordinary. He was thought ſkilful in his profeſſion, and had conſiderable practice. He died in 1592, aged ſixty-three; and was buried in the inner chapel of New college. His works are, 1. *A Diſcourſe of three Kinds of Pepper in common Uſe*, 1588, 8vo. 2. *Brief Treatiſe of the Preſervation of the Eye ſight*. Firſt printed in the reign of Elizabeth, in 12mo; afterwards at Oxford in 1616, and 1654, 8vo. 3. *Directions for Health, natural and artificial; with Medicines for all Diſeaſes of the Eyes*, 1626, 4to. 4. *Explicatio Galeni de potu convaleſcentium et ſenum*, &c. Manuſcript, formerly in Lord Ayleſbury's library.

BALGUY (John), an eminent divine of the church of England in the preſent century, was born on the 12th of Auguſt, 1686, at Sheffield in Yorkſhire. His father, Thomas Balguy, was maſter of the free grammar-ſchool in that place, and from him he received the firſt rudiments of his grammatical education. After his father's death, he was put under the inſtruction of Mr. Daubuz, who ſucceeded to the maſterſhip of the ſame ſchool, September 23, 1696, for whom he always profeſſed a great reſpect. In 1702 he was admitted of St. John's College, Cambridge, under the care of Dr. Edmondſon, and of Dr. Lambert, afterwards maſter of that college. He frequently lamented, in the ſucceeding part of his life, that he had waſted nearly two years of his reſidence there in reading romances; but at the end of that time he had the good fortune to meet with Livy, went through him with great delight, and from thence forward applied himſelf to ſerious ſtudies. In 1705-6 he was admitted to the degree of bachelor of arts, and to that of maſter of arts in the year 1726. Soon after he had taken his bachelor's degree he quitted the univerſity, and was engaged, for a while, in teaching the free-ſchool at Sheffield; but whether he was ever choſen maſter, or only employed during a vacancy, does not appear. On the 15th of July, 1708, he was taken into the family of Mr. Banks, as private tutor to his ſon, Joſeph Banks, eſq. afterwards of Reresby, in the county of Lincoln, and grandfather of the celebrated Sir Joſeph Banks, bart. ſo eminently diſtinguiſhed for his ſkill in natural hiſtory, and the expences, labours, and voyages he has undergone to promote that part of ſcience. Mr. Balguy, in 1710, was admitted to deacon's orders, by Dr. Sharp, archbiſhop of York; and in 1711 he was ordained a prieſt, by that prelate. By Mr. Banks's means he was introduced to the acquaintance of Mr. Bright of Badſworth, in the county of York; and was by him recommended to his father, Sir Henry Liddel, grandfather to the late Lord Ravenſworth. In 1711 this gentleman, who lived at Ravenſworth-caſtle, in the county of Durham, took Mr. Balguy into his family, and beſtowed upon him the donative of Lameſly and Tanfield, in that county. For the firſt four years after he had obtained this ſmall preferment, he did not intermit one week without writing a new ſermon; and all his ſermons were of his own compoſition. Being deſirous that ſo excellent an example ſhould be followed by his ſon, he deſtroyed almoſt his whole ſtock, and committed, at one time, two hundred and fifty to the flames, moſt of which deſerved to have been uſed in the beſt congregations. In July, 1715, he married Sarah, daughter of Chriſtopher and Sarah Broomhead, of Sheffield. She was born in 1686, and by her he had only a ſon, Dr. Thomas Balguy, archdeacon of Wincheſter, who owed his archdeaconry, and all his other preferments, to the favour and friendſhip of Biſhop Hoadly. In 1718 he publiſhed, without his name, Silvius's Examination of certain Doctrines lately taught and defended by the Rev. Mr. Stebbing; and in the following year, Silvius's Letter to the Rev. Dr. Sherlock. Both of theſe performances were written in vindication of Biſhop Hoadly. Mr. Stebbing having written againſt theſe pamphlets, Mr. Balguy, in 1720, again appeared from the preſs, in the cauſe of the biſhop, in a tract entitled, Silvius's Defence of a Dialogue between a Papiſt and a Proteſtant, in Anſwer to the Rev. Mr. Stebbing; to which are added, ſeveral Remarks and Obſervations upon that Author's Manner of Writing. This alſo being anſwered by Mr. Stebbing, Mr. Balguy had prepared a farther defence; but Dr. Hoadly prevailed upon him to ſuppreſs it, on account of the public having grown weary of the controverſy. In 1726 he publiſhed A Letter to a Deiſt, concerning the Beauty and Excellence of Moral Virtue, and the Support and Improvement which it receives from the Chriſtian Revelation. In this treatiſe he has attacked, with the greateſt politeneſs, and with equal ſtrength of reaſon, ſome of the principles advanced by the noble and celebrated writer of the Characteriſtics, in his Enquiry concerning Virtue. On the 25th of January, 1727-8, Mr. Balguy was collated by Biſhop Hoadly to a prebend in the church of Saliſbury; among the advantages of which preferment, was the right of preſenting to four livings,

and of preſenting alternately to two others. The beſt of them did not fall in his life-time; but two ſmall livings were diſpoſed of by him; one to Mr. Robinſon, who married his wife's ſiſter, the other to his own ſon. In the year 1727, or 1728, he preached an aſſize ſermon at Newcaſtle-upon-Tyne, the ſubject of which was party ſpirit. It was printed by order of the judges, and either inſcribed or dedicated to Dr. Talbot, biſhop of Durham. The Foundation of Moral Goodneſs, or a farther Enquiry into the Original of our Idea of Virtue, was publiſhed by him in 1728. In the ſame year he publiſhed The Second Part of the Foundation of Moral Goodneſs; illuſtrating and enforcing the Principles and Reaſonings contained in the former: being an Anſwer to certain Remarks communicated by a Gentleman to the Author. His next publication was, Divine Rectitude; or, A brief Enquiry concerning the Moral Perfections of the Deity; particularly in reſpect of Creation and Providence. This was followed by A Second Letter to a Deiſt, concerning a late Book, entitled, Chriſtianity as old as the Creation. To this ſucceeded The Law of Truth, &c. In 1741 appeared Mr. Balguy's Eſſay on Redemption. This, and his volume of ſermons, including ſix, which he had publiſhed before, were the laſt pieces committed by him to the preſs. A poſthumous volume was afterwards printed, which contained almoſt the whole of the ſermons he left behind him. He died on the 21ſt of September, 1748, in the 63d year of his age.

BALIOL. Balliol, or Boilliol (John), the brother of Alexander king of Scotland, and competitor with Robert Bruce for that crown.

BALL (John), a puritan divine in the ſeventeenth century, was born in the year 1585, of an obſcure family, at Caſſington, or Cherſington, near Woodſtock in Oxfordſhire. He was educated in grammar learning at a private ſchool, under the vicar of Yarnton, a mile diſtant from Caſſington; and was admitted a ſtudent of Brazen-noſe College in Oxford, in 1602. He continued there about five years, in the condition of a ſervitor, and under the diſcipline of a ſevere tutor; and from thence he removed to St. Mary's Hall, and took the degree of bachelor of arts in 1608. Soon after, he was invited into Cheſhire, to be tutor to the Lady Cholmondeley's children; and here he became acquainted with ſome rigid puritans, who gained ſo far upon his affections, that he went over to their party. About this time, having got a ſum of money, he came up to London, and procured himſelf to be ordained by an Iriſh biſhop, without ſubſcription. Soon after, he removed into Staffordſhire, and became curate of Whitmore, a chapel of eaſe to Stoke. He has, among the puritan writers, the character of an excellent ſchool-divine, a painful preacher, and a learned and ingenious author; and, though he was not well affected to ceremonies and church diſcipline, yet he wrote againſt thoſe who thought theſe matters a ſufficient ground for ſeparation. He died the 20th of October, 1640, aged about fifty-five.

BALLARD (George), one of thoſe ſingular compoſitions which ſhoot forth without culture, was born at Campden in Glouceſterſhire. Being of a weakly conſtitution, his parents put him to a habit-maker; and in this ſituation he maſtered the Saxon language. The time he employed in learning it was ſtolen from ſleep, after the labour of the day was over. Lord Chedworth, and the gentlemen of his hunt, who uſed to ſpend about a month of the ſeaſon at Campden, heard of his fame, and generouſly offered him an annuity of 100l.; but he modeſtly told them, that 60l. were fully ſufficient to ſatisfy both his wants and his wiſhes. Upon this he retired to Oxford, for the benefit of the Bodleian library; and Dr. Jenner, preſident, made him one of the eight clerks of Magdalen college. He was afterwards one of the univerſity beadles, but died in June, 1755, rather young; which is ſuppoſed to have been owing to too intenſe application. He left large collections behind him, but publiſhed only Memoirs of Britiſh Ladies, who have been celebrated for their Writings or Skill in the learned Languages, Arts, and Sciences, 1752, 4to. He drew up an account of Campden church, which was read at the Society of Antiquaries, November 21, 1771.

BALLENDEN (Sir John), a Scottiſh poet, in the reign of James V. of Scotland, was deſcended from an ancient family in that kingdom. His father, Mr. Thomas Ballenden, of Auchinoul, was director to the chancery in the year 1540, and clerk regiſter in 1541. Where our poet was educated, we are not informed; but from one of his poems we learn, that in his youth he had ſome employment at the court of King James V. and that he was in great favour with that prince. Having taken orders, and being created doctor of divinity at the Sorbonne, he was made canon of Roſs, and archdeacon of Murray. He likewiſe obtained the place of clerk regiſter, but was afterwards deprived of that employment by the factions of the times; however, in the ſucceeding reign, of Mary, he recovered that office, and was one of the lords of ſeſſion. Being a zealous papiſt, he, in conjunction with Dr. Laing, was extremely aſſiduous in retarding the progreſs of the reformation; till at laſt, finding the oppoſition too powerful, he quitted Scotland, and went to Rome, where he died in the year 1550. He is generally eſteemed one of the beſt Scottiſh poets of that age. His works are, 1. *The Hiſtory and Chronicles of Scotland of Hector Boëis* (Boethius), *tranſlated by Mr. John Ballenden*. Edinb. 1536. This is not a mere tranſlation, Ballenden having corrected ſeveral miſtakes of his author, and made large additions. It is in folio, and black letter. 2. *Coſmography to the Hiſtory of Scotland*, with a poetical Proem. 3. *A Deſcription of Albany*. 4. *Tranſlation of Boethius's Deſcription of Scotland*. 5. *Epiſtles to King James V.* Bale ſays he had ſeen theſe letters. 6. Several Poems in Carmichael's collection of Scottiſh Poems; beſides many others in manuſcript, in private libraries in Scotland. 7. *Virtue and Vice*, a poem, addreſſed to King James V.

BALLERUS, in ichthyology, the trivial name of a ſpecies of cyprinus. See Barbel.

BALLOGISTAN, Little, a country of Hindooſtan Proper, bordering on the N. of Mewat, and approaching within twenty-four miles of Delhi. It is eighty or ninety miles long, and from thirty to forty broad. Within this century it was ſeized by the Balloges, or Balloches, whoſe country adjoins to the W. bank of the Indus, oppoſite Moultan. They are repreſented as a very ſavage and cruel race. Their territory is full of ravines, and of courſe difficult of acceſs. It has, however, been ſucceſſively tributary to the Rohillas, the Jats, and the late Nudjuff Cawn. Weſtward it borders on the country of the Seiks.

BALNAVES (Henry), a Scottiſh proteſtant divine, born in the ſhire of Fife, in the reign of James V. and educated at the univerſity of St. Andrew's. He went afterwards to France in order to finiſh his ſtudies; and, returning to Scotland, was admitted into the family of the Earl of Arran, who at that time governed the kingdom: but in the year 1542 the earl diſmiſſed him for having embraced the proteſtant religion. In 1564 he joined, ſays Mackenzie, the murderers of Cardinal Beaton; for which he was declared a traitor, and excommunicated. Whilſt that party were beſieged in the caſtle of St. Andrew's, they ſent Balnaves to England, who returned with conſiderable ſupply of proviſions and money; but being at laſt obliged to ſurrender

to the French, he was ſent with the reſt of the garriſon to France. He returned to Scotland about the year 1559; and, having joined the congregation, he was appointed one of the commiſſioners to treat with the Duke of Norfolk, on the part of Queen Elizabeth. In 1563 he was made one of the lords of ſeſſion, and appointed by the general aſſembly, with other learned men, to reviſe the Book of Diſcipline. Knox, his contemporary and fellow-labourer, gives him the character of a very learned and pious divine. He died at Edinburgh in the year 1579. He wrote, 1. *A Treatiſe concerning Juſtification.* Edinb. 1550, 8vo. 2. *A Catechiſm, or Confeſſion of Faith.* Edinb. 1584, 8vo.

BALSHAM (Hugh de), or DE BEDESALE, or BELESALE, the tenth biſhop of Ely, and founder of St. Peter's College, otherwiſe Peter-houſe, in Cambridge, was in all probability born at Balſham in Cambridgeſhire (from whence he took his ſurname), towards the beginning of the thirteenth century. He was at firſt a monk, and afterwards ſub-prior of the Benedictine monaſtery at Ely. In 1247, November 13, he was choſen, by his convent, biſhop of Ely, in the room of William de Kilkenny, deceaſed. But King Henry III. who had recommended his Chancellor Henry de Wengham, being extremely angry at the diſobedience of the monks, refuſed to confirm the election; and, moreover, he ſelled the woods, ſpoiled the ponds, and otherwiſe waſted the manors and eſtates belonging to the biſhopric. He endeavoured at laſt to perſuade the monks to proceed to a new election; alleging, that it was not fit ſo ſtrong a place as Ely ſhould be intruſted with a man that had ſcarcely ever been out of his cloiſter, and who was utterly unacquainted with political affairs. Balſham, finding he was not likely to ſucceed at home, went to Rome, in order to be confirmed by the pope; who, through the plenitude of his apoſtolical power, pretended to diſpoſe of all eccleſiaſtical preferments in Chriſtendom. In the mean time, Boniface archbiſhop of Canterbury uſed his utmoſt intereſt at Rome to obſtruct Hugh de Balſham's confirmation, though he could allege no one fault againſt him; and recommended Adam de Maris, a learned Minorite friar, as a fit perſon to be promoted to the biſhopric: but all his endeavours proved unſucceſsful. As to Wengham, having been recommended by the king without his own deſire and knowledge, he did not ſtir in the leaſt to get himſelf elected by the monks; but rather, out of an uncommon exceſs of modeſty, declined the honour, alleging that the two others (Balſham and Maris) were more worthy of it, and more deſerving than himſelf. This matter remained in ſuſpence for above ten years, and was at length determined in favour of Hugh de Balſham. For Wengham being promoted to the biſhopric of London, upon Fulk de Baſſet's deceaſe, the pope confirmed Hugh de Balſham's election, on the 10th of March, 1257, and he was conſecrated the 14th of October following. Being thus fixed in his ſee, he applied himſelf to works of charity, and particularly, in the year 1257, or 1259 according to ſome, put in execution what he had deſigned, if not begun, before; that is, he laid the foundation of St. Peter's College, the firſt college in the univerſity of Cambridge. He built it without Trumpington gate, near the church of St. Peter (ſince demoliſhed), from whence it took its name. He died at Dodington, June 16, 1286, and was buried in the cathedral church of Ely.

BALTZAR (Thomas), a native of Lubec, was an eminent muſical compoſer, and eſteemed the fineſt performer on the violin of his time. He came into England in the year 1658, and lived about two years in the houſe of Sir Anthony Cope, of Hanwell in Oxfordſhire. He was the great competitor of Davis Mell, who, though a clockmaker by trade, was, till Baltzar came hither, allowed to be the fineſt performer on the violin in England; and after his arrival he divided with him the public applauſe, it being agreed that Mell excelled in the fineneſs of his tone and the ſweetneſs of his manner, and Baltzar in the power of execution and command of the inſtrument.—Moreover, it is ſaid of the latter, that he firſt taught the Engliſh the practice of ſhifting, and the uſe of the upper part of the finger-board. Baltzar was given to intemperance, and is ſaid to have ſhortened his days by exceſſive drinking: he was buried in Weſtminſter-abbey on the 27th day of July, 1663.

BALUZE (Stephen), a French writer, born in 1631, and ſome time librarian to M. Colbert. In 1693 he obtained a penſion, with the poſt of director of the royal college, for writing the lives of the Popes of Avignon; both which advantages he ſoon loſt in the fluctuation of court parties. M. Baluze is much more noted for collecting ancient MSS. and illuſtrating them by notes, than famed for his own compoſitions.

BALZAC (John Lewes Guez de), born at Angoulême in 1595. Voltaire allows him the merit of having given numbers and harmony to the French proſe, but cenſures his ſtyle as ſomewhat bombaſtic. The critics of his own time gave him no little diſquiet; and he gave them no little advantage over him by his ſallies of vanity, and ſome particular propoſitions which were a little dangerous. Mr. Balzac, getting rid of theſe diſputes by his moderation, ſettled at his country-ſeat; refined his ſtyle and genius; and got by his letters and other writings which he publiſhed from time to time, the reputation of being the firſt writer in France. He was at length drawn from his retirement by the hopes of making his fortune under Cardinal Richlieu, who had formerly courted his friendſhip; but in a few years he retired again, diſguſted with the ſlaviſh dependence of a court life. All he obtained from the court was a penſion of 2000 livres, with the titles of counſellor of ſtate and hiſtoriographer of France. He died in 1654; and was buried in the hoſpital of Notre Dame des Anges, to which he bequeathed 12,000 livres. He left an eſtate of 100 franks *per ann.* for a gold medal to be beſtowed every two years for the beſt diſcourſe on ſome moral ſubject.—Beſides his letters, he wrote a work called *Oeuvres Diverſes*, i. e. on various ſubjects; The Prince; The Chriſtian Socrates, &c. and many other pieces; all of which have been publiſhed in two volumes folio.

BAMBRIDGE or BAINBRIDGE (Chriſtopher), archbiſhop of York, and cardinal-prieſt of the Roman church, was born at Hilton, near Appleby, in Weſtmoreland, and educated at Queen's College, in Oxford. Having taken holy orders, he became rector of Aller, in the dioceſe of Bath and Wells. He enjoyed three prebends ſucceſſively in the cathedral church of Saliſbury; and that of South Grantham, in 1485, that of Chardſtock in the ſame year, and that of Horton in 1486. He was elected provoſt of Queen's College in 1495, and about the ſame time created doctor of laws. On September the 28th, 1503, he was admitted prebendary of Strenſhall, in the cathedral church of York, void by the conſecration of Jeoffrey Blyth to the ſee of Lichfield and Coventry; and on the 21ſt of December following, he was inſtalled in the deanery of that church, in the room of the ſaid Blyth. In 1505 he was made dean of Windſor, and the ſame year maſter of the rolls, and one of the king's privy-council. In 1507 he was advanced to the ſee of Durham, and received the temporalities the 17th of November. The next year he was tranſlated to the archbiſhopric of York, and received the

temporalities the 12th of December. Pits aſſures us, that Bambridge had been very intimate with Morton archbiſhop of Canterbury, and ſhared in that prelate's ſufferings during the uſurpation of Richard III. after whoſe death, his affairs took a more proſperous turn; for he was appointed almoner to King Henry VII. and employed by that prince on ſeveral embaſſies to the Emperor Maximilian, Charles VIII. king of France, and other potentates of Europe. But he diſtinguiſhed himſelf chiefly by an embaſſy from King Henry VIII. to Pope Julius II. who created him a cardinal, with the title of St. Praxede, in March 1511, and, eight days after, appointed him legate of the eccleſiaſtical army, which had been ſent into the Ferrareſe, and were then beſieging the fort of Baſtia. In return for which marks of honour, our new cardinal and legate prevailed with the king his maſter to take part with his holineſs againſt the King of France. Nor was he leſs zealous in the ſervice of that pontiff during his life, than in honouring and defending his memory after his death. There are extant in Rymer's Fœdera, &c. two letters, one from Cardinal Bambridge, during his reſidence at Rome, to King Henry VIII. concerning the pope's bull giving him the title of Moſt Chriſtian King; and another from the Cardinal de Sinigallia to the king, acquainting his highneſs that he had delivered that inſtrument to Cardinal Bambridge. This prelate died at Rome, the 14th of July, 1514, being poiſoned by one of his domeſtics, in revenge for ſome blows he had given him.

BAMPTON, a large town in Oxfordſhire, with a ſmall market on Monday. It is ſeated near the Thames, twelve miles W. of Oxford, and ſeventy W. by N. of London.—Long. 1. 25. W. Lat. 51. 46. N.

BANCROFT (Richard), archbiſhop of Canterbury, in the reign of King James I. was ſon of John Bancroft, gentleman, and Mary, daughter of Mr. John Curwyn, brother of Dr. Hugh Curwyn, archbiſhop of Dublin; and was born at Farnworth in Lancaſhire, in September 1544. After being ſeverely trained up in grammatical learning, he was entered a ſtudent of Chriſt College, in Cambridge, where, in 1566-7, he took the degree of bachelor of arts; and from thence he removed to Jeſus College, where, in 1570, he commenced maſter of arts. Soon after, he was made chaplain to Dr. Cox, biſhop of Ely, who, in 1575, gave him the rectory of Teverſham in Cambridgeſhire. The year following, he was licenſed one of the univerſity preachers; and in 1580 was admitted bachelor of divinity. September the 14th, 1584, he was inſtituted to the rectory of St. Andrew, Holborn, at the preſentation of the executors of Henry earl of Southampton. In 1585 he commenced doctor in divinity; and the ſame year was made treaſurer of St. Paul's cathedral, in London. The year following he became rector of Cottingham in Northamptonſhire, at the preſentation of Sir Chriſtopher Hatton, lord chancellor, whoſe chaplain he then was. February the 25th, 1589, he was made a prebendary of St. Paul's; in 1592, advanced to the ſame dignity in the collegiate church of Weſtminſter; and, in 1594, promoted to a ſtall in the cathedral of Canterbury. Not long before, he had diſtinguiſhed his zeal for the church of England by a learned and ſignificant ſermon, preached againſt the puritans at St. Paul's Croſs. In 1597, Dr. Bancroft, being then chaplain to the archbiſhop of Canterbury, Whitgift, was advanced to the ſee of London, in the room of Dr. Richard Fletcher, and conſecrated at Lambeth the 8th of May.—From this time he had, in effect, the archiepiſcopal power; for the archbiſhop, being declined in years, and unfit for buſineſs, committed the ſole management of eccleſiaſtical affairs to Biſhop Bancroft. Soon after his being made biſhop he expended 1000 marks in the repair of his houſe in London. In the year 1600, he, with others, was ſent by Queen Elizabeth to Embden, to put an end to a difference between the Engliſh and Danes: but the embaſſy had no effect. This prelate interpoſed in the diſputes between the ſecular prieſts and the Jeſuits, and furniſhed ſome of the former with materials to write againſt their adverſaries. In the beginning of King James's reign, Biſhop Bancroft was preſent at the conference held at Hampton-court, between the biſhops and the preſbyterian miniſters. The ſame year, 1603, he was appointed one of the commiſſioners for regulating the affairs of the church, and for peruſing and ſuppreſſing books, printed in England, or brought into the realm without public authority. A convocation being ſummoned to meet March 20, 1603-4, and Archbiſhop Whitgift dying in the mean time, Biſhop Bancroft was, by the king's writ, appointed preſident of that aſſembly. October 19th, 1604, he was nominated to ſucceed the archbiſhop in that high dignity, to which he was elected by the dean and chapter, November 17, and confirmed in Lambeth chapel, December 10. September 5, 1605, he was ſworn one of his majeſty's moſt honourably privy-council. This year, in Michaelmas term, Archbiſhop Bancroft exhibited certain articles, to the lords of the council, againſt the judges. In 1608 he was declared chancellor of the univerſity of Oxford, in the room of the Earl of Dorſet, deceaſed. In 1610 this archbiſhop offered to the parliament a project for the better providing a maintenance for the clergy, but without ſucceſs. One of our hiſtorians pretends, that Archbiſhop Bancroft ſet on foot the building a college near Chelſea, for the reception of ſtudents, who ſhould anſwer all popiſh and other controverſial writings againſt the church of England. This prelate died November 2, 1610, of the ſtone, in his palace of Lambeth.

BANCROFT (John), biſhop of Oxford, in the reign of King Charles I. and nephew of the preceding Dr. Richard Bancroft, archbiſhop of Canterbury, was born at Aſtell, or Eſtwell, a ſmall village, between Whitney and Burford, in Oxfordſhire, and admitted a ſtudent of Chriſt-church, in Oxford, in 1592, being then about eighteen years of age. Having taken the degrees in arts, and entered into holy orders, he became a preacher for ſome years in and near Oxford. In 1609, being newly admitted to proceed in divinity, he was, through the intereſt and endeavours of his uncle, elected head of the Univerſity College, in which ſtation he continued above twenty years; during which time he was at great pains and expence in recovering and ſettling the ancient lands belonging to that foundation. In 1632 he was advanced to the ſee of Oxford, upon the tranſlation of Dr. Corbet to that of Norwich, and conſecrated about the 6th of June. This prelate died in 1640, and was buried at Cuddeſden in Oxfordſhire, the 12th of February.

BANGALORE, a ſtrong fortreſs of Myſore, in the peninſula of Hindooſtan. It is a place of great political importance, being, from its ſituation, the bulwark of the Myſore country, toward Arcot. It was taken by the Engliſh in 1791; but reſtored by the treaty of peace in 1792. It is ſeventy-four miles from Seringapatam, the capital of Myſore. Long. 77. 37. E. Lat. 13. 0. N.

BANGIUS (Thomas), a Daniſh divine, and an elegant Latin writer on the origin of languages, and a variety of other ſubjects. He died in 1661.

BANJAR, a river in the iſland of Borneo, in the Indian Ocean, in the mouth of which is a town where the Engliſh Eaſt-India Company have a factory.

BANIER (Anthony), licentiate in laws, member of the Academy of Inſcriptions and Belles-lettres, and eccleſiaſtic of the dioceſe of Clermont in Auvergne; died in November 1741, aged 69. He is principally celebrated for his tranſla-

tion of the Metamorphoſes of Ovid, with hiſtorical remarks and explanations; which was publiſhed in 1732, at Amſterdam, in folio, finely ornamented with copper-plates, by Picart; and reprinted at Paris, 1738, in two vols. 4to.: and for his Mythology, or fables of the ancients explained by hiſtory; a work full of the moſt important information, which was tranſlated into Engliſh, and printed at London in 1741, in 4 vols. 8vo.

BANISTER (John), a phyſician and ſurgeon in the reign of Queen Elizabeth, was educated at Oxford, where, ſays Anthony Wood, he ſtudied logicals for a time; but afterwards applied himſelf ſolely to phyſic and ſurgery. In 1573 he took the degree of bachelor of phyſic; and, obtaining a licence from the univerſity to practiſe, ſettled at Nottingham, where he lived many years in great repute. When or where he died, is not known.' There was a long poetical memorial of him in the church of St. Olave, Silver-ſtreet, London, which is preſerved by Stow. He was author of, 1. *A needful, new, and neceſſary Treatiſe of Chirurgery, briefly comprehending the general and particular Curation of Ulcers.* Lond. 1575, 8vo. 2. *Certain Experiments*, of his own invention. 5. *The Hiſtory of Man, ſucked from the Sappe of the moſt approved Anatomiſts*, &c. in nine books. Lond. 1578, thin fol. 4. *Compendious Chirurgery, gathered and tranſlated eſpecially out of Wecker*, &c. Lond. 1585, 12mo. 5. *Antidotary chirurgical, containing variety of all Sorts of Medicines*, &c. Lond. 1589, 8vo. His works were collected and publiſhed in 1633, 4to.

BANSTEAD, a village of Surrey, noted for an abundance of walnut-trees; but more for its neighbouring downs, one of the moſt delightful ſpots in England, on account of its fine carpet ground, covered with ſhort herbage, perfumed with thyme and juniper, which make the mutton of this ſpot very ſweet, though ſmall. It has ſeveral ſeats around it, and a proſpect of ſeveral counties, including Windſor, Hampton-court, and London. Theſe downs form a tract of thirty miles, extending, under different denominations, from Croydon to Farnham. On that part of them near Banſtead is a noted four-miles courſe. Banſtead is thirteen miles S.S.W. of London.

BAPAUME, a town of France, in the department of the Straits of Calais, and late province of Artois, twelve miles S.E. of Arras. Long. 2. 35. E. Lat. 50. 8. N.

BARBARIUM (anc. geog.), a promontory of Luſitania, to the ſouth of the mouth of the Tagus; now called *Cabo de Eſpichel*. W. long. 6. N. lat. 37.

BARBARUS (Francis), a noble Venetian, was a man of great fame in the 13th century, not only for learning, but likewiſe for a ſkilful addreſs in the management of public affairs. He is author of a book *De Re Uxoria*, and ſome ſpeeches.

BARBARUS (Hermolaus), grandſon of the preceding, one of the moſt learned men in the 15th century. The public employments he was entruſted with early, did not prevent him from cultivating polite learning with great application. As he was very ſkilful in the Greek, he undertook the moſt difficult tranſlations, and began with a famous paraphraſe upon Ariſtotle. He then attempted Dioſcorides, whoſe text he corrected, gave a tranſlation of him, and added a commentary. But of all his works, there is none which has gained him ſo much reputation as that which he made upon Pliny; he corrected in him above 5000 paſſages, and occaſionally reſtored 300 in Pomponius Mela. Pope Innocent VIII. to whom he was ambaſſador, conferred the patriarchate of Aquileia upon him. He was ſo imprudent as to accept of it without waiting for the conſent of his ſuperiors: though he could not be ignorant that the republic of Venice had made laws to forbid all the miniſters they ſent to the court of Rome to accept any benefice. His ſuperiors were inflexible; and not being able to gain any thing upon them, either by his flattery or his father's intereſt, the father died of grief, and the ſon ſoon followed him.

BARBARUS (Daniel), of the ſame family with the preceding, was patriarch of Aquileia, and famous for his learning. He was ambaſſador from Venice to England; and was one of the fathers of the council of Trent, where he acted with great zeal for the intereſt of the pope. He wrote, 1. A commentary upon Vitruvius. 2. *Catena Græcorum Patrum in quinquaginta Pſalmos Latine verſa.* 3. *La Prattica della Perſpettiva.* He died in 1569, at 41 years of age.

BARBESUL (anc. geog.), a town and river of Bœtica, and a colony in the reſort of the Conventus Gaditanus in Spain: now *Marbella*, in Granada.

BARBEYRAC (John), was born in Beſiers, in Lower Languedoc, in 1674. He was made profeſſor of law and hiſtory at Lauſanne, in 1710; which he enjoyed for ſeven years, and during that time was three times rector: in 1717, he was profeſſor of public and private law at Groningen. He tranſlated into French the two celebrated works of Puffendorf, his *Law of Nature and Nations*, and his *Duties of a Man and a Citizen*; to both which he wrote excellent notes, and to the former an introductory preface. He tranſlated alſo Grotius's treatiſe *De Jure Belli ac Pacis*, with large and excellent notes; and ſeveral of Tillotſon's ſermons. He wrote a work entitled *Traité de Jeu*, two vols. 8vo.

BARBOUR (John), archdeacon of Aberdeen, was eſteemed an elegant poet in the reign of David I. He wrote the hiſtory of Robert de Bruce, in an heroic poem, which is ſtill extant, and which contains many facts and anecdotes omitted by other hiſtorians. The lateſt edition of this book is that of Glaſgow, 8vo. printed in the year 1672. It is entitled, The Acts and Life of the moſt victorious conqueror Robert Bruce, King of Scotland; wherein alſo are contained the martial Deeds of the valiant Princes Edward Bruce, Sir James Dowglaſs, Earl Thomas Randal, Walter Steward, and ſundry others. In one paſſage, he calls it a *romance*; but that word was then of good reputation: every body knows that the 'Romaunt of Romaunts' has been innocently applied to true hiſtory; as well as the 'Ballad of Ballads' to a ſacred ſong.

BARCINO (anc. geog.), a town of the Terraconenſis, in Spain, and capital of the Laletani. Now *Barcelona*. See that article.

BARCLAY (Alexander), a learned monk in the reign of Henry VIII. Where he was born, though of no great importance, was nevertheleſs a matter of virulent contention among his former biographers. Bale, who was his contemporary, is of opinion he was born in Somerſetſhire. There is indeed a village of his name, and a numerous family, in that county. Pits thinks he was born in Devonſhire.—Mackenzie is poſitive he was a Scotchman; but, without proof, unleſs we admit as ſuch his name, *Alexander*. He was, however, educated in Oriel College, Oxford. After leaving the univerſity, he went abroad, and continued ſome time in France, Italy, and Germany, where he acquired a competent knowledge of the languages of thoſe countries, as appears from ſeveral tranſlations of books, which he afterwards publiſhed. On his return to England, he was made chaplain to his patron the biſhop of Tyne, who likewiſe appointed him a prieſt of St. Mary, at the college of Ottery, in Devonſhire, founded by Grandiſon biſhop of Exeter. After the death of his patron, he became a Benedictine monk of Ely. On the diſſolution of that monaſtery, he firſt obtained the vicarage of St. Matthew, at Wokey in Somerſetſhire; and, in 1549,

being then doctor of divinity, was preſented to the vicarage of Much Badew in Eſſex. In 1552 he was appointed rector of Allhallows, Lombard-ſtreet, which he lived to enjoy but a very ſhort time. He died at Croydon in Surrey, in June 1552. He is generally allowed to have improved the Engliſh language, and to have been one of the politeſt writers of his time. He compoſed ſeveral original works; but was chiefly remarkable for his tranſlations from the Latin, Italian, French, and German languages. His verſion from Salluſt of the war of Jugurtha is accurate, and not without elegance. His lives of ſeveral ſaints, in heroic verſe, are ſtill unpubliſhed. His *Stultifera Navis*, or *The Ship of Fools*, is the moſt ſingular of his performances. It was printed by Richard Pynſon, at London, 1509, in folio; and contains a variety of wooden plates, which are worthy the inſpection of the curious.

BARCLAY (William), a learned Civilian, was born in Aberdeenſhire, in the year 1541. He ſpent the early part of his life, and much of his fortune, at the court of Mary queen of Scots, from whoſe favour he had reaſon to expect preferment. In 1573 he went over to France, and at Bourges commenced ſtudent of civil law under the famous Cujacius. He continued ſome years in that ſeminary, where he took a doctor's degree; and was ſoon after appointed profeſſor of civil law in the univerſity of Pont-à-Mouſſon, then firſt founded by the Duke of Lorraine. That prince afterwards made him counſellor of ſtate, and maſter of requeſts. Barclay, in the year 1581, married Ann de Maillaville, a French lady, by whom he had a ſon, who became a celebrated author, and of whom the reader will find an account in the next article. This youth the Jeſuits would gladly have received into their ſociety. His father refuſed his conſent, and for that reaſon theſe diſciples of Jeſus ſoon contrived to ruin him with the duke his patron. Barclay now embarked for Britain, where King James I. offered him conſiderable preferment, provided he would become a member of the church of England: but, not chooſing to comply, he returned to France in 1604; and, ſoon after his arrival, was appointed profeſſor of civil law in the univerſity of Angers, where he died the year following, and was buried in the Franciſcan church. He was eſteemed a learned civilian; and wrote elaborately in defence of the divine right of kings, in anſwer to Buchanan and others. The titles of his works are, 1. *De regno et regali poteſtate*, &c. 2. *Commentarius in tit. pandectarum de rebus creditis, et de jurejurando.* 3. *De poteſtate papæ*, &c. 4. *Præmetia in vitam Agricolæ.*

BARCLAY (John), ſon of the former, was, as we have above mentioned, ſo great a favourite of the Jeſuits, that they uſed all their efforts to engage him in their ſociety. His father would not conſent, and carried his ſon with him into England, who was already an author, for he had publiſhed *A Commentary upon the Thebais of Statius*, and a Latin poem on the coronation of King James, and the firſt part of *Euphormio*, 1603. He returned to France with his father; and after his father's death went to Paris, and ſoon after came back to London: he was there in 1606. He publiſhed *The Hiſtory of the Gunpowder Plot*, a pamphlet of ſix leaves, printed at Amſterdam. He publiſhed at London, in 1610, *An Apology for the Euphormio*, and his father's treatiſe *De poteſtate papæ*. And at Paris, 1612, he publiſhed a book entitled *Pietas*, in anſwer to Cardinal Bellarmin, who had written againſt William Barclay's book concerning the power of the pope. Two years after, he publiſhed *Icon Animorum*. He was invited to Rome by Pope Paul V. and received a great deal of civility from Cardinal Bellarmin, though he had written againſt him. He died at Rome in 1621, while his *Argenis* was printing at Paris. This celebrated work has ſince gone through a great number of editions, and has been tranſlated into moſt languages. M. de Peireſc, who had the care of the firſt edition, cauſed the effigies of the author to be placed before the book; and the following diſtich, written by Grotius, was put under it:

Gente Caledonius, Gallus notalibus, hic eſt,
Romam Romano qui decet ore loqui.

BARDON HILLS, in Leiceſterſhire: theſe hills, which are to the N.W. part of the county, riſe to a conſiderable height.

BAREGES, a village of France, in the department of the Upper Pyrenées and late province of Bigorre. It is much frequented on account of its mineral baths. It is ſeated in a valley of the ſame name (which contains the little town of Luz and 17 villages), twelve miles S. of Bagneres.

BARIUM (anc. geog.), a town of Apulia on the Adriatic; ſo called from the founders, who being expelled from the iſland Bora, built this town. It is now called BARI; ſee that article.

BARK (*Encycl.*). The bark of the oak has been long uſed in tanning leather, and even thought eſſential to that operation (ſee TANNING): but a different ſubſtance has been diſcovered, which anſwers the purpoſe full as well, and may be procured at a much cheaper rate; we mean oak ſaw-duſt, or the chips of oak reduced to powder. This valuable ſecret was purchaſed by the Society for the Encouragement of Arts, &c. Much facility in the preparation of bark for the purpoſes of tanning has lately been occaſioned by different patent inventions, of which we ſhall here give an account, in the words of the ſeveral ſpecifications.

Mr. Weldon, of Lichfield, ſtates his improvements on a machine or mill for grinding bark, and various other articles, for which he obtained a former patent, in the following way: "My former method of conſtructing mills for grinding bark (ſays he), is chiefly of caſt-iron, the teeth or cutters thereof caſt with them; and the method of keeping them ſharp, or renewing their teeth, is to chip or cut them with a hammer and chiſſel; and the method of making and conſtructing what are commonly called ſteel-mills, for the purpoſe of grinding malt, &c. are chiefly made of malleable iron caſe-hardened, the teeth of which are cut or raiſed out of the ſolid by means chiſſels and files, and are kept ſharp by the ſame method. But in order to avoid theſe difficulties, and make them (the teeth) more durable and laſting, and that the uſer of ſuch mills or machines may be able to ſharpen his own mill or machine, and keep the ſame in repair without ſending them to the maker, I have conſtructed them with looſe or moveable teeth, which may be taken out at any time, and by grinding them on a common grinding-ſtone, may be ſharpened and kept in order, or by replacing the teeth ſhould they wear out, the machine will then be as good as new; and to ſhew the nature of my invention, I have added drawings on the oppoſite ſide thereof; but as the principle of the machine or mill for grinding bark is the ſame as that of my former patent, it is not neceſſary to deſcribe any more of it than the manner in which the looſe teeth are to be fixed, which may be the ſame as that deſcribed in the drawing for a corn mill, or by any other method I may think moſt proper. Fig. 1. (Plate 15) repreſents the different parts of a mill for grinding bark, corn, &c. and the manner in which it is conſtructed. A, is a hopper made of wood, tin, or ſheet-iron, which receives the corn or any thing that is to be ground. B, is the axis of the ball or inner part of the mill, which may be made of wrought or caſt iron. C, is a conical covering, which prevents the materials, to be ground, from lodging on the cap, which may be made of wood, tin, or ſheet-iron. D D, is a looſe cap, which faſtens and ſecures the looſe teeth of the ball or inner part of the mill, by means of four ſcrews repreſented by *b*.

E, repreſents one ſide of the ball or inner part of the mill filled with teeth. G, ſhews one half of the inner part of the mill without teeth, wherein may be ſeen the manner in which the teeth are kept in their places. *d d*, ſhews the ſubſtance of the metal, which is of caſt-iron. HH, ſhews the bottom flanch that holds the teeth, and is caſt with the body part of the cone. *a a a*, ſhews the outer cylinder, which is caſt altogether, and ſhews in what manner the looſe teeth F,F, are fixed in it. II, is a flanch which faſtens or holds the looſe teeth of the outer part of the mill by means of ſix ſcrews, as ſhewn by fig. 3. KK, is the bridge which carries the inner part of the mill, and is faſtened to the outer cylinder by means of two ſcrews, *c, c*. L, is the lower part of an axis. M, the braſs ſtep on which the axis works. N, is a plate in which the regulating ſcrew works, and is made of wrought iron. O, the regulating ſcrew. Fig. 2. repreſents the under ſide of the outer cylinder, with the bridge K, and the box which contains the braſs ſtep M. Fig. 4. repreſents one of the looſe teeth on the outer part of the mill. Fig. 5. repreſents one of the teeth on the inner part of the mill: theſe teeth may be made of caſt-iron, wrought-iron, or ſteel, or any metal or materials that may be thought moſt proper. Theſe mills or machines are not confined to any preciſe form or ſhape, and may be made of any metal or materials I may think moſt ſuitable. They may be worked either as hand-mills or horſe-mills, or by any other power that can be applied to them."

Mr. Bagnall, of Worſley in Lancaſhire, has invented a mill or machine to chop bark, and grind, and riddle, and pound it; to beam or work green hides and ſkins out of the maſtering or drench, and make them ready and fitting for the ouſe or bark liquor; to beam ſheep ſkins, and other ſkins, for the ſkinner's uſe; and for ſcouring and taking the bloom off or from tanned leather when in the currying ſtate. See Plate 15.

Fig. 1. is a horizontal plan of the mill. Fig. 2. longitudinal ſection of it. Fig. 3. tranſverſe ſection of it.

A, The water-wheel, by which the whole machinery is worked.

B, The ſhafts.

C, The pit-wheel, which is fixed on the water-wheel ſhaft B, and turns the upright ſhaft E, by the wheel F, and works the cutters and hammer by tapets.

D, The ſpur and bevil-wheel at the top of upright ſhafts.

E, The upright ſhaft.

F, The crown-wheel, which works in the pit-wheel C.

G, The ſpur-nut to turn the ſtones I.

P, The beam, with knives or cutters fixed at the end to chop or cut the bark, which ſaid bark is to be put upon the cutters or grating *i*, on which ſaid beam is to fall.

Q, The tryal that receives the bark from the cutters *i*, and conveys it into the hopper H, by which it deſcends through the ſhoe J to the ſtones I, where it is ground.

K, The ſpout, which receives the bark from the ſtones, and conveys it into the tryal L, which tryal is wired to ſift or dreſs the bark, as it deſcends from the ſtones I.

M, The trough to receive the bark that paſſes through the tryal L.

R, The hammer, to cruſh or bruiſe the bark that falls into the diſh S, which ſaid diſh is on the incline, ſo that the hammer keeps forcing it out of the lower ſide of the ſaid diſh, when bruiſed.

k, A trough to receive the duſt and moſs that paſſes through the tryal Q.

T, The bevil-wheel, that works in the wheel D, which works the beam-knife by a crank V at the end of the ſhaft *u*.

W, The penetrating rod, which leads from the crank V to the ſtart *x*.

x, The ſtart, which has ſeveral holes in it to lengthen or ſhorten the ſtroke of the beam-knife.

y, The ſhaft, to which the ſlide rods *h, h*, are fixed by the ſtarts *n, n*.

h, The ſlide rod, on which the knife *f* is fixed; which ſaid knife is to work the hides, &c. On the knife are two ſprings *a, a*, to let it have a little play as it makes its ſtroke backwards and forwards, ſo that it may not ſcratch or damage the hides, &c.

z, Is a catch in ſlide-rod *h*, which catches on the arch-head *e*; and the ſaid arch-head conveys the knife back without touching the hide, and then falls back to receive the catch again.

l, The roller to take up the ſlide-rod *h*, while the hides are ſhifting on the beam *b* by pulling at the handle *m*.

b, The beam to work the hides, &c. on. Each beam has four wheels *p, p*, working in a trough road *g, g*, and removed by the levers *c, c*. When the knife has worked the hide, &c. ſufficiently in one part, the beam is then ſhifted by the lever *c* as far as is wanted.

d, A preſs, at the upper end of the beam, to hold the hide faſt on the beam while working.

e, An arch-head, on which the ſlide-rod *h* catches.

f, The knife fixed on the ſlide-rod *h*, to work the hides, &c.

i, Cutters or grating to receive the bark for chopping.

The beam P, with knives or cutters, may either be worked by tapers, as deſcribed, or by the bevil-wheel T, with a crank, as V, to cut the ſame as ſhears.

The knife *f* is fixed at the bottom of the ſtart, which is fixed on the ſlide rod *h*; the bottom of the ſtart is ſplit open to admit the knife, the width of one foot; the knife ſhould have a gudgeon at each end, to fix in the open part of the ſtart; and the two ſprings *a, a*, prevent the knife from giving too much way when working; the knife ſhould be one foot long and four or five inches broad.

The arch-head *e* will ſhift nearer to, or farther from, the beam *b*, and will be fixed ſo as to carry the knife back as far as is wanted, or it may be taken away till wanted.

The roller *l* is taken up by pulling at the handle *m*, which takes up the ſlide-rod ſo high as to give head-room under the beam-knife. The handle may be hung upon a hook for that purpoſe. The ſlide-rod will keep running upon the roller all the time the hide is ſhifting; and when the hide is fixed the knife is put on the beam again by letting it down by the handle *m*. There may be two or more knives at work on one beam at the ſame time, by having different ſlide-rods. There ſhould be two beams, ſo that the workman could be ſhifting one hide, &c. while the other was working. The beam muſt be flat, and a little on the incline. As to the breadth it does not matter, the broader it is the leſs ſhifting of the hides will be wanted, as the lever *c* will ſhift them as far as the width of the hide, if required. Mr. Bagnall has formed a kind of preſs *d*, to let down, by a lever, to hold the hide faſt on each ſide of the knife if required, ſo that it will ſuffer the knife to make its back ſtroke without pulling the hide up as it comes back. The ſlide-rod may be weighted, to cauſe the knife to lay ſtreſs on the hide, &c. according to the kind and condition of the goods to be worked.

Hides and ſkins for the ſkinner's uſe are worked in the ſame way as for the tanners.

Scouring of tanned leather for the currier's uſe will be done on the beam the ſame as working green hides. It is only taking the knife away, and fixing a ſtone in the ſame manner as the knife by the ſaid joint, and to have a bruſh fixed to go either before or after the ſtone. The leather will be better ſecured this way than by hand, and much ſooner.

The whole machinery may be worked by water, wind, ſteam, or any other power. And that part of the machinery

which relates to the beaming part of the hides, may be fixed to any horſe bark-mill, or may be worked by a horſe or other power ſeparately.

The intention of working hides and ſkins upon the beam is to clean, and get out of them all the lime and dirt that can be got out, which is the principal part of the buſineſs for making good leather; the dirt will be got out much better, and the hides be made cleaner, this way than they can by hand, and at much leſs expence.

BARKHAM (Dr. John), a learned divine and antiquary, born at Exeter about 1572, bred at Oxford, poſſeſſed ſucceſſively of ſeveral preferments, and dying at Bocking in Eſſex, of which he was rector and dean, 1642. Though not very diſtinguiſhed, he was yet a very accompliſhed man; an exact hiſtorian, a good herald, a great antiquary, and had an excellent collection of coins and medals, which he gave to Archbiſhop Laud, and which Laud gave to the univerſity of Oxford. He was concerned in ſeveral works, though he never publiſhed his name. The hiſtorian Speed, at the concluſion of his work, makes his acknowledgments for the aſſiſtance he had from Barkham; whom he ſtyles "a gentleman, compoſed of learning, virtue, and courteſy." The reigns of John and Henry II. are reckoned to be chiefly of his writing. He had alſo the chief hand in "Guillam's Diſplay of Heraldry," publiſhed in 1610, folio.

BARLÆUS (Gaſper), profeſſor of philoſophy at Amſterdam, and one of the beſt Latin poets of the 17th century. There was ſcarce any thing great that happened in the world while he lived, but he made a pompous elegy upon it, when reaſons of ſtate were no obſtacle to it. He was a great defender of Arminius; and ſhewed his abilities in hiſtory by his relation of what paſſed in Braſil during the government of Count Maurice of Naſſau, publiſhed 1647. He died the year after.

BARLOW (William), biſhop of Chicheſter, deſcended of an ancient family in Wales, was born in the county of Eſſex. In his youth he favoured the reformation; and travelled to Germany to be inſtructed by Luther, and other preachers of the new doctrine. How long he continued a Proteſtant is uncertain: but from his letter to King Henry VIII. quoted below, it appears that he wrote ſeveral books againſt the church of Rome. However, he was a regular canon in the Auguſtine monaſtery of St. Oſith in the county of Eſſex, and ſtudied ſome time at Oxford with the brothers of that order, where he took the degree of doctor in divinity. He was then made prior of the convent of Biſham in Berkſhire; and afterwards ſucceeded to the ſeveral priories of Blackmore, Typtree, Lega, Bromhole, and Haverford-weſt. On the diſſolution of abbeys, he reſigned not only with a good grace, but perſuaded ſeveral other abbots to follow his example. King Henry was ſo pleaſed with his ready obedience on this occaſion, that he ſent him, in 1535, on an embaſſy to Scotland; in the ſame year, made him biſhop of St. Aſaph; in two months after, tranſlated him to the ſee of St. David's, and in 1547 to that of Bath and Wells. During this time, our good biſhop, as appears from a letter of his to the king, was, or pretended to be, a ſtaunch Papiſt: it was written in 1533. However, when Edward VI. came to the crown, he was again a Proteſtant, and for that reaſon, on Queen Mary's acceſſion, was deprived of his biſhopric, and ſent priſoner to the Fleet, where he continued ſome time. At length he found means to eſcape, and immediately joined the other Engliſh Proteſtants in Germany. When Queen Elizabeth aſcended the throne, our prelate was raiſed to the ſee of Chicheſter, and ſoon after made firſt prebendary of the collegiate church of Weſtminſter. He died in 1568, and was buried in the cathedral at Chicheſter. He had five daughters, each of whom married a biſhop. He wrote, 1. *The Buryal of the Maſſe.* 2. *The climbing up of Fryers and religious Perſons portred with Figures.* 3. *Chriſtian Homilies.* 4. *A book upon Coſmography.* 5. *The godly and pious Inſtitution of a Chriſtian Man, commonly called the Biſhop's Book:* and ſeveral other works. He is ſaid to be the tranſlator of the apocrypha as far as the book of Wiſdom. His letters to M. Parker are in manuſcript in Corpus Chriſti College, Cambridge, Miſc. i. 445

BARLOW (William), a mathematician and divine, the ſon of the biſhop of Chicheſter, was born in Pembrokeſhire whilſt his father was biſhop of St. David's. In 1560 he was entered commoner of Baliol College in Oxford; and in 1564, took a degree in arts, which having completed by determination, he left the univerſity and went to ſea; but in what capacity is uncertain: however, he acquired conſiderable knowledge in the art of navigation. About the year 1573 he entered into orders; and became prebendary of Wincheſter and rector of Eaſton near that city. In 1588 he was made prebendary of Lichfield, which he exchanged for the place of treaſurer of that church. Some years after he was made chaplain to Prince Henry, the ſon of King James I.; and in 1614, archdeacon of Saliſbury. He was the firſt writer on the nature and properties of the magnet. Barlow died in the year 1625, and was buried in the church at Eaſton His works are, 1. *The Navigator's Supply, containing many Things of principal Importance belonging to Navigation, and Uſe of divers Inſtruments framed chiefly for that Purpoſe.* 1597, 4to. Dedicated to Robert earl of Eſſex. 2. *Magnetical Advertiſements, or diverſe pertinent Obſervations and approved Experiments concerning the Nature and Properties of the Loadſtone.* Lond. 1616, 4to. 3. *A brief Diſcovery of the idle Animadverſions of Mark Ridley, M. D. upon a Treatiſe entitled Magnetical Advertiſements.* 1618, 4to.

BARLOW (Thomas), born in 1607, was appointed fellow of Queen's College in Oxford in 1633; and two years after was choſen reader of metaphyſics to the univerſity. He was keeper of the Bodleian library, and in 1657 was choſen provoſt of Queen's College. After the reſtoration of King Charles II. he was nominated one of the commiſſioners for reſtoring the members unjuſtly expelled in 1648. He wrote at that time *The Caſe of Toleration in Matters of Religion*, to Mr. R. Boyle. In 1675, he was made biſhop of Lincoln. After the popiſh plot, he publiſhed ſeveral tracts againſt the Roman-catholic religion; in which he ſhews an uncommon extent of learning, and ſkill in polemical divinity. Nevertheleſs, when the Duke of York was proclaimed king, he took all opportunities of expreſſing his affection toward him; but after the revolution he as readily voted that the king had abdicated his kingdom; and was very vigorous in excluding thoſe of the clergy who refuſed the oaths from their benefices.

Mr. Granger obſerves, that "this learned prelate, whom nature deſigned for a ſcholar, and who acted in conformity with the bent of nature, was perhaps as great a maſter of the learned languages, and of the works of the celebrated authors who have written in thoſe languages, as any man of his age. The greateſt part of his writings, of which Mr. Wood has given us a catalogue, are againſt Popery; and his conduct for ſome time, like that of other Calviniſts, appeared to be in direct oppoſition to the church of Rome. But after James aſcended the throne, he ſeemed to approach much nearer to Popery than he ever did before. He ſent the king an addreſs of thanks for his declaration for liberty of conſcience, and is ſaid to have written reaſons for reading that declaration. His compliances were much the ſame after the revolution. His moderation, to call it by the ſofteſt name, was very great;

indeed ſo great, as to bring the firmneſs of his character in queſtion. But caſuiſtry, which was his moſt diſtinguiſhed talent, not only reconciles ſeeming contradictions, but has alſo been known to admit contradictions themſelves. He was, abſtracted from this laxity of principles, a very great and worthy man." He died at Buckden in Huntingdonſhire, in the 85th year of his age.

BARLOW (Francis), an eminent Engliſh painter, was born in Lincolnſhire. On his coming to London he was placed with one Shepherd, a limner; but his genius led him chiefly to drawing of birds, fiſh, and other animals. There are ſix books of animals from his drawings, and he painted ſome ceilings with birds for noblemen and gentlemen in the country. His etchings are numerous; his illuſtration of Eſop is his greateſt work. He died in 1702.—There is ſomething pleaſing in the compoſition and manner of this maſter, though neither is excellent. His drawing too is very indifferent; nor does he characteriſe any animal juſtly. His birds in general are better than his beaſts.

BARNARD (Sir John). His firſt appearance on the public ſtage, on which he afterwards made ſuch a diſtinguiſhed figure, was in the year 1722, when he was choſen one of the repreſentatives in parliament for the city of London; a truſt which he continued to enjoy during ſix ſucceeding parliaments, and which he always diſcharged with equal integrity and ability. In 1725 he received the thanks of the common-council, for oppoſing a bill introducing a change in the method of conducting elections in the city of London. In 1727 he was choſen alderman of Dowgate-ward; and the next year prepared and preſented to the Commons a bill for the better regulation and government of ſeamen in the merchant ſervice.

In 1730 the court of Vienna having begun a negociation in England for a loan of 400,000 pounds, a bill was propoſed and enacted, prohibiting all his majeſty's ſubjects from lending any ſum of money to any foreign prince whatever, without licence obtained from his majeſty, under his privy ſeal, or ſome greater authority. Violent oppoſition was made to this bill by a great number of members; among whom Mr. John Barnard (for the dignity of knighthood he obtained afterwards by his own merit) made no inconſiderable figure. He obſerved, that if the bill ſhould paſs in its preſent form, it would, in his opinion, open a channel for the Dutch to carry on a very lucrative branch of buſineſs to the prejudice of England: that the bill ought abſolutely to name the emperor as the power prohibited to borrow; for that otherwiſe, all the other ſtates of Europe would think themſelves equally affected by this act, which would give it the air as if England was at war with all the world: that he was by no means for making the Exchequer a court of inquiſition: he conceived it to be equally odious and unconſtitutional, that ſubjects ſhould be obliged to accuſe themſelves, and thereby incur the moſt ſevere penalties.

In the debate upon the famous exciſe ſcheme, projected by Sir Robert Walpole in 1733, Sir John ſhewed himſelf not more zealous for the trade of his country, than for the honour of thoſe by whom it was principally conducted. While this affair was depending in parliament, the merchants of London, having been convened by circular letters, repaired to the lobby of the Houſe of Commons, in order to ſolicit their friends to vote againſt the bill. Sir Robert Walpole, piqued at the importunity of theſe gentlemen, threw out ſome reflections againſt the conduct of thoſe whom he ſuppoſed to have been the means of bringing them thither; and at the ſame time inſinuated, that the merchants themſelves could be conſidered in no other light than that of STURDY BEGGARS. This expreſſion was highly reſented by all thoſe in the oppoſition, and particularly by Sir John Barnard. In a word, he made ſo ſtrenuous an oppoſition to this unpopular and unconſtitutional ſcheme, that, in conjunction with other members, he obliged the miniſtry entirely to lay it aſide.

In 1735 he moved for leave to bring in a bill to limit the number of play-houſes, and reſtrain the licentiouſneſs of players, which was now increaſed to an amazing degree: and though the bill miſcarried at that time, it was yet, about two years after, enacted into a law, which ſtill continues in force. In 1736 he ſerved with his brother-in-law, Sir Robert Godſchall, knight, alderman of Biſhopſgate-ward, the office of ſheriff of the city of London and county of Middleſex. In 1737 he formed a ſcheme for reducing the intereſt on the national debt; a project which, though it did not at that time ſucceed, was nevertheleſs afterwards carried into execution, to the great emolument of the trading part of the nation. In 1738 he ſerved the high office of lord-mayor of London; and during his mayoralty had the misfortune to loſe his lady, who was buried in a very grand manner at Clapham church. Upon the death of Sir John Thompſon, knt. in 1749, he removed purſuant to an act of common-council, and took upon him the office of alderman of Bridgeward-without, and then became in name, as he might already be conſidered in reality, the father of the city; and in July 1758, to the inexpreſſible regret of his brother aldermen, and of all his fellow-citizens, he reſigned his gown.

The ſame year, upon the motion of Sir Robert Ladbroke, then father of the city, the thanks of the court of aldermen were given to Sir John Barnard.

Upon his reſigning the office of alderman, he retired in a great meaſure from public buſineſs, and having again received the thanks of the court of aldermen, continued to live chiefly in a private manner at Clapham; where, after having attained near the age of eighty, he died the 29th of Auguſt, 1766.

BARNAVELDT, an iſland of America, to the S. of Tierra del Fuego. Long 66. 58. W. Lat. 55. 49. S.

BARNES (Joſhua), profeſſor of the Greek language at Cambridge in the beginning of the 18th century. He was choſen queen's profeſſor of Greek in 1695, a language he wrote and ſpoke with the utmoſt facility. His firſt publication was a whimſical tract, entitled *Gerania, or a new Diſcovery of the little Sort of People called Pygmies.* After that appeared his *Life of Edward* III. in which he introduces his hero making long and elaborate ſpeeches.—In the year 1700, when he publiſhed many of his works, Mrs. Maſon, of Hemmingford in Huntingdonſhire, a widow lady of between 40 and 50, with a jointure of 200l. *per annum,* who had been for ſome time a great admirer of him, came to Cambridge, and deſired leave to ſettle 100l. a-year upon him after her death; which he politely refuſed, unleſs ſhe would likewiſe condeſcend to make him happy with her perſon, which was not very engaging. The lady was too obliging to refuſe any thing to Joſhua, for whom, ſhe ſaid, "the ſun ſtood ſtill;" and they were accordingly married. Mr. Barnes wrote ſeveral other books beſides thoſe above mentioned, particularly, *Sacred Poems; The Life of Oliver Cromwell, the Tyrant; ſeveral dramatic pieces; A poetical Paraphraſe on the Hiſtory of Eſther, in Greek Verſe,* with a Latin tranſlation, &c.: and he publiſhed editions of *Euripides, Anacreon,* and *Homer's Iliad and Odyſſey,* with notes, and a Latin tranſlation. He wrote with greater eaſe in Greek than even in Engliſh, and yet is generally allowed not to have underſtood the delicacies of that language. He was of ſuch a humane diſpoſition, and ſo unacquainted with the world, that he gave his only coat to a vagrant begging at his door. This excellent man died on the 3d of Auguſt, 1712, in the 58th year of his age.

BARNEVELDT (John d' Olden), the celebrated Dutch ſtateſman, and one of the founders of the civil liberty of Holland. His patriotic zeal induced him to limit the autho-

rity of Maurice prince of Orange the ſecond ſtadtholder of Holland, the partiſans of that prince falſely accuſed him of a deſign to deliver his country into the hands of the Spaniſh monarch. On this abſurd charge he was tried by 26 commiſſaries deputed from the ſeven provinces, condemned, and beheaded in 1619. His ſons William and Réné, with a view of revenging their father's death, formed a conſpiracy againſt the ſtadtholder, which was diſcovered. William fled: but Réné was taken and condemned to die; which fatal circumſtance has immortalized the memory of his mother, of whom the following anecdote is recorded. She ſolicited a pardon for Réné; upon which Maurice expreſſed his ſurpriſe that ſhe ſhould do that for her ſon, which ſhe had refuſed for her huſband. To this remark, ſhe replied with indignation, "I would not aſk a pardon for my huſband, becauſe he was innocent. I ſolicit it for my ſon, becauſe he is guilty."

BARNSLEY, a village of Glouceſterſhire noted for large quarries of excellent free ſtone. It is four miles from Cirenceſter.

BARO, or BARON (Peter), profeſſor of divinity in the univerſity of Cambridge, in the 16th century, was born at Eſtampes in France, and educated in the univerſity of Bourges, where he was admitted a licentiate in the law: but being of the Proteſtant religion, he was obliged to leave his native country to avoid proſecution; and, withdrawing into England, was kindly entertained by Lord Burleigh. He afterwards ſettled at Cambridge; and, by the recommendation of his noble patron, was, in 1574, choſen Lady Margaret's profeſſor there. For ſome years he quietly enjoyed his profeſſorſhip: but there was at laſt raiſed a reſtleſs faction againſt him, by his oppoſing the doctrine of abſolute predeſtination; which rendered his place ſo uneaſy to him, that he choſe to leave the univerſity and to ſettle in London. He wrote, 1. *In Jonam Prophetam Prælectiones* xxxix. 2. *De Præſtantia & Dignitate Divinæ Legis:* and other pieces. He died in London, about the year 1600.

BAROACH, a town in Hindooſtan, in the N. W. of the Deccan, and on the S. bank of the river Nerbudda, 40 miles N. of Surat. Long. 72. 55 E. Lat. 21. 25. N.

BARON (Robert), a dramatic author, who lived during the reign of Charles I. and the protectorſhip of Oliver Cromwell. He received the earlier parts of his education at Cambridge, after which he became a member of the honourable ſociety of Gray's-Inn. During his reſidence at the univerſity, he wrote a novel called the *Cyprian Academy*, in which he introduced the two firſt of the dramatic pieces mentioned below. The third of them is a much more regular and perfect play, and was probably written when the author had attained a riper age. The names of them are, 1. *Deorum Dona*, a maſque. 2. *Gripus and Hegio*, a paſtoral. 3. *Mirza*, a tragedy. Mr. Baron had a great intimacy with the celebrated Mr. James Howell, the great traveller, in whoſe collections of letters there is one to this gentleman, who was at that time at Paris. To Mr. Howell, in particular, and to all the ladies and gentlewomen in England in general, he has dedicated his romance.

BARON (Michael), an excellent comedian of Paris, was the ſon of Michael Baron, another comedian, who was a native of Iſſoudun. He wrote ſome poems, and ſeveral theatrical pieces, which are printed together in two vols. 12mo. He died at Paris in 1729, aged 77.

BARON (Bonaventure) whoſe true name was Fitz-Gerald; was deſcended from a branch of the Fitz-Geralds, of Burnchurch, in the county of Kilkenny. He has been more remarkable in the learned world for his maternal genealogy, being the ſon of a ſiſter of Luke Wadding, that eminent Franciſcan friar, who, in the laſt century, demonſtrated his great abilities and induſtry, by many voluminous treatiſes of genius and labour. His uncle Wadding took great care of his education in his youth, which he ſaw rewarded by an uncommon diligence; and when he was of a proper age procured his admiſſion into the Franciſcan order, and ſent for him to Rome; where he lived under his own eye, in the college of St. Iſidore, a ſociety of that order founded by himſelf in 1625, for the education of Iriſh ſtudents in the ſtudy of the liberal arts, divinity, and controverſy, to ſerve as a ſeminary, out of which the miſſion into England, Scotland, and Ireland, might be ſupplied. Baron, after ſome time, grew into high reputation, and became eſpecially remarkable for the purity of his Latin ſtyle, which firſt fell under the notice of the public, by means of the ignorance of a Roman cardinal; from which time his fame increaſed, and he became the author of many books both in proſe and verſe. He was for a conſiderable time prælector of divinity in the college aforeſaid, and in all reſided at Rome about ſixty years, where he died on the 18th of March, 1696.

BARONI (Leonora), a celebrated ſinger and compoſer, was born at Naples, but ſpent the greateſt part of her life at Rome. She was daughter of Adriana Baroni, of Mantua, baroneſs of Pian-caretta; a lady alſo diſtinguiſhed for her muſical talents, and for her beauty ſurnamed *the fair*.—Leonora had leſs beauty than her mother; but excelled her in her profound ſkill in muſic, the fineneſs of her voice, and the charmingneſs of her manner. She is ſaid by Mr. Bayle to have been one of the fineſt ſingers in the world. She was, as well as her mother, celebrated by the wits, who ſtrove to excel each other in recording her praiſes; and in 1639, there was publiſhed, at Bracciano, a collection of Latin, Greek, Italian, Spaniſh, and French poems, made upon her, under this title, *Applauſi Poetici alle Glorie della Signora Leonora Baroni*. Among the Latin poems of Milton are no fewer than three entitled 'Ad Leonoram Romæ canentum,' wherein this lady is celebrated for her ſinging, with an alluſion to her mother's exquiſite performance on the lute. A fine eulogium on this accompliſhed woman is contained in a diſcourſe on the Muſic of the Italians, printed with the life of Malherbe, and ſome other treatiſes, at Paris, 1672, in 12mo. This diſcourſe was compoſed by Mr. Maugars, prior of St. Peter de Mac, the king's interpreter of the Engliſh language, and beſides ſo famous a performer on the viol, that the king of Spain and ſeveral other ſovereign princes of Europe deſired to hear him. The character given by this perſon of Leonora Baroni is as follows: "She is endowed with fine parts; ſhe has a very good judgment to diſtinguiſh good from bad muſic; ſhe underſtands it perfectly well; and even compoſes, which makes her abſolute miſtreſs of what ſhe ſings, and gives her the moſt exact pronunciation and expreſſion of the ſenſe of her words. She does not pretend to beauty, neither is ſhe diſagreeable, or a coquet. She ſings with a bold and generous modeſty, and an agreeable gravity; her voice reaches a large compaſs of notes, and is exact, loud, and harmonious; ſhe ſoftens and raiſes it without ſtraining or making grimaces. Her raptures and ſighs are not laſcivious; her looks have nothing impudent, nor does ſhe tranſgreſs a virgin modeſty in her geſtures. In paſſing from one key to another, ſhe ſhews ſometimes the diviſions of the enharmonic and chromatic kind with ſo much art and ſweetneſs, that every body is raviſhed with that fine and difficult method of ſinging. She has no need of any perſon to aſſiſt her with a theorbo or viol, one of which is neceſſary to make her ſinging complete; for ſhe plays perfectly well herſelf on both theſe inſtruments. In ſhort, I have had the good fortune to hear her ſing ſeveral times above thirty different airs, with ſecond and third ſtanzas compoſed by

herſelf. I muſt not forget to tell you, that one day ſhe did me the particular favour to ſing with her mother and her ſiſter. Her mother played upon the lute, her ſiſter upon the harp, and herſelf upon the theorbo. This concert, compoſed of three fine voices, and of three different inſtruments, ſo powerfully tranſported my ſenſes, and threw me into ſuch raptures, that I forgot my mortality, and thought myſelf already among the angels enjoying the felicity of the bleſſed."

BARONIUS (Cæſar), a pious and learned cardinal, was born at Sore in 1538. He ſtudied at Rome, and put himſelf under the diſcipline of St. Philip de Neri. In 1593 he was made general of the congregation of the Oratory by the reſignation of the founder Philip de Neri. Pope Clement VIII. made him his confeſſor, and created him a cardinal in 1596. He was afterwards made librarian to the Vatican; and died in 1605, at 68 years of age. He wrote ſeveral works, the principal of which is his *Annales Eccleſiaſtici*, from A.D. 1 to 1198, in twelve vols. folio; which has been abridged by ſeveral perſons, particularly by Henry Spondæus, Bzovius, and Ludovico Aurelio.

BARRATIERE (Philip), a moſt extraordinary inſtance of the early and rapid exertion of mental faculties. This ſurpriſing genius was the ſon of Francis Barratiere, miniſter of the French church at Schwobach, near Nuremberg, where he was born January 10, 1721. The French was his mother tongue, together with ſome words of High Dutch; but by means of his father inſenſibly talking Latin to him, it became as familiar to him as the reſt; ſo that, without knowing the rules of grammar, he, at four years of age, talked French to his mother, Latin to his father, High Dutch to the maid or neighbouring children; and all this without mixing or confounding the reſpective languages. About the middle of his fifth year he acquired Greek in like manner; ſo that in fifteen months he perfectly underſtood all the Greek books in the Old and New Teſtament, which he readily tranſlated into Latin. When he was five years and eight month old, he entered upon Hebrew; and in three years' time was ſo expert in the Hebrew text, that from a Bible without points, he could give the ſenſe of the original in Latin or Freneh; or tranſlate extempore the Latin or French verſions into Hebrew, almoſt word for word; and had all the Hebrew pſalms by heart. He compoſed at this time a dictionary of rare and difficult Hebrew words, with critical remarks and philological obſervations, in about 400 pages, in 4to; and, about his tenth year, amuſed himſelf for twelve months with the rabinical writers. With theſe he intermixed a knowledge of the Chaldaie, Syriae, and Arabic; and acquired a taſte for divinity and eccleſiaſtical antiquity, by ſtudying the Greek fathers, and councils of the firſt four ages of the church. In the midſt of theſe occupations, a pair of globes coming into his poſſeſſion, he could in eight or ten days' time reſolve all the problems on them; and in about three months, in Jan. 1735, deviſed his project for the diſcovery of the longitude, which he communicated to the Royal Society at London and the Royal Academy of Sciences at Berlin. In June 1731 he was matrieulated in the univerſity of Altorf; and at the cloſe of the year 1732 he was preſented by his father at the meeting of the reformed ehurches of the circle of Franconia; who, aſtoniſhed at his wonderful talents, admitted him to aſſiſt in the deliberations of the ſynod: and to preſerve the memory of ſo ſingular an event, it was ordered to be regiſtered in their acts. In 1734 the Margrave of Brandenburgh Anſpach granted this young ſcholar the uſe of whatever books he wanted from the Anſpach library, together with a penſion of fifty florins, which he enjoyed three years; and his father receiving a call to the French church at Stetin in Pomerania, young Barratiere was, on the journey, admitted maſter of arts, with univerſal applauſe, at the univerſity of Hall: at Berlin, he was honoured with ſeveral eonverſations with the King of Pruſſia, and was received into the royal academy. Towards the cloſe of his life he acquired a taſte for medals, inſcriptions, and antiquities; metaphyſical enquiries, and experimental philoſophy, intervening occaſionally between theſe ſtudies. He wrote ſeveral eſſays and diſſertations; made aſtronomical remarks, and laborious calculations; took great pains toward a hiſtory of the hereſies of the anti-trinitarians, and of the thirty-years' war in Germany: his laſt publication, which appeared in 1740, was on the ſucceſſion of the biſhops of Rome. The final work he engaged in, for which he had gathered large materials, was *Enquiries concerning the Egyptian Antiquities*. But the ſubſtance of this blazing meteor was now almoſt exhauſted: he was always weak and ſickly; and died October 5, 1740, aged nineteen years eight months and ſixteen days. He publiſhed eleven different pieces, and left twenty-ſix MSS. on various ſubjects, the contents of which may be ſeen in his life written by M. Formey, profeſſor of philoſophy at Berlin.

BARRE (Louis François Joſeph de la), of Tournay, author of ſeveral works printed at Paris. Amongſt others, *Imper. Orientale, Recueil des Medailles des Empereurs*, Memoirs for the hiſtory of France, &c. He died in 1738.

BARRINGTON (John Shute), lord viſcount, a nobleman of conſiderable learning, and author of ſeveral books, was the youngeſt ſon of Benjamin Shute, merchant, youngeſt ſon of Francis Shute, of Upton, in the county of Leiceſter, eſq. He was born at Theobalds in Hertfordſhire, in 1678, and received part of his education at Utrecht, as appears from a Latin oration which he delivered at that univerſity, and publiſhed there in 1698, in 4to. After his return to England, he applied himſelf to the ſtudy of the law in the Inner Temple. In 1701 he publiſhed, but without his name, An Eſſay upon the Intereſt of England, in Reſpect to Proteſtants diſſenting from the eſtabliſhed Chureh, 4to. This was reprinted two years after, with conſiderable alterations and enlargements. Some time after this he publiſhed another piece, in 4to. entitled The Rights of Proteſtant Diſſenters, in two parts. During the proſecution of his ſtudies in the law, he was applied to by Queen Anne's whig miniſtry, at the inſtigation of Lord Somers, to engage the Preſbyterians in Scotland to favour the important meaſure, then in agitation, of an union of the two kingdoms. Flattered, at the age of twenty four, by an application which ſhewed the opinion entertained of his abilities and influence by the greateſt lawyer and ſtateſman of the age, he readily ſacrificed the opening proſpects of his profeſſion, and undertook the arduous employment. The happy exeeution of it was rewarded, in 1708, by the plaee of eommiſſioner of the euſtoms; from which he was removed by the Tory adminiſtration, in 1711, for his avowed oppoſition to their principles and conduct. How high Mr. Shute's character ſtood in the eſtimation even of thoſe who differed moſt widely from him in religious and political ſentiments, appears from the teſtimony borne to it by Dr. Swift. In the reign of Queen Anne, John Wildman, of Beeket, in the eounty of Berks, eſq. adopted him for his ſon, after the Roman euſtom, and ſettled his large eſtate upon him, though he was no relation, and is ſaid to have been but ſlightly aequainted with him. Some years after he had another conſiderable eſtate left him by Francis Barrington, of Toſts, eſq. who had married his firſt eouſin, and died without iſſue. This occaſioned him to procure an act of parliament, purſuant to the deed of ſettlement, to aſſume the name and bear the arms of Barrington. On the acceſſion of King George, he was choſen member of

parliament for the town of Berwick-upon-Tweed. July 5, 1717, he had a reverſionary grant of the office of maſter of the rolls, in Ireland, which he ſurrendered December 10, 1731. King George was alſo pleaſed, by privy ſeal, dated at St. James's, June 10, and by patent at Dublin, July 1, 1720, to create him Baron Barrington, of Newcaſtle, and Viſcount Barrington, of Ardglaſs. In 1722 he was again returned to parliament as member for the town of Berwick; but in 1723, the Houſe of Commons taking into conſideration the affair of the Harburgh lottery, a very ſevere and unmerited cenſure of expulſion was paſſed upon his lordſhip, as ſub-governor of the Harburgh company, under the Prince of Wales. In 1725 he publiſhed, in two volumes 8vo. his Miſcellanea Sacra; or a new method of conſidering ſo much of the hiſtory of the Apoſtles, as is contained in Scripture; in an abſtract of their hiſtory, an abſtract of that abſtract, and four critical eſſays. In 1725 he publiſhed, in 8vo. An Eſſay on the ſeveral Diſpenſations of God to Mankind. He ſometimes ſpoke in parliament, but appears not to have been a frequent ſpeaker. He died at his ſeat in Berkſhire, after a ſhort illneſs, December 4, 1734, in the 66th year of his age.

He married Anne, eldeſt daughter of Sir William Daines, by whom he left ſix ſons and three daughters. William, his eldeſt ſon, ſucceeded to his father's honours; was elected, ſoon after he came of age, member for the town of Berwick, and afterwards for Plymouth; and, in the late and preſent reigns, has paſſed through the ſucceſſive offices of lord of the admiralty, maſter of the wardrobe, chancellor of the exchequer, treaſurer of the navy, and ſecretary at war. Francis, the ſecond, died young. John, the third, was a major-general in the army, commanded the land forces at the reduction of the iſland of Guadaloupe, in 1758, and died in 1764. Daines, the fourth, king's counſel, and one of the juſtices of the grand ſeſſion for the counties of Cheſter, &c. is author of, 1. Obſervations upon the Ancient Statutes, 1766; a valuable work, reprinted in the ſame year, and again in 1769 and 1775. 2. The Naturaliſt's Journal, 1767, 4to. 3. Directions for collecting Specimens of Natural Hiſtory, 1772, 4to. 4. The Anglo-Saxon Verſion of Oroſius, with an Engliſh Tranſlation and Notes, 1773, 8vo. 5. Several Tracts relative to the Probability of reaching the North Pole, 4to. 1775, &c. which are collected and enlarged in a volume of Miſcellanies, 1780, 4to. 6. Propoſed Forms of Regiſters for Baptiſms and Burials, 1781, 4to. He is alſo author of many curious papers in the philoſophical tranſactions, and Archæologia; ſome of which are likewiſe incorporated in the volume of Miſcellanies.—Samuel, the fifth, was vice admiral of the white, and greatly diſtinguiſhed himſelf in the three laſt wars. Shute, the ſixth, had his education at Eton ſchool, and the univerſity of Oxford; took orders in 1756, the degree of LL.D. in 1762, was promoted to the biſhopric of Llandaff in 1769, and tranſlated to Saliſbury in 1782.

BARRINGTON (Samuel), a Britiſh admiral, was fifth ſon of John the firſt Lord Viſcount Barrington, by Anne, daughter and coheireſs of Sir William Daines. The family was originally Norman, and of great antiquity and reſpect; their name was Shute, and many honourable memorials of their eminence, both in arms and letters, are preſerved in Normandy, as well as in England: one of the anceſtors of Admiral Barrington was a judge in the reign of Queen Elizabeth. The admiral's father, being adopted by Francis Barrington, eſq. of Tofts in the county of Eſſex, who married his couſin, on ſucceeding to the eſtate, aſſumed, in compliance with the terms of the ſettlement, the name and arms of Barrington: this too was a family of great honour and diſtinction, united in blood with the Plantagenets, by a marriage with the great grand-daughter of the Duke of Clarence, brother to Edward IV. Beſides the Barrington eſtate, he inherited the property of John Wildman, eſq. of Beckett in the county of Berks, and was raiſed to the peerage in 1720. The Honourable Samuel Barrington was born in the year 1729; electing the naval profeſſion, he was in 1747 appointed a poſt captain, and colonel of the Chatham diviſion of marines in 1770, in the room of Lord Howe, who was then made an admiral. On the 23d of January, 1778, he was created rear-admiral of the white, and on the 29th of the ſame month, rear-admiral of the red. He was immediately ſent to the Weſt Indies, where his valour, prudence, and good conduct, gained him the higheſt reputation: he diſtinguiſhed himſelf particularly in the arduous and important exploit of taking St. Lucia in 1778, an enterpriſe ſo difficult, and expoſed to ſuch oppoſition, as would have rendered a failure perfectly excuſable. While on this ſtation he was, in the month of February, 1779, appointed vice-admiral of the blue, and in September, 1780, vice-admiral of the white. The ferment of parties during the laſt war occaſioned many unexpected refuſals of promotion, and as Admiral Barrington was intimately connected with Lord Shelburne, Colonel Barry, and ſeveral other leading men in oppoſition, it may poſſibly be attributed to this circumſtance that he refuſed the command of the Channel fleet, which was offered to him after the reſignation of Admiral Geary in Auguſt, 1780, and on his declining to accept it, conferred on Admiral Darby. In 1782 he ſerved under Lord Howe, and diſtinguiſhed himſelf in the memorable relief of Gibraltar. The termination of the war put a period to Admiral Barrington's active ſervices. In February, 1786, he was made lieutenant-general of marines; and on the 24th of September, 1787, admiral of the blue. During the laſt ten years, his ill ſtate of health obliged him to decline all naval command; but as he was in the ſtricteſt habits of intimacy with the then illuſtrious commander of the Channel fleet, it is to be ſuppoſed that the benefit of his talents and experience was not entirely loſt to the country. Admiral Barrington was never married: he died the 16th of Auguſt, 1801. Few families have diſplayed ſo much of talent and ſucceſs as that of Barrington, during the laſt generation. John, the firſt viſcount, was a man of great abilities, and an elegant writer: his ſecond ſon died young; his third attained the rank of major-general, and was lieutenant-governor of Berwick; his fourth, Daines, was an author of great eminence, king's counſel, a Welſh judge, and judge of Cheſter; his ſixth ſon, Shute, was ſucceſſively biſhop of Llandaff, Saliſbury, and Durham, which ſee he now fills.

BARROW (Iſaac), biſhop of St. Aſaph, in the reign of Charles II. was ſon of Iſaac Barrow, of Spiney-abbey in Cambridgeſhire, and uncle of the famous Dr. Iſaac Barrow, maſter of Trinity College, in Cambridge. He had his education in Peter-houſe, in Cambridge, and became fellow of that college; but was ejected by the Preſbyterians, about the year 1643; whereupon going to Oxford, he was appointed one of the chaplains of New College, by the Warden Dr. Pink. It is ſaid he was created bachelor of divinity in that univerſity, the 23d of June, 1646; but his name is not to be found in the regiſter. He continued at Oxford till the garriſon of that place ſurrendered to the parliament, after which time he ſhifted from place to place, and ſuffered with the reſt of the royal and orthodox clergy till the reſtoration of King Charles II. when he was not only reſtored to his fellowſhip in Peter-houſe, but elected likewiſe one of the fellows of Eton College, near Windſor. July the 5th, 1663, he was conſecrated biſhop of the Iſle of Man, in Henry VIIth's chapel,

at Weſtminſter; and the year following he was appointed, by Charles earl of Derby, governor of the Iſle of Man; which office he diſcharged with great reputation all the time he held that ſee, and ſome time after his tranſlation to that of St. Aſaph. He held his fellowſhip of Eton in commendam with the biſhopric of Man, and was a conſiderable benefactor to that iſland, and eſpecially the clergy thereof. Afterwards going into England for the ſake of his health, and lodging in a houſe belonging to the Counteſs of Derby, in Lancaſhire, called Croſs-hall, he there received the news of his majeſty's conferring on him the biſhopric of St. Aſaph, to which he was tranſlated March 21ſt, 1669, and to which dioceſe he was no inconſiderable benefactor. This worthy prelate died in the 67th year of his age, at Shrewſbury, the 24th of June, 1680.

BARRY (Girald), commonly called *Giraldus Cambrenſis*, i. e. *Girald of Wales*, an hiſtorian and eccleſiaſtic in the reigns of Henry II. and Richard I. was born at the caſtle of Mainarper, near Pembroke, A. D. 1146. By his mother he was deſcended from the princes of South Wales; and his father, William Barry, was one of the chief men of that principality. Being a younger brother, and intended for the church, he was ſent to St. David's, and educated in the family of his uncle, who was biſhop of that ſee. He acknowledges, in his hiſtory of his own life and actions, that in his early youth he was too playful; but being ſeverely reproached for it by his preceptors, he became a very hard ſtudent, and greatly excelled all his ſchool-fellows in learning. When he was about 20 years of age, he was ſent, A. D. 1166, for his further improvement, to the univerſity of Paris; where he continued three years, and became, according to his own account, a moſt excellent rhetorician; which rendered him very famous. On his return into Britain, he entered into holy orders, and obtained ſeveral benefices both in England and Wales. Obſerving, with much concern, that his countrymen, the Welſh, were very backward in paying the tythes of wool and cheeſe, which he was afraid would involve them in eternal damnation, he applied to Richard archbiſhop of Canterbury, and was appointed his legate in Wales for rectifying that diſorder, and for other purpoſes. He executed this commiſſion with great ſpirit; excommunicating all, without diſtinction, who refuſed to ſave their ſouls by ſurrendering the tythes of their cheeſe and wool. Not ſatisfied with enriching, he alſo attempted to reform the clergy; and dilated the Archdeacon of Brechin to the archbiſhop, for the unpardonable crime of matrimony; and the poor old man, refuſing to put away his wife, was deprived of his arch-deaconry; which was beſtowed upon our zealous legate. In diſcharging the duties of this new office, he acted with great vigour, which involved him in many quarrels; but, if we may believe himſelf, he was always in the right, and always victorious. His uncle, the biſhop of St. David's, dying, A.D. 1176, he was elected his ſucceſſor by the chapter; but this election having been made without the permiſſion, and contrary to the inclination of Henry II. our author prudently declined to inſiſt upon it, and went again to Paris to proſecute his ſtudies, particularly in the civil and canon law, and theology. He ſpeaks with great raptures of the prodigious fame he acquired by his eloquent declamations in the ſchools, and of the crowded audiences who attended them, who were at a loſs to know whether the ſweetneſs of his voice, the beauty of his language, or the irreſiſtible force of his arguments, were moſt to be admired. Having ſpent about four years at Paris, he returned to St. David's; where he found every thing in confuſion; and the biſhop, being expelled by the people, he was appointed adminiſtrator by the Archbiſhop of Canterbury, and governed the dioceſe in that capacity to A. D. 1184, when the biſhop was reſtored. About the ſame time he was called to court by Henry II. appointed one of his chaplains, and ſent into Ireland, A. D. 1185, with Prince John. By this prince he was offered the united biſhoprics of Ferns and Leighlin; but declined them, and employed his time in collecting materials for his Topography of Ireland, and his Hiſtory of the conqueſt of that iſland. Having finiſhed his Topography, which conſiſted of three books, he publiſhed it at Oxford, A. D. 1187, in the following manner, in three days. On the firſt day he read the firſt book to a great concourſe of people, and afterwards entertained all the poor of the town; on the ſecond day he read the ſecond book, and entertained all the doctors and chief ſcholars; and, on the third day, he read the third book, and entertained the younger ſcholars, ſoldiers, and burgeſſes. "A moſt glorious ſpectacle! (ſays he), which revived the ancient times of the poets, and of which no example had been ſeen in England." He attended Baldwin archbiſhop of Canterbury in his progreſs through Wales, A. D. 1186, in preaching a croiſade for the recovery of the Holy Land; in which, he tells us, he was far more ſucceſsful than the primate; and particularly, that the people were prodigiouſly affected with his Latin ſermons, which they did not underſtand, melting into tears, and coming in crowds to take the croſs. Although Henry II. as our author aſſures us, entertained the higheſt opinion of his virtues and abilities, yet he never would advance him to any higher dignity in the church, on account of his relation to the princes and great men of Wales. But on the acceſſion of Richard I. A.D. 1189, his proſpects of preferment became better; for he was ſent for by that prince into Wales to preſerve the peace of that country, and was even joined in commiſſion with William Longchamp, biſhop of Ely, as one of the regents of the kingdom. He did not, however, improve this favourable opportunity; refuſing the biſhopric of Bangor in A. D. 1190, and that of Landaff the year after, having fixed his heart on the ſee of St. David's, the biſhop of which was very old and infirm. In A. D. 1192, the ſtate of public affairs, and the courſe of intereſt at court, became ſo unfavourable to our author's views, that he determined to retire. At firſt he reſolved to return to Paris to proſecute his ſtudies; but meeting with ſome difficulties in this, he went to Lincoln, where William de Monte read lectures in theology with great applauſe. Here he ſpent about ſix years in the ſtudy of divinity, and in compoſing ſeveral works. The ſee of St. David's, which had long been the great object of his ambition, became vacant, A.D. 1198, and brought him again upon the ſtage. He was unanimouſly elected by the chapter; but met with ſo powerful an adverſary in Hubert archbiſhop of Canterbury (who oppoſed his promotion with great violence), that it involved him in a litigation, which laſted five years, coſt him three journeys to Rome, at a great expence, and in which he was at laſt defeated, A.D. 1203. Soon after this he retired from the world, and ſpent the laſt 17 years of his life in a ſtudious privacy, compoſing many books, of which we have a very correct catalogue in the Biographia Britannica. That Girald of Wales was a man of uncommon activity, genius, and learning, is undeniable; but theſe and his other good qualities were much tarniſhed by his inſufferable vanity, which muſt have been very offenſive to his contemporaries, as it is highly diſguſting to his readers.

BARSANTI (Franciſco), an eminent muſical performer and compoſer, was born at Lucca about the year 1690. He ſtudied the civil law in the univerſity of Padua; but, after a ſhort ſtay there, choſe muſic for his profeſſion. Accordingly he put himſelf under the tuition of ſome of the ableſt maſters in Italy; and having attained to a conſiderable degree of proficiency in the ſcience of practical compoſition, took a reſolution to ſettle in England, and came thither with Geminiani, who was alſo a Luceſe, in the year 1714. He was a good

performer on the hautboy, and alſo on the flute; in the former capacity he found employment in the opera band, and in the latter derived conſiderable advantages by teaching. He publiſhed, with a dedication to the Earl of Burlington, ſix ſolos for a flute with a thorough-baſs, and afterwards ſix ſolos for a German flute and a baſs. He alſo made into ſonatas, for two violins and a baſs, the firſt ſix ſolos of Geminiani. He continued many years a performer at the opera-houſe; at length, reflecting that there was a proſpect of advantage for one of his profeſſion in Scotland, he went thither; and, with greater truth than the fame is aſſerted of David Rizzio, may be ſaid to have meliorated the muſic of this country, by collecting and making baſſes to a great number of the moſt popular Scots tunes. About the year 1750 Barſanti returned to England; but, being advanced in years, he was glad to be taken into the opera band as a performer on the tenor violin; and in the ſummer ſeaſon into that of Vauxhall. At this time he publiſhed twelve concertos for violins; and ſhortly after, Sei Antifone, in which he endeavoured to imitate the ſtyle of Paleſtrina, and the old compoſers of motets; but from theſe publications ſo little profit reſulted, that, towards the end of his life, the induſtry and economy of an excellent wife, whom he had married in Scotland, and the ſtudies and labours of a daughter, whom he had qualified for the profeſſion of a ſinger, but who became an actreſs at Covent-Garden, were his chief ſupport.

BARTAS (William de Saluſte du), a French poet, who lived in the 16th century. He was employed by Henry IV. of France in England, Denmark, and Scotland; and commanded a troop of horſe in Gaſcony, under the Marechal de Martignan. He was a Calviniſt; and died in 1590, aged 46. He wrote a great number of poems; the moſt famous of which are, 1. The Week, or the Creation of the World, in ſeven books. 2. The Poem of Judith; and, 3. The Battle of Ivry, gained by Henry IV. in 1590. Du Bartas wrote in a bombaſt ſtyle.

BARTH, or Bart (John), a brave fiſherman of Dunkirk, who roſe to the rank of an admiral; and is celebrated for his ſignal valour and naval exploits, in the annals of France. He died in 1702, aged 51.

BARTHIUS (Gaſper), a very learned and copious writer, born at Cuſtrin in Brandenburg, the 22d of June, 1576. Mr. Baillet has inſerted him in his *Enfans Célébrés*; where he tells us, that at 12 years of age he tranſlated David's Pſalms into Latin verſe of every meaſure, and publiſhed ſeveral Latin poems. Upon the death of his father (who was profeſſor of civil law at Francfort, counſellor to the Elector of Brandenburg, and his chancellor at Cuſtrin) he was ſent to Gotha, then to Eiſenach, and afterwards, according to cuſtom, went through all the different univerſities in Germany. When he had finiſhed his ſtudies, he began his travels; he viſited Italy, France, Spain, England, and Holland, improving himſelf by the converſation and works of the learned in every country. He ſtudied the modern as well as ancient languages, and his tranſlations from the Spaniſh and French ſhew that he was not content with a ſuperficial knowledge. Upon his return to Germany, he took up his reſidence at Leipſic, where he led a retired life, his paſſion for ſtudy having made him renounce all ſort of employment. He wrote a vaſt number of books; the principal of which are, 1. His *Adverſaria*, a large volume in folio; the ſecond and third volumes of which he left in manuſcript. 2. A Tranſlation of Æneas Gazæus. 3. A large volume of Notes upon Claudian, in 4to. 4. Three large volumes upon Statius, &c. He died at Leipſic in 1658, aged 71.

BARTHOLINUS (Caſpar), a learned phyſician and anatomiſt in the 17th century, was born at Malmoe, a town in the province of Schonen, which then belonged to Denmark. At three years of age he had ſuch a quick capacity, that in 14 days he learned to read; and in his 13th year he compoſed Greek and Latin orations, and pronounced them in public. When he was about 18, he went to the univerſity of Copenhagen, and afterwards ſtudied at Roſtock and Wirtemberg. He next ſet out upon his travels; during which he neglected no opportunity of improving himſelf at the different univerſities to which he came, and every-where receiving marks of reſpect. He was in 1613 choſen profeſſor of phyſic in that univerſity, which he enjoyed 11 years; when, falling into a dangerous illneſs, he made a vow, that if it ſhould pleaſe God to reſtore him, he would ſolely apply himſelf to the ſtudy of divinity. He recovered, and kept his word; and ſoon after obtained the profeſſorſhip of divinity, and the canonry of Roſchild. He died July 13, 1629, after having written ſeveral ſmall works, chiefly on metaphyſics, logic, and rhetoric.

Bartholinus (Thomas), a celebrated phyſician, ſon of the former, was born at Copenhagen in 1616. After ſtudying ſome years in his own country, he in 1637 went to Leyden, where he ſtudied phyſic during three years. He then travelled into France; and reſided two years at Paris and Montpelier, in order to improve himſelf under the famous phyſicians of thoſe univerſities. Afterwards going to Italy, he continued three years at Padua; and at length went to Baſil, where he obtained the degree of doctor of philoſophy. Soon after he returned to Copenhagen; where, in 1647, he was appointed profeſſor of the mathematics; and next year was nominated to the anatomical chair, an employment better ſuited to his genius and inclination; which he diſcharged with great aſſiduity for 13 years, and diſtinguiſhed himſelf by making ſeveral diſcoveries with reſpect to the lacteal veins and lymphatic veſſels. His cloſe application, however, having rendered his conſtitution very infirm, he, in 1661, reſigned his chair; but the king of Denmark allowed him the title of *honorary profeſſor*. He now retired to a little eſtate he had purchaſed at Hageſted, near Copenhagen, where he hoped to have ſpent the remainder of his days in peace and tranquillity; but his houſe being burnt in 1650, his library, with all his books and manuſcripts, was deſtroyed. In conſideration of this loſs, the king appointed him his phyſician, with a handſome ſalary, and exempted his land from all taxes; the univerſity of Copenhagen alſo appointed him their librarian; and in 1675 the king did him the honour to give him a ſeat in the grand council of Denmark. He wrote, 1. *Anatomia Caſpari Bartholini Parentis novis Obſervationibus primum locupletata*, 8vo. 2. *De Monſtris in Natura et Medicina*, 4to. 3. *De Armillis Veterum, præſertim Danorum Schedion*, 8vo.: and ſeveral other works. This great man died on the 4th of December, 1680.

BARTHOLOMEW ISLE, a ſmall iſland, one of the New Hebrides, lying in Bougainville's Paſſage, between Mallicola and the Tierra del Eſpiritu Sancto of Quiros. Long. 167. 24. E. Lat. 15. 42. S.

BARTOLOCCI (Julius), a learned monk, and profeſſor of Hebrew at Rome, was born at Celeno in 1613; and diſtinguiſhed himſelf by writing an excellent Hebrew and Latin catalogue of the Hebrew writers and writings, in four volumes, a continuation of which was performed by Imbonati his diſciple. He died in 1687.

BARTON (Elizabeth), commonly called The Holy Maid of Kent, was a religious impoſtor in the reign of Henry VIII. whoſe hiſtory may be very edifying. She was a ſervant at Aldington in Kent, and had long been troubled with convulſions, which diſtorted her limbs and countenance in the ſtrangeſt manner, and threw her body into the moſt violent agitations; and the effect of the diſorder was ſuch, that even after ſhe recovered ſhe counterfeited the ſame appearance.

Maſters, the miniſter of Aldington, with other eccleſiaſtics, thinking her a proper inſtrument for their purpoſe, perſuaded her to pretend that what ſhe ſaid and did was by a ſupernatural impulſe, and taught her to act her part in the moſt perfect manner. Thus ſhe would lie as it were in a trance for ſome time; then, coming to herſelf, after many ſtrange contortions, would break out into pious ejaculations, hymns, and prayers; ſometimes delivering herſelf in ſet ſpeeches, ſometimes in uncouth monkiſh rhymes. She pretended to be honoured with viſions and revelations, to hear heavenly voices, and the moſt raviſhing melody. She declaimed againſt the wickedneſs of the times, againſt hereſy and innovations; exhorting the people to frequent the church, to hear maſſes, to uſe frequent confeſſions, and to pray to our lady, and all the ſaints. All this artful management, together with great exterior piety, virtue, and auſterity of life, not only deceived the vulgar, but many far above the vulgar, ſuch as Sir Thomas More, Biſhop Fiſher, Archbiſhop Warkam; the laſt of whom appointed commiſſioners to examine her. She was now inſtructed to ſay, in her counterfeit trances, that the bleſſed Virgin had appeared to her, and aſſured her that ſhe ſhould never recover till ſhe went to viſit her image, in a chapel dedicated to her in the pariſh of Aldington. Thither ſhe accordingly repaired, proceſſionally, and in pilgrimage, as it were, attended by above three thouſand people, and many perſons of quality of both ſexes. There ſhe fell into one of her trances, and uttered many things in honour of the ſaints, and the Popiſh religion: for herſelf ſhe ſaid, that, by the inſpiration of God, ſhe was called to be a nun, and that Dr. Bocking was to be her ghoſtly father. Dr. Bocking was a canon of Chriſt-church, in Canterbury, and an aſſociate in carrying on the impoſture. Meanwhile, the archbiſhop was ſo ſatisfied with the reports made to him about her, as to order her to be put into the nunnery of St. Sepulchre, Canterbury; where ſhe pretended to have frequent inſpirations and viſions, and alſo to work miracles for all ſuch as would make a profitable vow to our Lady, at the aforeſaid chapel, in the pariſh of Aldington.

The prieſts, her managers, having thus ſucceeded in the impoſture, now proceeded to the great object of it; and Elizabeth Barton was directed publicly to announce, how God had revealed to her, that, "in caſe the king ſhould divorce Queen Catherine of Arragon, and take another wife during her life, his royalty would not be of a month's duration, but he ſhould die the death of a villain." Biſhop Fiſher, and others, in the intereſt of the queen, and of the Romiſh religion, hearing of this, held frequent meetings with the nun and her accomplices, and at the ſame time ſeduced many perſons from their allegiance, particularly the fathers and nuns of Sion, the Charter-houſe, and Sheen, and ſome of the obſervants at Richmond, Greenwich, and Canterbury. One Peto, preaching before the king at Greenwich, denounced heavy judgments againſt him to his face; telling him, that "he had been deceived by many lying prophets, while himſelf, as a true Micaiah, warned him, that the dogs ſhould lick his blood, as they had licked the blood of Ahab." Henry bore this outrageous inſult with a moderation very remarkable for him: but, to undeceive the people, he appointed Dr. Curwin to preach before him the Sunday following, who juſtified the king's proceedings, and branded Peto with the epithets of "rebel, ſlanderer, dog, and traitor." Curwin, however, was interrupted by a friar, and called "a lying prophet, who ſought to eſtabliſh the ſucceſſion to the crown upon adultery;" and he proceeded with ſuch virulence, that the king was obliged to interpoſe, and command him to be ſilent: yet, though Peto and the friar were afterwards ſummoned before the council, they were only reprimanded for their inſolence.

Encouraged by this lenity of the government, the eccleſiaſtics in this conſpiracy reſolved to publiſh the revelations of the nun, in their ſermons, throughout the kingdom: they had communicated them to the pope's ambaſſadors, to whom alſo they introduced the maid of Kent; and they exhorted Queen Catharine to perſiſt in her reſolutions. At length this confederacy began to be a very ſerious affair, and Henry ordered the maid and her accomplices to be examined in the ſtar-chamber. Here they confeſſed all the particulars of the impoſture, and afterwards appeared upon a ſcaffold erected at St. Paul's Croſs, where the articles of their confeſſion were publicly read in their hearing. Thence they were conveyed to the Tower, until the meeting of parliament; who, having conſidered the affair, pronounced it a conſpiracy againſt the king's life and crown. The nun, with her confederates, Maſters, Bocking, Deering, &c. were attainted of high treaſon, and executed at Tyburn, April 20, 1534; where ſhe confeſſed the impoſture, laying the blame on her accomplices the prieſts, and craving pardon of God and the king.

BARWICK (John), an eminent Engliſh divine in the ſeventeenth century, and dean of St. Paul's, was born at Wetherſlack, a little village in Weſtmoreland, the 20th of April, 1612. He was ſent to Sedberg ſchool in Yorkſhire, where, under the care of a tolerable maſter, he gave early marks both of genius and piety. In the year 1631, and the eighteenth of his own age, he was admitted of St. John's College at Cambridge, under the tuition of Mr. Thomas Fothergill, who proved at once a guardian and a preceptor, ſupplying his neceſſities as well as inſtructing him in learning. In 1635 he became bachelor of arts, and April the 5th, 1636, he was created fellow. In 1638 he took the degree of maſter of arts. When the civil war broke out, and the king wrote a letter to the univerſity, acquainting them that he was in extreme want, Mr. Barwick concurred with thoſe loyal perſons who firſt ſent him a ſmall ſupply in money, and afterwards their college plate; and upon information had, that Mr. Cromwell, afterwards the Protector, lay with a party of foot at a place called Lower Hedges, between Cambridge and Huntington, in order to make himſelf maſter of this ſmall treaſure, Mr. Barwick made one of the party of horſe which conveyed it through by-roads ſafely to Nottingham, where his majeſty had ſet up his ſtandard. By this act of loyalty, the parliament was ſo provoked, that they ſent Cromwell with a body of troops to quarter in the univerſity, where they committed ſuch outrages, as would ſcarcely have been credible in ſucceeding times, if Mr. Barwick, in conjunction with many other learned members of that celebrated ſociety, had not tranſmitted an authentic account of them to poſterity. Mr. Barwick alſo publiſhed a piece againſt the Covenant, and having thereby provoked ſuch as were then in power, he thought proper to retire to London, there to render all the ſervice that he was able to the royal cauſe. Soon after he ſettled there, he was intruſted with the management of the king's moſt private concerns, and carried on with great ſecrecy a conſtant correſpondence between London and Oxford, where the king's head-quarters then were: a nice and arduous employment, and for which there never was a man better fitted than he. When his majeſty came to be confined in Cariſbrook caſtle, in the iſle of Wight, ſo cloſely, that guards were poſted at all the avenues to his chamber, and even at his windows, to prevent his having any correſpondence, Mr. Creſſet, who was placed about him, through the dexterous management of Mr. Barwick, defeated all their diligence, and preſerved his majeſty a free intercourſe with his friends: for this purpoſe he firſt depoſited with Mr. Barwick a cypher, and then hid a copy of it in a crack of the wall in the king's chamber. By the help of this cypher, the king both wrote and read many letters every week, all of which paſſed through the hands of Mr. Barwick. He like-

wife was concerned in a very well-laid defign for procuring the king's efcape, which however was unluckily difappointed.

When the king was murdered, and the royal caufe feemed to be defperate, Mr. Barwick ftill kept up his fpirits, and though haraffed with a continual cough, followed by a fpitting of blood, and afterwards by a confumption of his lungs, yet would not interrupt the daily correfpondence he maintained with the miniflers of King Charles II. He was afterwards committed to the Tower, and put in a dungeon, where he was not only kept from pen, ink, and paper, and all books but the bible, with reftraint from feeing any perfon except his keepers, but, as an additional punifhment, had boards nailed before his window to prevent the coming in of the frefh air. In this melancholy fituation he remained many months, during which time the diet he ufed was herbs or fruit, or thin water-gruel made of oat-meal or barley, with currants boiled in it, and fweetened with a little fugar, by which he recovered beyond all expectation, and grew plump and fat. A cure fo perfect, and withal fo ftrange, that many phyficians have taken notice of it in their writings, as a moft pregnant inftance of the power of temperance, even in the moft inveterate difeafes. While he was thus fhut up, his friends laboured inceffantly for his fervice and relief, and his majefty King Charles II. for whom he thus fuffered, gave the higheft teftimonies of his royal concern for fo faithful a fubject. After fifteen months paffed in this ftrict confinement, Mr. Otway, and fome other friends, procured a warrant from Prefident Bradfhaw to vifit him, who were not a little furprifed to find him fo lufty, and in fo good health, whom they had feen brought fo low, as to engage this very Mr. Otway to take care of his burial. Through the friendly interceffion of Mr. Weft, the lieutenant of the Tower, he was difcharged on the 7th of Auguft, 1652. When the church of England was reftored in all its beauty by King Charles II. the deans and chapters revived, Dr. Barwick, according to his ufual modefty, contented himfelf with recommending his tutor, old Mr. Fothergill, to a prebend in the cathedral church of York: but as to himfelf, he would have refted content with the provifion made for him by his late patron the Bifhop of Durham, who had given him the fourth ftall in his cathedral, and the rectories of Wolfingham and Houghton in le Spring. Being made dean of St. Paul's, he took poffeffion of the deanery about the middle of October, 1661, and found, as he expected, all in very great diforder with refpect to the church itfelf, and every thing that concerned it. He fet about reforming thefe abufes with a truly primitive fpirit, and profecuted with great vigour the recovery of fuch revenues, as in the late times of diftraction had been alienated from the church; though with refpect to his own particular concerns, he was never rigid to any body, but frequently gave up things to which he had a clear title. He was appointed one of the nine affiftants to the twelve bifhops, commiffioned to hold a conference with the like number of prefbyterian miniflers upon the review of the liturgy; which conference was held at the Bifhop of London's lodgings in the Savoy. He was alfo by the unanimous fuffrage of all the clergy of the province of Canterbury, aflembled in convocation, chofen prolocutor on the 18th of February, 1661: in which high office he behaved himfelf in fuch a manner, as added even to the great reputation he had before acquired. His application, however, to the difcharge of fo many and fo great duties, brought upon him his old diftemper, fo that in November, 1662, he was confined to his chamber: he heightened his difeafe by officiating at the facrament the Chriftmas-day following, after which he was feized with fuch a violent vomiting of blood, that he brought up whole bafins full. Upon this he was adviled to a change of air, for the enjoyment of which he retired to Therfield in Hertfordfhire, of which he was rector, but finding himfelf there too far from London, he returned to Chifwick, where he in fome meafure recovered his health. As foon as he found he had a little ftrength, he applied himfelf there to the putting in order the archives of St. Paul's church, and fo threw himfelf down again. This was followed by an extraordinary flux of blood, which rendered him very weak, and defeated his favourite defign of retiring to Therfield. When he firft found his health declining, he made choice of and procured this living, intending to have refigned his deanery and office of prolocutor, to thofe who had vigour enough to difcharge them, and to fpend the remainder of his days in the difcharge of his paftoral office, to which he thought himfelf bound by his taking orders. But Providence prepared for him a ftill more quiet manfion; for coming upon fome extraordinary occafion to London, he was feized with a pleurify, which carried him off in three days. He was attended in his laft moments by Dr. Peter Gunning, afterwards bifhop of Ely, and as he lived, fo he died, with all the marks of an exemplary piety, on the 22d of October, 1664.

Barwick (Peter), phyfician in ordinary to King Charles the Second. He was brother to John before mentioned, and was born fome time in the year 1619, at Wetherflack in Weftmoreland. He went to the fame grammar fchool with his elder brother, till fuch time as he was fitted for the univerfity, when he removed to St. John's College in Cambridge. This was about the year 1637, and he continued there about fix years, being much farthered in his ftudies by the care taken of him by his brother. In 1642, being then in the twenty-fourth of his age, he took his degree of bachelor of arts. In 1644 he was nominated by the Bifhop of Ely to a fellowfhip of St. John's, in his gift. In 1647 he took his degree of mafter of arts, applying himfelf then aflduoufly to the ftudy of phyfic. In 1655 he was created doctor of phyfic, and two years afterwards, being then near forty, he took a houfe in St. Paul's Church-yard, and much about the fame time married the widow of an eminent merchant, who was a near relation of Archbifhop Laud's. Being thus fettled, he foon gained a very great repute in the city, for his fkill in his profeffion, as amongft the learned, by his judicious Defence of Dr. Harvey's Difcovery of the Circulation of the Blood, which was then, and is ftill, admired as one of the beft pieces written upon that fubject. After the Reftoration, in 1660, he was made one of the king's phyficians in ordinary, and in the year following received a ftill ftronger proof of his majefty's kind fenfe of his own and his brother's fervices. On the eighth of May, 1661, Dr. Gilbert Sheldon, then bifhop of London, with feveral other bifhops, deans, archdeacons, &c. met in the morning at our author's houfe, and proceeded thence to the cathedral of St. Paul's, in order to open the convocation. In 1666, being compelled by the dreadful fire to remove from St. Paul's Church-yard, where he had remained all the time of the plague, and been very active and ferviceable in his profeffion, he thought proper to take another houfe near Weftminfter-abbey, for the fake of being near that cathedral, to which he conftantly reforted every morning at fix o'clock prayers. He was a very diligent phyfician, and remarkably fucceisful in the fmall-pox, and in moft kinds of fevers. Yet he was far from making money the main object of his care; for during the many years that he practifed, he not only gave advice and medicines gratis to the poor, but likewife charitably adminiftered to their wants in other refpects. He was very kind to all who had fuffered for the royal caufe, to which he was a conftant votary all his life; and with a view to its fervice, in 1671 he drew up in Latin, which he wrote with unufual elegance and purity, the Life of the Dean his brother, and took care to depofit it, and the original papers ferving to fupport the facts therein mentioned, in the library in St. John's College at Cambridge.

Twenty years after this, when our author was in the seventy-fourth year of his age, and his eye-sight so much decayed, that he was forced to make use of the hand of a friend, he added an appendix in defence of the *Eikon Basilike*, against Dr. Walker, who was very well known to him, and of whom in that treatise he has given a very copious account. This piece of his is written with a good deal of asperity, occasioned chiefly by the frequency of scurrilous libels against the memory of Charles I. To this appendix, our author, as well as he could, subscribed his name. In 1694, growing quite dark, and being besides frequently afflicted with fits of the stone, he gave over practice, and dedicated the remainder of his life to the service of God, and the conversation of a few intimate friends, amongst whom Dr. Busby, the ever-famous master of Westminster school, was one. From this sedentary course of life, his old distemper, the stone, grew very much upon him, and toward the end of August, 1705, being seized with a vomiting and looseness, followed with an intermitting fever, and in a few days, with a great and sudden evacuation of blood, he exchanged this life for a better, the fourth of September, the same year, in the eighty-sixth year of his age.

BASAN (anc. geog.), a territory beyond Jordan, mentioned in scripture. By Josephus, Eusebius, and Jerom, it is called *Batanæa*. On the entering of the Israelites into the land of Canaan, the whole of the country beyond Jordan, from that of the Moabites, or Arabia, as far as mount Hermon and Lebanon, was divided into two kingdoms, viz. that of Sihon king of the Amorites, and of Og king of Basan or *Bashan*; the former to the south, and the latter to the north. The kingdom of Sihon extended from the river Arnon and the country of Moab, to the river Jabbok; which, running in an oblique course from the east, was at the same time the boundary of the Ammonites, as appears from Numb. xxi. 24. and Deuteron. ii. 37. and iii. 16. The kingdom of Sihon fell to the lot of the Reubenites and Gadites, and Basan to the half-tribe of Manasseh. To this was annexed a part of the hilly country of Gilead, and the district of Argob; yet so that Basan continued to be the principal and greatest part: but, after the Babylonish captivity, Basan was subdivided; so that only a part was called *Batanea*, or *Basan*, another *Trachonitis*, a third *Aurunitis*, or *Ituræa*, and some part also *Gaulonitis*; but to settle the limits of each of these parts is a thing now impossible.—Bashan was a country famous for its pastures and breed of large cattle.

BASIER, or BASIRE (Isaac), a learned and active divine in the seventeenth century, was born in the isle of Jersey in the year 1607. For some time he was master of the college or free-school at Guernsey; but, at length, became chaplain to Thomas Morton, bishop of Durham, who gave him the rectory of Stanhope, and the vicarage of Egglescliff, both in the county of Durham. In July 1640 he had the degree of doctor of divinity conferred upon him at Cambridge, by mandate; and was incorporated in the same at Oxford the November following. About that time he was made chaplain in ordinary to King Charles I. On the 12th of December, 1643, he was installed into the seventh prebend in the church of Durham, to which he was collated by his generous patron Bishop Morton. The next year, on the 24th of August, he was also collated to the archdeaconry of Northumberland, with the rectory of Howick annexed. But he did not long enjoy these great preferments: for, in the beginning of the civil wars, being sequestered, pursevanted, plundered, and forced to fly, he repaired to King Charles at Oxford, before whom, and his parliament, he frequently preached. In 1646 he had a licence granted him under the public seal of the university, to preach the word of God throughout England. Upon the surrender of the Oxford garrison to parliament, not caring to stay any longer within the British dominions, he resolved to make a virtue of necessity, and to go and propagate the doctrine of the English church in the East, among the Greeks, Arabians, &c. Leaving therefore his family in England, he went first to Zante, an island near the Morea, where he made some stay; and had good success in spreading among the Greek inhabitants the doctrine of the English church, the sum whereof he imparted to several of them, in a vulgar Greek translation of our Church Catechism. The effect of it was so remarkable, that it drew envy, and consequently persecution, upon him from the Latins. This occasioned his voluntary recess into the Morea, where the Metropolitan of Achaia prevailed upon him to preach twice in Greek, at a meeting of some of his bishops and clergy, which was well taken. At his departure he left him a copy of the catechism above mentioned. From thence, after he had passed through Apulia, Naples, and Sicily again (in which last, at Messina, he officiated for some weeks aboard a ship), he embarked for Syria; and after some months' stay at Aleppo, where he had frequent conversation with the patriarch of Antioch, then resident there, he left a copy of our Church Catechism, translated into Arabic, the native language of that place. From Aleppo he went in 1652 to Jerusalem, and so travelled over all Palestine. At Jerusalem he received much honour, both from the Greeks and Latins. Returning to Aleppo, he passed over the Euphrates, and went into Mesopotamia, Abraham's country, where he intended to send the Church Catechism in Turkish, to some of their bishops, who were mostly Armenians. This Turkish translation was procured by the care of Sir Thomas Bendyshe, the English ambassador at Constantinople. After his return from Mesopotamia, he wintered at Aleppo, where he received several courtesies from the consul, Mr. Henry Riley. In the beginning of 1653 he departed from Aleppo, and came to Constantinople by land, being six hundred miles, without either servant or christian, or any man with him, that could so much as speak the Frank language: yet, by the help of some Arabic he had picked up at Aleppo, he performed that journey in the company of 20 Turks, who used him courteously; the rather, because he was by the way physician to them and their friends. After his arrival at Constantinople, the French Protestants there desired him to be their minister. And, though he declared to them his resolution to officiate according to the English liturgy, yet they orderly submitted to it, and promised to settle on him, in three responsible men's hands, a competent stipend. Upon the restoration of King Charles II. Dr. Basier was recalled by his majesty to England, in a letter written to Prince Ragotzi. But this unfortunate prince dying soon after, of the wounds he received in a battle with the Turks at Gyala, the care of his solemn obsequies was committed to the doctor by his relict, Princess Sophia, whereby he was kept a year longer out of England. At length, returning in the year 1661, he was restored to his preferments and dignities; and made chaplain in ordinary to King Charles II. He wrote several books on divinity. Having for many years after the Restoration quietly enjoyed his large revenues, he died on the 12th of October, in the year 1676, and in the sixty-ninth year of his age.

BASILIPOTAMO, a river of Turkey in Europe, in the Morea, which falls into the gulf of Calochina. It was called Eurotes by the ancients.

BASILISCUS (*Encycl.*), in zoology, the trivial name of a species of lacerta: erroneously spelt BASILICUS in our original article.

BASILUZZO, one of the Lipari islands, in the Mediterranean, two miles in circumference, and uninhabited.

BASINGE (John), more commonly known by the name of Basingstochius, or de Basingstoke, was born at Basingstoke, a

ſown in the north part of Hampſhire, and from thence took his ſurname. He was a perſon highly eminent for virtue and learning. For having very good natural parts, he ſo improved them by ſtudy, that he became a perfect maſter of the Latin and Greek languages, and alſo an eminent orator, a complete mathematician, a ſubtil philoſopher, and a ſound divine. The foundation of his great learning he laid in the univerſity of Oxford, and, for his farther improvement, went to Paris, where he reſided ſome years. Not ſatisfied with that, he travelled to Athens, that agreeable ſeat of the muſes, and the mother of all polite literature, where he made many curious obſervations, and perfected himſelf in his ſtudies, particularly in the knowledge of the Greek tongue. At his return from thence to England he brought over with him ſeveral curious Greek manuſcripts, and introduced the uſe of the Greek numeral figures into this kingdom. He became alſo a very great promoter and encourager of the ſtudy of that language, which was much neglected in theſe weſtern parts of the world: and to facilitate it, he tranſlated from Greek into Latin a grammar, which he entitled, The Donatus of the Greeks. He died in the year 1252.

BASKERVILLE (Sir Simon), knight (of the ancient family of the Baſkervilles in Herefordſhire), an excellent ſcholar and eminent phyſician, famous for his ſkill in anatomy, and happy practice in the time of King James the Firſt and King Charles the Firſt, born at Exeter, 1573, was the ſon of Thomas Baſkerville, an apothecary in that city, who obſerving an early love of knowledge and thirſt after learning in his ſon, gave him a proper education for the univerſity, to which he was ſent at about eighteen years old, entering him in Exeter College in Oxford, on the 10th of March, 1591, putting him under the care of Mr. William Helm, a man no leſs famous for his piety than learning, under whoſe tutorſhip he gave ſuch early proofs of his love of virtue and knowledge, that he was on the firſt vacancy elected fellow of that houſe, before he had taken his bachelor's degree in arts which delayed his taking it till July the 8th, 1596, to which he ſoon after added that of arts-maſter; and when he was admitted had particular notice taken of him (according to our author's own words) for his admirable knowledge in humanity and philoſophy. After this, viz 1606, he was choſen ſenior proctor of the univerſity; when he bent his ſtudy wholly to phyſic, in the knowledge of which uſeful faculty he became a moſt eminent proficient; and was then in as great eſteem at the univerſity for his admirable knowledge in medicine, as he had been before for other parts of learning, taking at once by accumulation (on the 20th of June, 1611) both his degrees therein, viz. that of bachelor and doctor. After many years' ſtudy and induſtry, leaving the univerſity, he came to London, where he became of great eminency in his profeſſion; being a member of the College of Phyſicians, and for ſome time alſo preſident thereof. His high reputation for learning, great ſkill and good ſucceſs in phyſic, ſoon brought him in vogue at court, where he was ſworn phyſician to King James the Firſt, and afterwards to King Charles the Firſt; with whom he was in ſuch eſteem for his learning and accompliſhments, that he conferred the honour of knighthood upon him. He died July the 5th, 1641, aged ſixty-eight years.

BASNAGE (James), a learned and accompliſhed author, and paſtor of the Walloon church at the Hague, was born at Rouen in Normandy, Auguſt 8, 1653. He was the ſon of Henry Baſnage, one of the ableſt advocates in the parliament of Normandy. At 17 years of age, after he had made himſelf maſter of the Greek and Latin authors, as well as the Engliſh, Spaniſh, and Italian languages, he went to Geneva, where he began his divinity ſtudies under Meſtrezat, Turretin, and Tronchin; and finiſhed them at Sedan, under the profeſſors Jurieu and Le Blanc de Beaulieu. He then returned to Roan, where he was received as miniſter, September 1676; in which capacity he remained till the year 1685, when the exerciſe of the Proteſtant religion being ſuppreſſed at Rouen, he obtained leave of the king to retire to Holland. He ſettled at Rotterdam; and was a miniſter penſionary there till 1691, when he was choſen paſtor of the Walloon church of that city. In 1709 penſionary Heinſius got him choſen one of the paſtors of the Walloon church at the Hague, intending not only to employ him in religious but in ſtate affairs. He was employed in a ſecret negociation with marſhal d'Uxelles, plenipotentiary of France at the congreſs of Utrecht; and he executed it with ſo much ſucceſs, that he was afterwards entruſted with ſeveral important commiſſions, all which he diſcharged in ſuch a manner as to gain a great character for his abilities and addreſs; a celebrated modern writer has therefore ſaid of him, that he was fitter to be miniſter of ſtate than of a pariſh. The abbé du Bois, who was at the Hague in 1716, as ambaſſador plenipotentiary from his moſt Chriſtian majeſty, to negociate a defenſive alliance between France, England, and the States General, was ordered by the duke of Orleans, regent of France, to apply himſelf to M. Baſnage, and to follow his advice: they accordingly acted in concert, and the alliance was concluded in January 1717. He kept an epiſtolary correſpondence with ſeveral princes, noblemen of high rank, and miniſters of ſtate, both Catholic and Proteſtant, and with a great many learned men in France, Italy, Germany, and England. The Catholics eſteemed him no leſs than the Proteſtants; and the works he wrote, which are moſtly in French, ſpread his reputation almoſt all over Europe: among theſe are, 1. The Hiſtory of the Religion of the Reformed Churches; 2. Jewiſh Antiquities; 3. The Hiſtory of the Old and New Teſtament; and many others. He died Sept. 22, 1723.

BASNAGE (Henry), ſieur de Beauval, ſecond ſon to Henry Baſnage, and brother to James mentioned in the laſt article. He applied himſelf to the ſtudy of the law, and was admitted advocate in the parliament of Rouen in the year 1679. He did not follow the bar immediately upon his admiſſion; but went to Valencia, where he ſtudied under M. de Marville. Upon his return from thence he practiſed with great reputation till the year 1687, when the revocation of the edict of Nantz obliged him to fly to Holland, where he compoſed the greateſt part of his works, and died there the 29th of March, 1710. His chief work is *Hiſtoire des Ouvrages des Savans.* Rotterd. 24 vols. in duodecimo. This work was begun in the month of September 1687, and continued till June 1709. When he arrived in Holland, Mr. Bayle, through indiſpoſition, had been obliged to drop his Nouvelles de la République des Lettres, which induced Mr. Baſnage to undertake a work of the ſame kind under a different title.

BASNET (Edward), dean of St. Patrick's, Dublin, was an active man at the time of the Reformation, and a privy-councellor to King Henry VIII. and King Edward VI. He was deſcended of an eſquire's family, long ſeated at Eaton, in the county of Denbigh, in Wales, and had ſome relations in Ireland, who probably came over with him; for we find no ſuch names in hiſtory or records planted in Ireland before his time. He was preſented by King Henry VIII. to the vicarage of Swords, in the dioceſe of Dublin, on the 11th of May, 1535, during the vacancy of that ſee, by the murder of Archbiſhop Allen, and this is the firſt promotion we find he had in Ireland; ſo that in all probability he came over the year before, in the retinue and under the countenance of Sir William Skeffington, lord deputy. About the latter end of April 1537, he was elected by the chapter dean of the cathedral of St. Patrick's, Dublin, that dignity being void on the 8th of the ſame month by the death of Geoffry Fitche, his predeceſſor;

and this promotion gave him a rank almoſt equal to the epiſcopal. He was ſtyled Sir Edward Baſnet, and is ſo named in an act of parliament of that time; not that he had been created a knight, but was called ſo in the ſame ſenſe as thoſe that are called Sirs, who have taken the firſt degree in an univerſity. In 1544 a report was made by the lord deputy about the ſingular merit of Dean Baſnet from the crown. For this the king was pleaſed to reward him with a grant, to him and his heirs, of the caſtle, town, lands, and rectory of Kilterman, in the marches of the county of Dublin, to hold in capite by the ſervice of one knight's fee for ever, and three ſhillings, Iriſh money, per annum, rent. In 1545, Auguſt the 20th, the king, as a mark of his royal indulgence, granted the dean a particular favour, in which his chapter, under his countenance, was concerned, which is regiſtered among the records of the deanery. He died in the firſt year of Queen Mary's reign.

BASSANO, a town of Italy, in the territory of Venice, on the river Brante, in a country productive of excellent wine. Long. 11. 24. E. Lat. 45. 51. N.

BASSANTIN (James), a Scotch aſtronomer, ſon of the laird of Baſſantin in Mers, was born in the reign of James IV. He was educated at the univerſity of Glaſgow, travelled through Germany and Italy, and then fixed his abode in the univerſity of Paris, where he taught mathematics with great applauſe. Having acquired ſome fortune in this occupation in 1562, he returned to Scotland, where he died in the year 1568. From his writings, he appears to have been no contemptible aſtronomer, conſidering the times; but, like moſt of the mathematicians of that age, he was not a little addicted to judicial aſtronomy. Sir James Melvil, in his Memoirs, ſays that his brother Sir Robert, when he was exerting his abilities to reconcile the two queens, Elizabeth and Mary, met with one Baſſantin, a man learned in the high ſciences, who told him, "that all his travel would be in vain; for, ſaid he, they will never meet together; and next there will never be any thing but diſſembling and ſecret hatred for a while, and at length captivity and utter wreck to our queen from England." He added, "that the kingdom of England at length ſhall fall, of right, to the crown of Scotland; but it will coſt many bloody battles; and the Spaniards ſhall be helpers, and take a part to themſelves for their labour." Sir James Melvil is an author of credit; therefore it is probable that our aſtrologer ventured to utter his prediction: but, as it proved true only in part, either he miſunderſtood the ſtars, or they deceived the aſtrologer.—His works are, 1. *Aſtronomia Jacobi Baſſantini Scoti, opus alſolutiſſimum, &c. ter editum Latine et Gallice.* Genev. 1599, fol. This is the title given it by Tornæſius, who tranſlated it into Latin from the French, in which language it was firſt publiſhed. 2. *Paraphraſe de l'Aſtrolabe, avec un Amplification de l'Uſage de l'Aſtrolabe.* Lyons, 1555. Paris, 16.7, 8vo. 3. *Mathematic. Genethliaca.* 4. *Arithmetica.* 5. *Muſica ſecundum Platonem.* 6. *De Matheſi in genere.*

BASSENTHWAITE WATER, a fine lake in Cumberland, 3 miles N.W. of Keſwick. It is 4 miles long, bounded on one ſide by high hills, wooded, in many places, to their baſes; on the other by the fields, and the ſkirts of Skiddaw.

BASSETERRE, the capital of St. Chriſtopher, a fine town, built by the French when this part of the iſland was in their poſſeſſion, before it was ceded to the Engliſh in 1713. The houſes are of brick, freeſtone, and timber; and among other buildings are a townhouſe, an hoſpital, and a large church.

BASSETERRE, the principal town of Guadaloupe, in a diſtrict of the ſame name, in the W. part of the iſland. It is defended by a citadel and other fortifications.

BASSET (Peter), a gentleman of a good family, was chamberlain, or gentleman of the privy-chamber, to King Henry V. a conſtant attendant on that brave prince, and an eye-witneſs of his moſt glorious actions both at home and abroad; all which he particularly deſcribed in a volume entitled, *The Acts of King Henry* V. which remains in MS. in the college of heralds.

BASSET (Fulk), biſhop of London in the reign of Henry III. was brother of Gilbert Baſſet, one of the barons, who died by a fall from his horſe, leaving behind him only one ſon, an infant, by whoſe death ſoon after the inheritance devolved to Fulk. In the year 1225 he was made provoſt of the collegiate church of St. John of Beverly, and in 1230 dean of York. In December 1241 he was elected by the chapter of London biſhop of that ſee, in the room of Roger Niger, both in regard of his family and his great virtues, and notwithſtanding the king's recommendation of Peter de Egueblanche, biſhop of Hereford. The ſee of Canterbury being vacant at the time of this prelate's election, he was not conſecrated till the 9th of October, 1244, at which time the ſolemnity was performed at London, in the church of the Holy Trinity. In the year 1250 Biſhop Baſſet began to have a warm diſpute with Archbiſhop Boniface, concerning the right of metropolitan viſitation; in the courſe of which he met with very rough treatment from the archbiſhop, and at laſt, after a long conteſt, thought it beſt to ſubmit, and acknowledge his juriſdiction; but he ſucceeded better in the oppoſition he made to Ruſtand, the pope's legate, in 1255. In 1256 this prelate began to build the church of St. Faith, near that of St. Paul, on the ſpot which King John had formerly given to the biſhops and chapter of London for a market. In the latter part of his life he is ſaid to have inclined to the cauſe of the barons. He died of the plague in 1259, having ſat near fifteen years from the time of his conſecration.

BASTARD (Thomas), was born at Blandford in Dorſetſhire, and educated at Wincheſter ſchool, from whence he removed to New College, in Oxford, where he was choſen perpetual fellow in the year 1588, and two years after took the degree of bachelor of arts: but indulging too much his talent for ſatire, he was expelled the college for a libel. Not long after, being then in holy orders, he was made chaplain to Thomas earl of Suffolk, lord treaſurer of England; through whoſe favour and intereſt he became vicar of Bere Regis, and rector of Amour, or Hamer, in his native county, having ſome time before taken the degree of maſter of arts. He was a perſon of great natural endowments, well ſkilled in the learned languages, a celebrated poet, and in his later years an excellent preacher. His converſation was witty and facetious, which made his company courted by all ingenious men. Towards the latter end of his life, being diſordered in his ſenſes, and thereby brought into debt, he was confined in the priſon of All-Hallows pariſh, in Dorcheſter, where he died in April, 1618.

BASTERIA, ALL-SPICE; a genus of plants not deſcribed by Linnæus, but to which Mr. Miller has given the name of *Baſteria* from Dr. Job Baſter, F.R.S. a learned botaniſt of Holland. Of this there is only one ſpecies known, viz. with oval leaves placed oppoſite, flowers coming from the ſides of the ſtalks, and a branched ſhrubby ſtalk. It is a native of Carolina in America. The flowers appear in May, are of a dull purple colour, and have a diſagreeable ſcent. The bark is brown; and has a very ſtrong aromatic flavour, from whence the plant takes its name of *All-ſpice.*

BASTIOGNE, a ſmall town of the duchy of Luxemburg, 25 miles N.W. of Luxemburg, ſubject to the houſe of Auſtria. Long 6. 0. E. Lat. 50. 0. N.

BASTITANI (anc. geog.), a people of the province of Bætica in Spain. See BÆTICA.

BASTON (Robert), a Carmelite monk, afterwards prior of the convent of that order at Scarborough, and alſo poet laureat and public orator at Oxford, flouriſhed in the fourteenth

century. King Edward I. in his expedition into Scotland in 1304, took Robert Baston with him, in order to celebrate his victories over the Scots; but our poet being taken prisoner, was obliged to change his note, and sing the successes of Robert Bruce. He wrote several books in Latin, on the Wars of Scotland, the Luxury of Priests, Synodical Sermons, &c.; and also a volume of tragedies and comedies, in English. He died about the year 1310.

BASTWICK (Dr. John), born at Writtle in Essex, in 1593, practised physic at Colchester; but being a man of warm imagination, and a good Latin scholar, applied himself to writing books against popery. About the year 1633 he printed in Holland a Latin treatise entitled *Elenchus Religionis Papisticæ*, with *Flagellum Pontificis et episcoporum Latialium*, in which the English prelates thinking themselves also aimed at, he was fined 10 ol. in the high commission court, excommunicated, prohibited practising physic, his books ordered to be burnt, and himself to remain in prison until he made a recantation. Instead of recanting, he wrote in prison, *Apologeticus ad præsules Anglicanos*; and another book called, *The Litany*; wherein he severely exclaimed against the proceedings of that court, and taxed the bishops with an inclination towards popery. Prynne and Burton coming under the lash of the star chamber-court at the same time, they were all censured as scandalous seditious persons, condemned to a fine of 5000l. each, to be pillored, to lose their ears, and to perpetual imprisonment in three remote parts of the kingdom. The parliament in 1640 reversed these proceedings; and ordered Dr. Bastwick a reparation of 5000l. out of the estates of the commissioners and lords who had prosecuted him, which the ensuing confusions prevented his receiving: however, his wife had, in 1644, an allowance ordered for her and her husband's maintenance. What became of him afterward is not known.

BATACOLA, a sea-port on the coast of Malabar, between Onore and Barcelore. Here are the remains of a once considerable city, on the banks of a small river, four miles from the sea. The country round it produces a great quantity of pepper; and the English had a factory here till 1670, when a bull-dog belonging to the factory having unfortunately seized and killed a sacred cow, the natives rose and massacred them all.

BATAVORUM INSULA, the island of the Batavians (anc. geog.). Of this island Tacitus gives the following description. "The Rhine flowing in one channel, or only broken by small islands, is divided at its entering Batavia, as it were, into two rivers. One continues its course through Germany, retaining the same name, and violent current, till it falls into the ocean. The other washing the coast of Gaul, with a broader and more gentle stream, is called by the inhabitants *Vahalis*; which name it soon changes for that of *Mosa*, by the immense mouth of which river it discharges itself into the same ocean." According to Tacitus, therefore, the island of the Batavians was bounded by the ocean, the Rhine, and the Vahalis, now the *Wale*. Cæsar extends it to the Mosa, or *Meuse*; but Pliny agrees with Tacitus. However, this island was of greater extent in Tacitus's time than in Cæsar's; Drusus, the father of Germanicus, having by a new canal conveyed the waters of the Rhine into the ocean a considerable way north of the former mouth of that river. The Batavi were a branch of the Catti, who, in a domestic sedition, being expelled their country, occupied the extremity of the coast of Gaul, at that time uninhabited, together with this island situated among shoals. Their name *Batavi* they carried with them from Germany; there being some towns in the territory of the Catti called *Battenberg*, and *Battenhausen*. The bravery of the Batavi, especially the horse, procured them not only great honour from the Romans, being called their *brothers* and *friends*; but an exemption from taxes, being obliged only to furnish men and arms. The modern name of this island is *Betu*, or *Betaw*. See BETUE and BATTÆ.

BATE (George), an eminent physician, born at Maid's Morton, near Buckingham, in the year 1608. In 1629 he obtained a licence, and for some years practised in and about Oxford: his practice was chiefly amongst the puritans, who at that time considered him as one of their party. In 1637 he took his degree of doctor in physic, and became very eminent in his profession, so that when King Charles kept his court at Oxford, he was his principal physician. When the king's affairs declined, Dr. Bate removed to London, where he accommodated himself so well to the times, that he became physician to the Charter-house, fellow of the college of physicians, and afterwards principal physician to Oliver Cromwell. Upon the restoration, he got into favour with the royal party, was made principal physician to the king, and fellow of the Royal Society; and this, we are told, was owing to a report raised on purpose by his friends, according to Mr. Wood, that he gave the protector a dose which hastened his death. Dr. Bate wrote in Latin an account of the late commotions in England, and some other pieces. He died at his house in Hatton-garden, and was buried at Kingston-upon-Thames in Surrey.—There was another George BATE, who wrote a work entitled The Lives, Actions, and Execution, of the prime Actors and principal Contrivers of that horrid Murther of our late pious and sacred King Charles I.

BATE (John), prior of the monastery of Carmelites, at York, in the 15th century, was born in Northumberland, and educated at York in the study of the liberal arts; in which he was greatly encouraged by the favour of some persons, his patrons, who were at the expence of sending him to Oxford, to finish his studies in that university. Bate abundantly answered the hopes conceived of him, and became an eminent philosopher and divine, and particularly remarkable for his skill in the Greek tongue. He took the degree of doctor in divinity at Oxford, and afterwards distinguished himself as an author. The Carmelites of York were so sensible of his merit, that upon a vacancy they offered him the government of their house; which he accepted, and discharged that office with great prudence and success. He died the 26th of January, 1429, in the beginning of the reign of Henry VI.

BATECUMBE, or BADECOMBE (William), an eminent mathematician, is supposed to have flourished about the year 1420, in the reign of Henry V. He studied at Oxford, where he applied himself to natural philosophy in general, but chiefly to the mathematics, in which he made a very great proficiency, as is evident by his writings in that science, which introduced him to the acquaintance and intimacy of the greatest men of those times. His mathematical writings consist of, 1. Of the Formation and Use of the Concave Sphere. 2. Of the Solid Sphere. 3. Of the Use of the Astrolabe. 4 Philosophical Conclusions.

BATEMAN (William), bishop of Norwich in the fourteenth century, and founder of Trinity-hall in Cambridge, was born at Norwich, being the son of a citizen of good repute in that place. He was from his tenderest years of a docile and ingenious disposition: having therefore made a good proficiency in learning, wherein he surpassed all his equals, he was sent to the university of Cambridge. After having gone through the usual circle of the sciences, he applied himself to the study of the civil law, in which he took the degree of doctor, before he was thirty years of age, a thing then uncommon. On the 8th of December, 13[illegible]8, he was collated to the archdeaconry of Norwich: soon after this he went and studied at Rome, for his farther improvement; and so distinguished himself by his knowledge and exemplary behaviour, that he was promoted by the pope to the place of auditor of his palace. He was likewise advanced by him to

the deanery of Lincoln; and ſo great an opinion had he of his prudence and capacity, that he ſent him twice as his nuncio, to endeavour to procure a peace between Edward III. king of England, and the king of France. Upon the death of Anthony de Beck, biſhop of Norwich, the pope did, by his uſurped proviſional authority, confer that biſhopric upon our William Bateman, on the 23d of January, 1343, and conſecrated him with his own hands. He was confirmed the 23d of June, 1344. Being inveſted with that great dignity, he returned into his native country after many years' abſence, and lived in a regular, and withal in a generous and hoſpitable manner. Of Pope Clement VI. he obtained for himſelf and ſucceſſors the firſt fruits of all vacant livings within his dioceſe; which occaſioned frequent diſputes between himſelf and his clergy. In the year 1347 he founded Trinity-hall in Cambridge, for the ſtudy of the civil and canon laws; and another hall dedicated to the Annunciation of the Virgin Mary, for the ſtudy of philoſophy and divinity.

Being a perſon of great wiſdom, eloquent, and of a fine addreſs, he was often employed by the king and parliament in affairs of the higheſt importance; and particularly was at the head of ſeveral embaſſies, ſent on purpoſe to determine the great differences between the crowns of England and France. In 1354 he was by order of parliament diſpatched to the court of Rome, with Henry duke of Lancaſter, and others; to treat (in the pope's preſence) of a peace, then in agitation between the two crowns above mentioned. This journey proved fatal to him; for he died at Avignon, where the pope then reſided, on the 6th of January, 1354-5, and was buried with great ſolemnity in the cathedral church of that city. With regard to his perſon, he was of an agreeable countenance, tall, handſome, and well made. He was likewiſe a man of ſtrict juſtice and piety, punctual in the diſcharge of his duty, and of a friendly and compaſſionate diſpoſition.

BATES (William), D. D. an eminent Preſbyterian divine, born in November 1625. He was admitted in Emanuel College, Cambridge, and from thence removed to King's College in 1644. He was one of the commiſſioners, at the conference in the Savoy, for reviewing the public liturgy, and was concerned in drawing up the exceptions againſt the Common Prayer: however, ſoon after the reſtoration, he was appointed chaplain to King Charles II. and became miniſter of St. Dunſtan's in the Weſt, but was deprived of that benefice for nonconformity. Dr. Bates bore a good and amiable character; and was honoured with the friendſhip of the lord keeper Bridgman, the lord chancellor Finch, the Earl of Nottingham, and Archbiſhop Tillotſon. He was offered, at the reſtoration, the deanery of Litchfield; which he refuſed. He publiſhed Select Lives of illuſtrious and pious perſons, in Latin; and ſince his death all his works, except his Select Lives, have been printed in one volume in folio. He died on July 14, 1699, in the 74th year of his age.

BATHE (Henry de), a learned knight, an eminent and ſkilful juſticiary of the 13th century, was born at that ancient ſeat of this family, called Bathe-houſe, in the county of Devon. Being a younger brother, it is not unnatural to imagine he might, upon that account, apply himſelf to the ſtudy and profeſſion of the laws of his country, in the knowledge of which he grew ſo eminent, that he was advanced by King Henry III. in 1238, to be one of the juſtices of the Common Pleas, and in 1246 was conſtituted one of the juſtices itinerant (as they were then called) for the county of Hertford, and in 1248 he was appointed the ſame for Eſſex and Surrey, in 1249 for Kent, Berks, Southampton, and Middleſex, and in 1250 for Lincolnſhire; at which time he had allowed him out of the Exchequer, by a peculiar favour, an hundred pounds a-year for his ſuſtentation in the diſcharge of his office. But the year following he fell from the king's grace and favour, the occaſion of which were certain crimes laid to his charge: viz. that he had not exerciſed his office uprightly, but to his own private gain, having perverted juſtice through bribes, upon an occaſion of a ſuit betwixt him and one Everard Trumpington, which was chiefly ſupported againſt him by one Philip d'Arcis, Knight, who alſo added treaſon to that of infidelity in his office. The accuſed was attached in the king's court; but one Manſel, who was now become a great favourite at court, offered bail for his appearance. King Henry refuſed this; the caſe, as he alleged, not being bailable, he terming him guilty of high treaſon. Fulk Baſſet, however, then biſhop of London, and a great many of De Bathe's friends, interceding, the king at laſt gave orders that he ſhould be bailed, twenty-four knights becoming ſureties for his appearing, and ſtanding to the judgment of the court. But De Bathe ſeems to have been conſcious of his own demerits, or the prepoſſeſſion of his judges againſt him; for he was no ſooner ſet at liberty, than he wrote to all his relations either by blood or marriage, deſiring that they would apply to the king in his favour, at firſt by fair ſpeeches and preſents, and that if theſe did not prevail, they ſhould appear in a more warlike manner, thereby to intimidate the court. This they faithfully and unanimouſly promiſed to do, upon the encouragement given them by a bold knight, one Nicholas de Sandford: but the king, imagining that his own power, and the intereſt of De Bathe's accuſers, infinitely outweighed all the preparations of the others, appeared the more inexorable upon the intimation of theſe proceedings; he rejected all preſents from the friends of the accuſed, and put on an air as if nothing but his puniſhment ſhould ſatisfy his and the nation's juſtice. De Bathe knew well to what all this outward inflexibility tended; but was certain, that if Henry perſiſted in his reſolution, he himſelf muſt periſh. He therefore had recourſe to a more prudent meaſure; he applied himſelf to the Biſhop of London, and other his ſpecial friends, and with a great poſſe of theſe goes to Richard earl of Cornwall (afterwards king of the Romans), whom by prayer and fine promiſes he won over to his intereſt. The king continued deaf to all his remonſtrances, and about the end of February, De Bathe was ſummoned, and obliged to appear to anſwer what ſhould be laid to his charge. This he accordingly did, but ſtrongly defended by a great retinue of armed knights, gentlemen, and others, viz. his own and his wife's friends and relations; among whom was the family of the Baſſets and Sandfords, a band as undaunted as his perſecutors were violent. We may, from what our hiſtorian has delivered upon this occaſion, conclude that the aſſembly was divided between thoſe who depended upon the king for their poſts and preferments, and thoſe who, though a great majority, were ſo thoroughly exaſperated at the meaſures of the court, that they were reſolved not to find De Bathe guilty. It was not long before the king perceived this, and upon that occaſion he made an unjuſt and impolitic ſtretch of his prerogative, in an unheard-of proclamation. A new charge was now brought againſt De Bathe, and perhaps the chief and only one, at leaſt that had exaſperated King Henry, viz. he was impeached not only on the former articles, but particularly for alienating the affections of the barons from his majeſty, and creating ſuch a ferment all over the kingdom, that a general ſedition was now on the point of breaking out. This ſpeech was enforced from Bathe's brother juſticiary, who declared to the aſſembly, that he knew the accuſed to have diſmiſſed without any cenſure, for the ſake of lucre, a convicted criminal. Many other complaints were urged againſt De Bathe; but they ſeem to have been diſregarded by all but the king and his party, who was ſo much exaſperated to ſee De Bathe likely to be acquitted, that he mounted his throne, and with his own mouth made proclamation, That whoſoever ſhould kill Henry de Bathe, ſhould have the royal pardon for

him and his heirs; after which ſpeech he flung out of the room in a great paſſion. Many of the royal party, who were exceedingly keen upon this occaſion, would readily have executed the king's terrible doom, and were for diſpatching De Bathe in court; but his friend Manſel, one of the king's council, and Fulco Baſſet, biſhop of London, interpoſed ſo effectually, that he was ſaved; and afterwards, by the powerful mediation of his friends (among whom was the Earl of Cornwall, the king's brother, and the Biſhop of London), and the application of a ſum of money, viz. two thouſand marks to the king, he obtained not only a pardon, but all his former places and favour with the king, who re-eſtabliſhed him in the ſame ſeat of judicature as he was in before, and rather advanced him higher, for he was made chief-juſtice of the King's-Bench, after about three years' diſcontinuance from his office of a judge, in which honourable poſt he continued for eight years after, till the time of his death, which happened in 1261.

Bathe (William), was born in Dublin, in 1564. We have it by tradition, that he was of a ſullen, ſaturnine temper, and diſturbed in his mind that his family was reduced from its ancient ſplendour. His parents, who were Proteſtants, had a greater regard to the learning of their child, than his religion; and therefore put him, in his green years, under the tuition of an eminent Popiſh ſchoolmaſter, who thoroughly corrupted his principles, and fitted him for that ſtation of life which he afterwards embraced. He removed to Oxford, where he ſtudied ſeveral years with indefatigable induſtry; but the inquiſitive Anthony Wood could not diſcover in what college or hall he ſojourned, or whether he took any univerſity degree. The ſame writer alleges, that growing weary of the hereſy profeſſed in England (as he uſually called the Proteſtant faith), he quitted the nation and his religion together, and in the year 1596 was initiated among the Jeſuits, being then between thirty and forty years of age; though one of his own order ſays he was but twenty-five, which certainly is erroneous. Having ſpent ſome time among the Jeſuits in Flanders, he travelled into Italy, and completed his ſtudies at Padua; from whence he paſſed into Spain, being appointed to govern the Iriſh ſeminary at Salamanca. He is ſaid to have had a moſt ardent zeal for the gaining of ſouls, and was much eſteemed among the people of his perſuaſion for his extraordinary virtues and good qualities, though he was of a temper not very ſociable. At length, taking a journey to Madrid to tranſact ſome buſineſs of his order, he died there June 17, 1614.

BATHURST (Ralph), M.D. an eminent phyſician, poet, and divine, born in the year 1620. He ſtudied divinity in Trinity College, Oxford; but the times of confuſion coming on, he changed the courſe of his ſtudies, and applied himſelf to phyſic. He took a doctor's degree in that faculty; in which he roſe to ſuch eminence, that he was, in the time of the uſurpation, appointed phyſician to the ſtate. Upon the reſtoration, he quitted his profeſſion of phyſic; was elected a fellow of the Royal Society, and preſident of his college; and having entered into holy orders, he was made chaplain to the king, and afterwards dean of Wells. Soon after, he ſerved the office of vice-chancellor of Oxford, and was nominated by King William and Queen Mary to the ſee of Briſtol; which he refuſed to accept. His learning and talents were various. He was an orator, a philoſopher, and a poet: he poſſeſſed an inexhauſtible fund of wit, and was a facetious companion at 80 years of age. Ridicule was the weapon with which he uſed to correct the delinquents of his college; and he was ſo abſolute a maſter of it, that he had it always at hand. His poetical pieces in the *Muſæ Anglicanæ* are excellent in their kind. He wrote ſeveral poems, both in Engliſh and Latin; and died June 14, 1704, in the 84th year of his age.

BATSFORD, a village of Glouceſterſhire, through which paſſes the great Roman road from the north in its way to Cirenceſter, and there is a ſmall entrenchment almoſt entire, ſuppoſed to have been thrown up by the Romans. It is four miles from Campden.

BATTECOLA, a fortified town on the eaſt coaſt of Ceylon, ſubject to the Dutch. Long. 81. 3. E. Lat. 5. 55. N.

BATTIE (Dr. William), an Engliſh phyſician, was born in Devonſhire, 1704. He received his education at Eton; and, in 1722, was ſent to King's College, Cambridge. His own inclination prompted him to the profeſſion of the law; but his finances would not ſupport him at one of the inns of court. He had two couſins of the name of Coleman, old bachelors and wealthy citizens, to whom, upon this occaſion, he applied for aſſiſtance; but they declined interfering in his concerns. Upon this he turned to phyſic, and firſt entered upon the practice of it at Cambridge; where, in 1729, he gave a ſpecimen of an edition of Iſocrates, which he afterwards, 1749, completed in two vols. 8vo.

He afterwards removed to Uxbridge, and then to London; where, meeting with ſucceſs and flouriſhing, his relations the Colemans, who had now left off buſineſs and retired, grew fond, or rather proud of him, and behaved to him with cordiality and friendſhip. In 1738, or 1739, he fulfilled by marriage a long engagement to a daughter of Barnham Goode, the under-maſter of Eton ſchool, who is honoured with a place in the Dunciad, for having abuſed Pope in a piece called The Mock Æſop. Againſt Goode, it ſeems, the Colemans had a political antipathy: however, they behaved well to Mrs. Battie, and the ſurvivor of them left the doctor 30,000*l.* In the diſpute which the college of phyſicians had with Dr. Schomberg, about 1750, Dr. Battie, who was at that time one of the cenſors, took a very active part againſt that gentleman. In 1751 he publiſhed De Principiis Animalibus Exercitationes in Coll. Reg. Medicorum, in three parts; which were followed, the year after, by a fourth. In 1757, being then phyſician to St. Luke's Hoſpital, and maſter of a private mad-houſe near Wood's-cloſe in the road to Iſlington, he publiſhed, in 4to. A Treatiſe on Madneſs; in which, having thrown out ſome cenſures on the medical practice formerly uſed in Bethlem Hoſpital, he was replied to, and ſeverely animadverted on, by Dr. John Monro, whoſe father had been lightly ſpoken of in the fore-mentioned treatiſe. In 1762 he publiſhed Aphoriſmi de cognoſcendis et curandis morbis nonnullis ad principia accommodati. February 1763 he was examined before a committee of the Houſe of Commons, on the ſtate of the private mad-houſes in this kingdom; and received in their printed report a teſtimony very honourable to his abilities.

In 1776 Dr. Battie was ſeized with a paralytic ſtroke, of which he died, June the 13th, in his ſeventy-fifth year.

BATTING Machine, a machine for batting or beating and cleaning cotton from the huſks and foulneſſes contained in it. In Pl. 16. we have given a view of this curious engine, the invention of Mr. Bowden of Mellor in Derbyſhire. Fig. 1. is a perſpective view of the whole machine. A A A A, the frame of the machine. B, the flake, made of cords, upon which the cotton is batted, moving perpetually over the rollers *c*, C, which are moved by a pinion on the end of the axle of the cranks D, which drives a large bevel-wheel, fixed on the bottom of the upright ſhaft E, upon the top of which is a bevel pinion, which drives a large bevel-wheel upon the end of the axle of the roller C. F F, two boards fixed to the croſs-frames, on each ſide of the flake B, to prevent the cotton from falling off, [the which are notched, in order that the batting-ſticks may ſtrike the cotton upon the flake B. G, a looſe rod, croſſing the flake cloſe to the cords under the cotton, which, by the vibration of the cords, looſens the cotton therefrom before it falls over the roller C. Fig. 2. the ground-plan of the

machine, drawn by the ſcale T. D, an axle, having ten cranks, ſtanding upon ten different ſquares or ſides of ditto; the firſt and ſecond of which are oppoſite, as are all the reſt, upon different ſquares, alternately to the end, with a ſupport in the middle, with a braſs ſtep for the axle to move in, to keep the ſame from vibrating. Fig. 3. a plan of four of the arms, ſhewing their different movements, drawn by the ſcale U. H, H, H, H, the arms, fixed to the bottom croſs frame by an axle working in iron ſlides, which are moveable, if neceſſary, at *a a*. I, I, rails, worked by two oppoſite cranks at *c*, *c*, and fixed to the lower ends of the arms by ſwivel pins at *i*, *i*. J, J, iron ſlides, fixed by ſcrews to the ends of the rails I, I, in order to lengthen or contract them, as may be found neceſſary. K, K, rails fixed to the upper parts of the arms at *b*, *b*, by ſwivel pins, which work the oppoſite arms at *d*, *d*. L, L, L, L, wood rollers upon the tops of the arms, moving an axle in iron frames, to which axles are fixed the ſockets *e*, *e*, *e*, *e*, which hold the batting ſticks faſtened therein by hoops and ſcrews. M, M, M, M, leather ſtraps fixed to the rollers L, L, L, L, and to the upper croſs frame at *k k k*, as in Fig. 1. which ſtraps, when drawn tight by the arms moving forwards towards the ſlake B, as in fig. 1. ſtrike the blows upon the cotton. N, N, two catches or hooks, which are drawn by the ſprings *l*, *l*, that fall into ſquare holes, made for the purpoſe into iron hoops, on the ends of the rollers L, L, to prevent the ſticks from riſing after the blow is ſtruck before the ſticks are clearly drawn out of the cotton by the return of the arms. O, O, iron ſlides, faſtened by ſcrews to one ſide of the ends of the rails K, K, with ſtuds fixed thereto, on which the bottom part of the catches move; which ſtuds, when placed at a proper diſtance from the ſwivel pins, draw down the catches gradually as the arms move backwards, and prevent the ſticks from riſing, which they would naturally do, notwithſtanding the catches, owing to the circular motions of the arms. P, a long ſpring, with a ſmall leather ſtrap faſtened to the top part of the roller L, on the top of the arm, which throws back the ſtick to a bolſter put on the upper croſs-frame, as at *f*, in fig. 1. Q, a ſneck or catch faſtened on the end of the upper rail K, which frees the catch g from the roller when the arm returns to the back croſs-frame, as at L, fig. 3. R, R, two ſticks, which ſtrike upon the cotton at the ſame time, as do all the reſt in their turns, as the cranks move round. W, a ſmall ſcrew, in the bottom of the ſheck or catch Q, which binds on the top of the ſlide O, to be altered as may be neceſſary, to keep ſuch ſlide in its proper place. X, X, two ſcrews, moveable in two nuts, fixed in the ends of the croſs-frames on each ſide the ſlake B, as in fig. 2. by means of which the cords of the ſlake may be ſtraightened or ſlackened, as may be neceſſary. S, a pulley, fixed upon the end of the axle of the cranks at *h*, in fig. 2. by which the whole of the machine is moved.

The following are obſervations made by the Patentee.

"Though many attempts," ſays he, "have been made, no operation has been found out to clear the cotton, to expand its fibres, and bring it into that open and pulpy ſtate eſſential to good carding, ſave batting, which is a laborious employment, and having been chiefly confined to females, who are inadequate to the taſk, the work has been very imperfectly performed; beſides the diſagreeable neceſſity of either confining a great number of them in a room for that purpoſe, or of ſending the cotton out to as many different houſes—circumſtances which have long occaſioned the trade to lament the want of ſome invention to remove them, and which I flatter myſelf is accompliſhed by the above-deſcribed batting machine.

"In a department, hitherto confeſſedly the moſt perplexing of any attending the buſineſs of cotton ſpinning, a very conſiderable abridgment of labour is effected, inſomuch that, at moſt, two-thirds of the number of *girls* will now do the ſame quantity of work, and much better, than was done before by the ſtrongeſt women."

BATTLEFIELD, a large village in Shropſhire, five miles N. of Shrewſbury, where a victory was gained by Henry IV. over Henry Percy, ſurnamed Hotſpur. It has a large church, and one long broad ſtreet paved. Long. 2. 42. W. Lat. 52. 22. N.

BAUCONICA (anc. geog.), a town of the Vangiones in Gallia Belgica; nine miles from Mongontiacum, and eleven from Borbitomagum; and therefore ſuppoſed to be *Oppenheim*, a town in the Palatinate of the Rhine, and ſituated on that river.

BAUDELOT (Charles Cæſar), a learned advocate in the parliament of Paris, diſtinguiſhed himſelf by his ſkill in ancient monuments, and was received into the academy of Belles-Lettres in 1705. He wrote a Treatiſe on the Advantages of Travelling; many Letters and Diſſertations on Medals, &c.; and died in 1722, aged ſeventy-four.

BAUDIER (Michael), a gentleman of Languedoc, lived in the reign of Lewis XIII. and publiſhed ſeveral books, which procured him the character of a copious and laborious author; among which are, 1. An Inventory of the General Hiſtory of the Turks. 2. The Hiſtory of the Seraglio. 3. That of the Religion of the Turks. 4. That of the Court of the King of China. 5. The Life of Cardinal Ximenes, &c.

BAUDOBRIGA (anc. geog.), a town of the Treviri in Germany; now *Boppart*, in the electorate of Triers. See BOPPART.

BAUDRAND (Michael Anthony), a celebrated geographer, born at Paris, July 18, 1633. He travelled into ſeveral countries; and then applied himſelf to the reviſal of Ferrarius's Geographical Dictionary, which he enlarged by one-half. He wrote, 1. Notes to Papirius Maſſo's Deſcription of the Rivers of France. 2. A Geographical and Hiſtorical Dictionary. 3. Chriſtian Geography, or an Account of the Archbiſhoprics and Biſhoprics of the whole World: and made ſeveral maps. He died at Paris, May 29th, 1700.

BAUHIN (John), a great botaniſt, was born about the middle of the 16th century. He took his doctor's degree in phyſic, in 1562; and afterwards became principal phyſician to Frederick duke of Wirtemberg. The moſt conſiderable of his works is his Univerſal Hiſtory of Plants.

BAUHIN (Caſpar, or Gaſpar), younger brother to the preceding, was born at Baſil, 1550; and diſtinguiſhed himſelf by his ſkill in anatomy and botany. In 1580 he was choſen firſt profeſſor of theſe ſciences at Baſil; and in 1614 was made firſt profeſſor of phyſic, and firſt phyſician of that city, which he held till his death, which happened in 1623, at the age of ſixty-three. He wrote, 1. Anatomical Inſtitutions; 2. Prodromus Theatri Botanici; and other works.

BAUTRU, a celebrated wit, and one of the firſt members of the French academy, was born at Paris in 1588, and died there in 1665. He was the delight of all the miniſters at court, of all the favourites, and of all the great in general. He was indeed a kind of a fool among them; who, while he played the buffoon, took the uſual privilege of ſaying what he pleaſed. Many of his bons mots are preſerved. Once, when he was in Spain, having been to ſee the famous library of the Eſcurial, where he found a very ignorant librarian, the king of Spain aſked him what he had remarked? To whom Bautru replied, that "the library was a very fine one; but your majeſty," adds he, "ſhould make your librarian treaſurer of your finances." "Why ſo?" "Becauſe," ſays Bautru, "he never touches what he is entruſted with."

BAXTER (William), nephew and heir to Richard (ſee *Encycl.*), was an eminent ſchoolmaſter and critic He was born at Lanlugany in Shropſhire, in the year 1650; and it is

remarkable, that at the age of eighteen, when he firſt went to ſchool, he knew not one letter nor underſtood one word of any language but Welſh; but he ſo well improved his time, that he became a perſon of great and extenſive knowledge. His genius led him chiefly to the ſtudy of antiquities and philology, in which he compoſed ſeveral books. The firſt he publiſhed was a Grammar, in 1679, entitled *De Analogia ſeu Arte Latinæ Linguæ Commentariolus*. He alſo publiſhed a new and correct edition of Anacreon, with notes; an edition of Horace; a Dictionary of the Britiſh Antiquities, in Latin; and ſeveral other books. He was a great maſter of the ancient Britiſh and Iriſh tongues, was particularly ſkilled in the Latin and Greek, and in the northern and eaſtern languages. He died May 31ſt, 1723, after being above twenty years maſter of Mercers' School in London.

BAXTER (Andrew), a very ingenious writer of Scotland, was born in 1686, or 1687, at Old Aberdeen, of which city his father was a merchant, and educated in King's College there. His principal employment was that of a private tutor to young gentlemen; and among others of his pupils were Lord Grey, Lord Blantyre, and Mr. Hay of Drummelzier. About 1724 he married the daughter of a clergyman in the ſhire of Berwick. A few years after he publiſhed in 4to. An Enquiry into the Nature of the Human Soul, wherein its Immateriality is evinced from the Principles of Reaſon and Philoſophy; without date. In 1741 he went abroad with Mr. Hay, and reſided ſome years at Utrecht; having there alſo Lord Blantyre under his care. He made excurſions from thence into Flanders, France, and Germany; his wife and family reſiding, in the mean time, chiefly at Berwick-upon-Tweed. He returned to Scotland in 1747, and reſided till his death at Whittingham, in the ſhire of Eaſt Lothian. He drew up, for the uſe of his pupils and his ſon, a piece, entitled, Matho; ſive, Coſmotheoria puerilis, Dialogus. This was afterwards greatly enlarged, and publiſhed in Engliſh, in two volumes 8vo. In 1750 was publiſhed, An Appendix to his Enquiry into the Nature of the Human Soul;" wherein he endeavours to remove ſome difficulties which had been ſtarted againſt his notions of the vis inertiæ of matter, by Maclaurin, in his Account of Sir Iſaac Newton's Philoſophical Diſcoveries. To this piece Mr. Baxter prefixed a dedication to Mr. John Wilkes, with whom he had commenced an acquaintance abroad. He died this year, April the 23d, after ſuffering for ſome months under a complication of diſorders. He was a very ingenious and knowing man: the French, German, and Dutch languages were ſpoken by him with much eaſe, the Italian tolerably; and he wrote and read them all, together with the Spaniſh. He was a man alſo of great integrity, humanity, and candour.

BAYLY (Lewis), author of that moſt memorable book entitled The Practice of Piety, was born at Caermarthen in Wales, educated at Oxford, made miniſter of Eveſham in Worceſterſhire about 1611, became chaplain to King James, and promoted to the ſee of Bangor in 1616. His book is dedicated "to the high and mighty prince, Charles Prince of Wales;" and the author tells his highneſs, that "he had endeavoured to extract out of the chaos of endleſs controverſies the old practice of true piety, which flouriſhed before theſe controverſies were hatched." The deſign was good; and the reception this book has met with may be known from the number of its editions, that in 8vo. 1734, being the ſifty-ninth. This prelate died in 1634.

BAYLY (Thomas), ſon of the preceding, was educated at Cambridge, and having commenced bachelor of arts, was preſented to the ſubdeanery of Wells by Charles I. in 1638. In 1644 he retired, with other loyaliſts, to Oxford; and two years after we find him, with the Marquis of Worceſter, in Ragland caſtle. When this was ſurrendered to the parliament army, he travelled into France and other countries; but returned the year after the king's death, and publiſhed at London, in 8vo. a book, entitled Certamen Religioſum; or, a Conference between King Charles I. and Henry late Marquis of Worceſter, concerning Religion, in Ragland Caſile, Anno 1646. But this conference was believed to have no real foundation; and conſidered as nothing elſe than a prologue to the declaring of himſelf a Papiſt. The ſame year, 1649, he publiſhed The Royal Charter granted unto Kings by God himſelf, &c. to which he added, A Treatiſe, wherein is proved that Epiſcopacy is Jure divino, 8vo. Theſe writings giving offence, occaſioned him to be ſearched out, and committed to Newgate; whence eſcaping, he retired into Holland, and became a flaming Roman-catholic. During his confinement in Newgate, he wrote a piece entitled Herba Parietis; or, the Wall-Flower, as it grows out of the Stone Chamber belonging to the Metropolitan Priſon. Some time after he left Holland, and ſettled at Douay; where he publiſhed another book, entitled, The End to Controverſy between the Roman-catholic and Proteſtant Religions. At laſt this ſingular perſon went to Italy, where he lived and died extremely poor.

BAYNES (Sir Thomas), an eminent phyſician, and profeſſor of muſic at Greſham College, in London, was born about the year 1622, and educated at Chriſt's College, in Cambridge, under the tuition of the learned Dr. Henry More, where he took the degree of bachelor of arts about the year 1642. In 1649 he took the degree of maſter of arts, after which time he applied himſelf to the ſtudy of phyſic. He went into Italy in company with Mr. Finch (afterwards Sir John), with whom he had contracted the greateſt friendſhip; and at Padua they were both created doctors of phyſic. Upon the reſtoration of King Charles II. in 1660, Mr. Baynes and Mr. Finch returned into England, and the ſame year their grace was paſſed at Cambridge, for creating them doctors of phyſic in that univerſity. On the 26th of February following, Mr. Baynes, together with Sir John Finch, was admitted a fellow-extraordinary of the College of Phyſicians of London. Dr. Petty having reſigned his profeſſorſhip of muſic in Greſham College, Dr. Baynes was choſen to ſucceed him, the 8th of March, 1660; and the 26th of June following, he and his friend Sir John Finch were admitted graduates in phyſic at Cambridge, in purſuance of the grace paſſed in their favour the year before. The winter following, this inſeparable pair of friends deſigned to have made a ſecond tour into Italy, but did not execute their deſign. The 20th of March, 1663, they were elected fellows of the Royal Society, upon the firſt choice made by the council, after the grant of their charter, of which they had been members before; and May 15, 1661, had, with ſeveral others, been nominated a committee for a library (at Greſham College), and for examining of the generation of inſects. In March, 1664, Dr. Baynes accompanied Sir John Finch to Florence, where that gentleman was appointed his majeſty's reſident, and returned back with him into England in 1670. Towards the end of the year 1672, Sir John being appointed the king's ambaſſador to the grand-ſeignior, Dr. Baynes was ordered to attend him as his phyſician, and before he left England received from his majeſty the honour of knighthood. Nine years after, Sir Thomas ſtill continuing in Turkey, the Greſham committee, taking into conſideration his long abſence without ſupplying the duty of his place, thought fit to diſmiſs him from his profeſſorſhip, and on the 9th of Auguſt, 1681, choſe Mr. William Perry in his room. The news of this diſmiſſion could not reach Sir Thomas Baynes; for he died at Conſtantinople the 5th of the following month.

BEAVER (John), a Benedictine monk in Weſtminſter

abbey, flouriſhed about the beginning of the fourteenth century. He was a man of quick parts, and of great diligence and ingenuity; but he applied himſelf particularly to the ſtudy of the hiſtory and antiquities of England, and became a great maſter of both. Among other things, he wrote, A Chronicle of the Britiſh and Engliſh Affairs, from the coming in of Bruce to his own Time. He alſo wrote a book, De Rebus Cœnobii Weſtmonarienſis;—Of Weſtminſter-abbey, and the ſeveral Tranſactions relating thereto. Leland commends him as an hiſtorian of good credit; and he is alſo cited with reſpect by J. Stow, in his Survey of London and Weſtminſter.

BEAUCHAMP (Richard de), earl of Warwick, and one of the moſt conſiderable perſons in this kingdom in the fifteenth century, was born January 28, 1381, at the manor-houſe Salwarpe in the county of Worceſter, and had for his god-fathers, King Richard II. and Richard Scroope, then biſhop of Coventry and Lichfield, and afterwards archbiſhop of York. He was made Knight of the Bath at the coronation of King Henry IV. in the year 1399, and in the fourth year of the ſame reign he had livery of his lands, and was retained to ſerve the king one whole year, with one hundred men at arms, and three hundred archers. The next year, which was 1404, on the coronation of the queen, he kept, according to the cuſtom of thoſe times, juſts, in which he behaved himſelf very gallantly. He was called the ſame year to do the crown more ſerious ſervice, in that dangerous rebellion raiſed by Owen Glendower, againſt whom he behaved bravely, and took his ſtandard in open battle. He was, likewiſe, in the famous battle at Shrewſbury, againſt the Percies, where he gained great honour, and was, not long after, made Knight of the Garter. In 1408 he obtained a licence from King Henry IV. to viſit the holy ſepulchre at Jeruſalem, in purſuance of a vow he had made. From Jeruſalem he came back to Venice, and was there nobly received. Thence he travelled into Ruſſia, into Lithuania, Poland, Weſtphalia, and ſome countries of Germany, ſhewing great valour in divers tournaments whilſt he was in thoſe parts. No ſooner was he returned into England, than he was, by indenture, dated 2d October, 12 Henry IV. retained with Henry prince of Wales, afterwards king by the name of Henry V. to ſerve him as well in times of peace as war, both in this realm, upon, and beyond the ſeas. At the ceremony of the new king's coronation, he was conſtituted lord high-ſteward. In the ſame year, 1413, we find him one of the king's commiſſioners into France, to treat of a ſolid peace between the two kingdoms, to be ſtrengthened and cemented by a marriage between the king his maſter and the Princeſs Catherine, daughter to the king of France. In the year 1415 he was declared captain of Calais, an office of great truſt and honour in thoſe days, and never conferred but upon a man of known abilities as a ſoldier, and of a clear unqueſtionable character in point of fidelity. In May 1417, King Henry ſent him to the king of France, attended by a thouſand men at arms, to treat of a marriage between him and that king's daughter, the Lady Catherine: but the dauphin knowing that this marriage was intended to defeat his ſucceſſion, he ſent a body of five thouſand men, under the command of the earls of Vendoſme and Lymoſin, to obſtruct his paſſage, to whom the earl gave battle, in which both thoſe noblemen were killed, and one of them fell by the earl of Warwick's own hand, and about two thouſand of their troops were either ſlain or taken. He then proceeded on his embaſſy, in which, notwithſtanding the difficulties he had to ſtruggle with, he very happily ſucceeded, to the king's great ſatisfaction. In the firſt of Henry VI. he was by indenture retained to be captain of Calais for two years; which fortreſs being beſieged by Philip duke of Burgundy, now reconciled to the French, this noble earl, aſſiſted by Humphrey duke of Glouceſter, and Humphrey earl of Stafford, ſo gallantly defended it, that, after a long ſiege and great loſs, the Duke of Burgundy was forced to riſe from before it. Upon the death of the Duke of Bedford, who was regent of France for King Henry, the Earl of Warwick was conſtituted lieutenant-general of the realm of France and duchy of Normandy, the higheſt honour a ſubject of England could receive. He executed this great and difficult employment with his uſual wiſdom and diligence, for the four laſt years of his life, and died in poſſeſſion thereof in the caſtle of Rouen, April the 30th, 1439.

BEAUCHAMP (Henry de), ſon to Richard earl of Warwick, was born at Hanley caſtle in Worceſterſhire, on the 22d of March, 1424. Being a young nobleman of great ſpirit and courage, he offered his ſervice before he was full nineteen for the defence of Normandy, with which the king was ſo well pleaſed, that, by his charter, bearing date the ſecond of April, in the twenty-ſecond year of his reign, he created him Premier Earl of England, and for a diſtinction between him and all other earls, he farther granted him, and the heirs male of his body, leave to wear a gold coronet upon his head, as well in his own preſence as elſewhere, in all ſuch aſſemblies, and upon all feaſts in which the like ornaments were worn. Within three days after this he advanced him to the rank of Duke of Warwick, in conſideration of the many virtues and great ſervices of his father, granting him place in parliament and at all other meetings, next after the Duke of Norfolk, before the Duke of Buckingham; beſtowing likewiſe a penſion of forty pounds per annum, to be paid by the ſheriffs of Warwickſhire and Leiceſterſhire out of the revenues of thoſe counties, towards the better ſupport of that honour. But this extraordinary mark of the royal favour was not more kindly and gratefully received by the young Duke of Warwick, than it was hatefully and enviouſly looked upon by the Duke of Buckingham, who thought himſelf extremely injured thereby. In that reign every thing was apprehended from the feuds and diſputes of the nobility; and therefore, to prevent any ill conſequences that might ariſe from the differences between theſe two noblemen, this point was ſettled by an act of parliament; which declared, that from the ſecond of December then next enſuing, they ſhould take place of each other by turns, one that year, and the other the next, and ſo on as long as they ſhould live together; the Duke of Warwick to have the firſt year's precedency, and he which ſhould ſurvive, to take place of the other's heir male as long as he lived; and from that time the heir male of each was to take place of the other, according as it ſhould happen, that he had livery of his lands before him. Beſides theſe additional titles and marks of honour, the king gave Henry duke of Warwick more ſubſtantial proofs of his affection and gratitude, by granting him the reverſion after the death of the Duke of Glouceſter, of the iſlands of Guernſey, Jerſey, Sark, Erm, and Alderney, for the yearly tribute of a roſe, to be paid at the feaſt of St. John the Baptiſt, as alſo of the manor and hundred of Briſtol in Glouceſterſhire, for the yearly farm of ſixty pounds, as alſo the caſtles and manors of the king within the foreſt of Dean, yielding and paying the yearly rent of one hundred pounds. But, as if all theſe honours and grants had been ſtill inſufficient to expreſs the king's affection for this young nobleman, and his remembrance and reſpect for his father's ſervices, Henry VI. went ſtill farther, even to the utmoſt verge and extent of his prerogative, by declaring the ſaid Henry duke of Warwick king of the iſland of Wight, and placing the crown upon his head with his own hands. As this was the higheſt honour the king could beſtow, ſo it proved the laſt favour the

duke could receive; ſince he was taken off in the flower of his age, at the caſtle of Hanley, where he was born, on the 11th of June, 1445, in the twenty-ſecond year of his age.

Beauchamp (John de), baron of Kidderminſter, in the reign of Richard II. and the firſt baron created by patent in this kingdom. He was the ſon of Sir Richard Beauchamp of Holt, who was the grandſon of William de Beauchamp of Elmeley, and brother to William de Beauchamp, the firſt earl of Warwick of that family. He was born in the year 1320, and by the death of his father inherited the lands of Holt in Worceſterſhire, 1 Edward III. He was early in the ſervice of his prince; for 12 Edward III. when he was not more than twenty, he was in the expedition to Flanders, and in 20 Edward III. in France, and acquired reputation in both. In 1353, he was in Gaſcoigne, in the retinue of Thomas earl of Warwick, and continued there all the next year. In the thirty-third of the ſame reign he ſerved again in France with much honour. In the forty-ſecond of that king, he went over into that realm on the ſame account; and in 46 Edward III. he attended the king's ſon, John duke of Lancaſter, in his expedition into Spain. By theſe long and faithful ſervices to the crown, he ſo raiſed his credit at court, that in the ſixth of Richard II. being then one of the eſquires of the king's chamber, he had a grant of twenty marks per annum, out of the manor of Sutton, in the foreſt of Macclesfield in Cheſhire. But growing more and more into the king's favour, he, in the ninth of the ſame reign, from the like conſiderations, and becauſe he had received the honour of knighthood, under the king's banner diſplayed againſt Scotland, had an annuity granted him of one hundred marks, out of the king's rents and revenue in North Wales. But ſoon after he made a ſurrender of this annuity, and, inſtead thereof, had a conſiderable grant made him in Caermarthenſhire, and was alſo appointed chief-juſtice of North Wales, both for term of his life. He had alſo a ſpecial charter of divers liberties and privileges, as well in vert and veniſon, as other things, in his lordſhip of Kidderminſter, in the county of Worceſter, granted him much about the ſame time. By theſe repeated teſtimonies of royal kindneſs, Sir John Beauchamp, who was now advanced to be ſteward of the king's houſhold, and one of his chief favourites, was encouraged to procure new gifts from the crown; and, therefore, in the eleventh year of King Richard, laying hold of the breaking out of a French war, Sir John Beauchamp obtained for himſelf a grant of all the manors and lands belonging to the priory of Deerhurſt in the county of Glouceſter, then ſeized into the king's hands; as all other priories-alien were. By ſuch grants he acquired a good eſtate; and to add an augmentation of honour to thoſe of fortune, he procured himſelf to be created Baron Kidderminſter by patent, limiting that honour to his heirs male; which became the precedent for future creations. It was thought that the king intended him farther honours, had not a ſudden reverſe of fortune put a ſtop to his maſter's power, and to his proſperity. This happened in the year 1388, when the Duke of Glouceſter, and other powerful lords, having firſt defeated the army raiſed by the king's favourite, whom he had created Duke of Ireland, marched on to London, and forced him to call a parliament. Amongſt other noble perſons then called to account for their paſt behaviour, our Lord Beauchamp was one, who was firſt removed from his office of treaſurer of the king's houſhold, then ſent priſoner to Dover-caſtle, and laſtly condemned and executed for high treaſon upon Tower-hill.

Beauchamp (John de), ſon to Sir William de Beauchamp, conſtable of the caſtle of Glouceſter, was, on the death of Richard de Beauchamp, earl of Warwick, conſtituted one of the guardians of his ſon Henry. He purchaſed from Thomas de Botreax the moiety of the manor of Alceſter, and obtained from King Henry VI. a charter for various privileges and immunities to that place, as alſo the grant of another fair to be held there on the eve of St. Dunſtan, and to continue for two days following. He was in ſo great credit with that monarch, that in the twenty-fifth year of his reign, he was advanced by him to the dignity of Lord Beauchamp of Powyke, and had an annuity of ſixty pounds out of the fee-farm of the city of Glouceſter. He was alſo conſtituted juſtice of South Wales, with power to execute that office by himſelf, or his ſufficient deputy. About three years after this, by the kindneſs of the ſame prince, he was promoted to the office of lord high-treaſurer of England, which he did not hold full two years, but retiring to a private life, died at a good old age, in the year 1475.

Beauchamp (William de), Lord Bergavenny, was the younger ſon of Thomas de Beauchamp, earl of Warwick. He ſeems to have made his firſt campaign in 1366, under the famous John of Gaunt, duke of Lancaſter, in his expedition into Caſtile. He ſerved continually after this through that whole reign, ſometimes in Spain, ſometimes in France, by land ſometimes, and ſometimes by ſea. For theſe great ſervices and others expected from him, we find that in the firſt of Richard II. he was appointed governor of the caſtle and county of Pembroke, and in the fourth of the ſame king, lord chamberlain, with an annual penſion of two hundred pounds for life. The ſame year he was retained to ſerve by indenture with two hundred men at arms, and two hundred archers, under Edmund de Langley, earl of Cambridge, in Spain. In the ninth of King Richard, he attended the Duke of Lancaſter into Spain, to ſupport his pretenſions to the crown of Caſtile. He was the next year conſtituted captain of the caſtles of Pembroke and Kilgaran in Wales, and holding ſtill his command of Calais, was appointed the king's commiſſioner to treat with the Earl of Flanders. It was at this juncture he diſtinguiſhed himſelf in a manner ſo particular, that it deſerves to be for ever remembered. Amongſt other baſe ſchemes put into the head of King Richard II. by his favourites, one was, to retire, when the Duke of Glouceſter and the other lords were near London with an army, to France, and there purchaſe the aſſiſtance of that monarch, by giving up to him moſt of the fortreſſes he then held in that realm. If it be ſome ſcandal to our country, that it produced men baſe enough to betray a young and inconſiderate prince into ſo foul a contrivance; we muſt allow that it is no leſs honourable for us, that this gallant Lord Bergavenny had the courage to ſtand in the gap to ſecure our poſſeſſions from being ſo ſhamefully given up, and at the hazard of his life, to ſerve the king againſt his will, and merit his confidence by a noble act of diſobedience. For when all things were ready at home for carrying this dark deſign into execution, and the king ſent orders to this lord to quit his command, and tranſmit certain letters to the court of France, he ſtoutly refuſed both. He declared with reſpect to the former, that he was intruſted with this important fortreſs with the advice and conſent of the nobility, and without their conſent he would not render up his command. As for the letters (gueſſing at their tenor), inſtead of ſending them to Paris, he tranſmitted them to the Duke of Glouceſter in England. He went ſtill farther than this: for when John de la Pole, brother to the great favourite Suffolk, came with the king's orders to take from him the command of Calais, he not only refuſed to yield it into his hands, but ſeized him and carried him over priſoner to England, which at that time incenſed the king to ſuch a degree, as it entirely ruined the ſcheme of his miniſters, that he cauſed the Lord Bergavenny, immediately after his arrival, to be arreſted and committed to cloſe cuſtody; but ſoon after, either through fear or choice, cauſed him to be ſet at liberty again. In the firſt of Henry IV.

we find him conſtituted juſtice of South Wales for life, and reſtored to the government of the town and caſtle of Pembroke and lordſhip of Tineby, with the addition of the caſtle and lordſhip of Kilgaran, and county of Oſterlowe alſo for life, paying into the Exchequer ſeventy marks per annum. He died about the year 1411.

BEAUFORT (John), eldeſt ſon of John of Gaunt, duke of Lancaſter, was born in Beaufort-caſtle in Anjou. In 1394, being then a knight, he accompanied his father into Gaſcoigne. He was advanced to the honour of Earl of Somerſet, in a parliament held at Weſtminſter, by creation, bearing date 1396-7; and on September 29th, in a parliament held at the ſame place, was created marquis of Dorſet; but this laſt honour being vacated, he was created the ſame day, September 29th, Marquis of Somerſet: notwithſtanding which, he was ſummoned to parliament by the title only of Marquis of Dorſet; and by that denomination was made conſtable of Wallingford-caſtle, and ſteward of the honour of Wallingford, November 22, 1397; as alſo conſtable of Dover-caſtle, and warden of the Cinque-ports, on the 5th of February following; and not long after, King Richard the Second's lieutenant in Aquitain. He was likewiſe, on the 2d of February the ſame year, conſtituted admiral of all the king's fleet, both to the north and weſt. In 1397 he was one of thoſe lords who, at the great council at Nottingham, impeached Thomas duke of Glouceſter, &c. of treaſon; for which he and the reſt of them were adjudged, in the firſt parliament of King Henry IV. to loſe their titles, and the eſtates that had been given them, at or ſince the laſt parliament; belonging to any of thoſe perſons they had impeached, or ſuch as they enjoyed at the time of the Duke of Glouceſter's impriſonment. By this means, John Beaufort loſt the title of Marquis of Dorſet, and retained only that of Earl of Somerſet; but ſoon ingratiating himſelf with the new king, who was his brother by the father's ſide, he was conſtituted by him chamberlain of England for life, February 9, 1399-1400. In 1401 he was retained by indenture to ſerve the king as governor of the town of Caermardhyn, and had his eſtate reſtored to him. He was alſo made captain of Calais, with its marches. In 1401, or 1402, he was commiſſioned with others, to treat of a league of amity between the king of England and the Duke of Gueldres. In 1402 the commons in parliament petitioned for his reſtitution to the dignity of marquis; which he ſeemed unwilling to reſume, becauſe that title was new in this kingdom, he being the ſecond on whom it was conferred: however, he accepted of it at laſt. In the year 1404 he had an aſſignation of the iſle of Thanet, for the ſupport of himſelf, and the garriſon of Calais, which conſiſted of his ſoldiers; and was appointed ambaſſador to treat of a peace with the French. He alſo was one of the commiſſioners empowered to receive ſuch ſums of money as then remained unpaid for the ranſom of John king of France, taken priſoner at the battle of Creſſy. And finally, in the eighth year of King Henry IV. was conſtituted admiral of the king's whole fleet, as well for the north as weſt. Having thus paſſed through many honourable employments, he departed this life on the 21ſt of April, 1410.

BEAUFORT (Henry), biſhop of Wincheſter, and cardinal prieſt of the Roman church, was the ſon of John of Gaunt, duke of Lancaſter, by his third wife, Catherine Swinford. He ſtudied for ſome years at Oxford, but had his education chiefly at Aix la Chapelle, where he applied himſelf to the civil and common law. Being of royal extraction, he was advanced very young to the prelacy, and was elected biſhop of Lincoln in 1397, in the room of John Buckingham, who reſigned. In 1399 he was chancellor of the univerſity of Oxford, and at the ſame time dean of Wells. He was lord-high-chancellor of England in 1404, the fifth of his brother Henry IV. The next year he ſucceeded William of Wickham, by papal proviſion, in the ſee of Wincheſter, and received the ſpiritualities from the Archbiſhop of Canterbury, in the Biſhop of London's palace, the 18th of March. He was again lord chancellor in 1414, the ſecond of his nephew King Henry V. This prelate was one of King Henry the Sixth's guardians during his minority; and in 1424, the third of the young king's reign, he was a fourth time lord chancellor of England. There were perpetual jealouſies and quarrels between the Biſhop of Wincheſter and the protector, Humphrey duke of Glouceſter, which ended in the ruin and death of the latter. About two years after, the Biſhop of Wincheſter received with great ſolemnity, in the church of Our Lady at Calais, a cardinal's hat, with the title of St. Euſebius, ſent him by Pope Martin V. In September 1428 the new cardinal returned into England, with the character of the Pope's Legate lately conferred on him; and in his way to London, he was met by the lord mayor, aldermen, and the principal citizens on horſeback, who conducted him with great honour to his lodgings in Southwark. He died June 11, 1447.

BEAUFORT (Joan), queen of Scotland, was the eldeſt daughter of John Beaufort, earl of Somerſet, ſon of John of Gaunt, by Margaret, daughter of Thomas Holland, earl of Kent, and niece to the famous Henry Beaufort, cardinal of St. Euſebius, and Biſhop of Wincheſter. In February 1423 ſhe was married, with great ſolemnity, in the church of St. Mary Overrey in Southwark, to James the Firſt, king of Scotland, who had been priſoner in England ever ſince the 30th of March, 1404. Her portion was forty thouſand marks. This match was procured by her uncle, the Biſhop of Wincheſter above mentioned, in order to ſtrengthen and ſupport his family by an alliance with the kingdom of Scotland. She ſet out, with the king her huſband, for Scotland, in March 1423, being attended as far as Berwick by her father, and her uncle the cardinal; and on the 20th of that month arrived at Edinburgh. She was crowned with him the 22d of May, 1424. Through her merciful interceſſion with the king in 1427, ſhe ſaved the life of Alexander lord of the iſles, who had committed ſome acts of hoſtility; and in 1431 that of Archibald earl of Douglas, who was ſuſpected of treaſon. The 16th of October, 1430, ſhe was delivered at Stirling of two ſons at one birth, which were baptized by the names of Alexander and James. Alexander died young, but James lived to ſucceed his father. In the year 1437 ſhe received an informatien of a conſpiracy forming againſt the king her huſband's life; upon which ſhe went poſt to him to Roxburgh, and informed him thereof: but notwithſtanding her precaution, the king was moſt cruelly murdered in the Dominicans abbey at Perth, by the faction of Walter earl of Athol, his uncle, on the 21ſt of February, 1436-7, in the thirteenth year of his reign. When the ruffians entered the room, the queen, to her everlaſting honour, ſo long ſhrouded the king from the aſſaſſins with her own body, that ſhe received two wounds before ſhe could be drawn off him. She married to her ſecond huſband, James Stewart, called the Black Knight, ſon to the lord of Lorne; and dying in the year 1446, was buried at Perth, near the king her firſt huſband.

BEBRYCIA (anc. geog.), an ancient name of Bithynia, ſo called from the Bebryces its inhabitants. The Bebryces were afterwards driven out by the Thracians, *viz.* the Bithyni and Thyni; from whom, in proceſs of time, the country took the name of *Bithynia*. See BITHYNIA.

BEDDINGTON, a village near Croydon in Surrey. Here is Beddington Park, the ancient ſeat of the Carews, one of the many ſaid to have been the reſidence of Queen Elizabeth. In the park, which is famous for walnuts, is an avenue of trees, called Queen Elizabeth's Walk. The church

is a Gothic pile, with ſtalls in the aiſles, after the manner of cathedrals.

BEDEN, or BEDING, a village in Suſſex, thirteen miles from Lewes, near a river of its own name, which runs into the Engliſh Channel at New Shoreham, and produces very good mullets, pikes, eels, &c.

BEDERICK (Henry), a celebrated preacher in the fourteenth century, was a monk of the order of St. Auguſtin at Clare; and ſurnamed de Bury, becauſe he was born at St. Edmund's Bury in Suffolk. Having from his youth ſhewn a quick wit, and a great inclination to learning, his ſuperiors took care to improve theſe excellent faculties, by ſending him not only to our Engliſh, but alſo to foreign univerſities: where cloſely applying himſelf to his ſtudies, and being a conſtant diſputant, he arrived to ſuch fame, that at Paris he became a doctor of the Sorbonne. Not long after he returned to England, where he was much followed, and extremely admired for his eloquent way of preaching. This eminent qualification, joined to his remarkable integrity, uprightneſs, decent behaviour, prudence, and dexterity in the management of affairs, ſo recommended him to the eſteem of the world, that he was choſen provincial of his order throughout England; in which ſtation he behaved in a very commendable manner. He flouriſhed about the year 1380, in the reign of King Richard II. He wrote ſeveral things, namely, 1. Lectures upon the Maſter of the Sentences, *i. e.* Peter Lombard, in four books. 2. Theological Queſtions, in one book. 3. Sermons upon the Bleſſed Virgin. 4. A Courſe of Sermons for the whole year.

BEDFORD (Hilkiah), of Sibſey in Lincolnſhire, a quaker, came to London, and ſettled there as a ſtationer, between the years 1600 and 1625. He married a daughter of Mr. William Plat of Highgate, by whom he had a ſon Hilkiah, a mathematical inſtrument-maker in Hoſier-lane, near Weſt Smithfield. In this houſe (which was afterwards burnt in the great fire of London 1666) was born the famous Hilkiah, July 23, 1663; who in 1679 was admitted of St. John's College, Cambridge, the firſt ſcholar on the foundation of his maternal grandfather William Plat. Hilkiah was afterwards elected fellow of his college, and patronized by Heneage Finch earl of Winchelſea, but deprived of his preferment (which was in Lincolnſhire) for refuſing to take the oaths at the revolution, and afterwards kept a boarding-houſe for the Weſtminſter ſcholars. In 1714, being tried in the court of King's-Bench, he was fined 1000 marks, and impriſoned three years for writing, printing, and publiſhing, The Hereditary Right of the Crown of England aſſerted, 1713, folio; the real author of which was George Harbin, a nonjuring clergyman, whom his friendſhip thus ſcreened, and on account of his ſufferings he received 100l. from the late Lord Weymouth, who knew not the real author. His other publications were, a tranſlation of An Anſwer to Fontenelle's Hiſtory of Oracles, and a Latin Life of Dr. Barwick, which he afterwards tranſlated into Engliſh. He died November 26, 1724.

BEDFORD (Thomas), ſecond ſon of Hilkiah, was educated at Weſtminſter ſchool; and was afterwards admitted of St. John's College, Cambridge; became maſter's ſizar, to Dr. Robert Jenkin, the maſter; and was matriculated December 9, 1730. Being a nonjuror, he never took a degree; but going into orders in that party, officiated amongſt the people of that mode of thinking in Derbyſhire, fixing his reſidence at Compton near Aſhbourne, where he became much acquainted with Ellis Farneworth, and was indeed a good ſcholar. Having ſome original fortune, and withal being a very frugal man, and making alſo the moſt of his money for a length of years, Mr. Bedford died rich at Compton, in February 1773, where he was well reſpected. As ſoon as he took orders, he went chaplain into the family of Sir John Cotton, bart. then at Angiers in France. From thence, having a ſiſter married to George Smith, eſq. near Durham (who publiſhed his father Dr. John Smith's fine edition of Bede), Mr. Bedford went into the North, and there prepared his edition of Symeonis monachi Dunhelmenſis libellus de exordio atque proceurſu Dunhelmenſis eccleſiæ; with a continuation to 1154, and an account of the hard uſage Biſhop William received from Rufus; which was printed by ſubſcription in 1732, 8vo. from a very valuable and beautiful MS. in the cathedral library, which he ſuppoſes to be either the original, or copied in the author's life-time. He was living at Aſhbourne, 1742, and about that time publiſhed an Hiſtorical Catechiſm, containing, in brief, the ſacred hiſtory and doctrines of chriſtianity, and an explanation of the feaſts and faſts of the church, the ſecond edition, corrected and enlarged.

BEDNORE, or BIDDANORE, a town in the peninſula of Hindooſtan, and in the dominions of Tippoo Sultan, regent of Myſore. It was taken by General Mathews in January 1783; but it was ſurrendered to Tippoo in May following. The capitulation was perfidiouſly violated, and the general, it is ſuppoſed, was poiſoned. Bednore is 452 miles S.E. of Bombay, and 187 N.W. of Seringapatam. Long. 75. 30. E. Lat. 14. 0. N.

BEDRIACUM (anc. geog.), a village of Italy, ſituated, according to Tacitus, between Verona and Cremona, but nearer the latter than the former. From the account given by that hiſtorian, Cluverius conjectures that the ancient Bedriacum ſtood in the place where the city of Caneto now ſtands. This village was remarkable for the defeat of the emperor Galba by Otho, and afterwards of Otho by Vitellius.

BEDSTEAD, a frame for ſupporting a bed. Among the various materials uſed for bedſteads, iron is not only the moſt durable, but alſo the moſt beneficial, with reſpect to health. Oak is excellent for this purpoſe, being almoſt impervious to worms, if felled in the proper ſeaſon, and allowed to become dry; but cedar, were it not for its ſtrong odour, would be ſtill more efficacious in preventing the inroads of bugs, or other vermin. Hence, the beams and poſts of a bedſtead, made of any hard wood, might be inlaid with cedar.

On this occaſion, we cannot, in juſtice to Mr. Lambert, of Berwick-ſtreet, Soho, omit to give a conciſe deſcription of his newly-invented *bedſtead for the ſick and wounded*, which he terms the *Royal Patent Fracture Bed*, and which is ably calculated to alleviate the painful ſituation of the aged, the infirm, or diſeaſed. This ingenious contrivance, therefore, affords a comfortable accommodation to perſons confined by fractures, gout, palſy, &c.: it is particularly adapted to lying-in women. The bed may be made, and the linen changed, without in the ſlighteſt manner diſturbing the patient, which renders it highly ſerviceable in camps and hoſpitals.

We have given a plate of this uſeful invention, of which the following is an explanation: *A*, Pl. 17. the bedſtead; *B*, the feather-bed; *C*, the ſtraining-frame; *D*, the fracture-frame; *S,S,S,S*, four rings in the fracture-frame; *E*, the ſleeping-deſk; *R,R*, two rings in the ſleeping deſk; *F,F,F,F*, pullies put in motion by the machinery; *G,G,G,G*, receiving-hooks of the fracture-frame; 3333, four rings in the ſtraining-frame; *H,H,H,H*, receiving-hooks to ditto; *I*, the plate of the machinery; *K*, the great wheel; *L*, a pinion, with a winch turning the great wheel; *O*, a pall or ſtop; *M*, a pinion with a fly, to prevent a too ſudden deſcent; *N*, the rollers.

The ſubjoined directions ſhould be attended to in making and uſing the bed. Lay the ſtraining-frame *C*, covered with ticking, on the feather-bed *B*, then the under-blanket and ſheet: above theſe, place the fracture-frame *D* (on which

the patient is ſupported); then the bolſter, pillows, and upper clothes, in the uſual manner. When the feather-bed is to be made, wind up the two frames, *C* and *D*, by the winch, till the patient is ſupported above the bed, which may then be made, or, if neceſſary, another placed in its ſtead, and the two frames let down upon it.

In changing the linen, the two frames *C* and *D* muſt be wound up till they reach the four hooks *G,G,G,G*; ſecure the hooks in the four rings *S,S,S,S*, and wrap the ſheet you intend to remove round the upper clothes, to exclude cold; let down the under-frame *C*; replace the blanket, and put on the clean ſheet; draw away the other, and again wind up the frame to the fracture-frame, and unhook it at the four corners. Thus reſting on the under frame, the patient ſafely deſcends to the comforts of a new-made bed and clean linen.

As in the early ſtages of conſumptive, or aſthmatic diſorders, it is material to avoid the heat of a feather-bed, particularly if the patient be liable to night-ſweats, and if he be able to riſe and have the linen changed, the fracture-frame may not be neceſſary: in this caſe, the lower frame may be wound a little above the feather-bed; at the top of the frame C, there is a ſleeping-deſk, *E*, by which the head and ſhoulders may be raiſed at pleaſure, by fixing the two hooks at the end of the frame to the two rings *R,R*, and freeing thoſe at the feet: after which, by the uſe of the wynch, it may be lowered or raiſed at pleaſure.

The whole apparatus may be attached to any four-poſt bedſtead by a common carpenter.

It is needleſs to expatiate upon the utility of ſuch a bedſtead to families at a diſtance from the metropolis: and as we have no perſonal acquaintance with this ingenious artizan, we cannot be ſuſpected of partiality: indeed, the firſt account of his invention, together with a plate, was communicated to us by means of a foreign journal lately imported.

It deſerves to be noticed, that the prevailing cuſtom of providing the bedſteads of children with *curtains* is liable to ſtrong and ſerious objections: 1. Becauſe they prevent a free acceſs of air for the renewal of that maſs which has been rendered unfit for reſpiration; 2. They endanger the lives of infants by candle-light, from which fatal accidents have frequently happened; and, 3. They are pernicious receptacles for the fineſt particles of duſt, which, as we have already obſerved, are apt to be inhaled by the perſon confined within ſuch curtains on the leaſt motion of the bedſtead: and thence, perhaps, many young and blooming innocents may date the firſt period of their conſumptive attack. We do not, however, mean to inſinuate, that curtains ought to be univerſally abandoned, as there may occur a variety of inſtances in which the laws of propriety and *decorum* might render them uſeful and neceſſary.

BEEMAH, a river of Hindooſtan, in the Decan. It is a principal branch of the Kiſtna, coming from the N.W. and joining it near Edghir. It riſes in the mountains to the N. of Poonah, and paſſes within 30 miles of the E. ſide of that city.

BEGIA, or Beggia, a town of Africa, in the kingdom of Tunis, with a ſtrong caſtle, on the declivity of a mountain, 65 miles W. of Tunis. Long. 11. 30. E. Lat. 36. 42. N.

BEK (David), a famous Dutch portrait painter, and diſciple of Vandyck; whoſe ſkill in his profeſſion, and politeneſs of addreſs, acquired him high eſteem in moſt courts of Europe. He was in great favour with Charles I. king of England, and taught the principles of drawing to his ſons Charles and James. He went afterwards into the ſervice of the kings of France, Denmark, and of Chriſtina queen of Sweden, who made him firſt gentleman of her bedchamber. His manner of painting was ſo quick, that our king Charles told him he believed he could paint if he was riding poſt. It is ſaid, that in travelling through Germany he fell ſick at an inn, and was laid out for dead. His ſervants drinking for conſolation by his bed-ſide, one of them in a drunken freak ſaid, "Our maſter was fond of a glaſs while he was alive, and out of gratitude let us give him a glaſs now when he is dead." The propoſal proving agreeable, he raiſed up his maſter's head, and endeavouring to pour ſome wine into his mouth, Bek opened his eyes; and being compelled, nevertheleſs, to drink the glaſs full, gradually revived. He lived ſome years after, though he died at 35 years old, in 1656.

BEKINSAU (John), author of a book entitled De Supremo et Abſoluto Regis Imperio, was born at Broadchalke in Wiltſhire. He had his education in grammar learning at Wykeham's ſchool, near Wincheſter, from whence he was ſent very early to New College in Oxford; where, having ſerved two years of probation, he was admitted perpetual fellow in the year 1520. In 1526 he took the degree of maſter of arts. In his college he diſtinguiſhed himſelf by his extraordinary ſkill in the Greek language. In 1538 he reſigned his fellowſhip, and married. What preferment or employment he had afterwards is uncertain. He was familiarly acquainted with, and highly eſteemed by, the moſt learned men of the nation, particularly the famous antiquary and hiſtorian John Leland. He was in good eſteem with King Henry VIII. and King Edward VI. When Queen Mary came to the crown, and endeavoured to deſtroy all that her father and brother had done towards the reformation of the church, Bekinſau wheeled about with the times, and became a zealous Roman-catholic. After Queen Elizabeth's acceſſion, when Proteſtantiſm again took place, he retired to an obſcure village in Hampſhire, called Sherbourne, where he ſpent the remainder of his life in great diſcontent, and was buried in the church of that place, the 20th of December, 1559, aged about ſixty-three years.

BELAY (*Encycl.*). For the word "bevel" in that article, read "kevel."

BELCHIER (John), was born in the year 1706, at Kingſton in Surrey. He received his education at Eaton; and, diſcovering an inclination for ſurgery, was bound apprentice to Mr. Cheſelden, by far the moſt eminent man of his profeſſion. Under this great maſter he ſoon became an accurate anatomiſt. His preparations were next eſteemed to Dr. Nicholls's, and allowed to exceed all others of that time.

Thus qualified, his practice ſoon became extenſive; and, in the year 1736 he ſucceeded his fellow-apprentice, Mr. Craddock, as ſurgeon to Guy's hoſpital. In this ſituation, which afforded ſuch ample opportunity of diſplaying his abilities, he, by his remarkably tender and kind attention to his pauper patients, became as eminent for his humanity as his ſuperior ſkill in his profeſſion. Like his maſter Cheſelden, he was very reluctant before an operation, yet quite as ſucceſsful as that great operator. He was particularly expert in the reduction of the humerus, which, though a very ſimple operation, is frequently productive of great trouble to the ſurgeon, as well as excruciating pain to the patient.

He was elected fellow of the Royal Society, to which learned body he communicated ſeveral curious caſes that fell within his cognizance; particularly a remarkable caſe of an hydrops ovarii, publiſhed in the Philoſophical Tranſactions, No. 423; an account of a miller whoſe arm was torn off by a mill, Auguſt 15, 1737, No. 449; and a remarkable inſtance of the bones of animals being turned red by aliment only, 442. The greateſt diſcoveries frequently are owing to trifling and accidental cauſes. Such was the caſe in the laſt-mentioned circumſtance, Mr. Belchier being led to make his

enquiries on that ſubject by the bone of a boiled leg of pork being diſcovered to be perfectly red, though the meat was well-flavoured, and of the uſual colour.

On his reſignation as ſurgeon of Guy's, he was made governor both of that and St. Thomas's hoſpital, to which he was particularly ſerviceable, having recommended not leſs than 140 governors.

Mr. Belchier, in private life, was a man of ſtrict integrity, warm and zealous in his attachments, ſparing neither labour nor time to ſerve thoſe for whom he profeſſed a friendſhip. He was a great admirer of the fine arts, and lived in habits of intimacy with the principal artiſts of his time. He enjoyed a great ſhare of health, though far advanced in years when he died. His body was interred in the chapel at Guy's hoſpital.

BELERIUM (anc. geog.), a promontory of the Dumnonii, or Damnonii, the weſternmoſt Britons. Now called the *Land's End*, in Cornwall.

BELESTAT, a town of France, in the department of Arriege and late county of Foix, remarkable for a ſpring, which, it is ſaid, ebbs and flows 12 times in 24 hours, as exactly as a clock.

BELGRADE, a ſmall town of Romania, in European Turkey, on the ſtrait of Conſtantinople, 20 miles N. of that city. Long. 29. 0. E. Lat. 41. 22. N.

BELGRAVE (Richard), a writer of the 14th century, of the ancient family of the Belgraves in Leiceſterſhire, was born at the town of Belgrave, about a mile from Leiceſter, and educated in the univerſity of Cambridge, where he applied himſelf with great diligence, and the like ſucceſs, to his ſtudies, and afterwards took the degree of doctor of divinity. He entered himſelf into the order of Carmelite friars, and diſtinguiſhed himſelf by his great ſkill in the Ariſtotelian philoſophy, and ſchool divinity. However, he was more remarkable for the ſtrength and ſubtilty of his lectures, than the elegance of his ſtyle, the ſtudy of polite literature being generally neglected in that age. Pits gives him the character of a man of eminent integrity and piety. He flouriſhed in the year 1320, under the reign of King Edward II. and wrote, among other works, Theological Determinations, in one book; the ſubject of which was, Whether the Divine Eſſence could be ſeen? and Ordinary Queſtions, in one book.

BELING (Richard), was born in the year 1613, at Belingſtown, in the barony of Balrothery, and county of Dublin, the ancient ſeat of his family, which was of conſiderable rank in the Engliſh pale. He was the ſon of Sir Henry Beling, knight, and was educated in his younger years at a grammar ſchool in the city of Dublin, but afterwards put under the tuition of ſome prieſts of his own religion, which was Popiſh; who ſo well cultivated his good genius, that they taught him to write in a fluent and elegant Latin ſtyle, as appears by ſeveral of his pieces hereafter mentioned. Thus grounded in the polite parts of literature, his father removed him to Lincoln's Inn, to ſtudy the municipal laws of his country, where he abode ſome years, and returned home a very accompliſhed gentleman; but it does not appear that he ever made the law a profeſſion. His natural inclination turning to arms, he early engaged in the rebellion of 1641, and, though not above twenty-eight years of age, was then an officer of conſiderable rank: for in February that year he appeared at the head of a ſtrong body of the Iriſh before Lifmore, and ſummoned the caſtle to ſurrender; but the lord Broghill, who commanded in it a ſmall body of one hundred new-raiſed forces, ſlighted the ſummons, and another party coming to his aid, Mr. Beling thought fit to draw off, and quitted the ſiege. He afterwards became a leading member in the ſupreme council of the confederate Roman-catholics at Kilkenny, to which he was principal ſecretary; by whom he was ſent ambaſſador to the pope, and other Italian princes, in 1645, to crave aid for the ſupport of their cauſe. He brought back with him a fatal preſent in the perſon of the nuncio, John Baptiſt Rinuccini, archbiſhop and prince of Fermo, who was the occaſion of reviving the diſtinctions between the old Iriſh of blood, and the old Engliſh of Iriſh birth, which ſplit that party into factions, prevented all peace with the marquis of Ormond, and ruined the country which he was ſent to ſave. When Mr. Beling had fathomed the miſchievous ſchemes of the nuncio and his faction, and perceived that they had other views than merely to obtain a toleration for the free exerciſe of their religion, as in the beginning they pretended, nobody was more zealous than he in oppoſing and clogging their meaſures, or in promoting the peace then in agitation, and ſubmitting to the king's authority, which he did with ſuch heartineſs and ſincerity, that he became very acceptable to the marquis of Ormond, who entruſted him with many negociations, both before and after the Reſtoration, which he executed with great fidelity and ſufficiency. When the parliament army had ſubdued the Iriſh, Mr. Beling retired to France, where he continued ſeveral years, and in that time employed himſelf in writing ſeveral books in Latin, in oppoſition to ſuch writers of the Romiſh party as had endeavoured to clear themſelves from being the inſtruments of the rebellion, and to lay the blame thereof on the ſeverity of the Engliſh government. His account of the tranſactions of Ireland, during the period of the rebellion, is eſteemed by judicious men as being more worthy of credit than any written by the Romiſh party; and yet he is not free from a partiality to the cauſe he was at firſt embarked in, and his credulity has been taxed in the caſe of Father Finachty. He returned home upon the Reſtoration, and was repoſſeſſed of his eſtate, by the favour and intereſt of the duke of Ormond. He died in Dublin, in September 1675, and was buried in the churchyard of Malahidert, about five miles from that city.

BELL (Beaupré), ſon of Beaupré Bell, eſq. of Beaupré-hall, in Upwell and Outwell, in Clackcloſe hundred, Norfolk, where the Beaupré family had ſettled early in the fourteenth century, and enjoyed the eſtate by the name of Beaupré (or de Bello prato) till Sir Robert Bell intermarried with them about the middle of the ſixteenth. Sir Robert was ſpeaker of the Houſe of Commons 14 Eliz. and chief baron of the Exchequer, and caught his death at the black aſſize at Oxford, 1577. Beaupré Bell, his fourth lineal deſcendant, married Margaret, daughter of Sir Anthony Oldfield, of Spalding, bart. who died 1720, and by whom he had iſſue his nameſake, the ſubject of this article, and two daughters, of whom the youngeſt married William Graves, eſq. of Fulborn in Cambridgeſhire, who thereby inherited the family eſtate near Spalding, with the ſite of the abbey, and has a ſtriking likeneſs of his brother-in-law. Mr. Bell, junior, was educated at Weſtminſter ſchool, admitted of Trinity College, Cambridge, 1723, and ſoon commenced a genuine and able antiquary. He made conſiderable collections of church notes in his own and the neighbouring counties, all which he bequeathed to the college where he received his education. Mr. Bloomfield acknowledges his obligations to him for collecting many evidences, ſeals, and drawings, of great uſe to him in his Hiſtory of Norfolk. The old gentleman led a miſerable life, hardly allowed his ſon neceſſaries, and delapidated his houſe. He had five hundred horſes of his own breeding, many above thirty years old unbroke. He took home his ſon from college, where his library was left to mould. On his death, his ſon ſucceeded to his eſtate, of about 1500l. a-year, which he enjoyed not long, and dying of a conſumption unmarried, on the road

to Bath, left the reverſion, after the death of his ſiſter (who was then unmarried, and not likely to have iſſue), with his books and medals, to Trinity College, under the direction of the late vice-maſter, Dr. Walker. But his ſiſter marrying (as above), it is ſaid the entail was cut off. He was buried in the family burying-place, in St. Mary's chapel, in Outwell church, for the paving of which, and for a monument, he left 150l. The regiſters of the ſociety abound with proofs of Mr. Bell's taſte and knowledge in ancient coins, both Greek and Roman, beſides many other intereſting diſcoveries.

BELLENDEN, or BALLANTINE (William), a celebrated author, was, in 1602, profeſſor of humanity, or belles letres, at Edinburgh, and maſter of the requeſts to James I. who had ſo high an eſteem for him, that he enabled him to live in eaſy circumſtances at Paris, where he wrote theſe three books; the firſt entitled, De Statu priſci Orbis in Religione, Re politica, et Literis; or, the State of Religion, Politics, and Literature, in the old World, both before and after the Flood. The ſecond and third contain the opinions of Cicero on matters of the higheſt importance, delivered in his own words. They were dedicated to Charles prince of Scotland and Wales, afterwards King Charles I. and to his brother Henry. In a late edition, the Rev. Dr. Parr thought proper to inſcribe them to Mr. Burke, Lord North, and Mr. Fox, whoſe reſpective portraits are prefixed to each dedication, and whoſe talents and virtues he celebrates and defends in a preface of ſeventy-ſix pages, containing a very free and bold diſcuſſion of our public men and meaſures in very claſſical language, and a ſtrong and ſatirical repreſentation, under borrowed names of antiquity, of the chiefs of the other party, or the preſent miniſtry.

Bellenden wrote another work, publiſhed after his death, "De tribus Luminibus Romanorum," whom he conceives to be Cicero, Seneca, and the elder Pliny. The editor gives an account of this work, from whence he took the idea of drawing his characters of the three luminaries of Great Britain. He marks the proficiency in Greek and Roman literature which once diſtinguiſhed the Scotch, before the civil diſſenſions drove their brighteſt geniuſes abroad, and celebrates the ardour for philoſophy and literature ſo prevalent in North Britain at preſent. Dr. Middleton has been charged with borrowing not only the matter, but the arrangement, of his "Life of Cicero," from Bellenden, without the leaſt acknowledgment, and the editor confeſſes himſelf of this opinion.

BELLESME, a town of France, in the department of Orne, and late province of Perche, with an ancient caſtle, 75 miles S. W. of Paris. Long. 0. 42. E. Lat. 48. 23. N.

BELLOVACI (anc. geog.), a people of Gallia Belgica, reckoned the braveſt of the Belgæ; now the *Beauvaſis*, in the Iſle of France.

BELMEIS, or BEAUMES (Richard de), I. biſhop of London in the reign of Henry I. was advanced to that ſee through the intereſt of Roger Montgomery, earl of Shropſhire, and conſecrated 26th July, 1108. Immediately after his conſecration, he was appointed by the king warden of the marches between England and Wales, and lieutenant of the county of Salop; which offices he held about three years, reſiding for the moſt part of the time at Shrewſbury. This prelate expended the whole revenues of his biſhopric on the ſtructure of St. Paul's cathedral in London; but deſpairing ever to finiſh it, and growing tired of ſo much labour and expence, he turned the ſtream of his liberality another way; and, exchanging the manor of Landſworth for a place in the dioceſe of London called St. Oſith de Chich, he built there a convent of regular canons. Being ſeized with a dead palſy, and thereby diſqualified for the exerciſe of his epiſcopal functions, he intended to have reſigned his biſhopric, and to have ſpent the remainder of his life in the monaſtery of his own foundation: but whilſt he delayed his purpoſe from day to day, he was prevented by death, which took him out of this life January 16, 1127.

BELMEIS, or BEAUMES (Richard de), II. biſhop of London, in the reign of King Stephen, was nephew of Richard de Belmeis, biſhop of London in the preceding reign, by that prelate's brother, Walter de Belmeis. Before he came of age, he was appointed by his uncle archdeacon of Middleſex: but the biſhop was prevailed upon by William dean of London, his nephew by his ſiſter Adelina, and by the Prior of Chich, to commit the adminiſtration of the archdeaconry, during Richard's minority, to Hugh, one of his chaplains. It was with no ſmall difficulty that Richard afterwards recovered his archdeaconry out of the hands of this faithleſs guardian. In the beginning of October 1151 he was advanced to the ſee of London, in the room of Robert de Sigillo, and conſecrated at Canterbury by Archbiſhop Theobald, in the preſence of all the biſhops of England, excepting Henry of Winchеſter, who excuſed his abſence, and approved the choice of Richard, in a letter to the archbiſhop. This prelate died May 4, 1162.

BELUNUM (anc. geog.), a town of Rhætia, above Feltria, in the territory of the Veneti; now *Belluno*, capital of the Belluneſe in the territory of Venice.

BELVOIR-CASTLE, in Lincolnſhire, four miles from Grantham, the ancient ſeat of the dukes of Rutland, ſuppoſed to have been a Roman ſtation, as many of their antiquities have been dug up here. Its foundation was laid ſoon after the Norman conqueſt. It affords a delightful proſpect into the counties of Nottingham, Derby, Leiceſter, Rutland, and Northampton, as well as over the fruitful valley under it.

BELUS (anc. geog.), a ſmall river of Galilee, at the diſtance of two ſtadia from Ptolemais, running from the foot of mount Carmel out of the lake Cendevia. Near this place, according to Joſephus, was a round hollow or valley, where was a kind of ſand fit for making glaſs; which, though exported in great quantities, was found to be inexhauſtible. Strabo ſays, the whole of the coaſt from Tyre to Ptolemais has a ſand fit for making glaſs; but that the ſand of the rivulet Belus and its neighbourhood is a better ſort: and here, according to Pliny, the making of glaſs was firſt diſcovered.

BENBECULA, an iſland of Scotland, one of the Hebrides, lying between N. and S. Uiſt. See BARA.

BENBOW (John), vice-admiral of the blue ſquadron, and one of the moſt eminent Engliſh ſeamen mentioned in our hiſtories, was born about the year 1650, and was deſcended of a very ancient, worthy, and honourable family in Shropſhire. His father dying when he was very young, left his ſon John no other proviſion than that of the profeſſion to which he was bred, viz. the ſea, a profeſſion to which he had naturally a great propenſity, and in which he ſucceeded ſo happily, that before he was thirty he became maſter, and in a good meaſure owner, of a ſhip called the Bembow frigate, employed in the Mediterranean trade, in which he would probably have acquired a good eſtate, if an accident that happened to him in the laſt voyage he made had not given a new turn to his fortunes, and brought him to ſerve in the Britiſh navy, with equal reputation to himſelf, and good fortune to his country, to which he rendered many, and thoſe very important, ſervices. In the year 1686, Captain Benbow, in his own veſſel, was attacked in his paſſage to Cadiz by a Sallee rover, againſt whom he defended himſelf, though very unequal in the number of men, with the utmoſt bravery, till at laſt the Moors boarded him, but were quickly beat out of the ſhip again, with the loſs of thirteen men, whoſe heads Cap-

tain Benbow ordered to be cut off, and thrown into a tub of pork pickle. When he arrived at Cadiz, he went aſhore, and ordered a negro ſervant to follow him, with the Moors' heads in a ſack. He had ſcarcely landed before the officers of the revenue enquired of his ſervants what he had in his ſack? The captain anſwered, ſalt proviſions for his own uſe. "That may be," replied the officers, "but we muſt inſiſt upon ſeeing them." Captain Benbow alleged, that he was no ſtranger there, that he did not uſe to run goods, and pretended to take it ill that he was ſuſpected. The officers told him, that the magiſtrates were ſitting not far off, and that if they were ſatisfied with his word, his ſervants might carry the proviſions where he pleaſed, but that otherwiſe it was not in their power to grant any ſuch diſpenſation. The captain conſented to the propoſal, and away they marched to the cuſtom-houſe, Mr. Benbow in the front, his man in the centre, and the officers in the rear. The magiſtrates, when he came before them, treated Captain Benbow with great civility, told him they were ſorry to make a point of ſuch a trifle, but that ſince he had refuſed to ſhew the contents of his ſack to their officers, the nature of their employments obliged them to demand a ſight of them; and that as they doubted not they were ſalt proviſions, the ſhewing them could be of no great conſequence one way or the other. "I told you," ſaid the captain, ſternly, "they were ſalt proviſions for my own uſe. Cæſar, throw them down upon the table; and, gentlemen, if you like them, they are at your ſervice." The Spaniards were exceedingly ſtruck at the ſight of the Moors' heads, and no leſs aſtoniſhed at the account of the captain's adventure, who with ſo ſmall a force had been able to defeat ſuch a number of barbarians. They ſent an account of the whole matter to the court of Madrid, and Charles II. then king of Spain, was ſo much pleaſed with it, that he would needs ſee the Engliſh captain, who made a journey to court, where he was received with great teſtimonies of reſpect, and not only diſmiſſed with a handſome preſent, but his Catholic majeſty was alſo pleaſed to write a letter in his behalf to King James, who, upon the captain's return, gave him a ſhip, which was his introduction to the royal navy. After the Revolution, he was conſtantly employed, and frequently, at the requeſt of the merchants, was appointed to cruiſe in the channel, where he did very great ſervice, as well in protecting our own trade, as in annoying and diſtreſſing that of the enemy. He was likewiſe generally made choice of for bombarding the French ports, in which he ſhewed the moſt intrepid courage, by going in perſon in his boat to encourage and protect the engineers, who, for that reaſon, were very ſolicitous that he ſhould command the eſcorts whenever they went upon thoſe hazardous enterpriſes, in which they knew he would not expoſe them more than was abſolutely neceſſary, and that he would put them upon running no ſort of danger, in which he did not willingly take his ſhare. The vigour and activity of Captain Benbow, in every ſervice on which he was employed, recommended him ſo effectually to his royal maſter King William, who was both a good judge of men, and always willing to reward merit, that he was very early promoted to a flag, and intruſted with the care of blocking up Dunkirk; the privateers from thence proving extremely detrimental to our trade during all that war. In 1695 we find him thus employed with a few Engliſh and Dutch ſhips, when the famous Du Bart had the good luck to eſcape him, with nine ſail of clean ſhips, with which he did a great deal of miſchief, both to our trade and to that of the Dutch. In 1697, he ſailed the 10th of April, from Spithead, with ſeven third-rates and two fire-ſhips, and after ſome time returned to Portſmouth for proviſions; after which he had the good fortune to join the Virginia and Weſt-India fleets, and ſaw them ſafe into port.

After the concluding of the peace of Ryſwick, and even while the partition treaties were negociating, King William formed a deſign of doing ſomething very conſiderable in the Weſt-Indies, in caſe his pacific views ſhould be diſappointed, or Charles II. of Spain ſhould die ſuddenly, as was daily expected. There were, indeed, many reaſons, which rendered the ſending a ſquadron at that time into thoſe parts highly uſeful and requiſite. Our colonies were in a very weak and defenceleſs condition, the ſeas ſwarmed with pirates, the Scots had eſtabliſhed a colony at Darien, which, very unluckily for them, gave the Engliſh little ſatisfaction, at the ſame time that it provoked the Spaniards very much. King William himſelf fixed upon Rear-Admiral Benbow to command this ſquadron, which proved but a very ſmall one, as conſiſting only of three fourth-rates; and when he went to take upon him his command, he received private inſtructions from the king to make the beſt obſervations he could on the Spaniſh ports and ſettlements, but to keep as fair as poſſible with the governors, and to afford them any aſſiſtance he could, if they deſired it. He was likewiſe inſtructed to watch the galleons; for the king of Spain, Charles II. was then thought to be in a dying condition. Rear-Admiral Benbow ſailed in the month of November 1698, and did not arrive in the Weſt-Indies till the February following, where he found things in a very indifferent ſituation. Moſt of our colonies were in a bad condition, many of them engaged in warm diſputes with their governors, the forces that ſhould have been kept up in them for their defence ſo reduced by ſickneſs, deſertion, and other accidents, that little or nothing was to be expected from them: but the admiral carried with him Colonel Collingwood's regiment, which he diſpoſed of to the beſt advantage in the Leeward Iſlands. This part of his charge being executed, he began to think of performing the other part of his commiſſion, and of looking into the ſtate of the Spaniſh affairs, as it had been recommended to him by the king; and a proper occaſion of doing this very ſpeedily offering, he effected it. On his return to Jamaica, towards the latter end of the year, he received a ſupply of proviſions from England, and, ſoon after, orders to return home, which he did with ſix men-of-war, taking New England in his way, and arrived ſafe, bringing with him from the plantations ſufficient teſtimonies of his having diſcharged his duty, which ſecured him from all danger of cenſure, though the Houſe of Commons expreſſed very high reſentment at ſome circumſtance that attended the ſending this fleet. But in regard to the admiral, the greateſt compliments were paid to his courage, capacity, and integrity, by all parties; and the king, as a ſignal mark of his kind acceptance of all his ſervices, granted him an augmentation of arms, which conſiſted in adding to the three Bent Bows, he already bore, as many Arrows; which ſingular act of royal favour ſufficiently deſtroys the fooliſh report of his being of mean extraction. His conduct in this expedition raiſed him ſo much in the king's eſteem, that he conſulted him as much or more than any man of his rank, and yet without making the admiral himſelf vain, or expoſing him in any degree to the diſlike of the miniſters. It may be eaſily imagined, that, in the time the rear-admiral ſpent in the Weſt-Indies, the face of affairs was much changed: indeed, ſo much they were changed, that the king was forced to think of a new war, though he was ſenſible the nation ſuffered ſeverely from the old one. His firſt care therefore was, to put his fleet into the beſt order poſſible, and to diſtribute the commands therein to officers that he could depend upon; and to this it was that Mr. Benbow owed his being promoted to the rank of vice-admiral of the blue. After this, the command of a Weſt-India ſquadron was conferred on him; and in an engagement with the French, he had the misfortune to loſe

his leg. During all the time of his illneſs he behaved with great calmneſs and preſence of mind, having never flattered himſelf, from the time his leg was cut off, with any hopes of recovery, but ſhewed an earneſt deſire to be as uſeful as he could while he was yet living. He continued thus diſcharging his duty till the laſt moment; for dying of a ſhort conſumption, his ſpirits did not fail him till very near his end, and his ſenſes were very ſound to the day he expired, which was on the 4th of November, 1702.

BENBOW (John), ſon to the vice-admiral before mentioned. He was intended by his father for a ſeaman, and educated accordingly. His misfortunes began very early, viz. in the ſame year his father died in the Weſt-Indies, by being ſhipwrecked on the coaſt of Madagaſcar, where, after many diſmal and dangerous adventures, he was induced to live with, and in the manner of, the natives, for many years, and at laſt, when he leaſt expected it, he was taken on board by a Dutch captain, out of reſpect to the memory of his father, and brought ſafe to England, when his relations thought him long ſince dead. He was a young gentleman naturally of a very briſk and lively temper; but by a long ſeries of untoward events, came to alter his diſpoſition entirely, ſo as to appear, after his return, very ſerious, or rather melancholy, and did not much affect ſpeaking, except among a few intimate friends. But the noiſe of his remaining ſo long, and in ſuch a condition, upon the iſland of Madagaſcar, induced many to viſit him, and to enquire into the circumſtances of the life he led there, whom he civilly received, and readily ſatisfied their curioſity, though otherwiſe diſtinguiſhed, as has been ſaid, by his taciturnity; but he always looked upon his preſervation there, and his eſcape from thence, as ſuch ſignal inſtances of the favour of Providence, that he did not judge himſelf at liberty to conceal them. But notwithſtanding his freedom in communicating this part of his hiſtory, very few particulars relating to it can now be recovered. He lived ſeveral years after his return to England, but in a very private manner.

BENDLOWES (Edward), author of ſome poetical pieces, was ſon and heir of Andrew Bendlowes, eſq. and born in the year 1613. This gentleman was carefully educated in grammar learning, and at ſixteen years of age admitted a fellow-commoner of St. John's College, in Cambridge, to which he was afterwards a benefactor. From thence he went with a tutor to travel, and having gone through ſeveral countries, and viſited ſeven courts of princes, he returned home a moſt accompliſhed gentleman both in behaviour and converſation, but a little tinctured with the principles of Popery. Being very imprudent in the management of his worldly concerns, he made a ſhift, though he was never married, to ſquander away his eſtate (which amounted to ſeven hundred or a thouſand pounds a-year) on poets, muſicians, buffoons and flatterers, and in buying curioſities. He gave a handſome fortune with a niece named Philippa, who was married to Mr. Blount, of Maple Durham, in Oxfordſhire; and having beſides engaged himſelf for the payment of other men's debts, which he was not able to diſcharge, he was put into priſon at Oxford; but being ſoon after releaſed, he ſpent the remainder of his life, which was eight years, in that city. He was eſteemed in his younger days a great patron of the poets, eſpecially Quarles, Davenant, Payne, Fiſher, &c. who either dedicated books to him, or wrote epigrams and poems on him. His flatterers uſed to ſtyle him Benevolus, by way of anagram on his name, in return for his generoſity towards them. Towards the latter end of his life, he was drawn off from his inclination to Popery, and would often take occaſion to diſpute againſt the Papiſts and their opinions, and particularly diſliked the favourers of Arminius and Socinus. This gentleman, reduced through his own indiſcretion to great want, died at Oxford the 18th of December, 1686, aged ſeventy-three years.

BENEFIELD (Sebaſtian), an eminent divine of the 17th century, was born in 1559 at Preſtonbury in Glouceſterſhire, and educated at Corpus Chriſti College in Oxford. In 1603 he took the degree of doctor in divinity; and five years after, was choſen Margaret profeſſor in that univerſity. He had been preſented ſeveral years before to the rectory of Meyſey-Hampton in Glouceſterſhire. He publiſhed Commentaries upon the firſt, ſecond, and third chapters of Amos; a conſiderable number of ſermons; and ſome Latin treatiſes. He died in 1630.

BENEVENTUM (anc. geog.), a town of the Samnites, formerly called *Maleventum* from the unwholeſomeneſs of the wind, and under that appellation it is mentioned by Livy; but after a Roman colony was led thither in the 485th year of the city, it came to have the name of *Beneventum*, as a more auſpicious title. It is mentioned by Horace as an ancient city ſaid to have been built by Diomedes before the Trojan war. Now *Benevento*.

BENGUELA, the capital of the kingdom of the ſame name, where the Portugueze have a fort. It lies to the north of the bay of Benguela. Long. 12. 30. E. Lat. 10. 30. S.

BENI (Paul), profeſſor of eloquence in the univerſity of Padua. He was a Greek by nation, according to Bayle; but other authors affirm that he was born at Eugubio, in the duchy of Urbino. He was in the ſociety of Jeſuits for ſome time, but quitted them upon their refuſing him permiſſion to publiſh a commentary on the feaſt of Plato. He was a great critic, and maintained a diſpute with the Academy de la Cruſca of Florence. He publiſhed a treatiſe againſt their Italian dictionary, under the title of Anti-Cruſca, at Paragone della Lingua Italiana. He had likewiſe another conteſt with the ſame academy in regard to Taſſo, whoſe defence he undertook, and publiſhed two pieces on this ſubject. In one of theſe he compares Taſſo to Virgil, and Arioſto to Homer, in ſome particulars giving Taſſo the preference to theſe two ancients; in the other he anſwers the critical cenſures which had been made againſt this author. He publiſhed alſo ſome diſcourſes upon the Paſtor Fido of Guarini. Theſe pieces which we have mentioned were in Italian; but he left a great number of works in Latin. He died the 12th of February, 1625.

BENIGNUS (St.), archbiſhop of Armagh in Ireland, was the immediate ſucceſſor of St. Patrick in that ſee, anno 455. He was the ſon of Seſgnen, a man of wealth and power in Meath, who, in the war in 453, hoſpitably entertained St. Patrick in his journey from the port of Colp, where he landed, to the court of King Leogair at Tarah, and with his whole family embraced Chriſtianity, and received baptiſm. The youth grew ſo fond of his father's gueſt, that he could not be ſeparated from his company. St. Patrick took him away with him at his departure, and taught him his firſt rudiments of learning and religion. Benin profited greatly under ſuch a maſter, and became afterwards a man eminent for piety and virtue, whom St. Patrick thought worthy to fill the ſee of Armagh, which he reſigned to him in 455. Benin died in 468, on the 9th of November, having alſo reſigned his ſee three years before his death.

BENNEVIS, a mountain of Scotland, near Fort-William, in the ſhire of Inverneſs. It is eſteemed the higheſt in Britain, riſing more than 4300 feet above the level of the ſea, its pointed ſummit capped with ſnow.

BENNINGTON, the principal town of the ſtate of Vermont in New England, in the ſouth-weſt corner of the ſtate, near the foot of the Green Mountain. Its public buildings are a church, a court-houſe, and a gaol; but the aſſembly commonly hold the ſeſſions at Windſor. It has many elegant houſes, and is a flouriſhing town. Near the centre of the

town is Mount Anthony, which rises very high in the form of a sugar-loaf. Bennington is 30 miles east by north of Albany. Long. 73. 10. W. Lat. 43. 0. N.

BENTHAM (Edward), canon of Christ-church, Oxford, and king's professor of divinity in that university, was born in the college at Ely, July 23, 1707. His father, Mr. Samuel Bentham, was a very worthy clergyman, and vicar of Witchford, a small living near that city; who having a numerous family, his son Edward, on the recommendation of Dr. Smalridge, dean of Christ-church, was sent in 1717 to the school of that college. Having there received the rudiments of classical education, he was in Lent-term, 1723, when nearly sixteen years of age, admitted of the university of Oxford, and placed at Corpus-Christi College, under his relation, Dr. John Burton. In this situation his serious and regular deportment, and his great proficiency in all kinds of academical learning, recommended him to the notice of several eminent men; and, among others, to the favour of Dr. Tanner, canon of Christchurch, by whose death he was disappointed of a nomination to a studentship in that society. At Corpus-Christi College he formed a strict friendship with Robert Hoblyn, esq. of Nansfwydden in Cornwall, afterwards representative for the city of Bristol, whose character, as a scholar and a member of parliament, rendered him deservedly esteemed by the lovers of literature and of their country. In company with this gentleman and another intimate friend, Dr. Ratcliff, afterwards master of Pembroke College, Mr. Bentham made, at different times, the tour of part of France, and other places. Having taken the degree of bachelor of arts, he was invited by Dr. Cotes, principal of Magdalen-hall, to be his vice-principal; and was accordingly admitted to that society, March 6, 1729-30. Here he continued only a short time; for, on the 23d of April, in the year following, he was elected fellow of Oriel College. In act term, 1732, he proceeded to the degree of master of arts, and, about the same time, was appointed tutor in the college; in which capacity he discharged his duty in the most laborious and conscientious manner for more than twenty years. March 26, 1743, Mr. Bentham took the degree of bachelor in divinity; and April 22, in the same year, was collated to the prebend of Hundreton, in the cathedral-church of Hereford. July 8, 1749, he proceeded to the degree of doctor in divinity; and in April, 1754, was promoted to the fifth stall in that cathedral. Here he continued the same active and useful course of life for which he had always been distinguished. He served the offices of sub-dean and treasurer, for himself and others, for above twelve years. The affairs of the treasury, which Dr. Bentham found in great confusion, he entirely new-modelled, and put into a train of business in which they have continued ever since, to the great ease of his successors, and benefit of the society. So intent was he upon the regulation and management of the concerns of the college, that he refused several preferments which were offered to him, from a conscientious persuasion, that the avocations they would produce were incompatible with the proper discharge of the offices he had voluntarily undertaken. Being appointed by the king to fill the divinity chair, vacant by the death of Dr. Fanshawe, Dr. Bentham was, with much reluctance, and after having repeatedly declined, persuaded by Archbishop Secker and his other learned friends to accept of it; and, on the 9th of May, 1763, he was removed to the eighth stall in the cathedral. His unwillingness to appear in this station was increased by the business he had to transact in his former situation, and which he was afraid would be impeded by the accession of new duties; not to say that a life spent in his laborious and sedentary manner had produced some unfavourable effects on his constitution, and rendered a greater attention than he had hitherto shown to private ease and health absolutely necessary. Besides, as the duties, when properly discharged, were great and interesting, so the station itself was of that elevated and public nature to which his ambition never inclined him: he preferred a humble situation. The diffidence he had of his abilities had ever taught him to suspect his own sufficiency; and his inauguratory lecture breathed the same spirit; the text of which was, "Who is sufficient for these things?" But whatever objections Dr. Bentham might have to the professorship before he entered upon it, when once he had accepted of it, they never discouraged him in the least from exerting his most sincere endeavours to render it both useful and honourable to the university. He set himself immediately to draw out a course of lectures for the benefit of young students in divinity, which he constantly read at his house at Christ-church, gratis, three times a-week during term time, till his decease. The course took up a year; and he not only exhibited in it a complete system of divinity, but recommended proper books, some of which he generously distributed to his auditors. His intense application to the pursuit of the plan he had laid down, together with those concerns in which his affection for his friends, and his zeal for the public good in every shape, involved him, proved more than a counterbalance for all the advantages of health and vigour that a strict and uniform temperance could procure. It is certain that he sunk under the rigorous exercise of that conduct he had proposed to himself: for though sixty-eight years are a considerable proportion in the strongest men's lives, yet his remarkable abstemiousness and self-denial, added to a disposition of body naturally strong, promised in the ordinary course of things a longer period. Dr. Bentham was a very early riser, and had transacted half a day's business before many others began their day. His countenance was uncommonly mild and engaging, being strongly characteristic of the piety and benevolence of his mind; and at the same time it by no means wanted expression, but, upon proper occasions, could assume a very becoming and affecting authority. In his attendance upon the public duties of religion, he was exceedingly strict and constant; not suffering himself ever to be diverted from it by any motives, either of interest or pleasure. Whilst he was thus diligent in the discharge of his own duty, he was not severe upon those who were not equally diligent. He could scarcely ever be prevailed upon to deliver his opinion on subjects that were to the disadvantage of other men; when he could not avoid doing it, his sentiments were expressed with the utmost delicacy and candour. No one was more ready to discover, commend, and reward every meritorious endeavour. Of himself he never was heard to speak; and if his own merits were touched upon in the slightest manner he felt a real uneasiness. Though he was not fond of the formalities of visiting, he entered into the spirit of friendly society intercourse with great pleasure. His constant engagements, indeed, of one kind or other, left him not much time to be devoted to company; and the greater part of his leisure hours he spent in the enjoyment of domestic pleasures, for which his amiable and peaceable disposition seemed most calculated. Till within the last half-year of his life, in which he declined very fast, Dr. Bentham was scarcely ever out of order; and he was never prevented from discharging his duty, excepting by a weakness that occasionally attacked his eyes, and which had been brought on by too free an use of them when he was young. That part of his last illness which confined him, was only from the 23d of July to the 1st of August. Even death itself found him engaged in the same laborious application which he had always directed to the glory of the Supreme Being, and the benefit of mankind; and it was not till he was absolutely forbidden by his physicians, that he gave over a particular course of reading that had been undertaken by him with a view of answering Mr. Gibbon's Roman History. Thus he died at his post, like a faithful soldier, in the exercise of his arms, and the defence of his religion. That serenity of mind and meekness of disposition, which he had manifested on every former occasion, shone forth in a more espe-

cial manner in his latter moments; and, together with the conſciouſneſs of a whole life ſpent in the divine ſervice, exhibited a ſcene of true Chriſtian triumph. After a few days' illneſs, in which he ſuffered a conſiderable degree of pain without repining, a quiet ſigh put a period to his exiſtence below, on the 1ſt of Auguſt, 1776, when he had entered into the ſixty-ninth year of his age.

BENTHEIM, a town of Germany, in the circle of Weſtphalia, capital of a county of the ſame name, ſeated on the Vecht, 32 miles north-weſt of Munſter. Long. 7. 25. E. Lat. 52. 23. N.

BENTINCK, or BENTHINCK (William), earl of Portland, &c. one of the greateſt ſtateſmen of his time, and the firſt that advanced his family to the dignity of the Engliſh peerage. M. Bentinck was a native of Holland, being deſcended of an ancient and noble family of that name in the province of Guelderland. After a liberal education, he was, by the intereſt of his friends, promoted to be page of honour to William, then Prince of Orange (afterwards King William III. of England), in which ſtation, his good behaviour and addreſs ſo recommended him to the favour of his maſter, that he preferred him to the more honourable poſt of gentleman of his bed-chamber. In this capacity he accompanied the prince into England in the year 1670, where, going to viſit the univerſity of Oxford, he was, together with the prince, created doctor of civil law. In 1672, the Prince of Orange being made captain-general of the Dutch forces, and ſoon after ſtadtholder, M. Bentinck was promoted, and had a ſhare in his good fortune, being made colonel and captain of the Dutch regiment of guards, afterwards eſteemed one of the fineſt in King William's ſervice, and which behaved with the greateſt gallantry in the wars both in Flanders and Ireland. In 1675, the prince falling ill of the ſmall-pox, M. Bentinck had an opportunity of ſignalizing his love and affection for his maſter in an extraordinary manner, and thereby of obtaining his eſteem and friendſhip, by one of the moſt generous actions imaginable: for the ſmall-pox not riſing kindly upon the prince, his phyſicians judged it neceſſary that ſome young perſon ſhould lie in the ſame bed with him, imagining that the natural heat of another would drive out the diſeaſe, and expel it from the nobler parts. Nobody of quality could be found in all the court to make this experiment: at laſt, M. Bentinck, though he had never had the ſmall-pox, reſolved to run the riſk, and accordingly attended the prince during the whole courſe of his illneſs, both day and night. Nothing was given him, nor was he ever removed in his bed, by any other hand. In the year 1677, M. Bentinck was ſent by the Prince of Orange into England, to ſolicit a match with the Princeſs Mary, eldeſt daughter of James, at that time duke of York (afterwards King James II), which was ſoon after concluded. And in 1685, upon the Duke of Monmouth's invaſion of this kingdom, he was ſent over to King James to offer him his maſter's aſſiſtance, both of his troops and perſon, to head them againſt the rebels, but, through a miſconſtruction put on his meſſage, his highneſs's offer was rejected by the king. In the year 1688, when the Prince of Orange intended an expedition to England, he ſent M. Bentinck, on the Elector of Brandenburgh's death, with his compliments to the new elector, and alſo to lay before him the ſtate of affairs to communicate to him his deſign upon England, and to ſolicit his aſſiſtance to put it in execution, &c. In this negociation M. Bentinck was ſo ſucceſsful, that he carried to his maſter a more favourable and ſatisfactory anſwer than the prince had expected; the elector having generouſly granted even more than was aſked. M. Bentinck had alſo a great ſhare in the glorious revolution on which our preſent happy eſtabliſhment is founded, in which difficult and important affair, he ſhewed all the prudence and ſagacity of the moſt conſummate and able ſtateſman. M. Bentinck accompanied the prince in his expedition to England; and after King James's abdication, during the interregnum, he held the firſt place among thoſe who compoſed the prince's cabinet at that critical time, and that in ſuch a degree of ſuper-eminence, as ſcarcely left room for a ſecond; and we may be ſure that he was not wanting, as far as his ſervices could avail, in endeavouring to procure the crown for the prince his maſter; who, when he had obtained it, was as forward on his part in rewarding the faithful and ſignal ſervices of M. Bentinck. Immediately upon the prince's acceſſion to the Britiſh crown, M. Bentinck was made groom of the ſtole, privy purſe, firſt gentleman of the royal bed-chamber, and was the firſt commoner upon the liſt of privy-counſellors; and, to fit him for greater honours, was ſoon after naturalized by act of parliament; and, by letters patent bearing date the 9th of April, 1619, two days before the king and queen's coronation, he was created Baron of Cirencester, Viſcount Woodſtock, and Earl of Portland. In the year 1690, the Earl of Portland, with many others of the Engliſh nobility, attended King William to Holland, where the earl acted as envoy for his majeſty, at the grand congreſs held at the Hague the ſame year; an aſſembly the moſt honourable to the Engliſh nation that is any-where to be read of. In the year 1695 King William made this nobleman a grant of the lordſhips of Denbigh, Bromfield, Yale, and other lands, containing many thouſand acres, in the principality of Wales, which being part of the demeſne thereof, the grant was oppoſed, and the Houſe of Commons addreſſed the king to put a ſtop to the paſſing it, which his majeſty accordingly complied with, and recalled the grant, promiſing, however, to find ſome other way of ſhewing his favour to Lord Portland, who, he ſaid, had deſerved it by long and faithful ſervices; and this promiſe the king ſoon after made good. It was to this nobleman, that the horrid plot for aſſaſſinating King William, in the year 1695, was firſt diſcovered; and his lordſhip, by his wiſe counſel and indefatigable zeal, was very inſtrumental in bringing to light the whole of that execrable ſcheme. The ſame year another affair happened, in which this noble lord gave ſuch a ſhining proof of the ſtricteſt honour and integrity, as has done immortal honour to his memory. The parliament having taken into conſideration the affairs of the Eaſt-India Company, who, through miſmanagement and corrupt dealings, were in danger of loſing their charter; ſtrong intereſt was made with the members of both houſes, and large ſums properly diſtributed, to procure a new eſtabliſhment of their company by act of parliament. Among thoſe noblemen whoſe intereſt was neceſſary to bring about this affair, Lord Portland's was particularly courted, and an extraordinary value put upon it, much beyond that of any other peer; for he was offered no leſs than the ſum of 50,000 pounds for his vote, and to uſe his endeavours with the king to favour the deſign. But his lordſhip, poſſeſſed of a greatneſs of ſoul that placed him above corruption, treated this injurious offer with all the contempt and indignation it deſerved, telling the perſon employed in it, that if he ever ſo much as mentioned ſuch a thing to him again, he would for ever be the company's enemy, and give them all the oppoſition in his power. This is an inſtance of public ſpirit not often met with, and did not paſs unregarded; for we find it recorded in an eloquent ſpeech of a worthy member of parliament, who took occaſion to relate this noble action to the Houſe of Commons, much to the honour of Lord Portland. It was owing to this nobleman, that the Banqueting-houſe at Whitehall was ſaved, when the reſt of the palace was deſtroyed by fire. Going on thus in a courſe of honour and proſperity, his lordſhip, in February 1696, was created a knight of the moſt noble order of the Garter, at a chapter held at Kenſington, the ſovereign and ten knights being preſent, and was inſtalled at Windſor on the 25th of March, 1697, at which time he was alſo lieutenant-general of his majeſty's forces; for his lordſhip's ſervices were

not confined to the cabinet; he likewiſe diſtinguiſhed himſelf in the field on ſeveral occaſions, particularly at the battle of the Boyne, battle of Landen, where he was wounded, ſiege of Limerick, Namur, &c. As his lordſhip thus attended his royal maſter in his wars both in Ireland and Flanders, and bore a principal command there, ſo he was honoured by his majeſty with the chief management of the famous peace of Ryſwick.

The king had for a long time given the Earl of Portland the entire and abſolute government of Scotland; and his lordſhip was alſo employed, in the year 1698, in the new negociation ſet on foot for the ſucceſſion of the crown of Spain, called by the name of the Partition Treaty, the intention of which being fruſtrated by the treachery of the French king, the treaty itſelf fell under ſevere cenſure, and was looked upon as a fatal ſlip in the politics of that reign; and Lord Portland was impeached by the Houſe of Commons, in the year 1700, for adviſing and tranſacting it, as were alſo the lords concerned with him in it. The Partition Treaty was the laſt public tranſaction we find Lord Portland engaged in; the next year, 1701, having put a period to the life of his royal and munificent maſter King William III. but not without having ſhewn, even in his laſt moments, that his eſteem and affection for Lord Portland ended but with his life; for when his majeſty was juſt expiring, he aſked, though with a faint voice, for the Earl of Portland, but before his lordſhip could come, the king's voice quite failed him. The earl, however, placing his ear as near his majeſty's mouth as could be, his lips were obſerved to move, but without ſtrength to expreſs his mind to his lordſhip; but, as the laſt teſtimony of the cordial affection he bore him, he took him by the hand, and carried it to his heart with great tenderneſs, and expired ſoon after. His lordſhip had before been a witneſs to, and ſigned, his majeſty's laſt will and teſtament, made at the Hague in 1695; and it is ſaid, that King William, the winter before he died, told Lord Portland, as they were walking together in the garden at Hampton-Court, that he found his health declining very faſt, and that he could not live another ſummer, but charged his lordſhip not to mention this till after his majeſty's death. We are told, that at the time of the king's death, Lord Portland was keeper of Windſor Great Park, and was diſplaced upon Queen Anne's acceſſion to the throne: we are not, however, made acquainted with the time when his lordſhip became firſt poſſeſſed of that poſt. After King William's death, the earl did not, at leaſt openly, concern himſelf with public affairs, but betook himſelf to a retired life, in a moſt exemplary way, at his ſeat at Bulſtrode in the county of Bucks, where he erected and plentifully endowed a free-ſchool, and did many other charities. His lordſhip had an admirable taſte for gardening, and took great delight in improving and beautifying his own gardens, which he made very elegant and curious. At length, being taken ill of a pleuriſy and malignant fever, after about a week's illneſs he died, November 23, 1709, in the ſixty-firſt year of his age, leaving behind him a very plentiful fortune, being at that time reputed one of the richeſt ſubjects in Europe.

Bentinck (Henry), ſecond ſon of William earl of Portland, whilſt he was a commoner was elected in two parliaments in the reign of Queen Anne one of the knights of the ſhire for the county of Southampton; and on the 21ſt of July, 1710, was made captain of the firſt troop of horſe-guards, in the room of the Earl of Albemarle. He was created by King George the Firſt, marquis of Tichfield in Hampſhire, and duke of Portland, by letters patent, bearing date the 16th of July, 1706

When the king went to Cambridge in 1717, and the ceremony of admitting and creating ſeveral degrees was, according to cuſtom, performed in his royal preſence, his Grace the Duke of Portland was created doctor of laws. His grace was alſo one of the gentlemen of King George the Firſt's bedchamber; and on the 9th of September, 1721, was appointed captain-general and governor of the iſland of Jamaica, where his grace departed this life, of a fever, on the 4th of July, 1726, in the forty-fifth year of his age.

BERCHTOSGABEN, a town of Germany in Saltzburg, which ſerves all the neighbourhood with ſalt; ſeated on the river Aa, 10 miles ſouth-weſt of Saltzburg. Long. 13. 0. E. Lat. 47. 30. N.

BERDOA, a town of Perſia, in a fertile plain, 10 miles weſt of the river Cour, and 62 ſouth-eaſt of Grandga. Long. 48. 0. E. Lat. 41. 0. N.

BEREILLY, a ſmall city of Hindooſtan Proper, capital of Rohilcund, or country of the Rohillas, which was conquered by the Nabob of Oude in 1774. It lies half way between Lucknow and Delhi, 120 miles from each. Long. 79. 40. E. Lat. 28. 30. N.

BERING (Sinus), of Copenhagen, a Latin lyric poet, flouriſhed about 1560.

BERGMAN (*Encycl.*). In our original article, vol. I. we have inadvertantly ſaid, that Profeſſor Bergman's Eſſays were collected and tranſlated by Dr. Ed. Cullen, and publiſhed in two vols. 8vo. They were collected and publiſhed in ſix octavo volumes. The 1ſt and 2d at Upſal, by himſelf; the 3d at Leipzig, after his death, by Leſke; the 4th, 5th, and 6th, at Leipzig alſo, under the inſpection of Profeſſor Hebenſtreit. Three of theſe volumes (viz. 1. 2. 4.) have been tranſlated by Dr. Cullen. The laſt of them was publiſhed at Edinburgh in 1791. Beſides theſe ſix volumes of Eſſays, Profeſſor Bergman publiſhed ſeveral other works in the Swediſh and other Tranſactions, which are not yet added to the collection of his pieces; to ſay nothing of a very valuable work on Phyſical Geography in Swediſh, in two quarto volumes, which, we have heard, has been tranſlated into Engliſh. Its value is ſuch, that Profeſſor Hebenſtreit is ſaid to have intended a tranſlation of it into Latin; and that he propoſed publiſhing it in that language for the promotion of rational geology. In the ſix volumes are conſumed 72 eſſays; but the catalogue of his works given at the end of Peter James Hjelms Gedachtnefzrede contains one hundred and ſix.

BERGMANNIAN Society. This ſociety was inſtituted for the promotion of thoſe ſciences in which Bergman chiefly excelled; namely, Chemiſtry, Geology, Natural Hiſtory, Mineralogy, and Electricity. It conſiſts of about 150 members, of whom one third may be foreigners, diſtinguiſhed by their ſkilful and fortunate reſearches in theſe departments of ſcience. No perſon can be admitted a member or fellow (F. B.S. or S. B. S.) unleſs of juſt celebrity in them. The preſent of a flint will not ſecure an election into it, as a fortunate *Leontodon Taraxacum* has done into another ſociety formerly more reſpectable. Of the Bergmannian Society, Henry Hodgſon, M.D. of Market Raſen, Lincolnſhire, was choſen preſident on the 16th September, 1795. At the ſame time J. Atzelius Ardvidſſon (Bergman's ſucceſſor in the chemical chair at Upſal), Charles William Noſe, M.D. of Elberfield, Profeſſor Pentland, of Dublin, Dr. Prieſtley, and ſeveral other illuſtrious philoſophers, were elected fellows. It is uſual to addreſs communications on the immediate objects of the ſociety to the preſident.

BERGUES, St. Vinox, a town of France, in the department of the North, and late county of Flanders, fortified by Vauban. It is ſeated on the river Colme, at the foot of a mountain, five miles ſouth of Dunkirk. Long. 2. 28. E. Lat. 50. 57. N.

BERKELEY, a town of Glouceſterſhire, with a market on Wedneſday. It is governed by a mayor and aldermen. Here

is a caſtle begun in the reign of Henry I. and finiſhed in that of Stephen. It ſtands on a riſing ground, commanding a delightful view of the ſurrounding country and the Severn. In the civil wars it ſuffered conſiderably, as it did a few years ago by an accidental fire. The room in which Edward II. was impriſoned is ſtill to be ſeen. In the church are ſome elegant monuments of the Berkeleys. It is 18 miles from Glouceſter, and 113 north-weſt of London.

BERKHAMSTEAD, a town of Herts, with a market on Monday. It was anciently a Roman town; and Roman coins have been often dug up here. On the north ſide of the town are the remains of a caſtle, the reſidence of the kings of Mercia. In 697 a parliament was held here, and Ina's laws publiſhed. Here William the Conqueror ſwore to his nobility to maintain the laws made by his predeceſſors. Henry II. kept his court in this town, and granted to it many privileges; and James I. whoſe children were nurſed here, made it a corporation; but this government was dropped in the civil wars. Here are two hoſpitals, a handſome Gothic church, and a free-ſchool. It is 26 miles north-weſt of London. Long. 0. 31. W. Lat. 51. 46. N.

BERNARD, a town of Germany in the electorate of Brandenburg, five miles from Berlin, noted for excellent beer.

BERNARDI (John), was the ſon of Count Francis Bernardi, reſident in England from the republic of Genoa, and was deſcended from a very ancient and honourable family, created for their ſervices to the Houſe of Auſtria, counts of the holy Roman empire. He was born in 1657, and was very early inured to misfortunes and impriſonment; for his father being diſguſted at ſome ill uſage he received from the government of Genoa, refuſed to return thither, and being himſelf a native of England, retired into Worceſterſhire, where he ſettled; and being a great lover of gardening, ſpent a conſiderable fortune in improvements of that kind, which, however, did not ſo far amuſe or divert him, as to extinguiſh his ſenſe of the injuries he had received, which ſoured his temper to ſuch a degree, that he frequently confined his ſon John, for very ſlight cauſes, to a dark room, where he allowed him only bread and ſmall-beer for ſeveral days, which hard uſage ſo wrought upon his diſpoſition, that he reſolved, at all events, to leave his father's houſe, and to throw himſelf into the world, though a perfect child. Accordingly, in 1670 he quitted his father's ſeat, with a full reſolution never to return thither while the old man lived. He travelled that night ſixteen miles in the road to Coventry, and as day-light began to appear, he took ſhelter in the houſe of a wheelwright, who, upon hearing his melancholy ſtory, promiſed to conceal him, which he performed, and put him into a little room from whence he could look upon the road, and in which he had not been long before he ſaw his father on horſeback, who enquired of the wheelwright if he had ſeen ſuch a boy as he deſcribed, which being anſwered in the negative, prevented the young man from being carried back to confinement. When the ſecond night came on, he ſet out again for Packington-hall, the ſeat of Sir Clement Fiſher, who married the famous Mrs. Jane Lane, very inſtrumental in preſerving King Charles II. after the famous battle at Worceſter. But on his coming thither, being informed that Sir Clement and his lady were in London, he followed them up to town, and was very hoſpitably received, the lady having been very kind to him at his father's, and often intreated the old gentleman to deal more indulgently with his ſon, and to afford him a liberal education. He was by her recommended to a near relation, Captain Littleton Clent, who was then in garriſon at Portſmouth, who took him into his company, and cauſed him to be taught his exerciſe as a ſoldier, which gave him the firſt taſte for a military life. While he was under the protection of this gentleman, he very narrowly eſcaped a misfortune, which would have put an early end to his troubles and his life. On the concluſion of the Dutch war, Captain Clent being broke, was no other way in a condition of expreſſing his kindneſs for Mr. Bernardi, than by making him a preſent of twenty pounds. But the loſs of his patron was not the only miſchief which befel him in the year 1673; for he had the ſmall-pox ſoon after, which reduced him very low both in conſtitution and fortune. In this diſtreſs he addreſſed himſelf to his godfather, Colonel Anſelme, who propoſed to him going over to Holland, with which he readily complied, and ſoon after his arrival entered as a private ſoldier into the ſervice of the States, and then lifted in one of the Engliſh independent companies. He was in the famous action of Seneff, in which the Prince of Condé fell on the rear of the Prince of Orange's army, and took part of his baggage, but after an obſtinate engagement was obliged to retire. He was alſo preſent at the ſiege of Oudenarde, and afterwards at that of Grave, where he ſerved in the company of Captain Philip Savage, and had his ſhare in a very dangerous attack on the counterſcarp, in which he was wounded. The place ſurrendered on the 29th of October, 1674. Soon after this, the Engliſh troops in the ſervice of the States being regimented, Mr. Bernardi obtained an enſign's commiſſion from the Prince of Orange, dated the 2d of February, 1675, in the company of his godfather, who was appointed lieutenant-colonel of Diſney's regiment. In June following he was removed, with his godfather, to another regiment, commanded by Sir John Fenwick, and at the cloſe of the year had the misfortune to be wounded in endeavouring to part two gentlemen in a duel. He was preſent the ſucceeding year at the ſiege of Maeſtricht, where he had the misfortune to loſe the ſight of one of his eyes, and to be ſhot through one of his arms, the bones of which were ſhivered to ſplinters; when, taking his arm in the lappet of his coat, he crowded back to the breach, and fell down to the bottom among the dead. A ſoldier of his ſeeing him fall, jumped after him, took him up in his arms, and carried him to the ſurgeons in the trenches, where he was dreſſed. The Prince of Orange being informed of his behaviour, and that the lieutenant of the major's company of that regiment was killed in the attack, gave his commiſſion to Mr. Bernardi: but it appearing afterwards that the lieutenant was only taken priſoner, he miſſed of this preferment. In April 1677 he married a Dutch lady of a good family, with whom he lived comfortably eleven years. He had a ſhare the next campaign in the battle of St. Omers, at the cloſe of which he was appointed lieutenant in Captain Philip Savage's company, in which he firſt ſerved by a commiſſion from the Prince of Orange, dated September 6, 1677. He was preſent the next year in the battle of Mons, which was the laſt action in the war. After the peace his godfather, Colonel Anſelme, was ſo reduced as to be obliged to ſerve as a private man under Mr. Bernardi, who allowed him double pay, and excuſed him from duty. In 1683 Mr. Bernardi was made captain-lieutenant in Colonel Monk's company; and at this time he was in ſo great favour with the Prince of Orange, that upon the death of Captain Jaſper Paſton, brother to the Earl of Yarmouth, he had his company given him by a commiſſion from the prince, dated the 17th of November, 1685, which was confirmed by a commiſſion from the States, dated the 3d of December following. At this time his circumſtances were very eaſy, and he had juſt reaſon to be thankful to Providence for the condition he was in, having obtained by his merit a company at the age of twenty-ſeven, the profits of which, together with his wife's fortune, brought him in a clear revenue of 500*l.* a-year. But it was not long that he continued in this eaſy and happy ſituation: for King James II. in the year 1687, having conceived ſome diſpleaſure againſt the States-

General, demanded the ſix regiments of Britiſh troops that were in their ſervice, and which had been ſo for fifteen years. This the States refuſed; but, at the ſame time, did not conſtrain the officers to ſerve them againſt their will, though care was taken to repreſent to them, in very ſtrong terms, the difference between remaining upon a ſettled eſtabliſhment, and returning home upon an uncertainty. This had ſuch an effect, that out of two hundred and forty officers that were in the whole brigade, no more than ſixty thought proper to obey the king's commands, amongſt whom was Captain Bernardi. King James was no ſooner informed of this, than he ordered a yacht to ſail for Holland to bring thoſe gentlemen over, to whom he ſent alſo three months' pay; and upon their arrival in England, immediately raiſed three new regiments, in order to replace thoſe officers in their commands; and, at the ſame time, iſſued a proclamation, declaring all officers that remained in the ſervice of the States of Holland rebels. But the ſcene was very ſoon changed: his ſerene highneſs proceeded ſoon after on his expedition to England, which brought about the Revolution. One of the firſt ſteps taken by his highneſs after the king was withdrawn, was to ſend an aſſociation to every one of the regiments then in being, which all the officers were required to ſign, importing, that they were determined to defend the prince againſt all perſons whatever, and ſuch officers as refuſed it, were ordered to quit their commands. Amongſt theſe was Captain Bernardi, who having obtained a paſs for himſelf and his family, he tranſported them to Calais, where, finding many perſons of his own principles in great diſtreſs, the captain pledged his effects for fifty pounds for their relief, though they were worth double as much, and the conſequence was, that he loſt both effects and money. He proceeded from thence to St. Germain's, where he was very kindly received, and after a ſhort repoſe, made a long and fatiguing march to Breſt, to wait the return of the French fleet, which carried King James to Ireland, and ſpeedily tranſported 2300 of his adherents to the ſame kingdom. This was in the month of April, 1689, and it was with great difficulty they landed theſe people in Bantry Bay on the 1ſt of May, and the next day engaged the Engliſh fleet under Admiral Herbert. The Earl of Dover, who was appointed by King James to receive theſe recruits, conducted them directly to Dublin, where they were formed into ſeparate corps, and all the officers had commiſſions given them. Amongſt the reſt, Mr. Bernardi was appointed major of an Iriſh regiment, which was ſoon diſbanded for mutiny; and then he had the like command in the regiment of M'Carthy Moor, a great Iriſh chief, under whom he ſerved for ſome time. After Marſhal Schomberg landed in that kingdom with twenty thouſand men from England, King James found his affairs in a very declining condition; however, as he had ſtill a ſuperior army, he marched to Ardee, which he fortified, and thereby kept the marſhal in his camp near Dundalk, which being a marſhy unwholeſome place, half his troops ſoon died of fluxes. While King James was at Ardee, he formed a deſign of ſending the Earl of Seaforth into Scotland, in hopes that the preſence of that nobleman might ſupply the loſs of the famous Viſcount Dundee, then lately killed in his ſervice. To aſſiſt the earl in this enterpriſe, the king directed Major Bernardi and another field officer to attend him, which they did, and embarking on board a man-of-war at Galway, in the weſt of Ireland, ſteered their courſe for Scotland; but before they got clear of the Iriſh coaſt, they met with a ſtorm, by which their bowſprit and fore-maſt were both broke to pieces; upon which the captain with much difficulty and danger worked the ſhip into Broad-haven, in the province of Connaught, from whence the earl ſent Major Bernardi to King James, then in his camp at Ardee, to acquaint him with this unlucky accident, which hindered his intended voyage. King James thereupon ordered the ſhip back again to Galway, and put off the earl's voyage to the next ſpring, when he proceeded with Sir Thomas Southwell and Major Bernardi for Scotland, where he ſpeedily raiſed a great body of men for King James's ſervice, and made the neceſſary diſpoſitions for joining Major-general Buchan, who commanded the remains of Lord Dundee's forces, in order to form the ſiege of Inverneſs. But the earl was diſappointed in this deſign by the ſpeedy march of Major-general Mackay, with a conſiderable body of regular troops into thoſe parts; and while things were in this ſituation, the news came of the total defeat of King James's army at the Boyne, upon which Sir Thomas Southwell prevailed upon the earl to diſmiſs his forces, and to ſurrender himſelf priſoner to Major-general Mackay upon honourable terms. The earl taking this ſtep without the conſent of his uncle, Mr. Colin Mackenzie, and the reſt of his friends, it provoked them to ſuch a degree, that they would have cut Sir Thomas Southwell to pieces, if Major Bernardi had not interpoſed and prevented it. This Mr. Colin Mackenzie took Major Bernardi, and the reſt of the officers that came with him from Ireland, under his protection, and conducted them ſafely to Major-general Buchan, who was then a hundred miles diſtance, and who, upon hearing of the Earl of Seaforth's conduct, had diſmiſſed moſt of his forces. Major Bernardi had now nothing more to tranſact in the Highlands; and, therefore, as his preſence there could be of no ſervice, he deſired to go to England, and Major-general Buchan approved of it, and ſent for the Laird of Glenco to come with forty of his vaſſals to receive Bernardi at Invergary, and to conduct and guard him to the Braes of Monteth, being near a hundred miles, and very difficult travelling over rocks and mountains in that ſeaſon of the year, near the end of October. A great part of the journey was to be performed in the night-time, ſeveral detachments of King William's forces lying in their way, particularly at Inverlochy, or Fort-William, a place where was a garriſon of twelve hundred men, and there was no way to climb up an high mountain, but near the gate of the ſaid fortreſs, ſo that it was impoſſible to paſs them but when aſleep and their gate locked. The Laird of Glenco's country lying within 20 miles of that garriſon, Major Bernardi arrived ſafe at that gentleman's houſe, and remained there ſome days to reſt himſelf and recover his ſtrength. After having repoſed himſelf there ſix days, he deſired to proceed on his journey, and the laird appointed forty of his beſt men, under the command of a relation of his own, to conduct him to the Braes of Monteth, places as dangerous and difficult to paſs as any of the way he had come before. The ſame inconveniences, of ſmall garriſons of the government, were in their way, and their parties were continually about the country in the day-time. This made the ſecond part of Major Bernardi's journey to be moſtly night-work: however, he arrived ſafe at the Braes, at which place he was recommended by Major-general Buchan, to one Colonel Duncan Graham, to be then farther directed by him. Major Bernardi proceeded on his journey from the Braes of Monteth, under the conduct of a guide appointed him by Colonel Graham, and having no more need of guards, he arrived at Edinburgh in the month of November, in the year 1691. The magiſtrates of that city having heard ſome gentlemen were come from the Highlands, ordered their gates to be ſhut, and a general ſearch to be made for them. Bernardi's landlord getting notice of it, conducted him out of town but half an hour before the order was put in execution, otherwiſe his journey at that time had terminated in ſome priſon at Edinburgh: but eſcaping that, and ſome other dangers, he travelled on from thence to London, meeting with no more difficulties than thoſe of a long winter's journey. Having finiſhed his affairs in London, by diſpoſing of ſome effects he had

left with a friend when he went out of England, and by ſelling his Scots horſes, he purpoſed to go over to Flanders, and meeting with two gentlemen of his acquaintance ready to make the ſame voyage, he went with them to Colcheſter, where they were recommended to the maſter of a ſhip, who was in a ſhort time to carry over a lady of great quality to Oſtend; but the wind happening to be fixed in the eaſt, the lady ordered her trunks to be put on board, and then went to a gentleman's houſe about five miles off, charging the maſter to ſend for her as ſoon as the wind came fair. Bernardi and his friends met with two other gentlemen who were ſtrangers to them, and alſo unknown in the town, who were come thither to get a paſſage over in the ſame ſhip. They joined company, and lodged all together for ſome nights at Mr. Cook's, then poſt-maſter in Colcheſter; but having notice of ſome people's inquiſitiveneſs about them, Bernardi and his two friends went to a gentleman's houſe about a mile out of the town, and the other two gentlemen went to the maſter of the ſhip's houſe. The ſecond night after Bernardi and his friends went into the country, intimation was given, that Sir Iſaac Rebow, a juſtice of the peace, had iſſued out his warrant to apprehend them, and bring them before him; and the wind coming fair the ſame night, they went directly to the maſter of the ſhip's houſe to go on board. The maſter of the ſhip told them, that he had ſent a meſſenger to the lady, and expected her in an hour more, and ſent one of his men to conduct them on board a-ſhip, and ſaid he would follow them, with the other two gentlemen at his houſe, as ſoon as the lady came. A meſſage came from the lady, that ſhe could not poſſibly come before the next day in the afternoon. Bernardi and his two friends continued on ſhip-board to avoid the juſtice's warrant. The next day, towards the evening, came a company of trained bands, with five hundred country people, to the key, where the ſhip then lay dry at low water, about two miles from the town, and Bernardi and the two gentlemen with him were ſeized, and carried directly to Colcheſter gaol, where the other two gentlemen, and the maſter of the ſhip, had before been made priſoners. The lady who occaſioned all this ſtir was the Counteſs of Errol, with whom Mr. Bernardi was not at all acquainted; however, it coſt him a great deal of trouble, and hindered him from purſuing any ſettled courſe of life till a year and a half afterwards, that a bill being preferred againſt him and his friends in Eſſex for high-treaſon was rejected; by which he eſcaped, indeed, any further ſuffering on this head, but at the expence of ſeveral hundred pounds, a loſs almoſt inſupportable to a man already of a broken fortune. He went afterwards over to Holland with the Earl of Nottingham's paſs, who was then ſecretary of ſtate, and returning within the time preſcribed, merited thereby ſome farther indulgences from his lordſhip. The times being now dangerous for a man of Major Bernardi's ſentiments, who could ſcarcely live ſo cautiouſly as not to give ſome offence, he reſolved to retire into the country, where he lived peaceably, and without ſeeing much company, for ſome months, at a houſe near Brentford. But being obliged to quit this houſe, on accounts of its changing its owner, he came to London again about Chriſtmas 1695, which proved his ruin by a ſeries of very unfortunate accidents, ſuppoſing what he conſtantly profeſſed to be true, that he was in no reſpect privy to the baſe and barbarous conſpiracy for aſſaſſinating King William. For being unhappily at a tavern on Tower-hill, with one Captain Rookwood, who was his old acquaintance, and who was involved in that affair, they were ſeized together, and ſent to the Compter, and afterwards committed to priſon, where he died, September 20, 1736.

BERN-Castel, a town of Germany, in the electorate of Treves, with a caſtle, built in 1277. It is remarkable for its good wine, and is ſeated on the river Moſelle, between Trarbach and Weldens.

BERNERS (Juliana), was born at Roding in Eſſex, about the beginning of the fifteenth century, being the daughter of Sir James Berners, of Berners Roding, and ſiſter of Richard Lord Berners. The education of Juliana ſeems to have been the very beſt which that age could afford; and her attainments were ſuch, that ſhe is celebrated by various authors for her uncommon learning, and her other fine accompliſhments. Her extraordinary qualifications rendered her every way capable and deſerving of the office ſhe bore, which was that of prioreſs of Sopewell nunnery. This was a cell to, and very near, St. Alban's; and a good part of the ſhell of it is ſtill ſtanding. Here ſhe lived in high eſteem, and flouriſhed, according to Bale, Tanner, and Ballard, about the year 1460; but if what we have ſaid concerning her birth be the true account, ſhe muſt have flouriſhed ſomewhat earlier. She was a very beautiful lady, of great ſpirit, and loved maſculine exerciſes, ſuch as hawking, hunting, &c. With theſe ſports ſhe uſed frequently to recreate herſelf; and ſo thoroughly was ſhe ſkilled in them, that ſhe wrote treatiſes of hawking, hunting, and heraldry. So well eſteemed were Juliana Berners's treatiſes, and indeed ſo popular were the ſubjects on which they were written, that they were publiſhed in the very infancy of the art of printing. That part of our abbeſs's work which relates to hunting is written in rhyme. It is ſpoken in her own perſon; in which, being otherwiſe a woman of authority, ſhe aſſumes the title of dame. The barbariſm of the times ſtrongly appears in the indelicate expreſſions which Juliana Berners often uſes; and which are equally incompatible with her ſex and profeſſion. The book on Armory begins with the following curious piece of ſacred heraldry: "Of the offſpring of the gentilman Jafeth, come Habraham, Moyſes, Aron, and the profettys; and alſo the kynge of the right lyne of Mary, of whom that gentilman Jheſus was borne, very God and man: after his manhode kynge of the land of Jude and of Jues, gentilman by his modre Mary, prince of cote armure, &c." The moſt diligent enquirers have not been able to determine the exact period of Juliana Berners's deceaſe.

BEROEA (anc. geog.), a noble city of Macedonia, to the ſouth of Edeſſa, or Ægæ, and ſouth-eaſt of Certus. The people are commended in Scripture for their reception of the Goſpel on a fair and impartial examination: now ſuppoſed to be *Aleppo*. See that Article.

BERQUIN (Lewis de), a gentleman of Artois, who was burnt for being a Proteſtant, at Paris, in 1529. He was lord of a village, whence he took his name, and for ſome time made a conſiderable figure at the court of France, where he was honoured with the title of King's counſellor. Eraſmus ſays, his great crime was openly profeſſing to hate the monks; and that from hence aroſe his warm conteſt with William Quernus, one of the moſt violent inquiſitors of his time. A charge of hereſy was muſtered up againſt him, and the articles of his accuſation were drawn out of a book which he had publiſhed: he was thereupon committed to priſon; but, when his affair came to a trial, he was acquitted by the judges. His accuſers pretended that he would not have eſcaped, had not the king interpoſed his authority; but Berquin himſelf aſcribed it entirely to the juſtice of his cauſe, and was no more cautious than before. Some time after Noel Beda and his emiſſaries made extracts from ſome of his books, and accuſed him of pernicious errors, whereupon he was again ſent to priſon, and the cauſe being tried, ſentence was pronounced againſt him; viz. that his books be committed to the flames, that he retract his errors, and make a proper ſubmiſſion, and if he refuſe to comply, that he be burnt. Being a man of an undaunted, inflexible ſpirit,

he would ſubmit to nothing; and in all probability would at this time have ſuffered death, had not ſome of the judges, who perceived the violence of his accuſers, got the affair to be again heard and examined. It is thought this was owing to the intercеſſion of madame the Regent. In the mean time, Francis I. returning from Spain, and finding the danger of his counſellor from Beda and his faction, wrote to the parliament, telling them to be cautious how they proceeded, for that he himſelf would take cognizance of the affair. Soon after Berquin was ſet at liberty, which gave him ſuch courage, that he turned accuſer againſt his accuſers: he proſecuted them for irreligion; though, if he had taken the advice of Eraſmus, he would have eſteemed it a ſufficient triumph that he had got free from the perſecution of ſuch people. But not content, ſays Mr. Bayle, with eſcaping from his accuſers, he muſt needs have the honour of a victory, as a reward of his labour. Is not this like the crane (continues Bayle), who aſked for a reward after he had got his neck ſafe and ſound out of the wolf's throat? He was ſent a third time to priſon and condemned to a public recantation, and perpetual impriſonment. He would not acquieſce in this judgment; and being therefore condemned as an obſtinate heretic, he was ſtrangled on the Greve, and afterwards burnt. He ſuffered death with great conſtancy and reſolution, being then about forty years of age.

BERRIMAN (Dr. William), was the ſon of Mr. John Berriman, apothecary, in Biſhopſgate-ſtreet, London, where he was born on the 24th of September, 1688. He ſtudied at Oriel College, Oxford, where he took his ſeveral degrees, and became curate and lecturer of Allhallows in Thames-ſtreet, and lecturer of St. Michael's, Queenhithe. In 1720 he was appointed domeſtic chaplain to Dr. Robinſon, biſhop of London, who ſoon after collated him to the living of St. Andrew's Underſhaft; and in 1727 he was elected fellow of Eton College. He died on the 5th of February, 1750, in the 62d year of his age. He wrote, 1. A ſeaſonable Review of Mr. Whiſton's Account of primitive Doxologies. 2. An hiſtorical Account of the Trinitarian Controverſy, in eight Sermons, at Lady Moyer's Lecture. 3. Brief Remarks on Mr. Chandler's Introduction to the Hiſtory of the Inquiſition. 4. Sermons at Boyle's Lectures, 2 vols. 8vo. 5. Chriſtian Doctrines and Duties explained and recommended, in 2 vols. 8vo.: and other works.

BERTHEAU (Charles), an eminent French Proteſtant divine, long reſident in the city of London, was born in the year 1660, at Montpellier, where his father, whoſe name alſo was Charles, was miniſter. He ſtudied philoſophy and divinity, partly in France, and partly in Holland, and was admitted a miniſter in the ſynod held at Vigan in 1681, being then only twenty-one years of age. He was, however, the next year choſen paſtor to the church of Montpellier; but he did not make any long ſtay in that city, for he was ſoon after promoted to be one of the miniſters of the church of Paris, which met at Charenton. He continued in that ſtation about two years, and though he was yet in very early life, he diſcharged the paſtoral duties to which he was called in a manner greatly to his reputation. But when Lewis the Fourteenth thought proper, by the revocation of the edict of Nantz, to drive his Proteſtant ſubjects out of France, an act equally repugnant to juſtice, humanity, and the dictates of ſound policy, Mr. Bertheau found himſelf obliged to quit his native country. He accordingly came to England in 1685, and the following year was choſen one of the miniſters of the Walloon church, in Threadneedle-ſtreet, London, where he diſcharged the duties of the paſtoral office for about forty-four years, in ſuch a manner as procured very general applauſe. He died on the 25th of December, 1732, in the 73d year of his age, exceedingly regretted by his congregation, and by all who had the pleaſure of being acquainted with him. He was the author of two volumes of ſermons, and Diſcourſes upon the Catechiſm.

BERTIUS (Peter), a man diſtinguiſhed by religious adventures as well as letters, was born in a ſmall town of Flanders, 1565. He became profeſſor of philoſophy at Leyden, but loſt his profeſſorſhip for taking part with the Arminians. He went to Paris, where he abjured the Proteſtant religion in 1620, was made coſmographer to the king, and royal profeſſor-extraordinary of mathematics. He died in 1629, aged 64, and left ſome better things behind him than he had written about the Gomariſts and Arminians. 1. Commentaria Rerum Germanicarum, 12mo. 2. A good edition of Ptolemy's Geography, in Greek and Latin, folio. 3. De Aggeribus et Pontibus. 4. Introductio in Univerſam Geographiam.

BERTON (William), an eminent divine of the fourteenth century, and doctor in that faculty, flouriſhed about the year 1381, in the reign of Richard II. and was ſome time chancellor of the univerſity of Oxford. He is chiefly remarkable for his oppoſition to the doctrines of Wickliff: for by virtue of his office as governor of the univerſity, he appointed twelve cenſors, ſix of the order of mendicants, and ſix ſeculars, conſiſting of divines and lawyers, to examine Wickliff's opinions, who accordingly declared him an heretic. He wrote likewiſe againſt that pretended hereſiarch; and for this reaſon it is that his character is ſo differently repreſented by different authors.

BERWICK, a ſhire in Scotland, bounded by the river Tweed, on the ſouth; by Lothian, on the north; by the German Ocean, on the eaſt; and by Tiviotdale on the weſt. It abounds with corn and graſs, and has in it ſeveral ſeats of perſons of quality. The principal rivers are the Tweed, the Whiteater, Blackadder, Eye, and Ednel. The principal place is the town and caſtle of Dunſe, which is the beſt place for trade in the country. It ſends two members to parliament.

BERWYN HILLS, lofty hills at the N. E. angle of Merionethſhire, beneath which ſpreads the fine vale, in which flows the infant river Dee.

BERY, or BURY, the villa or ſeat of habitation of a nobleman, a dwelling or manſion-houſe, being the chief of a manor: from the Saxon *beorg*, which ſignifies a *hill* or *caſtle*; for heretofore noblemen's ſeats were caſtles ſituated on hills, of which we have ſtill ſome remains; as in Herefordſhire, there are the *beries* of Stockton, Hope, &c. It was anciently taken for a ſanctuary.

BERYTUS (anc. geog.), a ſea-port town of Phœnicia on the Mediterranean, ſo ancient as to be thought to have been built by Saturn. It was deſtroyed by Tryphon, but rebuilt by the Romans. Agrippa placed here two legions, whence it became a colony. It enjoyed the *jus Italicum*, and had an excellent ſchool for the ſtudy of the law in Juſtinian's time. Now *Beroot*; which ſee.

BESSICA (anc. geog.), a diſtrict of Thrace towards mount Hæmus to the ſouth of the Hebrus. It was inhabited by a fierce and barbarous people noted for their robberies. Their chief city Uſcudama is now known by the name of *Adrianople*. They lived under their own kings till the conſulate of M. Licinius Lucullus and C. Caſſius Varus; when the conſul Lucullus invaded their country, and having gained a great victory over them, took their metropolis, and ſubjected the whole nation to the Roman laws. The Romans, notwithſtanding they had ſubdued them by force of arms, ſtill ſuffered them to live under their own kings; for Piſo, while he governed Macedon in quality of proconſul, having treacherouſly ſeized Rabocentus, whom Suetonius calls *prince of the Beſſi*,

cauſed him to be publicly beheaded. This affront ſo exaſperated the whole nation, that they revolted; but were overthrown in a great battle by Octavius the father of Auguſtus. During the civil wars of Rome they attempted anew to recover their liberty, but were again defeated by the famous M. Brutus. In the reign of Auguſtus one Vologeſes, a native of the country, and prieſt of Bacchus, having, under pretence of religion, drawn together great crowds of people, made himſelf maſter of the whole country, and, entering the Cherſoneſus, committed there the moſt dreadful ravages. He was at laſt, however, overcome by L. Piſo; who obliged the ſavage inhabitants to lay down their arms, and ſubmit to ſuch conditions as he was pleaſed to impoſe upon them. From this time the Beſſi continued ſubject to the Romans without attempting any more to regain their liberty.

BESSIS (*Encycl.*) miſſpelt Besis.

BETA, the Beet (*Encycl.*). The following account is given of the extraction of ſugar from the beet-root, by Lampadius, profeſſor of chemiſtry at the mineral academy of Freybourg. He took a hundred pounds of the yellow beet, called, in Germany, *runckel-ruben*, by Linnæus *beta ciclaris*, from which he obtained four pounds of ſugar. He peeled his beets, and removed all the ſticky parts, then raſped them, and ſqueezed out the juice: by this proceſs he obtained forty-four pounds of liquid. This he placed in a ſtew-pan, and then, after heating ſome charcoal thoroughly, broke it into grains of the ſize of a pea, of which he threw forty-four ounces into the liquor, taking care not to throw in any of the duſt, which would have diſcoloured the ſugar: he then boiled the whole for a quarter of an hour, after which he filtered it through flannel, and then replaced the liquor thus filtered on the fire, to gain the conſiſtency of ſyrup. On this operation the cryſtallization principally depends. When the juice had attained the conſiſtency required, he put it in a cool place, and left it there a fortnight; the cryſtallization took place, and at the end of that period it appeared like a kind of pap of a dark brown colour, and when he took up a ſmall quantity in his fingers, he could eaſily feel the cryſtallized particles in ſmall grains. Lampadius then paſſed the whole contents through a linen cloth, preſſing it ſtrongly. The cryſtals which remained in the cloth were put in lime-water, in which was mixed a pound of ox's blood; the whole was then placed on the fire, and great care taken during the boiling to keep it well ſkimmed: it was then filtered through flannel, and put in a cool place to cryſtallize: after remaining eight-and-forty hours, it was turned out in a linen cloth, and the cryſtals found to be whiter and larger than at firſt: it was again boiled in lime-water, with a pound of ſkimmed milk, ſtill taking care as it boiled to keep it free from ſcum; the cryſtals obtained this time were blue; they were reduced to powder, which, being placed in a mould properly wetted, turned out a ſugar loaf of four pounds weight, pretty white, and in flavour exactly ſimilar to the ſugar in general uſe. In February Profeſſor Lampadius repeated his experiments: the juice he obtained was not quite ſo white as the firſt, and produced him but three pounds and a half of ſugar. From the different reſidues and ſyrups obtained by filtration, he acquired each time ſeven pounds of a kind of rum or arrack, which was very ſtrong. Encouraged by this ſucceſs, Profeſſor Lampadius, and a rich citizen and farmer, named Kanitzki, eſtabliſhed an extenſive ſugar manufactory, of the ſucceſs of which Lampadius has publiſhed an account.

BETHAM (Edward, B.D.), received his education at Eton, of which ſeminary he was a diſtinguiſhed ornament; was elected from thence to King's College, Cambridge, in 1728, of which he became a fellow in 1731; was ſome time burſar, and by the provoſt and fellows, when ſenior fellow, was preſented to the living of Greenford in Middleſex. In 1771 the provoſt and fellows of Eton elected him to the vacant fellowſhip in that ſociety. So unexceptionable was his life, that he may truly be ſaid to have made no enemy in the progreſs of it. Of manners gentle, of friendſhip moſt ſuſceptible, of knowledge extenſive, he acquired the praiſe and commendation of all men. His fortune was not extenſive, yet his liberality kept more than equal pace with it, and pointed out objects and things to which it was impoſſible for his nature to reſiſt lending his aſſiſtance. In his life-time he gave two thouſand pounds for the better maintaining a botanical garden at Cambridge, thereby encouraging a ſtudy which did peculiar honour to his taſte, and materially benefited mankind. So humane was his diſpoſition, that he founded and endowed a charity-ſchool in his own pariſh; and this moſt nobly in his life-time, when avarice might have forbid it, or the fear of want might have excepted againſt it. As in his life he indicated the moſt extenſive liberality, ſo at his death he exhibited a laſting record of his gratitude. Impreſſed with the higheſt ſenſe of the munificence of the royal founder of Eton, within whoſe walls he had imbibed the firſt ſeeds of education, he, by his will, directed a ſtatue of marble, in honour of Henry VI. to be erected at the expence of ſix hundred pounds.

BETHLEHEM, a town of North America, in the State of Pennſylvania, on the river Lehigh, a weſtern branch of the Delaware. The town being partly on an eminence, and partly on the lower banks of the Manakes (a fine creek, affording trout and other fiſh), has a very pleaſant and healthy ſituation, and is frequently viſited, in ſummer, by the gentry from different parts. It is the principal ſettlement of the Moravians in America. They were fixed here by Count Zinzendorf in 1741. They have a church; a public meeting-hall; the ſingle brethren's or young men's houſe, where the ſingle tradeſmen, journeymen, and apprentices, are boarded at a moderate rate, and have morning and evening prayers; the ſingle ſiſters' or young women's houſe, where they live, and are employed, under the care of female inſpectors, at liberty, however, to go about their buſineſs in the town, or to take a walk for recreation, and every year ſome of them are married; and a houſe for widows. The houſes are 60 in number, moſtly built of free-ſtone; and the inhabitants are between 500 and 600. The German langnage is more in uſe here than the Engliſh: the latter, however, is taught in the ſchools; and divine ſervice is performed in both languages. Bethlehem is 53 miles north of Philadelphia. Long. 75. 8. W. Lat. 40. 37. N.

BETON, a kind of water-cement. The name of *Beton* is applied in France to every compoſition of mortar that is intended to keep out water, or to be uſed in works under water, and which is ſuſceptible of becoming almoſt inſtantaneouſly ſolid.

Beton may be prepared in various ways. 1. The mortar of Loriot, when well prepared, holds water very well; I have uſed it for plaſtering the interſtices between the ſlabs of a terrace, and not the ſmalleſt filtration took place. I keep a maſs of this mortar formed into the ſhape of a vaſe, which, when filled with water, and placed upon a ſheet of paper, does not leave upon it any perceptible traces of humidity.

2. The mortar of Lafaye does not harden with equal rapidity; but when once it has become ſolid, it holds water very well without growing ſoft.

3. The mortar, of which Mr. Smeaton ſpeaks, made with equal parts of lime and terras, is a real beton, or water cement, as it may be uſed in the water without becoming ſoft.

4. The mortars compoſed with Pozzolana may alſo be uſed in the water, and when once they have become hard, they are ſuperior to all others in durability and reſiſtance to the motions of the water.

The moſt common kind of water cement is that which is made with pure lime. It is formed into priſms of hard paſte, which are ſunk into the water to form a wall; or it is poured into a ſpace, 21 or 22 decimeters in breadth, between two walls, in the manner of coffer-work, intended to confine the water in thoſe parts of canals that are elevated above the ground.

BETTS (John), an eminent phyſician in the ſeventeenth century, was ſon of Mr. Edward Betts by his wife Dorothy, daughter of Mr. John Venables, of Rapley in Hampſhire. He was born at Wincheſter, and educated there in grammar learning. From thence he was elected a ſcholar of Corpus-Chriſti College in Oxford, in February, 1642. He took the degree of bachelor of arts, February 9, 1646. Being ejected by the viſitors appointed by the parliament in 1648, he applied himſelf to the ſtudy of phyſic, and commenced doctor in that faculty, April 11, 1654, having accumulated the degrees. He practiſed with great ſucceſs at London, but chiefly among the Roman-catholics, being himſelf of that perſuaſion. He was afterwards appointed phyſician in ordinary to King Charles II. The time of his death is not certainly known. Dr. Betts wrote the two following phyſical treatiſes, viz. 1. Of the Origin and Nature of the Blood. 2. The Anatomy of Thomas Parr, who died in the 152d year and ninth month of his age, with the obſervations of the celebrated Dr. William Harvey, and others of the king's phyſicians who were preſent.

BEVERGERN, a town of Germany, in the circle of Weſtphalia and dioceſe of Munſter, 22 miles from that city.

BEVERIDGE (*Encycl.*). Biſhop Beveridge has had a high character given him by ſeveral writers. The author of a letter publiſhed in the Guardian, having made an extract of the biſhop's firſt ſermon, in the ſecond volume, relating to the Deity, tells us, that it may, for acuteneſs of judgment, ornament of ſpeech, and true ſublime, be compared with any of the choiceſt writings of the ancient fathers, or doctors of the church, who lived neareſt to the apoſtles' times.

Biſhop Beveridge left many learned works. Thoſe publiſhed by himſelf are as follow: 1. De Linguarum Orientalium Præſtantia. 2. Inſtitutionum Chronologicarum Libri Duo. 3. Sunodikon, ſive Pandectæ S.S. apoſtolorum et conciliorum. 4. Codex Canonum Eccleſiæ Primitivæ vindicatus et illuſtratus. 5. The Church Catechiſm explained. Beſides the above-mentioned works of this prelate, we have the following, publiſhed after his death. 6. Private Thoughts upon Religion. 7. Private Thoughts upon a Chriſtian Life. 8. The great Neceſſity and Advantage of public Prayer and frequent Communion. 9. One hundred and fifty Sermons and Diſcourſes on ſeveral Subjects. 10. Theſaurus Theologicus; or, a complete Syſtem of Divinity. 11. A Defence of the Book of Pſalms, collected into Engliſh Metre, by Thomas Sternhold, John Hopkins, and others. 12. Expoſition of the Thirty-nine Articles.

BEWCASTLE, a village in Cumberland on the river Leven, ſaid to have been built about the time of the Norman conqueſt. The church is in ruins; and in the church-yard is an ancient croſs, five yards high, on the ſides of which are ſeveral ſculptures, but the inſcriptions are not legible.

BEWLEY, or Beaulieu, a river in Scotland, which riſes in the N. of Inverneſsſhire, and flowing along the S. border of Roſsſhire, forms the fine eſtuary on which ſtands Inverneſs, and Fort St. George, and which terminates in the frith of Murray. At the mouth of this river is the ferry of Kiſſock, near which is a good ſalmon fiſhery.

BEX, a village in the diſtrict of Aigle and canton of Bern, in Swiſſerland, near the little town of St. Maurice, which guards the entrance from that canton into the Lower Valais. It is remarkable for its delightful ſituation, and the ſalt-works near it. The largeſt ſaline is entered by a paſſage cut out of the ſolid rock. Travellers, who have the curioſity to explore theſe gloomy abodes, are furniſhed with lighted torches, and dreſſed in a coarſe habit, to defend them from the drippings that fall from the roof and ſides of the paſſage.

BEZIERS, a town of France, in the department of Herault and late province of Languedoc. It is an ancient, large, and handſome town, in a delightful ſituation, and was lately an epiſcopal ſee. The inhabitants are above 17,000 in number. The remains of a circus, and ſome inſcriptions, beſpeak its ancient grandeur. It has an academy of ſciences and two hoſpitals; is ſeated near the Royal Canal, on a hill, at the foot of which flows the Obre; and is 8 miles N. of the Mediterranean, and 12 N.E. of Narbonne. Long. 3. 18. E. Lat. 21. 0. N.

BIBRACTE (anc. geog.), a citadel of the Æduni, according to Strabo; but Cæſar deſcribes it as a town well fortified, very large and populous, and of the greateſt authority among that nation. Now *Beureſt*, or Bevray; a deſolate place four miles to the north-weſt of Autun.

BIBROCI (anc. geog.), an ancient people of Britain, now the *Hundred of Bray* in Berks.

BICETRE, a caſtle, two miles from Paris, where lunatics, beggars, vagabonds, pilferers, and diſſolute young men, were impriſoned.

BIDASSOA, a river of Spain on the frontiers of France, which has its ſource in the Pyrenean mountains, and falls into the ſea between Andaye and Fontarabia.

BIDIS (anc. geog.), a ſmall city of Sicily not far from Syracuſe, whoſe ruins are ſtill to be ſeen in the territory of Syracuſe, about fifteen miles to the ſouth-weſt, with a church called S. Giovanni di Bidini.

BIGGAR, a town of Lanerkſhire, in Scotland, ten miles S.E. of Carnwath. Here are the ruins of a collegiate church, founded in 1545.

BIJORE, a ſmall province of Hindooſtan Proper, lying between the rivers Indus and Attock, having Cabul on the W. the Bokharian mountains on the N. Caſhmere on the E. and Piſhour or Peiſhore on the S. Its dimenſions are not more than fifty miles by twenty. It is full of mountains and wilds, inhabited by a ſavage and turbulent race. In this province is the famous mountain Aornus, the taking of which was one of the moſt ſplendid exploits of Alexander in theſe parts. Arrian deſcribes it to be eighteen or twenty miles in circuit at the baſe, to be of vaſt elevation, and acceſſible by one narrow paſs only, cut out of a rock. On the ſummit was a great extent of arable and paſture land, with ſprings of water, ſo that a garriſon of 1000 men might ſubſiſt without any extraneous aid. This celebrated mountain lies about fifty-five miles N.N.E. from Piſhour.

BILBILIS (anc. geog.), a town of Hiſpania Citerior, the birth place of Martial; now ſuppoſed to be Calatajud in Arragon on the Xalon. See Calatajud.

BILMA, a vaſt burning deſert of Africa, to the S E. of Fezzan, between 21° and 25° N. lat. Surrounded by this dreary ſolitude, the traveller ſees, with a dejected eye, the dead bodies of the birds that the violence of the wind has brought from happier regions; and liſtens, with horror, to the driving blaſt, the only ſound that interrupts the awful repoſe of the deſert.

BINCAZA, a ſea-port of Africa in the kingdom of Tripoli, 140 miles W. of Derna. Long. 19. 10. E. Lat. 32. 20. N.

BINCHESTER, a village on the river Were, near the city of Durham. By ſeveral inſcriptions and monuments,

it appears to have been a Roman town (Vinovium); many Roman coins are dug up here, which are called Binchester pennies; and two altars have been discovered, importing, that the twentieth legion was stationed in this place during the wars between the Picts and Caledonians.

BINGIUM (anc. geog.), a village or town of the Vangiones in Gallicia Belgica, seated at the confluence of the Nave and Rhine. Now *Bingen;* which see.

BISCHOFS WERDA, a town of Germany, in the circle of Upper Saxony, in Misnia, three miles from Dresden.

BISLEY, a village in Surrey, noted for a spring called St. John Baptist's Well, near the church of that name, whose water is said to be colder than any other in the summer, and warmer in the winter. It is three miles N. of Woking.

BISNAGUR, a town of the peninsula of Hindoostan, in the kingdom of Mysore, seated on the W. bank of the river Tungebadra. It was the capital of the ancient kingdom of Narsinga, and when visited by Cæsar Frederic in 1567, was a large city. It is 140 miles E. by S. of Goa. Long. 76. 10. E. Lat. 15. 30. N.

BLACK (Joseph), a physician very eminent in chemical science, was born at Bourdeaux, in France, of British parents, in 1728. He came at an early age to Great Britain, and was educated for the medical profession at the university of Glasgow. Dr. Cullen was at that time lecturer in chemistry there; and though his name does not rank high among the discoverers in that science, his methodical and investigating spirit rendered him a very useful teacher of it; and the popularity of chemical studies among the medical students of Scotland is greatly to be attributed to his mode of instruction. Mr. Black became one of his favourite pupils, enjoyed the free use of his laboratory, and assisted him in his experiments; whence he imbibed a decided taste for this branch of natural philosophy. In 1754 he took the degree of doctor of physic in the university of Edinburgh, where he had studied for some time; and the choice of a subject for his inaugural dissertation gave proof of his attachment to chemical topics. It was, De humore acido a cibris orto, & Magnesia alba. The germ of doctrine which he brought to light in his thesis, was fully developed in a paper read the next year before a society in Edinburgh, and published in the second volume of the Essays Physical and Literary, 1756, containing experiments on magnesia alba, quick-lime, and some other alkaline substances. In this, by the most ingenious and philosophical series of researches, he irrefragably proved the existence of an aërial fluid, which he denominated fixed air, the presence of which gave mildness, and its absence causticity, to alkalies and calcareous earths. This beautiful discovery is the undoubted parent of all those wonderful acquisitions in the knowledge of aërial bodies, which have immortalised the names of Cavendish, Priestley, Lavoisier, and others, and have given a new form to chemical philosophy. In 1756, on the removal of Dr. Cullen to Edinburgh, Dr. Black became professor of medicine, and lecturer in chemistry, at Glasgow. In the following year he enriched the science of chemistry with the curious and important doctrine of latent heat, in which he explained, in a most perspicuous and satisfactory manner, the connection of heat with fluidity, the phenomena that occur during the processes of freezing and boiling, and the manner in which they affect the thermometer. These discoveries, the result of his sagacity, and great experimental skill, have unquestionably led the way to all the subsequent facts relating to this part of chemistry, which have been added by several of the most eminent philosophers of the present day, and would alone have sufficed to confer celebrity on the name of Black. So high was his reputation, that on the vacancy in the chemical chair of Edinburgh, in 1765, made by the removal of Dr. Cullen to another department, all eyes were turned on Dr. Black, as the only man adequate to sustain in his branch the superiority which that famed medical school had acquired in almost all others. He was accordingly elected, and for a long series of years discharged the duties of his office with universal applause, equally distinguishing himself by the ease, perspicuity, and elegance, with which he communicated instruction in his lectures, and his neatness and accuracy in performing experiments. Very complete manuscript copies of his lectures were taken by several of his students, especially in the earlier part of his teaching, when they contained a great variety of matter that was hardly yet known to the chemical world, and these copies, read with avidity by the lovers of this science, have highly contributed to secure to him the honour of those discoveries, and of that original mode of reasoning, which he scarcely made public in any other form.

He published nothing after his election to the chemical chair at Edinburgh, but a paper On the Effect of Boiling upon Water in disposing it to freeze more readily, printed in the sixty-fifth volume of the London Philos. Trans. for 1774; and An Analysis of the Waters of some Hot-springs in Iceland, in the third volume of the Edinburgh Philos. Trans. 1791. The latter contains matter very interesting to the chemist, concerning the formation of the siliceous stone, which is deposited by these wonderful springs; and has long been considered as a model of neatness and accuracy in the analysis of mineral waters. Two of his letters on chemical subjects have been published by Prof. Crell, and Lavoisier. It must, indeed, be confessed, that the active vigour of his mind seems to have undergone an early decline, and that, either through indolence, or a dislike of being taught by newer men, he suffered others to pass him in the very career of discovery which he had opened. He was long a strenuous opposer of the new theories in chemistry; and injured his character for candour and liberality, both by invidiously avoiding altogether the mention of some justly celebrated names, and by undervaluing the merits of others. At length, however, he became an avowed convert to the principles of the French chemists, and did not hesitate to make amends, by his applause, for his former opposition. Dr. Black never distinguished himself as a practical physician. His manners were simple; his temper cold and reserved; and his habits of life adapted to his own convenience. His health began to decline some years before his death, which at length took place suddenly in his sixty-second year, on December 6, 1799. He was never married. He was a member of the philosophical societies of London and Edinburgh; and obtained, at the solicitation of Lavoisier (a man superior to all envy), the distinguished honour of being one of the eight foreign members of the Academy of Sciences of Paris.

BLACKHEATH, a fine elevated plain, five miles S.E. of London, commanding beautiful prospects, and situated in the parishes of Greenwich, Lewisham, and Lee. It is adorned with handsome villas; and on the skirts of it, but in the parish of Charlton, is Morden College, for decayed merchants. On this plain Wat Tyler mustered 100,000 rebels. On the ascent to the heath, in the road to Dover, is a curious cavern, discovered in 1780.

BLACKLOCK (the Rev. Dr.), an ingenious divine and poet of Scotland, was born at Annan, in the county of Annandale, in Scotland, in the year 1721. His parents were natives of Cumberland, in which county his paternal ancestors had lived from time immemorial. Young Blacklock, before he was six years old, was totally deprived of his sight by the small-pox. His father had intended to bring him up to some trade; but as this misfortune rendered him incapable of any, all that this worthy parent could do, was to shew the utmost

attention to him, in this unhappy ſituation. This left ſuch an indelible impreſſion on the mind of his ſon, that he mentioned it, ever after, with the greateſt warmth of gratitude and affection. Of this he has given a very ſtriking proof in his poems. What was wanting to this poor youth, from the loſs of his ſight, and the narrowneſs of his fortune, ſeems to have been compenſated to him by the goodneſs of his heart, and the capacities of his mind. It was very early that he ſhewed a ſtrong inclination to poetry in particular. His father, and a few other friends, uſed often to read to divert him; and, among the reſt, they read ſeveral paſſages out of ſome of our poets. Theſe were his chief entertainment and delight. He heard them not only with uncommon pleaſure, but with a ſort of congenial enthuſiaſm; and, from loving and admiring them ſo much, he ſoon began to endeavour to imitate them. Among theſe early eſſays of his genius, there is one inſerted in his works which was compoſed when he was only twelve years old, and has ſomething very pretty in the turn of it, and very promiſing for one of ſuch a tender age. Indeed, it is obſervable, that there have been few of our moſt eminent poets who have not given very early proofs of their genius this way; a quick and promiſing bloſſom pre-indicating, as it were, the abundance and excellence of the fruit which their maturity affords.

In 1740, Mr. Blacklock's father having been informed that a kiln, belonging to a ſon-in-law of his, was giving way, his ſolicitude for his intereſt made him venture in below the ribs, to ſee where the failure lay; when the principal beam coming down upon him, with eighty buſhels of malt, he was inſtantly cruſhed to death.

When this melancholy event happened, Mr. Blacklock had juſt attained his nineteenth year; and as the loſs of his good father occaſioned his falling into more hands than he had been accuſtomed to before, he began by degrees to be more talked of, and his extraordinary talents to be better known. About a year after, he was ſent for to Edinburgh by Dr. Stevenſon, a man of taſte, and one of the phyſicians of that city, who had the goodneſs to ſupply him with every thing neceſſary for his living and ſtudying in the univerſity. Mr. Blacklock juſtly conſidered this gentleman as his Mæcenas; and the firſt poem in his works was a tribute of gratitude which he addreſſed to him, in imitation of the firſt Ode of Horace, by which the Roman bard has immortalized his illuſtrious patron.

Mr. Blacklock ſtudied at Edinburgh ten years; in which time he not only acquired great knowledge in the Greek, Latin, and French languages, but made a conſiderable progreſs alſo in all the ſciences. What was ſtill more extraordinary, he attained great excellence in poetry, although the chief inlets to poetical ideas were cloſed up to him, and all the viſible beauties of the creation had been long blotted from his memory. How far he contrived, by the uncommon force of his genius, to compenſate for this vaſt defect; with what elegance and harmony he often wrote; with how much propriety, ſenſe, and emotion, it is as eaſy to perceive, on reading his poems, as it is difficult to account for it. Conſidered in either of theſe lights, he muſt be allowed to have an extraordinary ſhare of merit; but if thoroughly conſidered in all together, we may be allowed to ſay, with his friend the late celebrated Mr. Hume, that he muſt be regarded as a prodigy.

Mr. Hume, alſo, ſpeaking of his moral character, obſerved, that "his modeſty was equal to the goodneſs of his diſpoſition, and the beauty of his genius;" and Mr. Spence, ſpeaking of the pieces which Dr. Blacklock would not ſuffer to be printed, obſerves, that they abound with ſo many poetical beauties, that nothing could do him greater honour.

Mr. Spence's account of Mr. Blacklock having been firſt ſeparately publiſhed in 1754, it was afterwards prefixed to a quarto edition of his poems, publiſhed by ſubſcription, under the patronage of that gentleman. By this publication a conſiderable ſum of money was obtained, and, ſoon after, our poet was fixed in an eligible ſituation in the univerſity of Edinburgh. In 1760 he contributed ſome poems to a Scotch collection, publiſhed at Edinburgh; and there being ſtyled the Rev. Mr. Blacklock, it appeared that he had then entered into holy orders. In 1766 he obtained the degree of doctor of divinity; and in 1767 he publiſhed Paracleſis, or Conſolations deduced from natural and revealed Religion, in two diſſertations, 8vo. In 1768 he printed Two Diſcourſes on the Spirit and Evidences of Chriſtianity, tranſlated from the French of M. Armand. Theſe were his principal productions. At length, after a long life, devoid indeed of variety or adventure, but conſtantly devoted to the moſt laudable purſuits, this good and ingenious man terminated his mortal exiſtence on the 14th of July, 1791, being then ſeventy years of age.

BLAIR (Dr. Hugh), an eminent Scots divine, was born in Edinburgh, on the 7th day of April, 1718. His father, Mr. John Blair, a reſpectable merchant in that city, was a deſcendant of the ancient family of Blair, in Ayrſhire, and grandſon of the famous Mr. Robert Blair, miniſter of St. Andrew's, chaplain to Charles I. and one of the moſt zealous and diſtinguiſhed clergymen of that period. This worthy man, though firmly attached to the cauſe of freedom, and to the Preſbyterian form of church government, by his ſteady, temperate conduct, commanded the reſpect even of his opponents; and in preference to all the other leaders of the covenanting party, he was ſelected by the king to fill an office which, from the circumſtances of the time, gave frequent acceſs to the royal perſon. His talents ſeem to have deſcended as an inheritance to his poſterity. For, of the two ſons who ſurvived him, David, the eldeſt, was a clergyman of eminence in Edinburgh, father to Mr. Robert Blair, miniſter of Athelſtonford, author of *The Grave* a poem; and grandfather to his majeſty's ſolicitor general for Scotland. From his youngeſt ſon Hugh, who was a merchant, and filled a high ſtation in the magiſtracy of Edinburgh, ſprung the learned clergyman, who is the ſubject of this narrative.

After the uſual grammatical courſe at ſchool, Dr. Blair entered the Humanity Claſs in the Univerſity of Edinburgh, in October 1730, and ſpent eleven years there, aſſiduouſly employed in the literary and ſcientific ſtudies preſcribed by the church of Scotland. During this period he was diſtinguiſhed among his companions both for diligence and proficiency; and obtained from the profeſſors under whom he ſtudied, repeated teſtimonies of approbation. One of them deſerves to be mentioned particularly, becauſe, in his own opinion, it determined the bent of his genius towards polite literature. An eſſay, Περι του καλου, or, *On the Beautiful*, written by him when a ſtudent of logic in the uſual courſe of academical exerciſes, had the good fortune to attract the notice of Profeſſor Stevenſon, and, with circumſtances honourable to the author, was appointed to be read in public at the concluſion of the ſeſſion. This mark of diſtinction made a deep impreſſion on his mind; and the eſſay which merited it, he ever after recollected with partial affection, and preſerved to the day of his death as the firſt earneſt of his literary reputation.

Dr. Blair now commenced a method of ſtudy which contributed much to the accuracy and extent of his knowledge, and which he continued to practiſe occaſionally even after his reputation was fully eſtabliſhed. It conſiſted in making abſtracts of the moſt important works which he read, and in digeſting them according to the train of his own thoughts. Hiſtory, in particular, he reſolved to ſtudy in this manner; and, in concert with ſome of his youthful aſſociates, he conſtructed a very comprehenſive ſcheme of *chronological tables*,

calculated to receive into its proper place every important fact that ſhould occur. This ſcheme was afterwards improved, filled up, and given to the puplic by Dr. John Blair, prebendary of Weſtminſter, in his well-known work on Chronology.

In 1739, Dr. Blair took the degree of A.M. on which occaſion he defended a theſis *De Fundamentis et Obligatione Legis Naturæ*, which contains a ſhort but maſterly diſcuſſion of the ſubject, and exhibits, in elegant Latin, an outline of the moral principles which have been ſince more fully unfolded and illuſtrated in his diſcourſes from the pulpit.

Edinburgh, about this period, numbered among her pupils many who were ſoon to make a diſtinguiſhed figure in the civil, eccleſiaſtical, and literary hiſtory of their country. With moſt of them Dr. Blair entered into habits of intimate connection, which no future competition or jealouſy occurred to interrupt, which held them united through life in their views of public good, and which had the moſt beneficial influence on their own improvement, on the progreſs of elegance and taſte among their contemporaries, and on the general intereſts of the community to which they belonged.

After his academical courſe, he underwent the cuſtomary trials before the Preſbytery of Edinburgh, and received a licence to preach the Goſpel, on the 21ſt of October, 1741. His public life now commenced with very favourable proſpects. The reputation which he brought from the univerſity was fully juſtified by his firſt appearances in the pulpit; and, in a few months, the fame of his eloquence procured for him a preſentation to the pariſh of Coleſſie in Fife, where he was ordained to the office of the holy miniſtry, on the 23d of September, 1742. But he was not permitted to remain long in this rural retreat. A vacancy in the ſecond charge of the Canongate of Edinburgh furniſhed to his friends an opportunity of recalling him to a ſtation more ſuited to his talents. And, though one of the moſt popular and eloquent clergymen in the church was placed in competition with him, a great majority of the electors decided in favour of this young orator, the choice of whom took place in July 1743.

In this ſtation Dr. Blair, for eleven years, diſcharged with great fidelity the various duties of the paſtoral office. His diſcourſes from the pulpit in particular attracted univerſal admiration. They were compoſed with uncommon care; and, occupying a middle place between the dry metaphyſical diſcuſſion of one claſs of preachers, and the looſe incoherent declamation of another, they blended together, in the happieſt manner, the light of argument with the warmth of exhortation, and exhibited captivating ſpecimens of what had hitherto been rarely heard in Scotland, the poliſhed, well-compacted, and regular didactic oration.

In conſequence of a call from the town-council and general-ſeſſion of Edinburgh, he was tranſlated from the Canongate to Lady Yeſter's, one of the city churches, on the 11th of October, 1754: and on the 15th day of June, 1758, he was promoted to the High Church of Edinburgh. To this charge he was raiſed at the requeſt of the lords of council and ſeſſion, and of the other diſtinguiſhed official characters who have their ſeats in that church. And the uniform prudence, ability, and ſucceſs, which, for a period of more than forty years, accompanied all his miniſterial labours in that conſpicuous and difficult ſtation, ſufficiently evince the wiſdom of their choice.

Hitherto his attention ſeems to have been devoted almoſt excluſively to the attainment of profeſſional excellence; and to the regular diſcharge of his parochial duties. No production of his pen had yet been given to the world by himſelf, except two ſermons preached on particular occaſions, ſome tranſlations, in verſe, of paſſages of Scripture for the pſalmody of the church, and a few articles in the Edinburgh Review; a publication begun in 1755, and conducted for a ſhort time by ſome of the ableſt men in the kingdom. But ſtanding as he now did at the head of his profeſſion, and releaſed by the labour of former years from the drudgery of weekly preparation for the pulpit, he began to think ſeriouſly on a plan for teaching to others that art which had contributed ſo much to the eſtabliſhment of his own fame. With this view, he communicated to his friends a ſcheme of Lectures on Compoſition; and, having obtained the approbation of the univerſity, he began to read them in the college on the 11th of December, 1759. To this undertaking he brought all the qualifications requiſite for executing it well; and along with them a weight of reputation, which could not fail to give effect to the leſſons he ſhould deliver. For, beſides the teſtimony given to his talents by his ſucceſſive promotions in the church, the univerſity of St. Andrew's, moved chiefly by the merit of his eloquence, had in June 1757 conferred on him the degree of D.D. a literary honour which, at that time, was very rare in Scotland. Accordingly his firſt Courſe of Lectures was well attended, and received with great applauſe. The patrons of the univerſity, convinced that they would form a valuable addition to the ſyſtem of education, agreed in the following ſummer to inſtitute a rhetorical claſs, under his direction, as a permanent part of their academical eſtabliſhment: and, on the 7th of April, 1762, his majeſty was graciouſly pleaſed "To erect and endow a profeſſorſhip of rhetoric and belles-lettres in the univerſity of Edinburgh, and to appoint Dr. Blair, in conſideration of his approved qualifications, regius profeſſor thereof, with a ſalary of 70l." Theſe Lectures he publiſhed in 1783, when he retired from the labours of the office; and the general voice of the public has pronounced them to be a moſt judicious, elegant, and comprehenſive ſyſtem of rules for forming the ſtyle and cultivating the taſte of youth.

About the time in which he was occupied in laying the foundations of this uſeful inſtitution, he had an opportunity of conferring another important obligation on the literary world, by the part which he acted in reſcuing from oblivion the *poems of Oſſian*. It was by the ſolicitation of Dr. Blair and Mr. John Home that Mr Macpherſon was induced to publiſh his Fragments of Ancient Poetry; and their patronage was of eſſential ſervice in procuring the ſubſcription which enabled him to undertake his tour through the Highlands for collecting the materials of Fingal, and of thoſe other delightful productions which bear the name of Oſſian. To theſe productions Dr. Blair applied the teſt of genuine criticiſm, and ſoon after their publication gave an eſtimate of their merits in a diſſertation, printed in 1763.

The great objects of his literary ambition being now attained, his talents were for many years conſecrated ſolely to the important and peculiar employments of his ſtation. It was not till the year 1777 that he could be induced to favour the world with a volume of the Sermons which had ſo long furniſhed inſtruction and delight to his own congregation. But this volume being well received, the public approbation encouraged him to proceed: three other volumes followed at different intervals; and all of them experienced a degree of ſucceſs of which few publications can boaſt. They circulated rapidly and widely wherever the Engliſh tongue extends; they were ſoon tranſlated into almoſt all the languages of Europe; and his preſent majeſty, with that wiſe attention to the intereſts of religion and literature which diſtinguiſhes his reign, was graciouſly pleaſed to judge them worthy of a public reward. By a royal mandate to the exchequer in Scotland, dated July 25th, 1780, a penſion of 200l. a-year was conferred on their author, which was continued till his death, which happened on the 27th of December 1800.

He left in the hands of the printer a fifth volume of Sermons, which, it ſeems, from the account of the Reverend Dr.

Finlayson, who publiſhed them (together with the author's life from whence we draw this abridgment), were compoſed at very different periods of his life. They were however all written out anew in his own hand, and in many parts re-compoſed, during the courſe of the ſummer preceding his death, after he had completed his eighty-ſecond year. The laſt of them which he compoſed, though not the laſt in the order adopted for publication, was the ſermon on a Life of Diſſipation and Pleaſure—a ſermon written with great dignity and eloquence, and which ſhould be regarded as his ſolemn parting admonition to a claſs of men, whoſe conduct is highly important to the community, and whoſe reformation and virtue he had long laboured moſt zealouſly to promote.

The ſermons which he has given to the world are univerſally admitted to be *models in their kind*; and they will long remain durable monuments of the piety, genius, and ſound judgment of their author. But they formed only a ſmall part of his compoſitions in this way. Theſe, however, ſenſible of the injury done to the fame of departed authors by the publication of their literary fragments, and too modeſt to attribute to them the degree of merit requiſite for the preſs, he ſtrictly forbad the publication of.

Dr. Blair, from a natural diſlike to any ſituation which might expoſe him to the neceſſity of taking the ſmalleſt part in the conteſts of eccleſiaſtical politics, would never conſent to become moderator of the general aſſembly of the church of Scotland. His opinions, however, were frequently reſorted to; and the great reputation he had acquired in the diſcharge of his public duties, as well as the great reſpectability of his private character, always gave them conſiderable weight.

In April 1748, Dr. Blair married his couſin, Catharine, daughter of the Rev. James Bannaſtine, one of the miniſters of Edinburgh, by whom he had a ſon who died in his infancy, and a daughter, who lived to her 21ſt year. His domeſtic enjoyments were alſo fatally interrupted by the death of Mrs. Blair, which happened a few years before his own.

This ineſtimable man carried with him the trueſt regrets of all who knew him both in public and private life; a funeral ſermon was preached at his burial, and the magiſtrates directed his church to be put in mourning.

BLAIR ATHOL, a village of Perthſhire, in an angle formed by the rivers Tilt and Garry. Cloſe by it is Blair Caſtle, a noble ſeat of the Duke of Athol's, on an eminence, amid a beautiful plain ſurrounded by hills, woods, and deep glens. In its vicinity are many fine waterfalls. Blair Athol is 28 miles N.W. of Perth. Long. 3. 41. W. Lat. 56. 46. N.

BLANCA, an uninhabited iſland to the N. of Margaretta, near Terra Firma. Long. 64. 30. W. Lat. 11. 50. N.

BLANDA (anc. geog.), a Roman city in the territory of Barcino in Hiſpania Citerior; now *Blanes*, a ſea-port town of Catalonia, ſituated near the river Tordara. E. Long. 3. 40. N. lat. 41. 30.

BLANDONONA (anc. geog.), a ſmall city of Liguria in Italy; now *Bron*, or *Broni*. See that article.

BLANES, a ſea-port of Catalonia, in Spain, near the river Tordera, twenty miles S. of Gironne. Long. 2. 50. E. Lat. 41. 40. N.

BLEACHING (*Encycl.*). To the information already communicated on this important branch of the arts, we are induced to add, in the inventor's words, the following ſpecification of the patent granted to Mr. Turnbull, junior, of Cordale Printfield, in Scotland, for certain new proceſſes and apparatus applicable to the bleaching and purifying of cotton, flax, hemp, ſilk, and wool, or of mixtures of thoſe materials, by which a conſiderable ſaving will be effected in fuel, alkali, &c. After the goods have been thoroughly waſhed, Mr. Turnbull ſays,

"When thus cleanſed, they are put into a ley of vegetable or of mineral fixed alkali, or the volatile alkali, either mild or made cauſtic by quick-lime, or into a ley of quick-lime only, or into a ſoapy ley, or into a ley compoſed of all or any of theſe ſubſtances (with or without the addition of oxygenated muriatic acid), of a ſtrength fit for the purpoſe of extracting the coloured or colourleſs gummy, reſinous, or other impurities which may exiſt naturally in, or which may have been introduced (by accident or deſign) into the fibre or texture of the materials or goods under proceſs, and which are too intimately united with them to admit of being removed by the firſt above-deſcribed waſhing or cleanſing. The alkaline, ſoapy, or other ley, may be prepared by the method or methods uſually followed by bleachers; my invention not conſiſting in the kind of alkaline leys, or other liquors employed, or in the way of preparing them, but in the mode of applying ſuch alkaline, ſoapy, or other leys, and in the accompanying and ſubſequent manipulations; for, when the goods or articles to be bleached are immerſed in the alkaline, ſoapy, or other ley or liquor, as before directed, inſtead of boiling or bucking them in it, as is the practice uſually followed, I only ſteep them, or keep them long enough in the ſaid ley to be thoroughly impregnated with it, which requires a ſhorter or longer time, according to the quantity and texture of the articles or goods. The goods are then drawn out of the rack over the veſſel in which they were impregnated, and ſuffered to drain, that the ſuperficially adhering ley or liquor may run from them back into the veſſel. After this draining, the goods ſtill hold a ſufficient quantity of the ley or liquor employed to anſwer the end in view. They are then put into a veſſel of ſufficient ſtrength and dimenſion, made of wood, ſtone, brick-work, earthen-ware, metal, or any proper material. This veſſel, which I call a ſteaming-vat, may be almoſt of any form convenient for the premiſes or place where it is to be fixed, and is connected by means of a pipe, tube, hoſe, trunk, or hollow priſm, made of wood, metal, or of any fit material, with a boiler, kettle, or cauldron, which I call the ſteaming-kettle, and which may be of any convenient form and dimenſions. The tube above mentioned may paſs from any part of the edge or of the ſide of the ſteaming-kettle, or even from its cover, which ought to fit ſteam-tight, into any part of the ſide or bottom of the ſteaming-vat, the intention and uſe of it being to convey ſteam from the aforeſaid kettle to the aforeſaid vat. The tube, pipe, hoſe, trunk, or hollow priſm, is furniſhed with a ſtop-cock or valve, or any contrivance that will anſwer the purpoſe of ſhutting and opening at pleaſure the communication between the ſaid kettle and vat. The ſteaming-vat ought, for the convenience of lifting out the goods, to be furniſhed with a falſe bottom of ſome kind in the inſide, as of wood or of net-work, for the goods to lie upon; and to this falſe bottom ſhould be attached ropes, by means of which, and the aſſiſtance of a crane and pulley, or any other convenient mechanical power, the goods may be withdrawn from the vat after the operation of ſteaming them. The operation of ſteaming the goods is performed by opening the communication between the ſteaming-kettle and ſteaming-vat; the former, which contains ſome water or aqueous ſolution, being kept at a proper heat by means of a fire put under it, and the latter having previouſly its cover fitted on ſteam-tight. The ſteam is thus, as it were, pent up in the kettle and vat, and made to act with any preſſure that may be deſired, or that the ſtrength of the veſſels may be able to ſuſtain. To ſecure the ſafety of the people employed, the apparatus ought always to be furniſhed with a ſafety-valve attached to any part of the ſteaming-kettle, or of the ſteaming-vat, or of the tube of communication, that when the elaſtic force of the encloſed ſteam reaches the determined point, the valve may open of itſelf,

and allow a portion of it to eſcape. By this proceſs the goods can be heated conſiderably above the boiling point, a circumſtance that adds ſo much to the diſſolving power of the alkaline, or ſoapy, or other ley, that the quantity left in the goods, after draining, as before deſcribed, is found ſufficient to diſſolve and diſcharge, by one ſteaming, as much of the reſinous, gummy, or other impurities, from the goods under proceſs, as could have been diſcharged by a long boiling of the goods in the ley itſelf, as is the uſual practice, and by this means a great ſaving is made in the alkalis or other ingredients employed for whitening the goods. For, in the common method, the colouring matter, as diſcharged from the fibre or texture of the goods, is diffuſed throughout the whole ley, which ſoon renders it ſo foul that it is obliged to be changed long before it has become ſaturated with the ſubſtances or matters on which it exerciſes its power. But by my proceſs or proceſſes there is no more ley employed for one ſteaming than what is ſufficient merely to impregnate the goods thoroughly; and the alkali thus depoſited in the texture or fibre of the goods under proceſs is more or leſs diſengaged from the ſaid texture or fibre by the action of the ſteam, and is found at the bottom of the ſteaming-vat, of a dark colour, occaſioned by the matters it has diſſolved, and carried down with it. The ſteaming-vat may be very commodiouſly freed from this depoſit by a common ſtop-cock, or even a plug at or near its bottom, to be opened as often as it may be neceſſary. I alſo effect the ſame end by uſing only a deep boiler, with a ſteam-tight cover, ſuſpending the goods previouſly impregnated with the alkaline or other ley, as before directed, on frame or net-work, over boiling water, in the ſaid boiler, and employing oxygenated muriatic acid, acidulated waters, mill waſhing, or expoſure to the ſun and air, when theſe are neceſſary: particular care muſt be taken to keep a ſupply of water, or ſome aqueous ſolution in the lower part of the boiler, below the frame or net-work on which the goods lie, or otherwiſe they may be ſinged, or actually burnt, and a loſs be actually incurred. But I prefer putting the goods into ſteaming-vats, to putting them in a boiler, in the manner juſt deſcribed, and that on ſeveral accounts, but eſpecially becauſe, by means of one ſteaming-kettle, ſteam can be thrown into as many vats as can conveniently be ranged round it, which is a mean of making a conſiderable ſaving in the article of fuel. One ſteaming generally requires from four to eight hours, but the length of time will vary according to the kind or quality of the goods to be whitened, and the ſtrength of the ley that has been employed for impregnating them. After the ſteaming has been continued a ſufficient length of time, the cover of the ſteaming-vat is taken off. The communication with the ſteaming-kettle is cut off by means of the aforeſaid cock or valve, provided for that purpoſe, and the goods are lifted out by means of a crane and pulley, or other fit mechanical power, as before mentioned. They are then well waſhed by milling, or by any of the proceſſes followed by bleachers. After this they are again impregnated with ley, ſteamed, and then waſhed; and theſe manipulations are repeated in the manner that has already been deſcribed till the goods are brought to the required degree of whiteneſs and purity. The uſual operations of ſteeping in acidulated waters, and expoſure to the ſun and air, or to the action of the oxygenated muriatic acid, in ſuch ſtages of the proceſs as the bleacher may think proper, may be employed with advantage in my method, as well as in the common and uſual method of bleaching. I need hardly direct here, what every bleacher's own experience muſt point out to him, namely, that when acidulated waters, expoſure to the ſun and air, or the oxygenated muriatic acid, are to be employed after any ſteaming, the goods ſhould firſt be waſhed. When ſilk, ſheeps' wool, or goods containing ſheeps' wool or animal hair, or fur, of any kind, are wiſhed to be cleanſed, ſcoured, or whitened, by the above-deſcribed method, the ley employed ought to be much weaker than in the caſe of cotton, flax, or hemp, or of goods manufactured of theſe, or any of them; for a ſtrong cauſtic ley would entirely deſtroy the former, and convert them into a ſaponaceous matter.

There has been diſcovered a method of preparing the oxygenated muriate of lime in a dry form, and applying it to the purpoſes of bleaching, or removing colours from cloth, cotton, &c.

Mr. Charles Tenant, of Darnley, near Glaſgow, the patentee, having found that the oxygenated muriatic acid is capable of forming a compound with calcareous earth, and alſo with ſtrontites, barytes, and magneſia, merely by bringing the oxygenated muriatic acid gas into contact with them either when in lumps or in a pulveriſed ſtate, has very conſiderably improved upon his former diſcovery, namely, that theſe earths might be ſo impregnated when diffuſed in water, and might, in that ſtate, be employed in bleaching.

Till the diſcovery of theſe proceſſes, Mr. Tenant obſerves, pot-aſh was uſed to ſerve the purpoſe now obtained by lime or the other earths; and its expence to the bleacher was very conſiderable. The bleaching liquor, indeed, when made with alkali, enabled the cotton-manufacturers to bring their goods to market in one-third of the time they formerly required, and alſo to carry on their buſineſs at all ſeaſons of the year. Hence a more extenſive trade was carried on by the manufacturers of cotton; but linen goods, requiring the liquor in a much more concentrated ſtate, heretofore derived little or no benefit from the practice of bleaching by chemical means. By the introduction of lime, however, the liquor is made ſo cheap that linens are alſo bleached with it, and that ſo expeditiouſly, that the dealer can turn his ſtock over twice or thrice for once that he could when the practice prevailed of bleaching in the open air.

Mr. Tenant farther obſerves, that, by preparing the oxygenated muriates in the dry way, bleachers may be cheaply and conveniently ſupplied with it, and ſave much of the trouble and expence and hazard which attend the preparation of the bleaching liquor in the old way.

BLETERIE (John Philip René de la), born at Rennes, entered early into the congregation of the Oratory, and was there a diſtinguiſhed profeſſor. The order againſt wigs occaſioned his quitting it; but he retained the friendſhip and eſteem of his former brethren. He went to Paris, where his talents procured him a chair of eloquence in the College Royal, and a place in the Academy of Belles-Lettres. He publiſhed ſeveral works, which have been well received by the public. 1. The Life of the Emperor Julian, Paris, 1735, 1746, 12mo. a curious performance, well written, and diſtinguiſhed at once by impartiality, preciſion, elegance, and judgment. 2. The Hiſtory of the Emperor Jovian, with Tranſlations of ſome Works of the Emperor Julian, Paris, 1748, two vols. 12mo. a book no leſs valuable than the former. 3. A Tranſlation of ſome Works of Tacitus, Paris, 1755, two vols. 12mo. The Manners of the Germans, and The Life of Agricola, are the two pieces compriſed in this verſion, which is equally elegant and faithful. Prefixed is a Life of Tacitus, which is alſo worthy of this writer, by the ſtrength of its ſentiments, and the animation of its ſtyle. 4. Tiberius, or the ſix firſt Books of the Annals of Tacitus, tranſlated into French, Paris, 1768, three vols. 12mo. 5. Letters occaſioned by the Account of Quietiſm given by M. Phelypeaux, 1733, 12mo. 6. Some Diſſertations in the Memoirs of the Academy of Belles-Lettres. 7. Moſt humble Remonſtrances of M. de Montrempuis. The Abbé de la Bleterie died at an advanced age, in 1772. He was a man of learning, attached to religion, and his morals did not belie his principles.

QUÆSTOR, see QUESTOR.

QUAGGA, or QUACHA. See BARB.

QUAIL, in zoology. See TETRAO.

Quails are to be taken by means of the call during their whole wooing time, which lasts from April to August. The proper times for using the call are at sun-rising, at nine o'clock in the morning, at three in the afternoon, and at sun-set; for these are the natural times of the quail's calling. The notes of the cock and hen quail are very different; and the sportsman who expects to succeed in the taking them must be expert in both: for, when the cock calls, the answer is to be made in the hen's note; and, when the hen calls, the answer is to be made in the cock's. By this means they will come up to the person, so that he may, with great ease, throw the net over them and take them. If a cock quail be single, on hearing the hen's note he will immediately come; but if he has a hen already with him, he will not forsake her. Sometimes, though only one quail answers to the call, there will three or four come up; and then it is best to have patience, and not run to take up the first, but stay till they are all entangled, as they will soon be.

The quail is a neat cleanly bird, and will not run much into dirty or wet places: in dewy mornings, they will often fly instead of running to the call; and in this case, it is best to let them go over the net, if it so happens that they fly higher than its top; and the sportsman then changing sides, and calling again, the bird will come back, and then will probably be taken in the net.

The calls are to be made of a small leather purse, about two fingers wide, and four fingers long, and made in the shape of a pear; this is to be stuffed half full of horse-hair, and at the end of it is to be placed a small whistle, made of the bone of a rabbit's leg, or some such other bone: this is to be about two inches long, and the end formed like a flageolet, with a little soft wax. This is to be the end fastened into the purse; the other is to be closed up with the same wax, only that a hole is to be opened with a pin, to make it give a distinct and clear sound. To make this sound, it is to be held full in the palm of the hand, with one of the fingers placed over the top of the wax; then the purse is to be pressed, and the finger is to shake over the middle of it, to modulate the sound it gives into a sort of shake. This is the most useful call; for it imitates the note of the hen quail, and seldom fails to bring a cock to the net if there be one near the place.

The call that imitates the note of the cock, and is used to bring the hen to him, is to be about four inches long, and above an inch thick; it is to be made of a piece of wire turned round and curled, and covered with leather; and one end of it must be closed up with a piece of flat wood, about the middle of which there must be a small thread or strap of leather, and at the other end is to be placed the same sort of pipe, made of bone, as is used in the other call. The noise is made by opening and closing the spiral, and gives the same sound that the cock does when he gives the hen a signal that he is near her.

QUAKERS, a religious society which took its rise in England about the middle of the seventeenth century; spread rapidly there, and found its way into some other countries of Europe, and into the English settlements in North America. The first preacher was George Fox, an illiterate person, who made his first appearance in that character about the year 1648. The nation was then greatly agitated by religious controversies. Fox acquired several followers, and in the year 1650, being brought before two justices in Derby, for having interrupted a minister in the exercise of his function, one of them by way of jeer gave this people the name of *Quakers*; an appellation which has stuck to them ever since; though they themselves adopted, and still retain, the name of *Friends*.

Robert Barclay and William Penn are two of the principal writers of this society. The former wrote a masterly apology for their doctrines, to which he prefixed a remarkable address to King Charles II. Penn wrote several books, the chief of which is that entitled, No Cross, no Crown, shewing that the way to obtain the heavenly crown is by being willing to bear the cross.

These were writers of considerable learning and abilities, to whom may be added Sewell, the historian, who wrote an account of this people, first in Dutch, and afterwards in English. It may also be proper to mention, of later time, Anthony Pruver, who having been brought up (like Fox) in the employment of a shepherd, and a shoemaker, afterwards acquired so much knowledge in the dead languages, as to translate the whole of the Scriptures into English. It must be admitted, however, that the quakers, as a body, have produced few learned or scientific authors; and this reason may be assigned, that they avoid sending their children to public schools, and train them principally to mechanical or commercial employments, preferring the useful to the ornamental in their education. In medicine, nevertheless, the only learned profession which is open to them in Great Britain, they have had many who have attained and adorned the degree of doctor, among whom the learned world will readily recognize the name of Fothergill.

It is somewhat difficult to give an accurate account of their tenets, as they have no standard confession of faith. They have however, so lately as 1790, published a summary view of their doctrines: from which we learn, in brief, that the Friends believe in one eternal God, and in Jesus Christ, his Son, the Messiah and Mediator of the new covenant. They acknowledge the divinity of Christ, who is the wisdom and power of God unto salvation. To Christ alone they give the title of the *word of God*, and not to the Scriptures, but they highly esteem those sacred writings, in subordination to the spirit, from which they were given forth. They believe that, in order to enable men to put in practice the most excellent precepts of the gospel, every man is endued with a measure of the light, grace, or good spirit, of Christ, by which he is enabled to distinguish good from evil, and to correct those corrupt propensities of his nature which mere reason is insufficient to overcome. They believe that the influence of the spirit of Christ is necessary to enable them acceptably to worship; and that to wait for it, when met, in silence, is their proper business. They ascribe all true ministry to the same source, the immediate influence of the Holy Spirit. They reject, or disuse, baptism with water and the supper: the former as pertaining, according to John the Baptist's avowal, to a decreasing dispensation, and having been merely typical of spiritual baptism: the latter rite they do not consider as maintaining communion between Christ and his church; which is only obtained by a real participation of his divine nature through faith. As this society lays so much stress on the inward persuasion of the mind, effected by the operation of the light of Christ; and as they believe that lively faith is not at man's command, but is the gift of God in Christ, although nourished by man's obedience to its discoveries; they are so far from requiring of such as request admission among them, or such as are employed in the service of their church, any of those articles or formulas of faith, which are too often the means of inducing an insincere compliance, that they make no use of such forms at all. They say, in their summary, "We prefer the judging of men by their fruits, and depending on the aid of him who, by his prophet, hath promised to be a spirit of judgment to him that sitteth in judgment. Without this, there is a danger of receiving numbers into outward communion, without any addition to that spiritual sheepfold, whereof our blessed Lord hath declared himself to be both the door and the shepherd—that is, of such as know his voice, and follow him in the paths of obedience."

[Cancel pages 679 and 680 of vol viii. and insert this leaf in their stead.]

In their public worſhip, all is performed in ſilence, unleſs ſome believe themſelves inwardly moved to ſpeak; and, except during the time of prayer by one ſo moved, the men ſit covered at liberty. Their marriages, after due enquiry, are performed by the parties taking each other in a meeting, and the company ſubſcribe as witneſſes. Their burials are equally ſimple; but frequently preaching takes place on both occaſions. The quakers believe it wrong for Chriſtians to uſe ſuch flattering titles to men as your grace, your excellency, the right honourable, reverend, and the like, to uſe compliments, or to adopt, for flattery's ſake, the cuſtom of ſaying the plural you, to one perſon. Neither do they allow of kneeling or uncovering the head, in reſpect to any man, reſerving theſe geſtures for divine worſhip. They condemn gaiety and ſuperfluity of apparel; public diverſions, gaming, ſports, and unneceſſary frequenting of public-houſes. They alſo diſuſe thoſe names of the months and days, which, having been given in honour of the falſe gods or heroes of the heathens, originated in their ſuperſtition or flattery; and they believe it forbidden to Chriſtians to ſwear or to fight on any occaſion.

The ſobriety of their dreſs is a good contraſt to the ever-varying modes of a degenerate age. Their guarded and decent language, and regular deportment, however uncouth to light and ſuperficial minds, muſt excite admiration in the liberal and intelligent obſerver. The excellent manner in which they govern their families and bring up their children in an acquieſcence with their reſtraints and cuſtoms, may be recommended as deſerving imitation. The quakers have exerted themſelves with great zeal to endeavour to procure an abolition of the ſlave trade in this country; and have themſelves ſo far ſet the example of emancipation in America, that there is ſcarcely a quaker in that continent poſſeſſing a ſlave. Though they are, as has been mentioned, reſtrained by their principles from attempting to ſerve their country in its wars, they have always proved themſelves good ſubjects of the ſtate, and have experienced from the Britiſh government many acts of indulgence.

A ſyſtem of diſcipline has been eſtabliſhed among this people, which has been admired, even by their adverſaries; the object of it is, the relief of their poor—the maintenance of good order—the ſupport of their teſtimonies, which they believe it is their duty to bear to the world—and the help and recovery of ſuch as are overtaken in faults. This diſcipline is laid down in the rules which their yearly meeting has iſſued from time to time; and is carried into effect at their monthly meetings, which are compoſed of members living at a convenient diſtance, and ſometimes of ſeveral ſmall congregations for worſhip. All their monthly meetings in one county (or, in ſome inſtances, in two or three adjacent counties) form a quarterly meeting, which has the immediate ſuperintendance of the monthly meetings. The quarterly meetings in their turn are ſuperintended by the yearly meeting. The yearly meeting requires of the quarterly meetings, and theſe latter of their monthly meetings, anſwers, at ſtated times, to certain queries, by which means the circumſtances of the inferior meeting is made known to the ſuperintending one. The monthly meetings ſend repreſentatives to the quarterly meetings, and theſe, to the yearly meeting. The yearly meeting for Great Britain is held in London in the ſpring, to which come repreſentatives from the yearly meeting in Ireland. The American continent, on which there are numerous ſettlements of the Friends, compriſes ſix other yearly meetings, namely, New England, New York, Pennſylvania, Maryland, Virginia, and the Carolinas, &c. Theſe yearly meetings are no otherwiſe bound to each other than by ſimilarity of principle, and yet (though this ſimilarity is doubtleſs the cauſe) no diſpute on any point of faith has yet ariſen between them; and it is not unuſual for miniſters of one country to ſpend much time in travelling in that character in the other, in which the certificates from the meetings to which he belongs at home ſecure him a reception. Theſe are certificates of concurrence ſigned in the monthly meeting to which the miniſter belongs; and if the propoſed journey extend beyond the limit of his yearly meeting, it is neceſſary to have the joint concurrence of his quarterly meeting, and alſo of his fellow-miniſters and elders aſſembled at their yearly meeting. It may be here remarked, that among the Quakers, women, as well as men, fill the ſtation of miniſter; and, with the before-mentioned concurrence, are often engaged in travelling from place to place.

The Quakers have charity ſchools in ſome parts of the kingdom; but at Ackworth in Yorkſhire they have a large ſchool, under the direction of their yearly meeting, in which about one hundred and eighty boys, and one hundred and ſeventy girls, are boarded and educated.

This ſociety experienced at its outſet violent oppoſition, and was cruelly perſecuted during the times of Cromwell and of Charles II. although the Friends do not impeach the character of either, as being the ſprings of the perſecution. In New England, the government put four of them to death; but farther executions of that ſect were ſtopped by the interference of King Charles. The friends, however, did not flinch, either in England or America; and as they ſeem to have borne perſecution with as much patience as any people, ſo, when in their turn they came into power, they never ſhewed any diſpoſition to perſecute others. For William Penn, who founded Pennſylvania, laid down the wideſt plan of religious liberty that had then been deviſed, and reſerved no privileges for his own ſociety in the government of his province.

QUALITY is a word which, as uſed in philoſophical diſquiſitions, cannot be explained by any periphraſis. That which is expreſſed by it muſt be brought into the immediate view of the ſenſes or intellect, and the name properly applied, or he who is a ſtranger to the word will never be made to comprehend its meaning. Ariſtotle, who treated it as a general conception ſecond in order among the ten *predicaments* or *categories* (ſee CATEGORY), gives ſeveral characters of it; but though they are all in ſome reſpects juſt, no man could from them, without other aſſiſtance, learn what *quality* is. Thus he tells us, Ὑπαρχει δε εναντιοτης καὶα το ποιον: Επιδεχεῖαι δε το μαλλον και το ηττον τα ποια. And again, Ὁμοια δε η ανομοια καὶα μονας τας ποιοτηῖας λεγεῖαι ομοιον γαρ ἑτερον· ἑτερω ουκ εσῖι καῖ αλλο ουσιν, η καθ' ο ποιον εσῖιν.

When a man comprehends, by means of his ſenſes and intellect, what it is which the word *quality* denotes, he will indeed perceive that the firſt of theſe characters is applicable to ſome qualities and not to others, that the ſecond is more applicable to *quantity* than to quality; and that it is only the third which can with propriety be conſidered as the general characteriſtic of this predicament. Thus, when we have learned by our ſenſe of ſight that *whiteneſs* is a quality of ſnow, and *blackneſs* of coal; and by means of obſervation and reflection, that *wiſdom* is a quality of one man and *folly* of another; we muſt admit that the ſenſible quality of the ſnow is *contrary* to that of the coal, and the intellectual quality of wiſdom contrary to that of folly. There is, however, no contrariety between *wiſdom* and *whiteneſs* or *blackneſs*, nor between *hardneſs* or *ſoftneſs* and *any particular colour*; for ſenſible and intellectual qualities can never be compared; and it is not eaſy, if poſſible, to make a compariſon between qualities perceptible only by different ſenſes: nay, among qualities perceptible by the ſame ſenſe, we often meet with a difference where there is no contrariety; for though the *figure* of a *cube* is *different* from that of a *ſphere*, and the figure of a

BLIND (*Encycl.*). By way of illuſtrating what has been already ſaid under this article, we ſhall add one or two very ſingular hiſtories; and ſhall begin with an account of ſome remarkable particulars that happened to a lady after having had the confluent ſmall-pox. "In the courſe of this diſeaſe the lady was attended by the late Sir Hans Sloane, and ſeveral threatening ſymptoms appeared, which, however, were at length overcome; and the patient was thought out of danger. She was attacked afterwards with dreadful ſpaſms, to remove or mitigate which many remedies were tried; and, among others, the cold bath: but either by the natural effect of the bath, or by ſome miſmanagement in the bathing, the unhappy patient firſt became *blind*, and ſoon afterwards deaf and dumb. It is not eaſy to conceive what could increaſe the miſery of deafneſs, dumbneſs, blindneſs, and frequent paroxyſms of excruciating pain: yet a very conſiderable aggravation was added; for the loſs of her ſight, her hearing, and her ſpeech, was followed by ſuch a ſtricture of the muſcles of her throat, that ſhe could not ſwallow any kind of aliment either ſolid or liquid. It might reaſonably be ſuppoſed that this circumſtance, though it added to the degree of her miſery, would have ſhortened its duration: yet in this condition ſhe continued near three quarters of a year; and during that time was ſupported in a very uncommon manner, by chewing her food only; which having turned often, and kept long in her mouth, ſhe was obliged at laſt to ſpit out. Liquors were likewiſe gargled about in her mouth for ſome time; and then returned in the ſame manner, no part of them having paſſed the throat by an act of deglutition: ſo that whatever was conveyed into the ſtomach, either of the juices of the ſolid food, or of liquids, was either gradually imbibed by the ſponginеſs of the parts, which they moiſtened, or trickled down in a very ſmall quantity along the ſides of the veſſels.

But there were other peculiarities in the caſe of this lady yet more extraordinary. During the privation of her *ſight* and *hearing*, her *touch* and her *ſmell* became ſo exquiſite, that ſhe could diſtinguiſh the different colours of ſilk and flowers, and was ſenſible when any ſtranger was in the room with her.

After ſhe became blind, and deaf, and dumb, it was not eaſy to contrive any method by which a queſtion could be aſked her, and an anſwer received. This, however, was at laſt effected by talking with the fingers, at which ſhe was uncommonly ready. But thoſe who converſed with her in this manner, were obliged to expreſs themſelves by touching her hand and fingers inſtead of their own.

A lady who was nearly related to her, having an apron on, that was embroidered with ſilk of different colours, aſked her, in the manner which has been deſcribed, if ſhe could tell what colour it was? and after applying her fingers attentively to the figures of the embroidery, ſhe replied, that it was red, and blue, and green; which was true. The ſame lady having a pink coloured ribbon on her head, and being willing ſtill further to ſatisfy her curioſity and her doubts, aſked what colour that was? her couſin, after feeling ſome time, anſwered that it was pink colour: this anſwer was yet more aſtoniſhing, becauſe it ſhewed not only a power of diſtinguiſhing different colours, but different kinds of the ſame colour; the ribbon was not only diſcovered to be red, but the red was diſcovered to be of the pale kind called a *pink*.

This unhappy lady, conſcious of her own uncommon infirmities, was extremely unwilling to be ſeen by ſtrangers, and therefore generally retired to her chamber, where none but thoſe of the family were likely to come. The ſame relation, who had by the experiment of the apron and ribbon diſcovered the exquiſite ſenſibility of her *touch*, was ſoon after convinced, by an accident, that her power of ſmelling was acute and refined in the ſame aſtoniſhing degree.

Being one day viſiting the family, ſhe went up to her couſin's chamber, and after making herſelf known, ſhe intreated her to go down, and ſit with her among the reſt of the family, aſſuring her that there was no other perſon preſent: to this ſhe at length conſented, and went down to the parlour door; but the moment the door was opened ſhe turned back, and retired to her own chamber much diſpleaſed; alleging, that there were ſtrangers in the room, and that an attempt had been made to deceive her: it happened indeed that there were ſtrangers in the room; but they had come in while the lady was above ſtairs, ſo that ſhe did not know they were there. When ſhe had ſatisfied her couſin of this particular ſhe was pacified; and being afterwards aſked how ſhe knew there were ſtrangers in the room, ſhe anſwered, by the ſmell.

But though ſhe could by this ſenſe diſtinguiſh in general between perſons with whom ſhe was well acquainted, and ſtrangers, yet ſhe could not ſo eaſily diſtinguiſh one of her acquaintance from another without other aſſiſtance. She generally diſtinguiſhed her friends by feeling their hands; and when they came in, they uſed to preſent their hands to her, as a mean of making themſelves known: the make and warmth of the hand produced in general the differences that ſhe diſtinguiſhed; but ſometimes ſhe uſed to ſpan the wriſt, and meaſure the fingers. A lady, with whom ſhe was very well acquainted, coming in one hot day, after having walked a mile, preſented her hand as uſual; ſhe felt it longer than ordinary, and ſeemed to doubt whoſe it was; but after ſpanning the wriſt, and meaſuring the fingers, ſhe ſaid, 'It is Mrs. M. but ſhe is warmer to-day than ever I felt her before.'

To amuſe herſelf in the mournful and perpetual ſolitude and darkneſs to which her diſorder had reduced her, ſhe uſed to work much at her needle; and it is remarkable, that her needle-work was uncommonly neat and exact: among many other pieces of her work that are preſerved in the family is a pin-cuſhion, which can ſcarce be equalled. She uſed alſo ſometimes to write; and her writing was yet more extraordinary than her needle-work: it was executed with the ſame regularity and exactneſs; the character was very pretty, the lines were all even, and the letters placed at equal diſtances from each other: but the moſt aſtoniſhing particular of all, with reſpect to her writing, is, that ſhe could by ſome means diſcover when a letter had by ſome miſtake been omitted, and would place it over that part of the word where it ſhould have been inſerted, with a caret under it. It was her cuſtom to ſit up in bed at any hour of the night, either to write or to work, when her pain or any other cauſe kept her awake.

Theſe circumſtances were ſo very extraordinary, that it was long doubted whether ſhe had not ſome faint remains both of hearing and ſight, and many experiments were made to aſcertain the matter; ſome of theſe experiments ſhe accidentally diſcovered, and the diſcovery always threw her into violent convulſions. The thought of being ſuſpected of inſincerity, or ſuppoſed capable of acting ſo wicked a part as to feign infirmities that were not inflicted, was an addition to her miſery which ſhe could not bear, and which never failed to produce an agony of mind not leſs viſible than thoſe of her body. A clergyman who found her one evening at work by a table with a candle upon it, put his hat between her eyes and the candle, in ſuch a manner that it was impoſſible ſhe could receive any benefit from the light of it if ſhe had not been blind. She continued ſtill at her work with great tranquillity; till, putting up her hand ſuddenly to rub her forehead, ſhe ſtruck it againſt the hat, and diſcovered what was doing; upon which ſhe was thrown into violent convulſions, and was not without great difficulty recovered. The family were, by theſe experiments, and by ſeveral accidental

circumſtances, fully convinced that ſhe was totally deaf and blind; particularly by ſitting unconcerned at her work, during a dreadful ſtorm of thunder and lightning, though ſhe was then facing the window, and always uſed to be much terrified in ſuch circumſtances. But Sir Hans Sloane, her phyſician, being ſtill doubtful of the truth of facts which were ſcarce leſs than miraculous, he was permitted to ſatisfy himſelf by ſuch experiments and obſervations as he thought proper; the iſſue of which was, that he pronounced her to be abſolutely deaf and blind.

She was at length ſent to Bath, where ſhe was in ſome meaſure relieved; her convulſions being leſs frequent, and her pains leſs acute: but ſhe never recovered her ſpeech, her ſight, or her hearing, in the leaſt degree.

Many of the letters dated at Bath, in ſome of which there are inſtances of interlineations with a caret, the writer of this narrative hath ſeen; and they are now in the cuſtody of the widow of one of her brothers, who, with many other perſons, can ſupport the facts here related, however wonderful, with ſuch evidence as it would not only be injuſtice, but folly to diſbelieve.

In the Annual Regiſter for 1762, we have the following account of a French lady, blind from her infancy, who could read, write, and play at cards, &c. A young gentlewoman of a good family in France, then in her eighteenth year, loſt her ſight when only two years old, her mother having been adviſed to lay ſome pigeon's blood on her eyes to preſerve them in the ſmall-pox; whereas, ſo far from anſwering the end, it injured them. Nature, however, may be ſaid to have compenſated for this unhappy miſtake, by the beauty of her perſon, ſweetneſs of temper, vivacity of genius, quickneſs of conception, and many talents which certainly much alleviated her misfortune. The narrative continues thus:

"She plays at cards with the ſame readineſs as others of the party. She firſt prepares the packs allotted to her, by pricking them in ſeveral parts; yet ſo imperceptibly, that the cloſeſt inſpection can ſcarce diſcern her indexes. She ſorts the ſuits, and arranges the cards in their proper ſequence, with the ſame preciſion, and nearly the ſame facility, as they who have their ſight. All ſhe requires of thoſe who play with her is, to name every card as it is played; and theſe ſhe retains ſo exactly, that ſhe frequently performs ſome notable ſtrokes ſuch as ſhew a great combination and ſtrong memory.

"The moſt wonderful circumſtance is, that ſhe ſhould have learned to read and write; but even this is readily believed on knowing her method. In writing to her, no ink is uſed, but the letters are pricked down on the paper; and by the delicacy of her touch, feeling each letter, ſhe follows them ſucceſſively, and reads every word with her fingers' ends. She herſelf in writing makes uſe of a pencil, as ſhe could not know when her pen was dry; her guide on the paper is a ſmall thin ruler and of the breadth of her writing. On finiſhing a letter, ſhe wets it, ſo as to fix the traces of her pencil, that they are not obſcured or effaced; then proceeds to fold and ſeal it, and write the direction: all by her own addreſs, and without the aſſiſtance of any other perſon. Her writing is very ſtraight, well cut, and the ſpelling no leſs correct. To reach this ſingular mechaniſm, the indefatigable cares of her affectionate mother were long employed, who accuſtomed her daughter to feel letters cut in cards or paſte-board, brought her to diſtinguiſh an A from a B, and thus the whole alphabet, and afterwards to ſpell words; then, by the remembrance of the ſhape of the letters, to delineate them on paper; and, laſtly, to arrange them ſo as to form words and ſentences.

"She has learned to play on the guitar, and has even contrived a way of pricking down the tunes as an aſſiſtance to her memory. So delicate are her organs, that in ſinging a tune, though new to her, ſhe is able to name the notes.

"In figured dances ſhe acquits herſelf extremely well, and in a minuet with inimitable eaſe and gracefulneſs. As for the works of her ſex, ſhe has a maſterly hand; ſhe ſews and hems perfectly well; and in all her works ſhe threads the needles for herſelf however ſmall.

"By the watch her touch never fails telling her exactly the hour and minute."

From this account, however, it would appear, that, except reading and writing, the French lady has nothing to boaſt of in which ſhe is not excelled by Mr. Stanley already mentioned, if we may credit all that is reported of him. The works peculiar to her ſex are gained mechanically; but the *diſtinguiſhing colours*, telling the preciſe time by a watch, naming the notes in muſic, and many other things depending upon the ear and touch, are ſaid to have been ſo familiar to him, that his friends ceaſe to think them extraordinary. Attainments ſtill more wonderful are aſcribed to him; as, the naming the number of perſons in a room on entering it; the directing his voice to each perſon in particular, even to ſtrangers when they have once ſpoken; the miſſing any perſon abſent, and telling who that perſon is; and laſtly, his being able to form juſt conceptions of youth, beauty, ſymmetry, and ſhape.

To the foregoing particulars, which abundantly demonſtrate what the blind, even when ſelf-inſtructed, are *capable of*, we ſhall now add a curſory account of ſome of the public inſtitutions ſet on foot in this country for their benefit, the methods practiſed there, and the degree of ſucceſs which has attended them, as far as we have had the means of aſcertaining the facts from printed documents which accident has thrown in our way. Theſe, however ſhort of the fulleſt information to be obtained, are at leaſt ſufficient to countenance any attempt to render general, throughout the united kingdom, ſimilar inſtitutions for the benefit of the moſt forlorn of our ſpecies. England ſeems to have been indebted to her late enemy and republican neighbour in this, as in ſome other material inſtances, for the example of ſchools for the blind*. The firſt eſtabliſhed in Britain was undertaken at Liverpool, at the ſuggeſtion and under the management of a benevolent clergyman there, who, in his public communications on the ſubject, evinced an obvious deſign to imitate the French ſchool, which had then been for ſome time eſtabliſhed, and given public proofs of ſucceſs. This inſtitution was called the "*Aſylum for the Blind*," and was, for near ten years, carried on in two very ſmall adjoining houſes, ſituated in an airy part of the town. Except one room, in which the manufactured goods were expoſed to ſale, and the apartments neceſſary for the ſuperintendant and his wife, the reſt of the premiſes were occupied with blind pupils, who purſued their ſeveral employments during the ſtated hours for work, and were allowed proper intervals for going home to their meals, and for relaxation. Their attendance was only *during the day*, as they were neither lodged nor boarded; nor were they received, unleſs the pariſhes to which they belonged (or their

* The following fact, however, will ſhew the *poſſibility* of the French having borrowed the *hint* from ourſelves. The Rev. Dr. David Johnſton, of Leith, deſcribing the ſtate of the ſchool for the blind at Edinburgh, writes thus to a gentleman in London in 1801:—"I have ſeen a plan of the ſame kind," ſays he, "which was formed in your city (London) *thirty years ago*, and the firſt people in the kingdom ſeemed to have countenanced it, but how it miſcarried I cannot tell."

friends, if able) contributed ſomething weekly towards their maintenance. With this allowance, the amount of their earnings, and a ſmall additional weekly payment from the inſtitution, they were ſupported till they became ſufficiently expert in their buſineſs to leave the aſylum and maintain themſelves, which the greater part of them have been enabled to do very decently. The average number of ſcholars from the commencement of the inſtitution in December 1790 is about forty-five. The following extract from the committee's report, will ſhew at once the articles they manufactured, and the amount of the ſales in the four ſucceſſive years.

The ſame ſyſtem is now purſued in a new building purpoſely erected for the accommodation of the pupils (ſee Pl. 18.) near the infirmary.—It was firſt opened in the year 1800, to about ſixty ſcholars of both ſexes, and of indiſcriminate ages; and arrangements are now preparing for the boarding and lodging of ſome, whoſe poverty and want of friends to aſſiſt them diſtinguiſh them particularly as objects of charity.

This laudable example was ſoon followed by the inhabitants of Briſtol, at which place a ſchool for the blind, upon a ſmall ſcale, has been ſucceſsfully carried on for ſeveral years; the particulars of this need not be detailed, ſince the plan and good effects ſo nearly reſemble thoſe of its prototype.

In the Edinburgh inſtitution, which is profeſſedly calculated "*for the relief of the induſtrious blind,*" the employments of the pupils are theſe:

They work four looms in the manufacture of a kind of callico, which they call "Glaſgow *blune.*" A ſuperintendant, who is a regular workman, conſtantly attends to rectify the miſtakes of thoſe who are not yet perfect in this buſineſs. Upon an average each perſon weaves four ells per day, for which two pence per yard is paid by the proprietors of the goods. Boys are alſo employed in picking and untwiſting old junk, which is afterwards made into door-mats; ſome teaze horſe-hair, which is uſed for the ſtuffing of mattreſſes or chair bottoms, others card wool with the carding-machine; ſome are employed in the manufacture of fiſhing-nets—an art which they practiſe very readily, merely with their fingers and a needle, no bar being employed to ſquare the meſhes. It is ſomewhat curious that even thoſe who, previous to their becoming blind, were in the habit of netting with a bar, and could not work without one, afterwards have found it an obſtacle. So accurate is their ſenſe of touch, that one of them pointed out the irregularity of ſome meſhes made by a by-ſtander, and detected ſome imperfect knots, which he dexterouſly untied before he reſumed his work. Their cabbage-nets are made by firſt working a ſquare piece, then bringing the ſelvedges together, and afterwards faſtening the ends. All kinds of wicker-work are made; and when the twigs intended to be wrought are of different colours, the workman makes the diſtinction by keeping one kind on the right, the other on the left hand.

In the ſummer ſeaſon the pupils begin their work at ſeven in the morning, and quit it at the ſame hour in the evening; in winter they begin at eight and quit at ſix. They breakfaſt at nine, and dine at two o'clock, and are allowed one hour for each meal. Their food is provided by themſelves at their own homes, care being taken to fix their habitations as near as poſſible to the ſchool—an arrangement which, in a town like Edinburgh, is not by any means difficult. Thoſe who have no families, or live at a diſtance, bring their proviſions for dinner with them, ſo that they only have to come in the morning and return in the evening. Many find the way without aſſiſtance; others are conducted by one of their children or friends, ſo that little of their time is loſt. With a view of gratifying the curioſity of the inhabitants, and thereby inducing farther contributions, they have four public dinners in the year. The higheſt wages paid by the inſtitution is ſix ſhillings per week, the loweſt three and ſix-pence: this, however, does not ſo much depend on the quality or quantity of work they may perform, but on their domeſtic or perſonal exigencies; for a man ſhall receive ſix ſhillings a-week whoſe earnings may not amount, probably, to more than half that ſum.

Beſides the articles already mentioned, they manufacture a ſtrong cloth for ſtairs and paſſages, which is ſold for *3s. 6d.* a-yard. They alſo make various kinds of mattreſſes for ſale; and in the execution of theſe works, if the overſeer, who is an intelligent man, is not able to inſtruct them, proper maſters attend to give their aſſiſtance. Great attention, indeed, is found neceſſary in the different departments, to rectify any little miſtakes, to keep good order, and induce the pupils to pay a diligent attention to their work: on this, indeed, in a great meaſure, does the happineſs of theſe unfortunate perſons depend; it is this that guards them from *ennui,* and at night they are ſeen returning to their houſes with cheerful countenances.

The profits on their collective labours probably do not amount to more than 50*l.* annually, whereas about 250*l.* is diſtributed among them every year, the deficiency being made up by the funds of the inſtitution.

We have heard of ſimilar plans carrying on in ſome other towns in England, and alſo of one in Dublin; but as the ſketches already given convey a ſufficient idea of the nature of theſe undertakings, to enter into a minute deſcription of them would only be uſeleſs repetition. The only ſchool for the blind, therefore, on which it is farther neceſſary for us to dwell, as having ſome diſtinguiſhing features in its plan and extent, is that eſtabliſhed in 1799, in the neighbourhood of London.

This inſtitution, like that of Liverpool, owes its exiſtence to the exertions of a ſingle individual, who, relying on that benevolence and public ſpirit which on all occaſions has diſtinguiſhed the inhabitants of the Britiſh metropolis, brought a hoſt of friends to the undertaking by the ſimple act of circulating, at his own expence, a few printed copies of an addreſs tending to demonſtrate, by the example of the Liverpool aſylum, the importance and utility of ſuch an inſtitution in a place where the number of blind perſons could not but be conſiderable, where their poverty and depravity rendered them doubly the objects of commiſeration, and where the means of inſtruction and future employment were even more attainable than in remoter ſituations.

The plan of the London "*School for the indigent Blind,*" embraces two diſtinct objects:—

1. To provide a place of permanent reſidence and inſtruction for thoſe whoſe peculiar ſituation demands it, till they ſhall have learned what may be neceſſary for their future ſupport.

2. To eſtabliſhing, in *various parts* of the metropolis, *day-ſchools* to which the blind may reſort for inſtruction.

The former of theſe only have been carried into effect, though ſteps are now taking to accompliſh the latter; and it is intended to make the important and novel addition of *a cheap dinner* for ſuch as *chooſe* to partake of it at the ſchool; inſtead of going home and returning again to work, the inconvenience of which, to a blind perſon, in a crowded and buſy metropolis, muſt be obvious.

The principal ſchool (which alſo ſerves as a *day*-ſchool to the *neighbourhood*) is ſituated in St. George's Fields, and contains, at preſent, twenty boys and ten girls; a preference having been given to thoſe between thirteen and eighteen years of age, partly becauſe their organs are more flexible at that early period of life, and partly becauſe their term of exiſtence has been little abridged. They are inſtructed, by proper teachers, in ſuch manufactures as are found to anſwer beſt in other inſtitutions of the ſame deſcription; the chief are, baſket-making, ſpinning, netting, the manufacture of faſh-line, clothes-line, clock-line, and of woollen-liſt ſlippers.* The pupils are not confined to one ſingle employment, but inſtructed in ſeveral, that they may have the better chance of maintaining themſelves, at leaſt with ſome little aſſiſtance from their pariſhes or friends, in one or other of them. Whilſt ſome few are incapable of being taught, and are therefore diſmiſſed, the occaſional ingenuity diſplayed by others is exceedingly ſtriking: there is now in the ſchool a girl who threads a *fine* needle, by the aſſiſtance of her tongue, with the greateſt readineſs. Nor is this, though it demonſtrates how accurate the remaining ſenſes become in blind perſons, an unuſual accompliſhment with them; two women, at the Liverpool ſchool do the ſame thing, and one of them *cuts out* and *makes* her own caps and body linen, with a degree of perfection, and even *neatneſs*, that is truly ſurpriſing. The committee of the London ſchool have relaxed (we think improperly) from the practice ſo beneficially exerciſed at Liverpool, of requiring ſome pecuniary aid from the *friends* of the pupils, only demanding a weekly payment from the *pariſhes*. We condemn only the *uniform* exerciſe of this ill-directed humanity, many of the friends of ſuch objects being abundantly able, and even willing, to contribute to an expence which would, without the aſſiſtance of the charity, be wholly their own, and without any proſpect of its termination; whilſt the *entirely diſburthening* the parents, inſtead of aſſiſting them *in an exact proportion to their efforts to aſſiſt themſelves*, weakens that motive for exertion which is the life-ſpring of induſtry, of morality, and of happineſs to the poor.

It is not the object of theſe remarks to caſt any cenſure on the way in which theſe or other inſtitutions for the ſame laudable purpoſe are ſupported or conducted; they are, undoubtedly, entitled to every degree of praiſe, and every poſſible aſſiſtance from the wealthy and benevolent; they demonſtrate that human ingenuity may be made to triumph, in a variety of ways, over the moſt conſiderable of human privations; and that beggary and want, though they may be eventually, are not neceſſarily, the lot of the indigent blind. In ſearch of principles, however, we may be allowed ſome freedom of remark; and, therefore, the following concluſions, ſupported at once by theory and experience, may be hazarded for the advantage of thoſe who may attempt to form ſchools for the blind, in parts of the country where they do not now exiſt.

This ſubject ſeems to demand the following conſiderations:

1. What are the moſt attainable and profitable trades or employments for the blind?

2. How is the inſtruction to be afforded them in the cheapeſt manner?

3. As they cannot be ſuppoſed in any inſtance capable of earning ſo much as thoſe who have the benefit of ſight, are there any means of rendering the produce of their labour equal to their ſubſiſtence?

On the firſt of theſe ſubjects we may obſerve, that many of the employments which have been choſen for the blind, though the reſult of circumſtances, and apparently the beſt that their local ſituation admits of, are nevertheleſs better calculated to diſplay their ingenuity, than to enable them ſpeedily and effectually to provide for themſelves.

The manufacture of ſome one article of general conſumption, a knowledge of which is eaſily acquired by the pupil, which requires neither capital nor cumbrous machinery, and which will afford the workman a livelihood, are undoubtedly the objects to be attended to in theſe inſtitutions. It may not, perhaps, in all caſes, be expedient to qualify the blind man for a vender of his own wares; and in that caſe he may either manufacture the goods of his employer at home, or work out of doors on weekly wages, at trades which require the aid of machinery.

With regard to the ſecond object of enquiry, it is of the utmoſt importance to avoid the expences of an eſtabliſhment which, in general, are ſo conſiderable, as to leave the objects intended to be relieved a very ſcanty ſhare of that which ſhould be, if poſſible, wholly and excluſively applied to their advantage. Where a regular building is thought abſolutely neceſſary, the plan of the ſchool at Liverpool (ſee Pl. 18.) may very properly be adopted. There are ſome few inſtitutions, however, conducted on more economical principles, and there is no doubt but one of that nature might eaſily be eſtabliſhed in every conſiderable town. There would be no difficulty, for inſtance, in ſetting up a baſket-maker, who ſhould vend no other goods than thoſe manufactured by blind perſons *inſtructed by himſelf on the recommendation of the inhabitants*. His pupils, whilſt learning their buſineſs, ſhould attend to work in his ſhop till they became ſufficiently perfect in their buſineſs to be entruſted with materials to work at their own homes, and for which they ſhould then receive a fair remuneration when the goods were delivered. The only expence which the ſupporters of ſuch a plan would have to ſuſtain, would be the rent of an outhouſe for the workſhop, the price of a few twigs which would be ſpoiled by beginners, and an adequate ſalary to the maſter, who would, no doubt, derive farther encouragement by almoſt excluſively ſupplying the town with his goods at the uſual profit.

With regard to the third enquiry, as to the means of rendering the *little* which the blind are capable of earning *adequate to their ſubſiſtence* (without which the object we have in view is, in fact, only half accompliſhed), it may be obſerved, that whilſt it can be demonſtrated, that a *penny* or *three halfpence per day* is ſufficient, even in theſe dear times,

* As the manufactures which the blind are capable of conducting *entirely and without aſſiſtance*, and in their own confined dwellings, are very limited, the committee of the London ſchool have given ſome conſideration to the following queſtion propoſed to them, viz. *May not many of the ſimpler mechanic exerciſes, now too complex for the touch alone, be aided by machinery*, as is the caſe with the manufacture of horſe-whips? It is even propoſed to offer *premiums* to the ingenious for the diſcovery of means of this ſort, which may lead to the moſt important conſequences in the inſtruction of the blind, in theſe humane and highly uſeful ſeminaries throughout the country.

to provide a poor man with *a wholeſome and nutritious dinner*, there can be no difficulty in this part of the undertaking. All that is neceſſary on this head may be found in the firſt volume of Reports of the Society, eſtabliſhed in London, for increaſing the Comforts and bettering the Condition of the Poor. The information in their account of a *cheap dinner* ſupplied for ſeventy-ſeven labouring children at Epping, is well worth the attention of thoſe who propoſe to add to the number of theſe excellent ſeminaries. At the Liverpool ſchool, and in ſome other inſtitutions for procuring the means of ſubſiſtence to the blind, muſic has been taught—a heavenly ſcience, and one in the practice of which the blind have been long known to make great attainments. It is this notoriety which has occaſioned its omiſſion in the foregoing remarks. Indeed, as it demands a long and perſevering application on the part both of pupil and teacher, before the former is capable of practiſing it for a livelihood, it did not enter into the ſyſtem here recommended, which has in view means of more extenſive utility. There is no doubt, however, that a few of theſe unfortunate perſons in every place might, with great propriety, be taught muſic, and fill the ſituation of organiſts in all our churches, to which even an indifferent player is known to be competent. It ſhould by no means be forgotten, when the means of a livelihood are furniſhed for the blind, peremptorily to interdict their remaining idle, or becoming ſtreet beggars, or contributing to vice and immorality by fiddling in ale-houſes. In great towns, the temptation to mendicity is particularly ſtrong, ſince more is to be gotten by ſtanding at the corner of a ſtreet for two hours than perhaps can be procured by the induſtry of twenty-four. Thoſe charitable perſons, however, who really wiſh the happineſs of the indigent blind, or indeed the poor of any other deſcription, will *conſcientiouſly withhold the wages of idleneſs*, and direct their bounty to flow in a more indiſputable though circuitous courſe, namely, through the hands of thoſe who will not fail to apply it judiciouſly and with effect.

BLOCKLEY, a village of Worceſterſhire, though incloſed by Glouceſterſhire, ſeven miles S.E. of Evetham. Long. 1. 53. W. Lat. 52. 0. N.

BLYTHBOROUGH, a decayed town in Suffolk, on the river Blyth. It has a ſtately church, and is 98 miles N.E. of London. Long. 1. 40. E. Lat. 52. 26. N.

BOAT (*Encycl.*): M. Bernieres invented a boat which is not liable to be overſet or ſunk. Some trials were made with this veſſel at Paris, in the year 1777, in the preſence of a vaſt concourſe of ſpectators. Eight men went into the boat, and rocked it till it filled with water, and afterwards rowed it along the river in that ſtate, without danger of ſinking. M. Bernieres then ordered a maſt to be erected in the ſame boat, when filled with water, and hauled down by a rope faſtened to the top of the maſt till it touched the ſurface of the river, ſo that the veſſel heeled in a poſition to which neither winds nor waves could bring her; yet as ſoon as the rope was let go, the boat recovered her equipoiſe in leſs than a ſecond. This experiment proved that the boat could neither be ſunk nor overturned, and that it afforded the greateſt poſſible ſecurity againſt accidents. Hence this invention is of the firſt importance to the inhabitants of maritime ſtates.

In the year 1785, a patent was granted to Mr. Lukin for his improvement in the conſtruction of boats and ſmall veſſels, ſo that they will neither overſet nor ſink. This uſeful invention is deſcribed in the ſpecification of the patent as follows: To the outſides of boats and veſſels, of the common or any other form, are projecting gunwales, ſloping from the top of the common gunwale, in a ſeint curve, towards the water, ſo as not to interrupt the oars in rowing; and, from the extreme projection (which may be greater or leſs, according to the ſize and uſe the boat or veſſel is intended for), returning to the ſide in a ſlight curve, at a proper diſtance above the water-line. Theſe projecting gunwales may be made ſolid, of any light materials, that will repel the water, or hollow and water-tight, or of cork, and covered with thin wood, canvas, leather, tin, or any other light metal, mixture, or compoſition. Theſe projections are very ſmall at the ſtem and ſtern, and increaſe gradually to the dimenſions required; they will effectually prevent the boat or veſſel from being overſet by ſudden ſqualls, or violent gales of wind, either in ſailing or rowing, or by imprudent or unſkilful management. In the inſide, at the ſtem and ſtern, and at the ſides (where the projecting gunwales are not neceſſary), and under the ſeats and thwarts, are incloſures or bulk-heads, made water-tight, or filled with cork, or other light materials that will repel the water: the ſpaces between the timbers may in like manner be filled up. By this means the boat or veſſel will be ſo much lighter than the body of water it muſt diſplace in ſinking, that it will with ſafety carry more than its common burthen, though the remaining ſpace ſhould by any accident be filled with water. Under the bottom, along the centre of the keel, is affixed a falſe one of caſt-iron, or other metal; this will ſtrengthen and protect the bottom from injury in many caſes; and, by being placed ſo much below the ſurface of the water, will act as ballaſt with more power than a much greater weight in the common ſituation, and is much more ſafe, by being fixed in the proper place, and not liable to ſhift by any ſudden motion of the boat or veſſel.

Ice-BOAT, a modern invention of Thomas Ritzler, of Hamburgh, whoſe name deſerves to be tranſmitted to poſterity; as his ingenious and uſeful contrivance has already ſaved many valuable lives from a watery grave. We have given an accurate repreſentation of ſuch a boat in the annexed plate, and ſhall here furniſh the reader with the deſcription.

Fig. 1. Pl. 17. is a perſpective view of the boat, the body of which conſiſts of wicker-work covered with leather, to render it impermeable by water; and ſo remarkably light, that it may be eaſily managed by one perſon both on the ice and in the water. Its length, when meaſured on the outſide, is $7\frac{1}{2}$ feet in the keel, and 12 feet above from end to end: its breadth 3 feet at the bottom, and 4 at the upper part.

Fig. 2. repreſents the plan of the boat, the bottom of which is ſhod with two ſmall pieces of iron, marked *x*, *x*; by means of two hooks, one of which is delineated on the plate, the boat may with the greateſt facility be ſlided over the ice. In the lower part, or body of the veſſel, there is a large opening, 3 feet long and 15 inches wide, pointed out by *o*, *o*, *o*, fig. 2.; and *o*, fig. 3.; the four ſides of which are ſecured by a frame-work, marked *r*, fig. 1. and 3. to prevent the water from entering the veſſel. Through this opening, alſo, the boatman is enabled to ſtep upon the ice in thoſe places where it is too uneven to admit the ſliding of the boat, and to carry it, by means of the handles, as repreſented in fig. 1. where the perſon ſtanding is marked only with dotted lines, to ſhew that he has quitted his former ſtation in the boat. Another advantage derived from this aperture, in the middle of the boat, is the counterpoiſe which a column of water in its centre produces, and thus prevents it from being overſet, while the man who carried it over the ice immediately raiſes himſelf above the level of the water, and ſits down in the veſſel. But, in order to approach nearer to the perſon whoſe life is endangered, there is alſo employed a ladder with a long jointed handle, which is puſhed forward and held by another aſſiſtant ſtanding on the firm ice. On this ladder (which will be delineated among the implements of reſtoration from drowning) the boatman places himſelf, and advances as near as poſſible to

the body immerſed in the water. Having ſucceſsfully extracted it, no time ſhould be loſt in laying it in a proper poſture in the boat; for which purpoſe there is a kind of chair with an elevated back, on the ſtern of the boat, marked *n*, in fig. 1. and 3.; which laſt exhibits the longitudinal ſection of the veſſel.

M. Gunther, one of the moſt active members of the Hamburgh Society for the Encouragement of the Arts and uſeful Trades, informs us in the third volume of their Tranſactions, publiſhed in 1795, that he has often been preſent when unfortunate perſons have been reſcued from untimely death, by means of the ice-boat, and that the ſwiftneſs and dexterity with which this machine may be managed by expert aſſiſtants, is almoſt incredible. Hence the veſſel is not intruſted to any other but ſkilful hands, and during ſummer it is depoſited in an airy place, and the leather preſerved from becoming either too dry or mouldy. The whole of this uſeful apparatus coſts only 150 marks currency, or about 10l. ſterling; a ſum ſo inſignificant, that, while the city of Hamburgh has built five ſuch ice-boats, the great city of London ought to be in poſſeſſion of at leaſt one hundred.

Life-Boat, at Shields, one of the moſt uſeful modern inventions, by which many lives and much property have already been ſaved. It was built by Mr. Greathead, an eminent ſhip-builder, and generouſly preſented to the inhabitants of South Shields by the preſent Duke of Northumberland, by whoſe beneficence North Shields has alſo been ſupplied with a boat of a ſimilar conſtruction.

Mr. Fairleſs, who furniſhed ſome uſeful hints reſpecting the original plan, deſcribes the veſſel as meaſuring thirty feet by ten, reſembling in form a common Greenland boat, but more flat in the bottom. The quantity of cork employed in the conſtruction is about ſeven hundred weight, with which the boat is lined inſide as well as outſide of the gunwales, two feet in breadth; the ſeats being alſo filled with the ſame material. It is rowed by ten men, double banked, and ſteered by one at each end with oars, being alike in its form at both ends, and contrived ſo as not to ſink in the ſand.

This boat draws very little water, and can carry twenty perſons even when full of water. Being water-proof, and rendered buoyant by cork, it always keeps afloat, preſerving its equilibrium without danger of overſetting, and is able to contend againſt the moſt tremendous ſea, having never failed, in a ſingle inſtance, of conveying a diſtreſſed ſhip's crew in ſafety.

When taken out in the higheſt ſeas and broken water, the men teſtify no apprehenſion; and though cork-jackets were at firſt provided for them, yet their confidence in the boat is ſo great that they now refuſe them.

A model of this uſeful boat is kept at Northumberland-houſe in the Strand. It might be improved, by providing it with wheels, for its more ready conveyance to the place where it is immediately wanted.

The veſſel, when complete and copper-nailed, coſts about 150l.—But in the moment of diſtreſs, what ſhipwrecked mariner would not think this article a cheap purchaſe, and pronounce the value of ſuch a boat to be truly ineſtimable?

A patent has lately been granted to Mr. Edward Seers, of the Inner Temple, for a machine to be applied to boats and other veſſels, for the purpoſe of moving them with eaſe and ſwiftneſs. This invention conſiſts of two or more paddles, moving by means of machinery, in contrary and alternate directions. The paddles are ſo conſtructed, that when the machinery is ſet in motion, the broad ſurface of one or more of them will preſs againſt the water, while the broad ſurface of the other, or others, will give way to it, and by this means the veſſel will be moved.

BOBENHAUSEN, a town of Germany, in Weteravia, with a caſtle; ſeated on the ſmall river Gerſbrentz, three miles from Francfort on the Maine.

BOCAT, a fine valley of Syria, in Aſia, in which are ſituated the magnificent ruins of Balbec. "It might be rendered," ſays Mr. Volney, "one of the richeſt and moſt beautiful ſpots in Syria, it being more fertile than the celebrated vale of Damaſcus, and better watered than the rich plains of Rama and Eſdraelon."

BOCCALINI (*Encycl.*). From the laſh of this celebrated ſatirical writer ſovereign princes even did not eſcape. The cardinals Borgheſe and Gætan having declared themſelves his protectors, he publiſhed his *Ragguaglio di Parnaſſo*, and *La Secretaria di Apollo*, which is the continuation of the former. Theſe two works were received by the public with uncommon applauſe. He there feigns, that Apollo, holding his court at Parnaſſus, heard the complaints of the whole world, and did juſtice according as the caſes required. He at length printed his *Pietra di Paragone;* wherein he attacks the court of Spain, ſetting forth their deſigns againſt the liberty of Italy, and inveighing particularly againſt them for the tyranny they exerciſed in the kingdom of Naples. The Spaniards complained of him in form, and were determined at any rate to be revenged. Boccalini was frightened, and retired to Venice; but was there aſſaſſinated in a very ſtrange manner. He lodged with one of his friends, who having got up early one morning, left Boccalini in bed; a minute after ſome armed men entered his chamber, and gave him ſo many blows with bags full of ſand, that they left him for dead; ſo that his friend returning ſome time after, found him ſpeechleſs. Great ſearch was made at Venice for the authors of this murder; and though they were never diſcovered, it was univerſally believed that they were employed by the court of Spain.

BOCHIUS, or Bocaui (*Encycl.*), travelled into Italy, Germany, Poland, and Muſcovy, and at his return became ſecretary to the duke of Parma. He died on the 13th of January, 1609. The critics in the Netherlands ſet ſo great a value on his poetry, that they gave him the name of the *Belgic Virgil.* He wrote, 1. *De Belgii Principatu.* 2. *Parodia Heroica Pſalmorum Davidicorum.* 3. *Obſervationes Phyſicæ, Ethicæ, Politicæ, et Hiſtoricæ, in Pſalmos.* 4. *Vita Davidis.* 5. *Orationes.* 6. *Poëmata.*

BOECLER (John Henry), hiſtoriographer of Sweden, and profeſſor of hiſtory at Straſburg, was born in Franconia 1611, and died in 1686. He received penſions from ſeveral princes; among others, from Lewis XIV. and Chriſtina, which latter invited him to Sweden. His principal works are, 1. Commentationes Plinianæ. 2. Timur, vulgo Tamerlanus, 1657, 4to. 3. Notitia Sancti Romani Imperii, 1681, 4to. 4. Hiſtoria, ſchola Principum. 5. Commentatio in Grotii librum de Jure Belli et Pacis. With all the warmth and zeal, which commentators and biographers uſually have for their principals, he laviſhes panegyric upon Grotius. He ſwears, in a letter publiſhed after his death, that no man will ever approach him; and that whoever ſhould attempt to equal this work of his, would only furniſh matter of laughter to poſterity.

BOETHIUS, Boece, or Boeis (Hector), a famous Scottiſh hiſtorian, was born at Dundee, in the ſhire of Angus, about 1470. After having ſtudied at Dundee and Aberdeen, he was ſent to the univerſity of Paris, where he applied to philoſophy, and became a profeſſor of it there. Here he contracted an acquaintance with ſeveral eminent perſons, particularly with Eraſmus, who kept a correſpondence with him afterwards. Elphinſton biſhop of Aberdeen having founded the King's College in that city, about 1500, ſent for Boeis from Paris, and appointed him principal. He took for his

colleague Mr. William Hay, and by their joint labour the kingdom was furniſhed with ſeveral eminent ſcholars. Upon the death of his patron he undertook to write his life, and thoſe of his predeceſſors in that ſee. The work is in Latin, and entitled, Vitæ Epiſcoporum Murthlacenſium et Aberdonenſium. Paris, 1522, quarto. He begins at Beanus, the firſt biſhop, and ends at Gawin Dunbar, who was biſhop when the book was publiſhed. A third part of the work is ſpent in the life of Elphinſton, for whoſe ſake it was undertaken. He next applied to write, in the ſame language, The Hiſtory of Scotland; the firſt edition of which was printed at Paris, by Badius Aſcenſius, in 1526, which conſiſted of ſeventeen books, and ended with the death of James I. but the next, in 1574, was much enlarged, having the addition of the eighteenth book, and part of the nineteenth. The work was afterwards brought down to the reign of James III. by Ferrerius, a Piedmonteſe.

Mackenzie obſerves, that of all Scots hiſtorians, next to Buchanan, Boetius has been the moſt cenſured and commended by the learned men who have mentioned him. Nicolſon tells us, that in the firſt ſix books there are a great many particulars not to be found in Fordun, or any other writer now extant; and that, "unleſs the authors which he pretends to have ſeen be hereafter diſcovered, he will continue to be ſhrewdly ſuſpected for the contriver of almoſt as many tales as Jeoffrey of Monmouth." His eighteenth book, however, is highly commended by Ferrerius, and other writers. He was a great maſter of polite learning, well ſkilled in divinity, philoſophy, and hiſtory; but ſomewhat credulous, and much addicted to the belief of legendary ſtories.

BOFFRAND (Germain), a celebrated French architect, was the ſon of a ſculptor, and of a ſiſter of the famous Quinaut; and born at Nantes, in Bretagne, 1667. He was trained under Harduin Manſarad, who truſted him with conducting his greateſt works. Boffrand was admitted into the French academy of architecture in 1709. Many princes of Germany choſe him for their architect, and raiſed conſiderable edifices upon his plans. His manner of building approached that of Palladio, and there was much of grandeur in all his deſigns. As engineer and inſpector-general of the bridges and highways, he cauſed to be conſtructed a number of canals, ſluices, bridges, and other mechanical works. There is of this illuſtrious architect a curious and uſeful book, which contains the general principles of his art; to which is added, an account of the plans, profiles, and elevations, of the principal works which he executed in France and other countries. A very gracious idea is tranſmitted to us of this artiſt, who is repreſented as of a noble and diſintereſted ſpirit, and of a pleaſing and agreeable manner. He died at Paris, in 1755.

BOG, a river of Poland, which runs ſouth-weſt through Podolia and Budziac Tartary, falling into the Black Sea, between Oczakow and the river Dnieper.

BOILER. Many ingenious veſſels and utenſils have, at different periods, been invented, with a view to facilitate the proceſs of boiling, and ſave the conſumption of fuel. In the latter reſpect, Count Rumford ſtands at the head of thoſe experimental enquirers, who have directed their labours to the benefit of ſociety; yet we muſt confeſs that there is ſtill great room for improvement. One of the lateſt inventions in this department of domeſtic economy, is that of Mr. Tho. Rowntree, engine-maker, of Great Surrey-ſtreet, Blackfriars-road, who, in 1798, obtained a patent for "a new method of applying fire for the purpoſe of heating boilers and other veſſels, where heat is required." But as the patentee had not given a clear ſpecification, from which an ordinary tradeſman could have conſtructed a furnace on his principles, without any farther explanation, his patent was declared void, after a trial before Lord Elden and a ſpecial jury, on the 3d of November laſt, and has conſequently become public property. Theſe proceedings, however, have been attended with a good effect, as the obſcure account publiſhed by Mr. Rowntree, has been more clearly defined by the evidence given in court, eſpecially by that of Mr. Hindmarſh. We ſhall, therefore, preſent our readers with the ſpecification communicated by the patentee, and accompanying it with the neceſſary illuſtrations.—The following is a literal abſtract of the inventor's deſcription:—

"For heating of coppers, boilers, furnaces, ovens, and ſtoves, my fire-place is much ſmaller than heretofore made uſe of for the ſame ſized copper, boiler, furnace, oven, or ſtove. Inſtead of placing my fire-place, according to the common practice, immediately under the boiler, or other veſſel, I place it at the front, ſide, or end, as I ſee moſt convenient, in ſuch a manner as to oblige the flame to riſe in the front, ſide, or end, and paſs all round the veſſel, &c. while at the ſame time it ſtrikes the bottom of the veſſel, &c. without ſuffering the flame to paſs off in a flue, or flues, as it uſually does in the common way, and by that means ſending the heat into the flues, inſtead of its being uſed where it ought to be, namely, on the veſſels, &c.; this my method effectually prevents; for, by means of a ſmall perpendicular or other opening, into a box or trap, which I call a reſervoir, and which I place horizontally, or diagonally, as the ſituation may require, and is made of iron, brick, ſtone, or any other material capable of bearing heat, where a valve is placed riding on centres or otherwiſe, and ſtanding in a diagonal or other direction, as is found moſt convenient, the flame is returned or impeded in its progreſs to the chimney, and made to deſcend below the bottom of the veſſel, and paſs out at the bottom, top, or ſide of ſaid box, trap, or reſervoir, into the common chimney. This reſervoir is placed between the veſſel, &c. and the chimney. To the opening, which admits the flame into the reſervoir, are affixed, when neceſſary, ſliders, regiſters, or ſtops, which ſerve to increaſe or diminiſh the heat. The valve in the reſervoir is for the ſame purpoſe in another degree, which more immediately appertains to increaſing or diminiſhing the draught, which it does by moving the ſaid valve into different poſitions, as the ſpeed of the operation may require."

It would be needleſs to ſtate the particulars of the evidence relative to the effect produced to the new-invented furnaces, in heating boilers, &c. as well as the great ſaving of fuel, which was proved to be more than one-third, and in ſome caſes nearly one-half, of what is uſually conſumed in furnaces conſtructed on the old plan. Hence we ſhall communicate only the ſubſtance of Mr. Hindmarſh's evidence, which greatly tends to illuſtrate the principles of the invention. This, he conceives, principally conſiſts in the three following circumſtances:

1. In the peculiar mode of conſtructing the furnace, or ſetting the boiler, and of placing the fire, not immediately under, but a little in front, or at one ſide of it, whereby the flame and hot air can get acceſs to every part of the veſſel, and not only ſtrike with force againſt its bottom, with alſo with equal effect reverberate againſt, and violently embrace, its ſides, and whole external ſurface; unlike every former contrivance, the moſt perfect of which could only cauſe the flame and hot air to act partially upon the bottom and ſides of the veſſel.

2. In the elevated ſituation, and ſmallneſs, of the aperture leading from the furnace towards the chimney; whereby the flame and hot air are impeded in their progreſs to the atmoſphere, and compelled to tarry in the cavity of the furnace, and occupy every part thereof much longer than they otherwiſe would do. This effect in ſtopping, checking, and as it were arreſting the flame and hot air, in their attempt to eſcape into the atmoſphere, Mr. Hindmarſh conſidered as not only new, but ſingularly beneficial; for, by this means, the

flame and hot air are detained in the very place where their preſence is moſt wanted, and conſtrained to give forth their energies with an impetus againſt the bottom and ſides of the veſſel to be heated: whereas, in none of the furnaces heretofore erected, was any effectual ſtop interpoſed between the fire and the chimney, to cauſe the flame and hot air to dwell under and round the ſides of the veſſel; but they paſſed rapidly off into the atmoſphere, either by a direct communication through the chimney, or indirectly, but almoſt as ſpeedily, by flues; or elſe by a drain (as it is called), the aperture of which is equal in dimenſions to that of the chimney itſelf.

3. In an open ſpace between the furnace and chimney, called by the patentee a box, trap, or reſervoir, and intended as a receptacle of the flame, hot air, and ſmoke, after they have quitted the furnace, and paſſed through the ſmall aperture as above deſcribed. This ſpace, or reſervoir, for the flame, hot air, and ſmoke, being cloſed at the top and external ſides, and open only at the bottom outwards, for the purpoſe of permitting the ſmoke, &c. to paſs off into the chimney, ſtill farther checks and detains the flame and hot air in the furnace; and being itſelf conſtantly full of warm air, ſmoke, &c. cauſes the heat to be reverberated againſt the ſides and bottom of the veſſel or boiler, and effectually prevents the admiſſion of the cold atmoſpheric air from the chimney, which, on the old plans of conſtruction, is found by experience to rob the furnace and veſſel of more than half the ſupply of heat which any given quantity of fuel is capable of yielding. The valves, ſliders, and dampers, are not eſſential parts of the invention, but merely as regulators, which, in many caſes, may be altogether omitted, without detriment to the operation of the fire.

Although Count Rumford has ſucceſsfully extended his reſearches to diſcover the moſt economical plan in the management of fire, and the generation of heat for culinary and other purpoſes, it does not appear from his writings, that he had a diſtinct conception of the new method ſuggeſted by Mr. Rowntree, till after the enrolment of his ſpecification in May 1798. Nay, ſays Mr. Hindmarſh, the count evidently takes it for granted (ſee vol. II. p. 73, of his Eſſays), and even reaſons on the fact, which he there ſuppoſes to be unavoidable, and beyond remedy, that the fire cannot be made to impinge againſt the ſides of a veſſel with the ſame force and effect as againſt the bottom: which is a plain proof, that at the time of writing that eſſay, he was totally unacquainted with Mr. Rowntree's method of applying and managing the fire; in which the very effect which the count conſiders as a deſideratum in ſcience, and which appears to have been one grand object of his philoſophical purſuits, is now in a great meaſure completed.

BOILING, or EBULLITION (*Encycl.*). Count Rumford, in his admirable Eſſays, has taken much pains to impreſs on the minds of thoſe who exerciſe the culinary art the following ſimple, but *practical important fact*, namely, that, when water *begins* only to be *agitated* by the heat of the fire over which it is placed, it is *incapable of being made hotter*; and that the violent ebullition occaſioned by the application of more heat, is nothing more than an unprofitable diſſipation of the water in the form of ſteam, and an abſolute *waſte of the fuel employed*. See FIRE-PLACE.

BOLABOLA, one of the Society Iſlands, in the South Pacific Ocean, ſurrounded by a reef of rocks, and ſeveral ſmall iſlands, none of them more than eight leagues in compaſs. It is four leagues to the north-weſt of Otaha.

BOLBITINUM (anc. geog.), the ſecond mouth of the Nile reckoning from weſt to eaſt; now very ſmall, choaked up with ſand, and called *le Bras de Beltin*.

BOLENTIUM (anc. geog.), a town of Pannonia Superior; now *Rackerſburg* in Stiria.

BOLSEC (Jerome), a Carmelite of Paris; who, having preached ſomewhat freely in St. Bartholomew's church, forſook his order, and fled into Italy. He ſet up for a phyſician, and married; but ſoon after did ſomething or other for which he was driven away. He ſet up afterwards in Geneva as a phyſician; but not ſucceeding in that profeſſion, he went over to divinity. At firſt he dogmatized privately on the myſtery of predeſtination, according to the principles of Pelagius; and afterwards had the boldneſs to make a public diſcourſe againſt the received opinion. Upon this Calvin went to ſee him, and cenſured him mildly. Then he ſent for him to his houſe, and endeavoured to reclaim him from his error; but this did not hinder Bolſec from delivering in public an inſulting diſcourſe againſt the decree of eternal predeſtination. Calvin was among his auditors; but, hiding himſelf in the crowd, was not ſeen by Bolſec, which made him the bolder. As ſoon as Bolſec had ended his ſermon, Calvin ſtood up, and confuted all he had been ſaying. This was not all; a magiſtrate, who was preſent in that aſſembly, called him a ſeditious fellow, and ſent him to priſon. The cauſe was diſcuſſed very fully; and at laſt, with the advice of the Swiſs churches, the ſenate of Geneva declared Bolſec convicted of ſedition and Pelagianiſm; and as ſuch baniſhed him from the territory of the republic, on pain of being whipped if he ſhould return thither. This was done in 1551. He retired into a neighbouring place, which depended on the canton of Bern, and raiſed a great deal of diſturbance there. He boldly accuſed Calvin of making God the author of ſin. Calvin, to prevent the impreſſions which ſuch complaints might make upon the gentlemen of Bern, cauſed himſelf to be deputed to them, and pleaded his cauſe before them. He was ſo fortunate, that though he could not get a determination upon his doctrine, whether it was true or falſe, yet Bolſec was ordered to quit the country.

He retired to France, and applied himſelf to the Proteſtants; firſt at Paris, and afterwards at Orleans. He ſhewed a great deſire to be promoted to the miniſtry, and to be reconciled to the church of Geneva; but the perſecution that aroſe againſt the proteſtants, made him reſolve to take up his firſt religion, and the practice of phyſic. He went and ſettled at Autun, and proſtituted his wife to the canons of that place; and, to ingratiate himſelf the more with the papiſts, exerted a moſt flaming zeal againſt the reformed. He changed his habitation often: he lived at Lyons in 1582, as appears by the title of a book, which he cauſed to be printed then at Paris, againſt Beza. He died not long after; for he was not living in 1585. The book juſt mentioned is entitled, The Hiſtory of the Life, Doctrine, and Behaviour, of Theodore Beza, called the Spectable great Miniſter of Geneva. This was preceded by the Hiſtory of the Life, Actions, Doctrine, Conſtancy, and Death of John Calvin, heretofore Miniſter of Geneva; which was printed at Lyons, in 1577. Both theſe hiſtories are altogether unworthy of credit; as well becauſe they are written by an author full of reſentment, as becauſe they contain facts notoriouſly falſe.

BOLTON (Dr. Robert), was born in Northamptonſhire, about the year 1690, and received his education at Wadham College, Oxford, where, on the 13th of June, 1718, he took the degree of maſter of arts. Being a valetudinarian and hypochondriac, he found a college life not agreeable to his temper; and being poſſeſſed of a ſmall private fortune, he did not long reſide at Oxford. In 1720 he lived at Fulham, where his acquaintance commenced with Mrs. Butler, which afterwards occaſioned his being known to Mr. Pope; and he ſometimes took up his abode with old Lady Blount, at Twickenham. About 1724 he reſided at Kenſington, where the celebrated Mr. Whiſton then dwelt; and in part by his recommendation, on the reſignation of Dr. Butler, afterwards biſhop

of Durham, of the chaplainſhip of Sir Joſeph Jekyl, maſter of the rolls, our author was received into that gentleman's family in the ſame capacity, and continued there unto the time of Sir Joſeph's death.

Dr. Bolton's connection with Sir Joſeph Jekyl, introduced him to the patronage of Lord Hardwicke, by whoſe means, in the year 1735, he was promoted to the deanery of Carliſle. In 1738 he was appointed vicar of St. Mary's, Reading: and both theſe preferments, the only ones he ever received, he held until the time of his death. He was an excellent pariſh prieſt, and a good preacher; charitable to the poor, and having, from his own valetudinary ſtate, acquired ſome knowledge of phyſic, he kindly aſſiſted them by advice and medicine. He was greatly beloved by his pariſhioners, and deſervedly; for he performed every part of his duty in a truly exemplary manner. On Eaſter Tueſday, 1739, he preached one of the Spital ſermons at St. Bride's, Fleet-ſtreet, which was afterwards printed in quarto. We do not find that he aſpired to the character of an author, though ſo well qualified for it, until late in life. His firſt performance was entitled, A Letter to a Lady on Card-playing on the Lord's-day, 8vo. 1748, ſetting forth, in a lively and forcible manner, the many evils attending the practice of gaming on Sundays, and of an immoderate attachment to that fatal purſuit at any time. In 1750 appeared The Employment of Time, three eſſays, 8vo. dedicated to Lord Hardwicke; the moſt popular of our author's performances; and, on its original publication, generally aſcribed to Gilbert Weſt. The next year, 1751, produced The Deity's Delay in puniſhing the Guilty, conſidered on the Principles of Reaſon, 8vo.; and in 1755, An Anſwer to the Queſtion, Where are your Arguments againſt what you call Lewdneſs, if you can make no Uſe of the Bible? 8vo.

Continuing to combat the prevailing vices of the times, he publiſhed, in 1757, A Letter to an Officer of the Army on Travelling on Sundays, 8vo.; and, in the ſame year, The Ghoſt of Erneſt, Great Grandfather of her Royal Highneſs the Princeſs Dowager of Wales; with ſome Account of his Life; 8vo. Each of the above performances contains good ſenſe, learning, philanthropy, and religion, and each of them is calculated for the advantage of ſociety.

The laſt work which Dr. Bolton gave the public, was not the leaſt valuable. It was entitled, Letters and Tracts on the Choice of Company, and other Subjects, 8vo. 1761. This he dedicated to his early patron, Lord Hardwicke, to whom he inſcribed The Employment of Time, and who at this period was no longer chancellor. He died at London, on the 26th of November, 1763, and was buried in the porch between the firſt and ſecond door of the pariſh church of St. Mary, Reading.

BOLZANO, a large and handſome town of Germany, in the Tyrol, on the river Eiſach, twenty-ſeven miles north of Trent. Long. 11. 26. E. Lat. 46. 35. N.

BONA (John), a cardinal, famous for piety and learning, was deſcended from an ancient and noble family, and born at Mondovi, a town in Piedmont, upon the 10th of October, 1609. He was devoted to ſolitude, and had a contempt of the world from his infancy. At fifteen years of age he betook himſelf to a monaſtery near Pignerol, belonging to the begging friars of the order of St. Bernard; and in 1651 was made general of his order. Cardinal Fabio Chigi, who was Bona's great friend, and in 1655 choſen pope, under the name of Alexander VII. would have had him to have continued in this office, and uſed ſome means to prevail with him; but Bona preſſed ſo earneſtly to be diſcharged, that the pope at length ſuffered him to reſign it. He did it, however, upon this condition, that Bona ſhould not depart from Rome; and, in order to reconcile him to it, gave him ſeveral conſiderable places. Clement IX. continued him in theſe places, conferred upon him new ones, and made a cardinal of him in November, 1669. This pontiff dying ſoon after, many people wiſhed that Bona might ſucceed him in the holy ſee; but they were diſappointed.

Bona was very learned, held a correſpondence with moſt of the literati in Europe, and was ſometimes at the pains of reviſing and correcting their works. He was the author of ſeveral things himſelf, chiefly written in the devotional way, which were much eſteemed, and have been tranſlated moſt of them into French. Bona died at the age of ſixty-five.

Bona (*Encycl.*), a ſea-port town of Algiers. The inhabitants deny it to be the ancient Hippo, which had been ſo often taken, retaken, and deſtroyed by the wars; and pretend it to be ſince rebuilt at the diſtance of two or three miles from the ancient Hippo, out of its ruins, and called *Balced-el-Ugned*, from a ſort of trees of that name that grow in the neighbourhood. It is now a very mean place, poorly built, and thinly inhabited, with ſcarce any traces of its former grandeur, except the ruins of a cathedral, or, as others gueſs, of a monaſtery, built by St. Auſtin, about three miles diſtance from the city. Near theſe ruins is a famed ſpring called by his name, much reſorted to by the French and Italian ſailors, who come to drink of its waters, and pay their devotions to a maimed ſtatue, ſaid alſo to belong to the ſaint, but ſo mutilated that no traces either of face or dreſs are remaining; and as each of them ſtrives to break off ſome ſplinter, or to ſcrape off ſome part of it, on account of its ſuppoſed ſanctity, it will probably be ſoon reduced to a ſtate of non-exiſtence. Bona was taken by the pirate Barbaroſſa, and joined to his new kingdom of Algiers; but as quickly loſt, and recovered by its old maſters the Tuniſeens, who ſoon after loſt it again. It is commanded by a little fort, in which is a garriſon of about 300 Turks, under the command of an aga, who is alſo governor of the town. The road for the ſhips is good for nothing before the town, but a little farther weſt is very deep and ſafe. Dr. Shaw tells us, that the continual diſcharging of ballaſt into the road, and the neglect of cleanſing the port which came to the very walls, is the cauſe of both becoming ſo unſafe and incommodious; though this might be eaſily remedied, ſo as to make the town one of the moſt flouriſhing in all Barbary.

BONAVENTURE of Padua, a cardinal, was born in that city in 1332, and deſcended from a noble and illuſtrious family. He ſtudied divinity at Paris, where he diſtinguiſhed himſelf by his uncommon parts and application. He was of the order of St. Auguſtin, of which he was made general in 1377. Pope Urban VI. gave him a cardinal's cap the year after; which engaging him to ſtand up for the rights of the church againſt Francis de Carrario of Padua, that petty monarch contrived to have him murdered. He was diſpatched with the ſhot of an arrow, as he was paſſing St. Angelo's bridge at Rome, in 1386. He was the author of ſeveral works: as, Commentaries upon the Epiſtles of St. John and St. James, Lives of the Saints, Sermons, Speculum Mariæ, &c.

BONAVISTA, a cape on the eaſt ſide of the iſland of Newfoundland.

BONNA (anc. geog.), one of the fifty citadels built by Druſus on the Rhine; ſuppoſed by ſome to be the ſame with the *Ara Ubiorum*: now Bonn.

BONNER (*Encycl.*). The following pieces were publiſhed under the name of this prelate. 1. Preface to the Oration of Stephen Gardiner, biſhop of Wincheſter, concerning true obedience. 2. Several letters to the lord Cromwell. 3. A Declaration to Lord Cromwell, deſcribing to him the evil behaviour of Stephen (biſhop of Wincheſter). 4. Letter of his

about the proceedings at Rome concerning the king's divorce from Catharine of Arragon. 5. An Admonition and Advertiſement given by the Biſhop of London to all readers of the Bible in the Engliſh tongue. 6. Injunctions given by Bonner, biſhop of London, to his clergy (about preaching), with the names of books prohibited. 7. Letter to Mr. Lechmore. 8. Reſponſum & Exhortatio; Lond. 1553, 8vo. Anſwer and exhortation to the clergy in práiſe of prieſthood: ſpoken by the author in St. Paul's cathedral, the 16th October, 1553. 9. A Letter to Mr. Lechmore, 6th September, 1553, 10. Articles to be enquired of in the general viſitation of Edmund biſhop of London, exerciſed by him in the year 1554, in the city and dioceſe of London, &c. 11. A profitable and neceſſary Doctrine, containing an Expoſition on the Creed, ſeven Sacraments, ten Commandments, the Pater Noſter, Ave Maria, with certain Homilies adjoining thereto, for the inſtruction and information of the dioceſe of London. 12. Several letters, declarations, arguings, diſputes, &c. of his are extant in John Fox's Book of Martyrs. 13. His Objections againſt the Proceſs of Robert Horne, biſhop of Wincheſter, who had tendered the oath of ſupremacy to him a ſecond time.

BONNEVAL (Claudius Alexander de), count, known in the latter part of his life by the name of *Oſman Baſhaw*, deſcended from a family related to the blood-royal of France, entered himſelf at the age of ſixteen in the ſervice of that crown, and married the daughter of Marſhal de Biron. He made the campaign in Flanders in 1690; but ſoon after left the French army, and entered into the imperial ſervice under Prince Eugene, who honoured him with an intimate friendſhip. The intrigues of the Marquis de Prié, his inveterate enemy, ruined his credit, however, at the court of Vienna, and cauſed him to be baniſhed the empire. He then offered his ſervice to the republic of Venice, and to Ruſſia; which being declined, his next tender was to the Grand-Signior, who gladly received him: it was ſtipulated, that he ſhould have a body of 30,000 men at his diſpoſal; that a government ſhould be conferred on him, with the rank of baſhaw of three tails, and a ſalary of 10,000 aſpers a-day; and that, in caſe of a war, he ſhould be commander in chief. The firſt expedition he engaged in after his arrival at Conſtantinople, was to quell an inſurrection in Arabia Petræa, which he happily effected; and at his return had large offers made him by Kouli Khan, but he did not chooſe to accept them. Some time after, he commanded the Turkiſh army againſt the emperor, over whoſe forces he gained a victory on the banks of the Danube. But ſucceſs does not always protect a perſon againſt diſgrace; for Bonneval, notwithſtanding his ſervice, was firſt impriſoned, and then baniſhed to the iſland of Chio. The ſultan, however, continued his friend; and the evening before his departure made him baſhaw-general of the Archipelago, which, with his former appointment of beglerbeg of Arabia, rendered him one of the moſt powerful perſons in the Ottoman empire. In this iſland he found a retirement quite agreeable to his wiſhes; but did not long enjoy it, being ſent for back, and made *topigi* or maſter of the ordnance, a poſt of great honour and profit. He died in this employment, aged ſeventy-five, in 1747, and wrote the memoirs of his own life.

BONNY, a town of France, in the ci-devant Gatinois, ſeated at the confluence of a river of the ſame name with the Loire. E. long. 2. 54. N. lat. 47. 36.

BONONIA (anc. geog.), a town of Panonia Inferior, between Murſa to the north-weſt, and Taurinum to the eaſt.—Another Bononia, a town of Mœſia Superior, on the Danube; now *Bodon*, in Bulgaria. See BODON.

BONWICKE (Ambroſe), a nonjuring clergyman of great piety and learning, ſon of the Rev. John Bonwicke, rector of Mickleham in Surrey, was born April 29, 1652, and educated at Merchant Taylors' ſchool; he was elected to St. John's College, Oxford, in 1668, where he was appointed librarian in 1670; B.A. 1673; M.A. March 18, 1675; was ordained deacon May 21, 1676; prieſt, June 6 (Trinity Sunday), 1680; proceeded B.D. July 21, 1682; and was elected maſter of Merchant Taylors' ſchool, June 9, 1680. In 1689, the college of St. John's petitioned the Merchant Taylors' company, that he might continue maſter of the ſchool (which is a nurſery for their college) for life; but at Chriſtmas, 1691, he was turned out for refuſing to take the oath of allegiance, and was afterwards for many years maſter of a celebrated ſchool at Headley, near Leatherhead, in Surrey, where he had at one time the honour of having the poet Fenton for his uſher, and Bowyer (who was afterwards the learned printer) for a ſcholar.

BOODGE-BOODGE, a town of Hindooſtan Proper, capital of the rajah of Cutch, 330 miles N.E. by E. of Surat. Long. 68. 0. E. Lat. 23. 16. N.

BOOK-BINDING (*Encycl.*). The following is an extract from the ſpecification of the patent granted to Mr. Ebenezer Palmer, of Saint Mary Cole, Cheapſide, ſtationer; for an improved mode of binding books, eſpecially merchants' account books. It is dated December 30, 1800. The improvement conſiſts in the addition of a metallic hinge or chain, contrived and made in the following manner:

"Firſt. There are certain various ſmall bars of metal, or compoſition of metals, about the thickneſs of a ſhilling, or more, according to the ſize and thickneſs of the book to be made, the length of each ſuch bar being from half an inch to ſeveral inches long, in proportion to the ſtrength required in the back of the book.

"Secondly. At each end of every ſuch bar of metal is made a pivot, by being filed down, or otherwiſe, and which are of different lengths, alſo in proportion to the thickneſs of two links, which they are to receive.

"Thirdly. There are a certain number of links, made rather in an oval form, to the ſaid hinge, each of which contains two holes, according to the ſizes of the pivots they are to go on, which links are of the ſame metal as the hinge, or a compoſition of metals, as is judged neceſſary; each of the ſaid links being nearly the length that two of the above-deſcribed bars are wide.

"Fourthly. When ſuch metallic pivots are prepared, the afore-mentioned links are then rivetted on thoſe pivots, each pivot receiving two links, and thereby hold the ſaid hinge together, on the principle of a link-chain or hinge.

"Fifthly. There are two holes, or more, of different ſizes, as required in each bar of the hinge or chain, by which means each ſection of the book is ſtrongly faſtened to the ſame; which hinge, ſo faſtened, operates with the back of the book, when bound, in ſuch an improved manner that thereby occaſions the ſaid ſections to open in ſuch a manner as to bring them on a parallel with each other, and in conſequence thereof admit of the ruled lines being written into, even cloſe to the back, without any inconvenience."

BOOK-KEEPING (*Encycl.*). In the year 1796, a patent was granted to Mr. Edward Thomas Jones, of Briſtol, for his method or plan of detecting errors in accounts of all kinds, by which they may be adjuſted in a regular and conciſe manner. This work is entitled, The Engliſh Syſtem of Book-keeping, which requires a day-book, or journal, an alphabet, and a ledger, ruled in the following manner: namely, the day-book has three columns on each page, for receiving the amount of the tranſactions; one column of which to receive the amount of the debits and credits, one column to receive the debits only, and another to receive the credits only; or it may be ruled

with only two columns on each page, one to receive the amount of the debits, and the other the amount of the credits. There muſt alſo be on each page of the day-book, four other columns ruled, two on the left ſide, next the amount of the debits, and two on the right ſide next the amount of the credits, for receiving the letter or mark of poſting, and the page of the ledger to which each amount is to be poſted. The alphabet need not be ruled at all, but muſt contain the name of every account in the ledger, the letter that is annexed to it as a mark of poſting, and the page of the ledger. The ledger muſt be ruled with three, four, five, or ſeven columns on each page, as may be moſt agreeable, for receiving the amounts of the different tranſactions entered in the day-book.

But in order to prevent any miſtakes that may happen from the hurry of buſineſs in a counting-houſe, Mr. Jones has given only one column for receiving the amount of every tranſaction, whether debits or credits, at the inſtant of making the entry: and, for the convenience of ſeparating the debits from the credits, previous to poſting, which is neceſſary to prevent confuſion and perplexity, he has two other columns on the ſame page; that on the left ſide, into which the amount of every debit muſt be carefully entered, and that on the right for the amount of the credits; which columns muſt be caſt up once a month. The column of debits and credits of itſelf forms one amount; the column for the debits produces a ſecond amount; and the column of credits a third amount; which ſecond and third amounts, added together, muſt exactly agree with the firſt amount, or the work is not done right. By this means, the man of buſineſs may obtain monthly ſuch a ſtatement of his affairs, as will ſhew how much he owes for that month, and how much is owing to him; and the debits being added together for any given time, with the value of the ſtock of goods on hand, will, when the amount of the credits is ſubtracted therefrom, ſhew the profits of the trade.

The patentee's manner of examining the books kept by this method, alſo profeſſedly differs from that hitherto practiſed, as well in expedition as in the certain accuracy which attends the proceſs; it being only neceſſary to caſt up the columns through the ledger debits and credits, according to the examples given, and the amount of thoſe columns, if right, muſt agree with the columns in the day-book for the ſame correſponding ſpace of time. Theſe caſtings ſhould take place once a month, and if the amounts do not agree, the poſting muſt then, but not elſe, be called over; and when the time, whether it be one, two, three, or four months, that is allotted to each column of the ledger, is expired, the amount of each column ſhould be put at the bottom of the firſt page, and carried forward to the bottom of the next, and ſo on to the end of the accounts; taking care that the amount in the day-book, of each month's tranſactions, be brought into one groſs amount for the ſame time.

Having already enlarged upon this ſubject, we ſhall only obſerve, that this new ſyſtem of book-keeping, however ingeniouſly contrived, has not met with that general approbation to which it is apparently entitled. To enforce his claim to public patronage, Mr. Jones concludes the ſpecification of his patent by aſſerting, that upon his plan every page will be proved in the progreſs of calculation, and "the balance of ten thouſand ledgers could not unobſervedly be taken off wrong." —We give him full credit for this aſſertion; though it has, perhaps by invidious rivals, been objected that his method is more complicated than the old Italian ſyſtem of book-keeping; which has, by experience, been found fully adequate to the purpoſe of mercantile accuracy.

BOOTAN, a country N.E. of Hindooſtan Proper, between Bengal and Thibet, of which laſt it is a feudatory or dependency. The ſouthernmoſt ridge of the Bootan mountains riſes near a mile and a half perpendicular above the plains of Bengal, in a horizontal diſtance of only fifteen miles; and from the ſummit the aſtoniſhed traveller looks back on the plains, as on an extenſive ocean beneath him. The capital of this country is Teſſaſudon.

BOOTH (Barton), a famous Engliſh actor, born in Lancaſhire in 1681, and educated in Weſtminſter ſchool under the celebrated Dr. Buſby, where his ſucceſs in the Latin plays cuſtomarily performed by the ſcholars gave him an inclination for the ſtage. He was intended for the church; but running away from ſchool to Dublin, he there commenced actor. His firſt appearance was in the part of Oroonoko, in which he came off with every teſtimonial of approbation from the audience. From this time he continued daily improving; and, after two ſucceſsful campaigns in that kingdom, conceived thoughts of returning to his native country, and making a trial of his abilities on the Engliſh ſtage. To this end, he firſt, by letter, reconciled himſelf to his friends; and then, as a further ſtep towards inſuring his ſucceſs, obtained a recommendation from Lord Fitzharding (one of the lords of the bed-chamber to Prince George of Denmark) to Mr. Betterton, who with great candour and good-nature took him under his care, and gave him all the aſſiſtance in his power. The firſt part Mr. Booth appeared in at London was that of Maximus in Lord Rocheſter's Valentinian, his reception in which exceeded even his moſt ſanguine expectations; and very ſoon after his performance of Artaban, in Rowe's Ambitious Stepmother, which was a new tragedy, eſtabliſhed his reputation, as ſecond at leaſt to his great inſtructor. Pyrrhus, in the Diſtreſſed Mother, was another part in which he ſhone without a rival. But he was indebted to a happy coincidence of merit and chance, for that height of fame which he at length attained in the character of Cato, as drawn by Mr. Addiſon, in 1712. For this play being conſidered as a party one, the Whigs, in favour of whoſe principles it was apparently written, thought it their duty ſtrongly to ſupport it; while at the ſame time the Tories, who had too much ſenſe to appear to conſider it as a reflection on their adminiſtration, were ſtill more vehement in their approbation of it, which they carried to ſuch an height, as even to make a collection of fifty guineas in the boxes during the performance, and preſent them to Mr Booth with this compliment, "That it was a ſlight acknowledgment for his honeſt oppoſition to a perpetual dictator, and his dying ſo bravely in the cauſe of liberty." Beſides this, he had a preſent of an equal ſum from the managers, in conſideration of the great ſucceſs of the play, which they attributed in a good meaſure to his extraordinary merit in the performance; and certain it is, that no one ſince that time has ever equalled, or even nearly approached, his excellence in that character.—But theſe were not the only advantages which were to accrue to Mr. Booth from his ſucceſs in this part; for Lord Bolingbroke, then one of the principal ſecretaries of ſtate, in a little time after procured a ſpecial licence from Queen Anne, recalling all the former ones, and nominating Mr. Booth as joint manager with Wilks, Cibber, and Dogget; none of whom were pleaſed at it; but the laſt eſpecially took ſuch diſguſt as to withdraw himſelf from any further ſhare in the management. In 1704 Mr. Booth had married a daughter of Sir William Barkham, bart. who died in 1710 without iſſue. Being now eſtabliſhed in the management, he once more turned his thoughts towards matrimony; and in the year 1719 united himſelf to the celebrated Miſs Heſter Santlow, a woman of a moſt amiable diſpoſition, whoſe great merit as an actreſs, added to the utmoſt diſcretion and prudential economy, had enabled her to ſave up a conſiderable fortune. During the twenty years in which Mr. Booth continued a manager, the theatre

was in the greateſt credit; and his illneſs and death, which happened on the 10th of May, 1733, contributed not a little to its decline.

Mr. Booth wrote a dramatic entertainment called Dido and Æneas; but his maſter-piece was a Latin inſcription to the memory of Mr. William Smith, a celebrated actor, who died while he was young.—As an actor, his excelleney lay wholly in tragedy, not being able to endure ſuch parts as had not ſtrong paſſion to inſpire him. And, even in this walk, dignity rather than complacency, rage rather than tenderneſs, ſeemed to be his taſte. For a particular idea of his abilities, we muſt refer to the deſcription Mr. Cibber has given of him in his Apology; and the admirable character drawn of him by that excellent judge of dramatic perfection, Aaron Hill, eſq. in a political paper publiſhed by him called the Prompter, which may be ſeen at length in Theoph. Cibber's Lives of the Poets, and Chetwood's Hiſtory of the Stage.—His character as a man was adorned with many amiable qualities, among which, a goodneſs of heart, the baſis of every virtue, was remarkably conſpicuous; and ſo particularly was he diſtinguiſhed and careſſed, and his company ſought by the great, that, as Chetwood relates of him, not one nobleman in the kingdom had ſo many ſets of horſes at command as he had.

BORBETOMAGUS (anc. geog.), a city of the Vangiones on the Rhine; now *Worms*, in Germany.

BORCOVIUM (anc. geog.), a town of the Ottadini in Britain, now *Berwick-on-Tweed*.

BORDE (Andrew), a phyſician, was born at Pevenſey in Suſſex, early in the 16th century, and ſuppoſed to have been educated at Weſtminſter ſchool. In his Introduction to Knowledge, he ſays that he was a ſtudent of Oxford; but of what college, he does not mention. He left the univerſity without a degree, and entered himſelf a brother of a Carthuſian convent in or near London; but, not liking the ſevere diſcipline of that order, he returned to Oxford, and applied himſelf to the ſtudy of phyſic. Some time after, he embarked for the Continent; and, as he himſelf expreſſes it, "travelled through and round about Chriſtendom, and out of Chriſtendom into ſome parts of Africa." In the years 1541 and 1542 he reſided at Montpelier in France, where he was made doctor of phyſic, and after his return to England was incorporated into the ſame degree at Oxford. From the preface to his introduction above mentioned, it appears that he had been in Scotland, which probably was ſoon after his return from France. Having now ſatisfied his inclination for travelling, he ſettled firſt at Pevenſey where he was born, afterwards at Wincheſter, and finally in London, where he is ſaid to have become a fellow of the college of phyſicians, and firſt phyſician to King Henry VIII. But, notwithſtanding his eminence in his profeſſion, he had the misfortune to ſpend the latter end of his life in the Fleet priſon, where he died in the year 1549. As to his character, Wood ſays, that "he was eſteemed a noted poet, a witty and ingenious perſon, and an excellent phyſician." Pits calls him a man of ſufficient learning, but too volatile and inconſtant. Bale and ſome others, on the contrary, abuſe him groſsly. His writings are: 1. A book of the introduction of knowledge, the whych doth teach a man to ſpeak part of all manner of languages, &c. Lond. 1542, 4to.; dedicated, from Montpelier, to the Lady Mary, daughter to Henry VIII. It is written partly in verſe, and partly in proſe, containing thirty-nine chapters, before each of which is a wooden print of a man. 2. The breviary of health, wherein are remedies for all manner of ſickneſſes and diſeaſes, &c. Lond. 1547, &c. 4to. 3. Dietary of health, Lond. 1576, 8vo. 4 The merry tales of the madmen of Gotham. Printed, ſays Wood, in the time of Henry VIII. in whoſe reign, and after, it was accounted a book full of wit and mirth by ſcholars and gentlemen. Afterwards being often printed, it is now ſold only on the ſtalls of ballad-ſingers. 5. A right pleaſant and merry hiſtory of the mylner of Abington, with his wife and his fair daughter, and of two poor ſcholars of Cambridge. Lond. printed by Richard Jones, 4to. 6. A book of every region, country, and province; which ſhews the miles and leagues diſtance from city to city, and from town to town, with the noted things in the ſaid cities and towns. Wood ſays that the author lent the manuſcript of this book to his friend Thomas Cromwell, who loſt it, to the great grief of the author, who would otherwiſe have publiſhed it. In this inſtance, however, the antiquary was miſinformed; for it has ſince been publiſhed by Hearne at the end of *Benedictus abbas Peterb. de vita Henrici* II. Oxf. 1735, 8vo. 7. The principles of aſtronomy, the whych diligently perſecuted is in a manner a prognoſtication to the world. Lond. printed by Robert Copland, 12mo. The author ſays that he wrote this little book in four days, with one old pen without mending.

BORDUNI, or BORDONE (Paris), an excellent Italian painter, was born at Venice about the year 1512; and, being of a noble family, had a polite education. He was the diſciple of Titian; but has been admired more for the delicacy of his pencil than for the truth of his outlines. He was at the court of France in the reign of Francis I. who had a great eſteem for him, and for whom he drew not only abundance of hiſtory-pieces, but the portraits of ſeveral court-ladies, in ſo fine a manner, that original nature was hardly more charming. He at length returned to Venice, laden with riches and honour; and having gained great reputation in all parts of Italy, died in 1387, aged ſeventy-five.

BOREL (Peter), a learned phyſician, was the ſon of James Borel, who publiſhed ſeveral poems, and was born at Caſtres in 1620. He applied himſelf to the ſtudy of phyſic, of which he was created doctor, and practiſed with great ſucceſs in the city of Caſtres. Towards the end of the year 1653 he went to Paris, and was ſoon after made phyſician in ordinary to the king. In 1674 he was received into the Academy of Sciences, and diſtinguiſhed himſelf by writing a great number of works. The moſt eſteemed are, 1. *Hiſtoriarum & Obſervationum medico-phyſicarum.* 2. *Bibliotheca Chymica, duodecimo.* 3. *De vero teleſcopii inventore, cum brevi omnium conſpicillorum hiſtoria.* He died in 1678.

BORELLI (John Alphonſo), a famous philoſopher and mathematician, born at Naples the 28th of January, 1608. He was profeſſor of philoſophy and mathematics in ſome of the moſt celebrated univerſities of Italy, particularly at Florence and Piſa, where he became highly in favour with the princes of the houſe of Medicis; but having been engaged in the revolt of Meſſina, he was obliged to retire to Rome, where he ſpent the remainder of his life under the protection of Chriſtina queen of Sweden, who honoured him with her friendſhip, and by her liberality towards him ſoftened the rigour of his hard fortune. He continued two years in the convent of the regular clergy of St. Pantaleon, called the *pious ſchools*, where he inſtructed the youth in mathematical ſtudies. He died there of a pleuriſy, the 31ſt of December 1679, in the 72d year of his age. He wrote, in Latin, 1. Euclid reſtored. 2. The theory of the influence of the planets in medicine, deduced from phyſical cauſes. 3. Of percuſſive force. 4. Of natural motions depending upon gravity. 5. An hiſtorical and meteorological account of the burning of mount Ætna, in the year 1669. 6. Of the motion of animals: and ſeveral other works, ſome of which are in Italian.

BORGIA (Cæſar), natural ſon of Pope Alexander VI. was a brave general, but a moſt abandoned villain. It is incredible what numbers he cauſed to be taken off by poiſon, or by the ſword; and it is notorious that ſwarms of aſſaſſins were con-

ſtantly kept in pay by him at Rome, for the ſake of removing all who were either obnoxious or inconvenient to him. He experienced various turns of fortune; and was ſometimes very proſperous, ſometimes the reverſe. He very narrowly eſcaped dying by poiſon in 1503: for having concerted with the pope a deſign of poiſoning nine newly created cardinals at once, for the ſake of poſſeſſing their effects, the poiſoned wine, deſtined for the purpoſe, was by miſtake brought to and drank by themſelves. The pope died of it; but Cæſar, by the vigour of his youth, and the force of antidotes, after many ſtruggles, recovered. He only recovered to outlive his fortune and grandeur, to ſee himſelf depreſſed, and his enemies exalted; for he was ſoon after diveſted of all his acquiſitions, and ſent a priſoner to Spain, in order to free Italy from an incendiary, and the Italian princes from thoſe dangers which the turbulent and reſtleſs ſpirit of Cæſar made them fear even though he was unarmed. He eſcaped from thence; and got ſafe to Navarre, to King John his brother-in-law, who was then at war with his ſubjects. Cæſar ſerved as a volunteer in that war, and was killed in 1507.

BORGOGNONE, a celebrated painter, whoſe true name was *Giacomo Corteſi;* but he is commonly called *Borgognone*, from the country where he was born, about the year 1605. He was much admired and highly applauded for his admirable guſto, and grand manner of painting battles. He had for ſeveral years been converſant in military affairs, was an officer of conſiderable rank in the army, made the camp his ſchool, and formed all his ideas from what he had ſeen performed in the field. His ſtyle is roughly noble, full of fire and ſpirit, and there are a few prints etched by his own hand. Towards the cloſe of his life he retired to the Jeſuits' convent in Rome, where he is ſaid to have taken ſanctuary to rid his hands of an ill bargain he had got of a wife. But happily ſurviving her, he lived in great eſteem and honour till after the year 1675.

BORISTHENES (anc. geog.), the largeſt river of Sarmatia Europea, thus deſcribed by Mela, who copies *verbatim* from Herodotus: "It runs through a cognominal people, is the moſt pleaſant of all the rivers of Scythia, and calmer than all of them in its courſe, and very agreeable to drink: it feeds very rich paſtures, and produces large fiſh of the beſt flavour, and without bones: it comes a great way, riſing from ſprings unknown; its courſe is a diſtance of forty days, and ſo far it is navigable." It is now called the *Dnieper* or *Nieper*.

BORLASE (Dr. Edmund), an eminent phyſician and Engliſh writer in the 17th century, was the ſon of Sir John Borlaſe, maſter of the ordnance, and one of the lord juſtices of Ireland in 1643. He ſtudied in Dublin College, and afterwards at the univerſity of Leyden, at which laſt place he took the degree of doctor of phyſic. He afterwards practiſed phyſic with great ſucceſs in the city of Cheſter, and was incorporated doctor of the faculty in the univerſity of Oxford. Among the books which he wrote and publiſhed are the following: 1. Lathan Spaw in Lancaſhire, with ſome remarkable caſes and cures performed by it. 2. The reduction of Ireland to the crown of England. 3. The hiſtory of the Iriſh rebellion. 4. Brief reflections on the Earl of Caſtlehaven's memoirs, &c. He died after the year 1682.

BORNOU (*Encycl.*). No information can be obtained of this country from the actual viſits of any European; but Mr. Lucas, the geographical miſſionary, ſent by the African aſſociation, in 1788, obtained many particulars from ſome reſpectable Mahometans, whoſe information, however, on ſome accounts (without impeaching their veracity) is not abſolutely to be depended on. The climate of Bornou, according to them, is characteriſed by exceſſive, though not by uniform, heat. Two ſeaſons, the one commencing ſoon after the middle of April, and the other at the ſame period in October, may be ſaid to divide the year. The firſt is introduced by violent winds, that bring with them, from the S.E. and S. an intenſe heat, with a deluge of ſultry rain, and ſuch tempeſts of thunder and lightning as deſtroy multitudes of the cattle and many of the people. At the commencement of the ſecond ſeaſon, the ardent heat ſubſides; the air becomes ſoft and mild, and the weather perfectly ſerene. The complexion of the natives is black; but they are not of the negro caſt. The dreſs of the greater part conſiſts of ſhirts of blue cotton manufactured in the country, of a red cap imported from Tripoli, and a white muſlin turban from Cairo. Noſe-rings of gold are worn by the principal people. But the only covering of the poorer ſort, is ſometimes a kind of girdle for the waiſt. They cultivate two kinds of Indian corn, the horſe-bean of Europe, the common kidney-bean, cotton, hemp, and indigo. The hoe is uſed in tillage; the plough being unknown. While the men, with their hoes, form the trenches in ſtraight parallel lines, the women follow and throw in the ſeed; but the latter take the hoe when the weeds begin to appear. They have neither olives nor oranges, but few figs, and no good apples, plums, or dates; but they have abundance of grapes, apricots, pomegranates, lemons, limes, and melons. The moſt valuable tree is called Redeynah, in form and height like an olive, the leaf reſembling that of a lemon, and bearing a nut, both the kernel and ſhell of which are in great eſtimation; the firſt as a fruit, the laſt on account of the oil it produces when bruiſed. Horſes, aſſes, mules, dogs, horned cattle, goats, ſheep, and camels (of the fleſh of which they are very fond), are the common animals of the country; but they have no oxen. Their hives of bees are ſo numerous, that the wax is often thrown away as an article of no value. Their game conſiſts of the huadde, and other ſpecies of antelopes, the partridge, wild duck, and oſtrich, the fleſh of which they prize above every other. Their other wild animals are the lion, leopard, civet cat, wolf, fox; the wild dog, that hunts the antelope; the elephant, which is not common, and of which they make no uſe; the cameleopardalis, crocodile, and hippopotamus. They are much infeſted with ſnakes, ſcorpions, centipedes, and toads. In ſome parts, particularly the mountainous, the herdſmen prefer a reſidence in tents to ſtationary dwellings. More than thirty different languages are ſaid to be ſpoken in Bornou and its dependencies. The reigning religion is the Mahometan. Their monarchy is elective. On the death of the ſovereign; the privilege of chooſing a ſucceſſor, from among his ſons, without regard to primogeniture, is conferred on three of the moſt diſtinguiſhed men, whoſe age and character for wiſdom are denoted by their title of elders. Theſe retire to a ſequeſtered place, the avenues to which are carefully guarded; and, while their deliberations laſt, the princes are cloſely confined in ſeparate chambers of the palace. Their choice being made, they proceed to the apartment of the ſovereign-elect, and conduct him, in ſilence, to the gloomy place, where the unburied corpſe of his father, that cannot be interred till the concluſion of this awful ceremony, awaits his arrival. There the elders expatiate to him on the virtues and defects of his deceaſed parent; deſcribing, with panegyric or cenſure, the meaſures that exalted or ſunk the glory of his reign. "You ſee before you," ſay they, "the end of your *mortal* career: the *eternal*, which ſucceeds it, will be miſerable or happy, in proportion as your reign ſhall have proved a curſe or a bleſſing to your people." The preſent ſultan (in 1788) is a man of unoſtentatious appearance; undiſtinguiſhed, in his dreſs, from his ſubjects. But he is ſaid to have 500 ladies in his ſeraglio, and to be the reputed father of 350 children, of whom 300 are males: a diſproportion which naturally ſuggeſts the idea, that the mother, preferring the joy of being the ſuppoſed parent of a future candidate for the

empire to the gratification of natural affection, ſometimes exchanges her female child for the male offſpring of a ſtranger. His ſtud likewiſe contains 500 horſes. He has a vaſt army, which conſiſts almoſt entirely of horſe. Fire-arms, though not unknown to them, they neither uſe nor poſſeſs. The ſabre, lance, pike, and bow, are their weapons of offence, and a ſhield of hides is their armour. In their manners the people are courteous and humane. They are paſſionately fond of play; the lower claſſes of draughts; while the higher ranks excel in cheſs. Their capital is of the ſame name.

Bornou, the capital of the empire of Bornou in Africa, ſituated in a flat country, on the banks of a ſmall river. According to the information obtained by Mr. Lucas, it is of greater extent than Tripoli, but conſiſting of a multitude of houſes, ſo irregularly placed, that the ſpaces between them cannot be called ſtreets. Their moſques are conſtructed of brick and earth; and they have ſchools, in which the koran is taught, as in the principal towns of Barbary. The royal palace, ſurrounded by high walls, and forming a kind of citadel, is built in a corner of the town. The houſes of the inhabitants are neatly plaſtered, both within and without, with clay or mud, and are ſimilar in form to thoſe of Tripoli. Bornou is ſurrounded by a wall, and is 650 miles S.E. of Mourzook. Long. 27. 30. E. Lat. 19. 40. N.

BOROMÆUS (Frederic), cardinal and archbiſhop of Milan. He, in 1609, celebrated the council of Milan. He founded the Ambroſian library, which he enriched with 9000 manuſcripts. He left ſeveral works behind him, and died in 1632.

BORONDON (St.), an iſland in the Atlantic Ocean, mentioned by ſome writers, particularly Linſchotten, in their deſcription of the Canary iſlands, as ſomething ſupernatural. It is ſaid to be about 100 leagnes diſtance from Ferro, probably weſt, though no writer has pretended to lay down its exact ſituation. Here it is affirmed ſeveral ſhips have touched by accident, and all agree in their relations of the ſtate of the inhabitants and iſland. They affirm, that it is perpetually clothed with a great variety of wood, chiefly fruit-trees: that the valleys are in a perpetual ſtate of verdure; and continually decked with flowers, graſs, and plants, the ſpontaneous productions of the earth; or with corn and pulſe, cultivated with great care by the inhabitants: that the ſoil is ſo prolific as to raiſe large quantities of corn for exportation; and that the ſhips that call here never fail of meeting with refreſhments of every kind. It is ſaid to be peopled by Chriſtians, who have a language of their own, apparently combined of a variety of modern languages; for, ſay they, whoever underſtands the European tongues may make ſhift to hold converſation with this people. It is remarkable, that no ſhips, expreſsly ſent upon this diſcovery, were ever fortunate enough to fall in with the iſland of St. Borondon, though the Spaniards have ſeveral times attempted it from the Canaries. Hence it has been called the *marvellous iſland*; and hence indeed we may conclude, either that it exiſts wholly in imagination, or at leaſt that it is ſurrounded with ſuch currents as inſenſibly carry ſhips out of their courſe, and prevent their meeting with it. Some writers affirm that it actually diſappears upon certain occaſions, and ſhifts its poſition; while others, with more appearance of truth, allege, that it is frequently overcaſt with thick and impenetrable clouds, which occaſion the diſappointment of all the adventurers who have gone in ſearch of it.

BORRICHIUS one of the moſt learned men of his age, the ſon of a Lutheran miniſter in Denmark, was born in 1626. He applied himſelf to phyſic in the univerſity of Copenhagen, and began to practiſe during a moſt terrible plague that made great havoc in that city. He travelled: but before his departure, in 1660, he was appointed profeſſor in poetry, botany, and chemiſtry; and at his return diſcharged his duties with great aſſiduity, of which the works he publiſhed afford full proof. He was raiſed to the office of counſellor in the ſupreme council of juſtice in 1686; to that of counſellor of the Royal Chancery, in 1689; and died of the operation for the ſtone, in 1690. He publiſhed, 1. Lingua pharmacopæorum; 2. Diſſertationes de poeticis Græcis et Latinis; 3. De ortu et progreſſu chemiæ: and ſeveral other works.

BORROWDALE, a diſtrict in the S. part of Cumberland, on the borders of Weſtmorland. It is a dreary region, abounding, beyond any other part of the world, with the fineſt ſort of that valuable and ſingular mineral, black-lead or wad; the mines of which are only opened at intervals, and then carefully cloſed again, leſt this precious ſubſtance ſhould become too common. Copper, lead, and calamine, are alſo found in this tract.

BORROWSTONESS. See Burrowstoness.

BORZONI (Luciano), a Genoeſe hiſtorian and portrait-painter of great genius and abilities, flouriſhed about the middle of the 17th century. His three ſons were profeſſors of the ſame art: but only one, Francis Maria, ſucceeded; and that was in ſea-pieces, particularly ſtorms.

BOS (John Baptiſt du), a celebrated author and member of the French Academy, was born at Beauvais in 1670, and finiſhed his ſtudies at the Sorbonne. In 1695 he was made one of the committee for foreign affairs under Mr. Torez; and was afterwards charged with ſome important tranſactions in England, Germany, Holland, and Italy. At his return to Paris, he was handſomely preferred, made an abbé, and choſen perpetual ſecretary of the French Academy. He was the author of ſeveral excellent works; the principal of which are, 1. Critical reflections upon poetry and painting, 3 vols. 12mo. 2. The hiſtory of the four Gordians, confirmed and illuſtrated by medals. 3. A critical hiſtory of the eſtabliſhment of the French monarchy among the Gauls, 2 vols. 4to., 4 vols. 12mo. He died at Paris, on the 23d of March, 1742.

BOSCOBEL, a village of Shropſhire, near White Ladies, in the pariſh of Tongue, noted for the Royal Oak in which Charles II. was concealed, and ſaw the ſoldiers paſs by in queſt of him, after the battle of Worceſter. The tree was incloſed by a brick wall, but is now almoſt cut away by travellers.

BOSCAN (John), a Spaniſh poet of the 16th century, born at Barcelona. He was the friend of Garcilaſſo de Vega, another Spaniſh poet. Theſe two were the firſt who made any great improvement in the poetry of their nation, and their pieces were printed together. Boſcan, who died about the year 1542, principally ſucceeded in ſonnets.

BOSCHAERTS (Thomas Vuillebos), a celebrated painter, was born at Bergen-op-zoom; and, like the great painters who flouriſhed at that time, began to draw, when very young, in the books that were intended for other ſtudies. Preferring his pencil to every thing elſe, he drew his own picture, by his reſemblance in a looking-glaſs, ſo like, that thoſe who ſaw it were aſtoniſhed. This he did before he had the leaſt inſtruction from any one, and when he was only twelve years of age. Upon this, his parents ſent him to a maſter, that he might follow the bent of his genius; but his firſt maſter being only an indifferent painter, and incapable of ſatisfying his earneſt deſire of learning, he left him, and engaged himſelf with Gerard Segers, under whom, after four years' practice, he proved a moſt accompliſhed artiſt. Antwerp being at that time the ſeat of arts, where there was a conflux of the moſt eminent painters, he thought it the fitteſt place for his improvement; and there executed ſuch a number of noble pieces as added greatly to the ſplendor of that wealthy city. In 1642, Henry Frederick prince of Orange, and his ſon Prince William, em-

ployed him in their ſervice; in which he continued ſeveral years, and made thoſe excellent pieces that are to be ſeen in that prince's palace at the Hague, and other parts of Holland, and painted portraits for moſt of the perſons of quality that were then living. He died in the flower of his age, in 1670.

BOSSE (Abraham), an able engraver, born at Tours, was well ſkilled in perſpective and architecture. He wrote two treatiſes, which are eſteemed; the one on the manner of deſigning, and the other upon engraving.

BOSSU (Rene le), born at Paris in 1631, was admitted a canon regular in the abbey of St. Genevieve, in 1649; and after a year's probation, took the habit. He taught polite literature with great ſucceſs in ſeveral religious houſes for 12 years, when he gave up the taſk for retirement. He then publiſhed a parallel betwixt the principles of Ariſtotle's natural philoſophy and thoſe of Des Cartes, with a view to reconcile them; which was but indifferently received. His next treatiſe was on epic poetry; which Boileau declared one of the beſt compoſitions on that ſubject in the French language, and which produced a great friendſhip between them. He died in 1680, and left a great number of MSS. which are kept in the abbey of St. John de Chartres.

BOSSUET (James Benigne), Biſhop of Meaux, was born at Dijon, on the 27th of September, 1627. He diſtinguiſhed himſelf by his preaching, and the zeal he diſcovered in his endeavours to bring over the Proteſtants of France to the Romiſh church; by his oppoſition to Quietiſm; and by his numerous writings both in French and Latin, which have been collected together, and printed at Paris in 17 vols. 4to. This famous divine died at Paris, in 1704, aged 77.

BOSSUS (Matthew), diſtinguiſhed by his virtue and his learning, was born in 1427. He devoted himſelf to the eccleſiaſtical ſtate in 1451, in the congregation of regular canons of Lateran, and afterwards taught divinity at Padua. His orations, his ſermons, and his letters, have often been printed. He alſo wrote a ſort of an apology for Phalaris, and other works. He died at Padua in 1502, aged 75.

BOSWELL (James), an ingenious Scottiſh writer. He was the ſon of Alexander Boſwell, lord Auchinleck, a judge in the ſupreme court of ſeſſion and juſticiary, and was born at Edinburgh in 1740. After ſtudying the civil law at Edinburgh and Glaſgow, he viſited London, where he wiſhed to enter into the army, but his father was inflexibly bent againſt the meaſure, being deſirous to ſee his ſon make a figure at the bar. In compliance with his wiſh, he went to Utrecht, after which he made the tour of Europe. In 1763 he contracted an intimacy with Dr. Johnſon, which laſted till the doctor's death. In 1766 he was admitted an advocate at the Scotch bar. In 1768 he publiſhed an Account of Corſica, with Memoirs of General Paoli, which is a curious and well-written book. In 1784 appeared another original work, which had a great run, a Journal of a Tour to the Hebrides with Dr. Johnſon, full of anecdote, and highly entertaining. The ſame year he ſettled in London, and was admitted at the Engliſh bar. In 1790 appeared the work which will ſecure him a laſting name, the Life of Samuel Johnſon, LL.D. This reſpectable and ſenſible man died in London in 1795: he had by his lady, who died before him, two ſons and three daughters. Mr. Boſwell printed ſeveral pamphlets and fugitive pieces.

BOTALLUS (Leonard), phyſician to the duke of Alençon, and to Henry III. was born at Aſti in Piedmont. He introduced at Paris the practice of frequent letting of blood; which was condemned by the faculty; but ſoon after his death it came into practice with all the phyſicians. He publiſhed ſeveral books in phyſic and ſurgery; the beſt edition of which is that of Leyden in 1660, octavo.

BOTANY (*Encycl.*). In page 48, 25th claſs, 2d line, for "*ſpadax*," read "*ſpadix*."

BOTH (John and Andrew), Flemiſh painters, and pupils of Bloemart. The union of theſe brothers was very ſingular; they were inſeparable in their ſtudies, travels, and paintings. John painted the landſcape part of their pictures in the manner of Lorrain, and Andrew the figures and animals in the ſtyle of Bamboche. They both died in 1650. John's taſte in landſcape is elegant; his ideas are grand; his compoſition beautiful; and his execution rich and maſterly in the higheſt degree. His light is not always well diſtributed; but his figures are excellent. It is to be regretted that we have not more of his works; for they are certainly, upon the whole, among the beſt landſcapes we have.

BOTTRIGARO (Hercole), a perſon eminently ſkilled in the ſcience of muſic, though not a muſician by profeſſion. He was a man of rank in Bologna; and appears, from ſeveral letters to him that have been printed, to have had the title of *count*. He publiſhed ſeveral controverſial pieces on the ſubject of muſic. It ſeems that he entertained ſtrong prejudices in favour of the ancient muſic; and that he attempted, as Vincentino and others had done, to introduce the chromatic genus into practice, but with no better ſucceſs than had attended the endeavours of others. He corrected Gogavino's Latin verſion of Ptolemy in numberleſs inſtances; and that to ſo good a purpoſe, that Dr. Wallis has in general conformed to it in that tranſlation of the ſame author, which he gave to the world many years after. He alſo tranſlated into Italian *Boetius de Muſica*, and as much of Plutarch and Macrobius as relates to muſic: beſides this, he made annotations upon Ariſtoxenus, Franchinus, Spataro, Vicentino, Zarline, and Galiſlei; and, in ſhort, on almoſt every muſical treatiſe he could lay his hands on, as appears by the copies which were once his own, and are now repoſited in many libraries in Italy. Of Bottrigaro's works it is ſaid that they contain greater proofs of his learning and ſkill in muſic, than of his abilities as a writer, his ſtyle being remarkably inelegant: nevertheleſs, he affected the character of a poet; and there is extant a collection of poems by him, in 8vo, printed in 1557. Walther repreſents him as an able mathematician, and a collector of rarities; and ſays that he was poſſeſſed of a cabinet, which the emperor Ferdinand II. had a great deſire to purchaſe. He died in 1609.

BOUCHART, a ſmall town of France, in the department of Indre and Loire, and late province of Touraine. It is ſituated in a ſmall iſland of the river Vienne, 15 miles from Tours.

BOUCHET (John), a French poet and hiſtorian, flouriſhed in the 16th century. The moſt conſiderable of his writings are the Annals of Aquitaine, and his *Chapelet des Princes*.

BOUFLERS (Lewis Francis, duke of), a peer and marſhal of France, was born in 1644. He diſtinguiſhed himſelf by his valour and conduct in ſeveral ſieges and battles, and had the command of the right wing when the French were defeated at the bloody battle of Malplaquet. He died at Fontainbleau in 1711. Marſhal Boufflers, his ſon, died at Genoa, after having delivered that republic.

BOUGEANT (William Hyacinth), a famous Jeſuit, firſt taught humanity at Caen and Nevers, and afterwards ſettled at the college of Lewis the Great, where he employed himſelf in writing ſeveral works; the principal of which were, 1. A collection of phyſical obſervations, extracted from the beſt authors; 2. An hiſtory of the wars and negociations

which preceded the treaty of Weſtphalia; 3. The female doctor, a philoſophical amuſement on the language of beaſts, &c. He died in 1743.

BOUILLE (Marquis de), a celebrated French general, was deſcended of an ancient and noble family, from whom he inherited an ample patrimony. He received an excellent education, and was no leſs celebrated for the elegance of his manners than beloved for the goodneſs of his heart. During the American war he ſerved in the Weſt-Indies, and was appointed commandant of all the French Weſt India iſlands: he was alſo advanced to the rank of lieutenant-general, and received the knighthood of the moſt noble order of the Holy Ghoſt. In the courſe of the war, ſeveral of the Britiſh iſlands fell under the dominion of the French, and the Marquis de Bouillé was endeared to the vanquiſhed by the ſuavity of his manners, and the mildneſs of his ſway. At the end of the war, after a ſhort abode in the French metropolis, he came to London, and was received in a moſt favourable manner by the king; the Weſt-India merchants alſo paid the homage due to him for the liberality he had ſhewn when their property was committed to his diſpoſal. He afterwards viſited Holland, Pruſſia, Bohemia, and Vienna, being every-where received with the confidence due to his rank and talents, and entruſted with the ſecret of thoſe important plans which, at the moment, agitated the boſoms of all the continental potentates. In the ſummer of the year 1785 he returned to Pruſſia, intending to have viſited the court of Catherine II.; but his journey was delayed by orders for his return to Paris, in conſequence of a grand project formed by France and Holland, for an invaſion of the Britiſh dominions in India, the command of which was to be entruſted to him. The execution of the project was, however, ſtill diſtant, and the revolution in Holland, in 1787, ultimately prevented its proſecution.

The derangement of the French finances now demanded new and effectual exertions: M. de Calonne, having conceived a wiſe and juſt plan for repairing the deficiences of the revenue, and having ſecured, as he thought, the neceſſary co-operation, convoked the *notables* to meet in January, 1787; a meaſure which had not been recurred to ſince the year 1626, in the reign of Lewis XIII. It is not neceſſary here to detail the cauſes which fruſtrated Calonne's intentions, and occaſioned the diſmiſſion of the notables; M. de Bouillé was one of their number, and, immediately on their diſſolution, was appointed commandant of Metz, and of the province *des Evêchés*.

In the year 1778 thoſe meaſures were purſued which laid the government entirely at the mercy of intriguers, which afforded a pretext for the convocation of the ſtates-general, and for the recal of Necker. This quack-miniſter thought proper again to convene the *notables*, merely to ſhew them that he diſregarded their advice. M. de Bouillé was again a member of this aſſembly, and ſaw with indignation the efforts which were daily uſed, and generally encouraged, to ſubvert the ancient conſtitution of the kingdom. He oppoſed, in an open and energetic manner, the project of the innovators, detailed the miſeries to which they would give birth, and expoſed the errors both of Necker and La Fayette in the moſt perſpicuous terms. Alarmed at his firmneſs, they procured an invitation to be ſent to him, through the Baron de Stael, Necker's ſon-in-law, to accept a command in the ſervice of the king of Sweden, who was then at war with Ruſſia. M. de Bouillé would, with pleaſure, have accepted an offer which would have exempted him from witneſſing and taking a ſhare in the calamities which he ſaw ready to burſt forth on his country; but was ſuddenly, in the month of March, 1789, ordered to his government of Metz.

His conduct in this department, at ſuch a critical period, needs no other eulogy than his own inartificial narrative:—"While I commanded at Metz," he ſays, "not one perſon was aſſaſſinated; property in the towns, as well as in the country, remained inviolate; not a ſeat was burned, nor any nobleman or landholder expoſed to the fury of the people, which evaporated in empty threats. For the firſt twelve months of the revolution, I was ſo happy as to preſerve, among the twenty thouſand men I had under my command, the ſame temper of mind as formerly." Here he had an opportunity of experiencing the ignorance, or, more properly, the treachery of Necker, who refuſed an offer which he made to diſtribute part of the grain in his poſſeſſion among the people, on condition of its being reſtored to the garriſon at the next harveſt.

In this ſituation M. de Bouillé paſſed the eventful year 1789, contemplating with horror the progreſs of the revolution, in which he took no ſhare, though earneſtly ſolicited, and that, under the moſt plauſible pretences, by La Fayette, who was his kinſman, and with whom he had been intimate from his infancy. But M. de Bouillé penetrated into the feeble and crafty character of this vain pretender to ſuperiority in revolutions, and not only avoided a connection with him, but with every other political party which had a ſelfiſh view, derogatory to the true conſtitution of French government: he declared with honeſt magnanimity, "I am neither ariſtocrat nor democrat, I am a royaliſt."

But the efforts of the king's real friends received a fatal impediment from his viſit to the aſſembly on the 4th of February, 1790, when, influenced by the advice of hypocritical traitors, he threw himſelf into the boſom of that rebellious body, and declared himſelf the head and protector of that revolution which had already deprived him of the beſt prerogatives, and his liberty, and was rapidly proceeding in thoſe meaſures which hurled him to an untimely grave.

The diſtribution of arms among the populace, and the diſſemination of jacobin principles among the ſoldiery, had already induced moſt of the commandants of provinces to reſign, or to abandon the kingdom. M. de Bouillé, who had long contemplated with confidence the garriſon under his command, as a reſource for the royal family in the expected extremity, was now convinced no effectual uſe could ever be made of their ſervices: he exerted himſelf with effect in maintaining order and quelling inſurrection, but earneſtly ſolicited leave to reſign, and ſeek another country. This reſolution he was induced to abandon by the king's own requeſt: he took the conſtitutional oath, and permitted the federation of the national guards in his government with the troops of the line.

Having by theſe acts, in a certain degree, relinquiſhed the line of conduct which his own principles would have dictated, M. de Bouillé endeavoured to ſerve the royal cauſe, as connected with the imaginary, and as yet unfounded, conſtitution, but in vain. The diſſimulation of La Fayette, his folly, which gave a decided aſcendancy to the jacobins, rendered all ſuch attempts unavailing; and the troops who had been called to Paris to aſſiſt at the abſurd ceremony of the confederation, ſpread anarchy and inſurrection in every part of the kingdom. The garriſon of Metz, in Auguſt, 1790, commenced a moſt dangerous inſurrection, which was with difficulty ſuppreſſed: Nancy, in the ſame month, followed the example: the heroiſm of Deſilles, who oppoſed his perſon to a loaded cannon, was inſufficient to reſtrain the popular fury: M. de Bouillé, after eſſaying, without effect, every conciliatory meaſure, was reduced to the neceſſity of employing force, which he was authoriſed to do by a decree of the aſſembly; and, after an ob-

ſtinate conteſt, reduced the inſurgents, though not without great ſlaughter. For this timely effort he was aſſailed with all the virulence of jacobin vituperation; the ready pens of the Palais Royal were employed in aſperſing his character, and the eager echoes of jacobin invention in other countries were prepared to repeat, with atrocious additions, the calumnies derived from that never-failing ſource. The Orleans faction, who could never forgive this check on their favourite projects, haraſſed the aſſembly with perpetual motions on the ſubject, and eſſayed all means to obtain the cenſure of the marquis, in which they were at length ſucceſsful.

The conteſts of the various factions who pretended to give laws to France, tended only to one certain end, that of degrading the king, and making him miſerable. La Fayette was become his gaoler, and with the office, adopted the manners of a turnkey. Worn out with repeated indignities, which were daily renewed and increaſed under various pretences, the king reſolved to quit the capital, and ſeek refuge in one of the frontier towns, under the command of M. de Bouillé. Our limits do not allow a recapitulation of the negociations with Mirabeau; the projects of various individuals; the cauſes which retarded the king's departure, and occaſioned the final fruſtration of his plan. Throughout this critical emergency, which forms one of the moſt embarraſſing criſes of his life, Lewis diſplayed the utmoſt integrity of heart and goodneſs of diſpoſition. M. de Bouillé, failing in all his efforts to ſecure the retreat of his ſovereign, reluctantly ſecured his own ſafety by quitting a land which he conſidered irreparably diſhonoured, and where the advantages of birth, fortune, long ſervices, and unſhaken loyalty, could no longer ſecure him an aſylum. Still intent on rendering the lateſt ſervice in his power to the king, M. de Bouillé wrote a letter to the national aſſembly, avowing himſelf the ſole perſuader and contriver of the king's flight, and endeavouring, by every means, to divert the force of popular fury from the king to himſelf: his efforts were inſufficient to ſave the king; but the demagogues eagerly ſeized the opportunity of ſtigmatiſing a man whom they had long regarded as one of their moſt formidable enemies. The aſſembly paſſed a decree of accuſation againſt him and his ſon, their eſtates were confiſcated, and the national convention afterwards offered a reward to the man who would aſſaſſinate him.

M. de Bouillé, not ſeeing in the year 1791 any thing which denoted hoſtile preparations againſt France, offered his ſervices to the empreſs of Ruſſia, but being preſſed by the king of Sweden, who was then at Aix-la-Chapelle, he accepted a commiſſion in his ſervice. Guſtavus and Catherine had formed extenſive and beneficial projects relative to France, which were however fruſtrated, partly by the backwardneſs of Auſtria and Pruſſia, partly by the inflexible neutrality of Great Britain, and finally by the aſſaſſination of the king of Sweden.

Soon after this event, M. de Bouillé quitted the ſervice of Sweden. He had now, to uſe his own expreſſion, connected his fate with that of two ſovereigns, equally unfortunate, and henceforth reſolved to ſecure himſelf from the frowns of Fortune by troubling her no longer. On the preparations in the year 1792 to invade France, he was offered a command of ſix thouſand troops, but pecuniary difficulties prevented the intended arrangement, and he ſerved as a volunteer under the prince of Condé. After the retreat of the allies, he took no public ſhare in military or political tranſactions.

M. de Bouillé publiſhed in the year 1797 his memoirs relating to the French revolution, a work in which the moſt excellent principles are combined with a clear and ingenious narrative: and in which the author has the ſingular candour to review his own conduct with frequent and decided diſapprobation.

BOULAY (Cæſar Egaſſe du), in Latin *Bulæus*, was born at St. Ellier, a village of Maine in France; and became profeſſor of humanity at the college of Navarre, regiſter, rector, and hiſtoriographer of the univerſity of Paris. He died in 1678, after having publiſhed ſeveral works. The principal of them are, *A Hiſtory of the Univerſity of Paris*, in Latin, 6 vols. folio; and the *Treaſure of Roman Antiquities*, in 1 vol. folio.

BOULTER (Dr. Hugh), was born in or near London, of reputable and wealthy parents. He was educated at Merchant-taylors' ſchool; and, before the revolution, was from thence admitted a commoner of Chriſt-church in Oxford. Some time after, he was choſen a demy of Magdalen College, at the ſame election with Mr. Addiſon and Dr. Wilcox. From the merit and learning of the perſons elected, this was commonly called by Dr. Hough, preſident of the college, the *golden election*. He afterwards became fellow of the ſame college; in which ſtation he continued in the univerſity till he was invited to London by Sir Charles Hodges, principal ſecretary of ſtate, in the year 1700, who made him his chaplain, and recommended him to Dr. Teniſon archbiſhop of Canterbury; but his firſt preferments were owing to the Earl of Sunderland, by whoſe intereſt and influence he was promoted to the parſonage of St. Olave in Southwark, and the archdeaconry of Surrey. Here he continued diſcharging very faithfully and diligently every part of his paſtoral office, till he was recommended to attend George I. as his chaplain, when he went to Hanover in 1719. He had the honour to teach Prince Frederick the Engliſh language; and by his conduct he ſo won the king's favour, that he promoted him to the deanery of Chriſt-church, and the biſhopric of Briſtol, in the ſame year. As he was viſiting his dioceſe five years afterwards, he received a letter from the ſecretary of ſtate, acquainting him that his majeſty had nominated him to the archbiſhopric of Armagh and primacy of Ireland. This honour he would gladly have declined; and deſired the ſecretary to uſe his good offices with his majeſty to excuſe him from accepting it. Ireland happened to be at this juncture in a great flame, occaſioned by Wood's ruinous project; and the miniſtry thought that the biſhop would greatly contribute to quench it by his judgment, moderation, and addreſs. The king therefore laid his abſolute commands upon him: to which he ſubmitted, but with ſome reluctance. As ſoon as he had taken poſſeſſion of the primacy, he began to conſider that country, in which his lot was caſt for life, as his own; and to promote its true intereſt with the greateſt zeal and aſſiduity. Accordingly, in innumerable inſtances, he exerted himſelf in the nobleſt acts of beneficence and public ſpirit. His charities for augmenting ſmall livings and buying glebes amounted to upwards of 30,000l., beſides what he deviſed by will for the like purpoſes in England. In ſhort, the inſtances he gave of his generoſity and benevolence of heart, his virtue, his piety, and his wiſdom, are almoſt innumerable, and the hiſtory of his life is his nobleſt panegyric. This excellent prelate died at London, on the 2d of June, 1742; and was interred in Weſtminſter-abbey, where a beautiful monument of finely poliſhed marble is erected to his memory.

BOURBON (Nicholas), a famous Latin poet in the 16th century, was a native of Vandeure near Langres, and the ſon of a wealthy man who was maſter of ſeveral forges. Margaret de Valois appointed him preceptor to her daughter Jane d'Albert of Navarre, the mother of King Henry IV. At length he retired to Condé, where he had a benefice, and died about the year 1550. He wrote eight books of Epigrams; and a

poem on the forge, which he has entitled *Ferraria*. He had great knowledge of antiquity and of the Greek language. Eraſmus praiſes his epigrams.

BOURBON (Nicholas), a celebrated Greek and Latin poet, was nephew of the preceding. He taught rhetoric in ſeveral colleges of Paris; and the Cardinal de Perron cauſed him to be nominated profeſſor of eloquence in the Royal College: he was alſo canon of Langres, and one of the 40 of the French academy. At length he retired to the fathers of the Oratory, where he died in 1644, aged 70. He is eſteemed one of the greateſt Latin poets France has produced. His poems were printed at Paris in 1630.

BOURCHIER (John), lord Bemars, grandſon and heir of a lord of the ſame name, who was deſcended from Thomas of Woodſtock, duke of Glouceſter, and had been knight of the Garter, and conſtable of Windſor-caſtle, under Edward IV. Our Lord John was created a knight of the Bath at the marriage of the Duke of York, ſecond ſon of Edward IV., and was firſt known by quelling an inſurrection in Cornwall and Devonſhire, raiſed by Michael Joſeph, a blackſmith, in 1495, which recommended him to the favour of Henry VII. He was captain of the pioneers at the ſiege of Therouenne, under Henry VIII., by whom he was made chancellor of the exchequer for life, lieutenant of Calais and the Marches, appointed to conduct the lady Mary the king's ſiſter into France on her marriage with Lewis XII., and had the extraordinary happineſs of continuing in favour with Henry VIII. for the ſpace of 18 years. He died at Calais in 1532, aged 63. He tranſlated, by King Henry's command, Froiſſart's Chronicle; which was printed in 1523, by Richard Pinſon, the ſcholar of Caxton, and the fifth on the liſt of Engliſh printers. His other works were a whimſical medley of tranſlations from French, Spaniſh, and Italian novels, which ſeem to have been the mode then, as they were afterwards in the reign of Charles II. Theſe were, The life of Sir Arthur, an Armorican knight; The famous exploits of Sir Hugh Bourdeaux; Marcus Aurelius; and, The caſtle of love. He compoſed alſo a book, Of the duties of the inhabitants of Calais; and a comedy entitled *Ite in Vineam*, which is mentioned in none of our catalogues of Engliſh plays. Anthony Wood ſays it was uſually acted at Calais after veſpers.

BOURDALOUE (Lewis), a celebrated preacher among the Jeſuits, and one of the greateſt orators France has produced, was born at Bourges, on the 20th of Auguſt, 1632. After having preached at Provence, he, in 1699, went to Paris; and there met with ſuch applauſe, that the king reſolved to hear him: on which he was ſent for to court, and frequently preached before Lewis XIV. He aſſiſted the ſick, viſited the priſons and hoſpitals, and was very liberal in giving alms. He died in Paris on the 13th of May, 1704. The beſt edition of his ſermons is in octavo.

BOURMONT, a town of France, in the department of Upper Marne, and late province of Champagne, 22 miles from Chaumont. Long. 5. 43. E. Lat. 48. 14. N.

BOURTON-ON-THE-HILL, a village of Glouceſterſhire, on the ſide of a hill, with a fine proſpect into Oxfordſhire. There are two ſprings in this pariſh, one of which runs E. and empties itſelf into the Thames, and the other W. into the Severn. It is five miles from Stow, and 30 from Glouceſter.

BOURTON-ON-THE-WATER, a village, about a mile from the preceding place, and near the Roman Foſs: it is watered by a river that riſes near it, which here ſpreads 30 feet wide, over which is a ſtone bridge, beſide ſeveral others of wood at proper diſtances. It has many good houſes and a tolerable trade. Adjoining to it is a quadrangular Roman camp, inclosing 60 acres, now divided into 20 fields, where coins and other antiquities are dug up.

BOUSSAC, a town of France, in the department of Creuſe and late province of Marche, with a caſtle, on an almoſt inacceſſible rock, 25 miles N.E. of Gueret.

BOXHILL, a hill near Dorking, in Surrey, celebrated for its extenſive proſpects. It received its name from the box trees planted on the ſouth ſide of it, by the Earl of Arundel, in the reign of Charles II.

BOXHORNIUS (Marc Zuerius), a learned critic, born at Bergen-op-Zoom in 1612, was profeſſor of eloquence at Leyden, and at length of politics and hiſtory in the room of Heinſius. He publiſhed, 1. *Theatrum urbium Hollandiæ*. 2. *Scriptores hiſtoriæ Auguſtæ, cum notis*. 3. *Poetæ ſatyrici minores, cum comment*. 4. Notes on Juſtin, Tacitus: and a great number of other works. He died in 1653, aged 41.

BOXLEY, a village in Kent, a little to the eaſt of Pinnenden Heath, near Maidſtone; famous for an abbey of Ciſtertian monks, founded by William earl of Kent in 1146, the remains of which ſtill exiſt. It was during his reſidence in this abbey that Edward II. granted the charter to the city of London, empowering them to elect a mayor from their own body. This abbey was alſo famous for the wooden figure, called the Rood of Grace; the lips, eyes, and head of which moved on the approach of its votaries. It was broken to pieces, at St. Paul's Croſs, in 1538, by Hilſey biſhop of Rocheſter, who ſhewed to the credulous people the ſprings and wheels by which it had been ſecretly moved.

BOYD (Mark Alexander), an extraordinary genius, was ſon of Robert Boyd, who was eldeſt ſon of Adam Boyd of Pinkhill, brother to Lord Boyd. He was born in Galloway on the 13th of January, 1562, and came into the world with teeth. He learned the rudiments of the Latin and Greek languages at Glaſgow under two grammarians; but was of ſo high and intractable a ſpirit, that they deſpaired of ever making him a ſcholar. Having quarrelled with his maſters, he beat them both, burnt his books, and forſwore learning. While he was yet a youth, he followed the court, and did his utmoſt to puſh his intereſt there; but the fervour of his temper ſoon precipitated him into quarrels, from which he came off with honour and ſafety, though frequently at the hazard of his life. He, with the approbation of his friends, went to ſerve in the French army, and carried his little patrimony with him, which he ſoon diſſipated at play. He was ſhortly after roufed by that emulation which is natural to great minds, and applied himſelf to letters with unremitted ardour, till he became one of the moſt conſummate ſcholars of his age. He is ſaid to have tranſlated Cæſar's Commentaries into Greek in the ſtyle of Herodotus, and to have written many Latin poems which were little inferior to the firſt productions of the Auguſtan age. He alſo left ſeveral manuſcripts on phylological, political, and hiſtorical ſubjects, in Latin and French, which languages were as familiar to him as his native tongue. He could with facility dictate to three amanuenſes at the ſame time, in different languages and on different ſubjects. He was alſo one of the beſt Scottiſh poets of the age. To all this we muſt add, that his perſonal beauty and accompliſhments were equal to his mental ſuperiority. He died at Pinkhill in Scotland, in 1601. The following works, which are all that have been printed, were publiſhed in the *Delicæ Poetarum Scotorum;* Amſtel. 1637. 12mo.: 1. *Epigrammata*, lib. ii. 2. *Heroidum Epiſtolæ* XIV. lib. i. 3. *Hymni* XIV.

BOYLE (John), earl of Cork and Orrery, a nobleman diſtinguiſhed by his learning and genius, was the only ſon of Charles earl of Orrery, and was born on the 2d of January, 1707. He was educated at Chriſt-church College in Ox-

ford: but, as he himſelf declares, early diſappointments, indifferent health, and many untoward accidents, rendered him fond of retirement, and of improving his talents for polite literature and poetry; of which laſt art he gave ſeveral excellent ſpecimens. He alſo wrote a Tranſlation of Pliny the Younger's letters, with various notes, for the ſervice of his eldeſt ſon the Lord Boyle, in two volumes 4to. This was firſt publiſhed in 1751. The year following he publiſhed the Life of Dean Swift, in ſeveral letters, addreſſed to his ſecond ſon Hamilton Boyle; and afterwards printed Memoirs of Robert Cary earl of Monmouth, a manuſcript preſented to him by a relation, with explanatory notes. He died in 1762.

BOYOLO, a town of Italy, in the duchy of Mantua, capital of a territory of the ſame name, ſubject to the houſe of Auſtria. It is fifteen miles S. W. of Mantua. Long. 10. 35. E. Lat. 45. 6. N.

BOYSE (Samuel), an Engliſh poet of ſome merit, but more worth recording as an example of the extreme diſtreſs conſequent upon vice and folly in a literary character, was the ſon of the Reverend Joſeph Boyſe, a diſſenting miniſter of eminence in Dublin. He was born in 1708; and after receiving his ſchool education in his native city, he was ſent to the univerſity of Glaſgow. Here his ſtudies were interrupted by a love affair with the daughter of a tradeſman in the place, as thoughtleſs as himſelf, whom he married before he reached his twentieth year. He took his wife and her ſiſter to Dublin, and lived a diſſolute life at his father's expence, till the death of this unfortunate parent. He then removed to Edinburgh, where in 1731 he publiſhed a volume of poems, which gained him reputation, and the patronage of ſome perſons of rank; but a radical meanneſs of character, and fondneſs for low company and pleaſures, prevented him from obtaining any ſolid advantages from the favour he acquired by his talents. On his removal to London, however, he carried with him recommendatory letters from the Ducheſs of Gordon and Lord Stormont, to Mr. Pope, the lord chancellor, and other perſons of conſequence; but his negligence and miſconduct ruined every proſpect. His talents, indeed, were merely thoſe of a writer, and he was totally unfit to make his way by the powers of converſation, or any other mode of ingratiating himſelf with the reſpectable part of ſociety. He ſoon fell into a ſtate of extreme indigence, which he relieved as long as he could by begging with ſhameleſs importunity from the principal diſſenters, and others to whom his father's name was known. What he obtained in this manner he ſquandered in ſelfiſh luxury, leaving his wife and child to ſtarve at home. His induſtry was exerted in writing verſes for the magazines, which he did with great facility, and for wretched pay. He pawned all his clothes, and even the ſheets of his bed; and the manner in which at this period he *courted the muſe* is thus deſcribed by an eye-witneſs: "He ſat up in bed with the blanket wrapt about him, through which he had cut a hole large enough to receive his arm; and placing the paper on his knee, ſcribbled in the beſt manner he could the verſes he was obliged to make." *Cibber, Lives of the Poets* When he again appeared abroad, he occaſionally ſupplied the want of a ſhirt by ſlips of white paper round his wriſts and neck. Beſides his poetry, he was employed in tranſlating from the French, which he was capable of performing well; but it was his conſtant practice, after ſending a ſheet to the preſs, to pawn the original, and to repeat this as often as it was redeemed during the courſe of his work. Thus paſt his wretched and profligate life, in the viciſſitudes of ſponging-houſes, garrets, and ale-houſes. One of its principal changes was a reſidence at Reading in 1745, on the invitation of Mr. D. Henry, proprietor of the Gentleman's Magazine, for the purpoſe of compiling an hiſtorical work on the events in Europe from the commencement of the Spaniſh war in 1739 to the rebellion in Scotland. Here his wife died, and he ſeems to have been reclaimed to a ſtate of ſomewhat more decent manners and conduct. Indeed, the original impreſſions of a religious education were never effaced in him, and they aggraved the miſeries of his life by the remorſe with which his vicious indulgences were ever followed. He returned to London in declining health, married a ſecond time a woman in low life, and died in May 1749, in obſcure lodgings in Shoe-lane. His funeral was at the pariſh expence.

Boyſe's poetical effuſions, if collected from the periodical works, &c. in which they were inſerted, would make ſeveral volumes; but this labour is certainly what they are not entitled to. A collection in two volumes was publiſhed during his life, but probably with little ſucceſs. By much the moſt celebrated of his works is "Deity," a religious poem, probably firſt publiſhed about 1741. This was publicly praiſed by two very different writers: Harvey in his Meditations, and Fielding, in his Tom Jones: and it attracted notice enough to have paſt through three editions in 1752. It is a piece without much plan or connection, but profuſe in the ſplendid thoughts and images which belong to the ſubject, and generally harmonious and poetical in its diction, though with frequent inequalities. Boyſe himſelf uſed to relate, that Pope, on being aſked if he were not the author of it, diſclaimed the work, but ſaid there were many lines in it of which he ſhould not be aſhamed. Indeed, the ſtyle and verſification ſeemed formed on that poet's manner, though certainly with very inferior powers. His other productions have a like mixture of poetical fancy and elevation with flatneſs and inaccuracy. The beſt of them are admitted into a very comprehenſive collection of the poets of Great Britain, printed at Edinburgh, with biographical prefaces by Dr. Anderſon. In Ogle's Canterbury Tales of Chaucer modernized, ſeveral appear under Boyſe's name, and are executed with ſpirit.—We are indebted to the popular biographical work of Dr. AIKIN for the foregoing particulars.

BRAAN, a river of Scotland, which deſcends from the hills of Perthſhire, E. of Loch Tay, and falls into the Tay a little above Dunkeld. Upon this river is a grand ſcene, at a place called the Rumbling Bridge. Under an arch, thrown over a narrow chaſm, between two projecting rocks, which almoſt meet, the whole waters of the river are precipitated in a fall of nearly fifty feet.

BRADESLEY, or BADESLEY, a village near Bromſgrove, in Worceſterſhire, where are the ruins of a ſuperb abbey, founded by the Empreſs Maud, mother of Henry II.

BRADFORD (John), a divine, and martyr to the reformation, was born in the former part of the reign of Henry VIII. at Mancheſter in Lancaſhire. Being a remarkable penman and accountant, he became ſecretary to Sir John Harington, who was ſeveral times employed by King Henry and his ſucceſſor Edward VI. as paymaſter to the troops abroad. Bradford at this time was a gay man, and to ſupport his extravagance made free with the king's money; but being at laſt unable to ſupport the reflection of his guilt, he determined to make reſtitution, and actually repaid the money. Quitting his employment of ſecretary, about the year 1547, he took chambers in the Inner Temple, and for ſome time ſtudied the law; but finding in himſelf an inclination to preach the goſpel, in the following year he removed to Catharine-hall in Cambridge, where he

applied with ſuch uncommon aſſiduity to the ſtudy of divinity, that in a much ſhorter time than uſual he was admitted to the degree of maſter of arts, and ſoon after made fellow of Pembroke-hall. Biſhop Ridley, who, in 1550, was tranſlated to the ſee of London, charmed with Bradford's application and zeal, now ſent for him to the metropolis, ordained, and appointed him his chaplain. In 1553 he was alſo made chaplain to Edward VI. during which time he became one of the moſt popular preachers in the kingdom. Such a reformer was too dangerous to be ſuffered in the ſucceeding reign. Mary was hardly in poſſeſſion of the crown, before Bradford's perſecution began. He was firſt confined in the Tower for ſedition, where he continued a year and a half; during which time he wrote ſeveral epiſtles that were diſperſed in various parts of the kingdom. He was afterwards removed to other priſons, and at laſt brought to his trial before that infernal court of inquiſition in which Gardiner ſat as chief inquiſitor, where he defended his principles to the laſt, in contempt of their utmoſt power. They condemned him to the flames; and he was accordingly burnt alive in Smithfield, on July 1, 1555. His works are: 1. Seventy-two letters, written to various people, whilſt the author was in priſon; printed in Biſhop Coverdale's collection. 2. Ten letters, printed in Fox's acts and monuments. 3. Complaint of verity, 1559, 8vo. 4. Three examinations before the commiſſioners, and his private talk with the prieſts, with the original of his life, 1561, octavo. 5. Two notable ſermons, 1574, octavo, 1631. 6. Godly meditations and prayers, 1614, 24to. 7. Treatiſe of repentance, 1622. With ſeveral tranſlations and other pieces.

BRADSHAW (Henry), a Benedictine monk, was born at Cheſter, about the middle of the fifteenth century. Diſcovering an early propenſity to religion and literature, he was received while a boy into the monaſtery of St. Werberg in that city; and having there imbibed the rudiments of his education, he was afterwards ſent to Glouceſter College, in the ſuburbs of Oxford, where for a time he ſtudied theology with the novices of his order, and then returned to his convent at Cheſter; here, in the latter part of his life, he applied himſelf chiefly to the ſtudy of hiſtory, and wrote ſeveral books. He died in the year 1513, the fifth of Henry VIII. His poetry is not inferior to that of any of his contemporaries. His works are: 1. *De antiquitate et magnificentia urbis Ceſtriæ.* 2. *Chronicon.* 3. The life of the glorious virgin of St. Werberg. Printed Lond. 1521, 4to, in verſe. The life of St. Werberg makes only part of this work; for it contains alſo a deſcription of the kingdom of Mercia, life of St. Etheldred, the life of St. Sexburg, the foundation and hiſtory of Cheſter, and the chronicles of ſome kings. Poſſibly this work may include the two firſt. Biſhop Tanner ſays, that he wrote a chronicle in Engliſh verſe, extracted from Bede, Malmſbury, Geraldus, and others. Probably this is the chronicle above mentioned.

BRADWARDIN (Thomas), archbiſhop of Canterbury, was born at Hartfield in Suſſex, about the cloſe of the thirteenth century. He was educated at Merton College, Oxford, where he took the degree of doctor of divinity; and acquired the reputation of a profound ſcholar, a ſkilful mathematician, and conſummate divine. Authors are not agreed as to his firſt preferments. Pits ſays he was profeſſor of divinity at Oxford. They agree, however, in aſſerting, that from being chancellor of the dioceſe of London, he became a courtier and confeſſor to Edward III. whom he conſtantly attended during his war with France, aſſiſting that victorious prince with his advice, animating the troops, and fervently praying for their ſucceſs. After his return from the war, he was made prebendary of Lincoln, and afterwards archbiſhop of Canterbury. He died at Lambeth in the year 1349, forty days after his conſecration; and was buried in St. Anſelm's chapel, near the ſouth wall. His works are: 1. *De cauſa Dei*, printed in London, 1618, publiſhed by J. H. Savil. 2. *De geometria ſpeculativa*, &c. Paris, 1495, 1512, 1530. 3. *De arithmetica practica*, Paris, 1502, 1512. 4. *De proportionibus*, Paris, 1495, Venice, 1505, folio. 5. *De quadratura circuli*, Paris, 1495, folio.

BRADY (Robert), born in Norfolk in 1643, was maſter of Caius College, Cambridge, regius profeſſor there, and twice repreſentative of that univerſity in parliament. In 1685 he was made keeper of the records in the Tower, and was phyſician in ordinary to James II. He wrote, An introduction to the Old Engliſh hiſtory; An hiſtory of England, from the time of the Romans, to the end of the reign of Richard II.; and, A treatiſe on Engliſh boroughs. He died in 1700.

BRAILA, a town of Turkey in Europe, in Walachia, on the Danube. It has a caſtle, taken by the Ruſſians in 1711; but afterwards reſtored.

BRALIO, a lofty mountain of the Alps, in the country of the Griſons. It ſeparates the valley of Munſter from the county of Bormio; and this part of the Alps is ſuppoſed to be the ſame which Tacitus mentions under the name of Juga Rhætica.

BRAMHALL (Dr. John), archbiſhop of Armagh, was born of an ancient family at Pontefract in Yorkſhire, about the year 1593. He was invited over to Ireland by the Lord-deputy Wentworth; and ſoon after obtained the archdeaconry of Meath, the beſt in that kingdom. In 1634 he was made biſhop of Londonderry, which ſee he improved very much; but the greateſt ſervice he did to the church of Ireland, was by getting, with the deputy's aſſiſtance, ſeveral acts paſſed for aboliſhing fee-farms, recovering impropriations, &c. by which and by other means he regained to the church in the ſpace of four years 30,000 or 40,000l. a-year. In the convocation he prevailed upon the church of Ireland to unite in the ſame faith with the church of England, by adopting the thirty-nine articles of that church; and would willingly have introduced the Engliſh canons, but could only prevail on their accepting ſuch as they deemed proper. Articles of treaſon were exhibited againſt him in the Iriſh parliament; and at the treaty of Uxbridge in 1644, the Engliſh parliament made it a preliminary article, that Biſhop Bramhall, with Archbiſhop Laud, and others, ſhould be excepted from the general pardon. He went abroad; but on the reſtoration was appointed archbiſhop of Armagh, primate and metropolitan of all Ireland, and was choſen ſpeaker of the Houſe of Lords. He died in 1663; and was the author of ſeveral works, which are collected in one volume folio.

BRAMPTON, a village in Herefordſhire, one mile S. of Roſs. Here are the ruins of a magnificent caſtle; and the gatehouſe, which is entire, is a very curious ſtructure.

BRAN (*Encycl.*) The ſcarcity of bread which has occurred of late years has led to many important experiments and diſcoveries. One of theſe is, that bran contains *a very large portion* of what is nutritious in wheat. The advantages to be derived from kneading flour for baking with bran-water inſtead of common water, were firſt made public in the following copy of a letter from the reverend Francis Haggitt, prebendary of Durham, to the lord biſhop of Durham, dated Nuneham, February 18, 1800.

"If you were ſurpriſed, my lord, at receiving from me a

loaf of bread, your ſurpriſe will ceaſe when I explain my reaſon for ſending it; in doing which, I muſt enter into ſome details which, I am perſuaded, will be far from unintereſting to your lordſhip. In the courſe of reading an old work of Rural Economy, I lately met with the following aſſertion, viz. that flour kneaded with bran-water will produce a more *ſubſtantial* bread, and a *greater quantity* of it, than is obtained by the common mode of baking. As the author ſays nothing more upon the ſubject, I conclude he wrote in a time of plenty; but the information (if it ſhould prove correct) appeared to me of vaſt importance in theſe days of ſcarcity, and I determined to make the experiment without delay. Accordingly I cauſed four buſhels of wheat (nine-gallon meaſure) to be ground, and nothing but the coarſe bran taken out: the produce was four buſhels and a half of flour, and 22lb. of bran. About ten days ago, I boiled ſome of the bran, and kneaded a due proportion of the flour with the ſtrained liquor, and the reſult of the expement was ſo highly ſatisfactory, that I reſolved to repeat it with the moſt ſtrict attention, and the moſt ſcrupulous exactneſs. The details of this ſecond experiment I am now about to communicate to your lordſhip; and I thought proper to ſend you alſo ſome of the bread produced by it, that you might form a judgment of its excellence. Yeſterday I took 5lb. of bran, boiled it, and with the liquor ſtrained from it kneaded 56lb. of flour, adding the uſual quantity of ſalt and yeaſt. When the dough was ſufficiently riſen it was weighed, and divided into loaves; the weight, before being put into the oven, being 93lb. 13oz. or about 8lb. 10oz. more than the ſame quantity of flour kneaded in the common way; it was then baked two hours, and, ſome time after being drawn, the bread was weighed, and gave 83lb. 8oz.—loſs in baking 10lb. 5oz. The ſame quantity of flour kneaded with common water loſes about 15lb. 11oz. in the baking, and produces only 69lb. 8oz. of bread;—gain by my method 14lb; that is, a clear increaſe of one-fifth of the uſual quantity of bread from a given quantity of flour. This increaſe, which at firſt appears aſtoniſhing (ſince only 5lb. of bran were boiled), ſeems to depend on a combination of three cauſes;—firſt, the water in which the bran is boiled weighs half a pound more per gallon than plain water; ſecondly, owing to its glutinous conſiſtence, it is leſs ſubject to evaporation by heat; thirdly, and principally, a greater quantity of it is neceſſary to make the dough; a buſhel (or 56lb.) of flour requires three gallons (i. e. 27lb.) of plain water; but it imbibed three gallons and three quarts of bran-water, weighing 35lb. 10oz. The bran, after being uſed in this way, is equally fit for many domeſtic purpoſes, and I ſuſpect even more nutritious for pigs and poultry than if given to them raw. I had the curioſity to weigh it after the liquor was ſtrained off, and found that it had gained 12lb. and if water incorporates with it in the ſame manner as it does with rice, why may not its nutritive power be increaſed in the ſame manner? The conjecture accords, at leaſt, with Count Rumford's principle. But to return to my experiment: I have amuſed myſelf with the following calculation, which perhaps will make your lordſhip ſmile. The increaſe of bread, by this method, being a fifth from a given quantity of flour, the conſumption of flour would be ſaved by it every ſixth day, or ſixty days in a year. Suppoſing then that the practice were univerſally adopted, and taking the conſumption of flour in this kingdom at 200,000 buſhels per day, the *annual ſaving* would amount to twelve millions of buſhels, which, at the preſent price, would coſt about ten millions ſterling, and in ordinary times about four millions. Of the wholeſomeneſs of the bread there can be no doubt; of its flavour you will judge by the ſpecimen I have ſent you; and I can add from experience, that it keeps very well. After my *firſt* batch had been baked ten days, I put a loaf which remained of it into my oven for about twenty minutes, and, being ſuffered to grow cool again, it was cut, and had every appearance of new bread; nay, we even thought it better than it was at firſt. I am," &c.

This was publiſhed by the ſociety for bettering the condition of the poor in London, but as the trials of this method fell ſhort in ſome inſtances, it was followed by theſe "curſory obſervations on the uſe of bran in making bread."

"Moſt of the objections to the uſe of bran in the making of bread, appear to be founded on a preſumption, that no mode of preparation will make any difference in the degree of nutriment to be derived from food. Though the ſubject is as yet but little underſtood, ſtill we have gone far enough to aſcertain the fact, that in moſt kinds of grain, ſome increaſe of the ordinary nutritive power *may* be produced by culinary proceſs. The very making bread affords an example of this increaſe. In rice it is very great; and in barley-meal, particularly when uſed in ſoup, its increaſed power of nutriment may be extended to a ſurpriſing degree. It is now well known that rice, when increaſed by water to a ſolid ſubſtance of five times its original weight, or by the addition of milk to eight times what it originally weighed, is converted from a hard indigeſtible grain into a wholeſome nouriſhing food.

"It appears from chemical experiments, and particularly from thoſe made by a very able man, the late Dr. Addington, the miniſter's father, and mentioned in the Houſe of Commons, that wheat contains 'an eſſential oil of a moſt beneficial quality; and that *almoſt the entire of the oil is confined to the* BRAN.' Theſe words are copied from the account given in the public papers, with a view of ſuggeſting to the reader's mind, whether (if we *can* be perſuaded that the reſult of theſe chemical experiments is juſt, and that there really is *a very nutritious eſſential oil in the bran* of wheat) that circumſtance alone will not at once explain the cauſe of the increaſe, and demonſtrate the value of the diſcovery.

"The uſe and application of Mr. Haggitt's proceſs is now conſiderably extended, by the addition of the whole of the boiled bran to the dough. This has been adopted, for the laſt month, in ſome families, in the making of all their bread for common uſe; and the bread ſo made is perfectly good and ſweet, and (as far as one may at preſent judge) quite as *wholeſome* and *nouriſhing* as any other bread.

"The fact ſeems to be, that the boiling of the bran ſoftens it, and diveſts it of its dry huſky quality; thus preparing the nutritive part, *the eſſential oil*, for food. The increaſe in the quantity of bread by the addition of bran to 56lb. of flour, is from 34lb. to 36lb. of bread beyond what is produced in the common mode. In one inſtance, the 56lb. of flour with 14lb. 14oz. of bran, has produced 106lb. and a half of bread, weighed the next day when cold; above half as much again as what is commonly made, and about twice the quantity that is produced from a buſhel of wheat when merely the fine white flour is uſed. This improvement (if adopted only in the families of gentlemen and farmers, and in public inſtitutions) would have an inſtantaneous effect in reducing the price of flour, and in baffling the arts of the *ſpeculator*; and if univerſally adopted throughout the whole kingdom, the ſaving from it would be equal to one-third of our conſumption; or to the annual amount of as much wheat as, with the ſame economy, would ſupply the whole kingdom for ſix months;—of as

much wheat as *one thouſand ſhips* would import to our ſhores, if the reſt of Europe were *glutted* with grain, and the *millions* which it would coſt were no object of expenditure.

"There is not the moſt diſtant idea of preſſing upon the poor any variation in their habits; particularly with reſpect to bread, now become their chief article of ſubſiſtence. But it is conceived, that, in the preſent criſis, the *rich* are *inexcuſable*, if they neglect to attend to every practicable ſaving that can be made in the conſumption of wheat corn. Whether the high price of bread is occaſioned by actual ſcarcity, or by baneful monopoly, or whether (as ſome think) it owes its exiſtence to both cauſes, it is one of our firſt duties to adopt every juſt and legal expedient to keep down the price of corn, and to huſband this eſſential article of life for the benefit of our poor and neceſſitous brethren. Something has been already done, and with great and good effects: but it is hardly poſſible to conjecture what the price of bread *would have been at this day*, and how inſupportable might have been the preſſure upon the poor, if no meaſures had been taken for their relief and protection. When, therefore, we find any perſons openly oppoſing thoſe meaſures, or clandeſtinely endeavouring to diminiſh their effects, it is not very eaſy to diveſt the mind of the idea that they have an intereſt in the increaſe of the evil, and are taking advantage of a public calamity."

BRANCASTER, a village of Norfolk, to the E. of the promontory of St. Edmund's-chapel, was anciently Branodunum, a conſiderable Roman city, where ancient coins have been frequently dug up.

BRANDELS, a town of Bohemia, on the river Elbe, 10 miles N. E. of Prague. Long. 14. 45. E. Lat. 50. 15. N.

BRANDT (Gerard), a learned divine of the reformed religion, was born at Amſterdam in 1626, and was ſucceſſively miniſter in ſeveral places of the Netherlands. He wrote ſome works which are eſteemed, particularly The Hiſtory of the Reformation of the Netherlands, 4 vols. 4to.; and The Life of Admiral Ruyter; both written in the Flemiſh tongue. He died at Rotterdam in 1685.

BRASSA, a ſmall iſland to the N. of Scotland, one of the Shetland iſlands. Between this and the principal iſland, called the Mainland, is the noted Braſſa Sound; where a thouſand ſail may at once find commodious mooring.

BRATTON-CASTLE, on the E. ſide of Weſtbury, in Wilts, the remains of a ſtrong fortification, where the Danes held out againſt the Engliſh twenty-four days. It is ſeated on a hill, and is encompaſſed by two ditches, within which ſeveral pieces of old iron arms have been dug up.

BRAUBACH, a town of Germany, in Weteravia, with a caſtle, ſeated on the Rhine, eight miles S. of Coblentz.

BRAUN (George), in Latin *Braunius*, archdeacon of Dortmund, and dean of Notre Dame in Gradibus, at Cologne. He publiſhed a Latin oration againſt the prieſts guilty of fornication; he alſo wrote the Life of Jeſus Chriſt, that of the Holy Virgin, and a controverſial treatiſe againſt the Proteſtants; but his chief work is the *Theatrum Urbium*, in ſeveral volumes folio.

BRAY, a village of Berkſhire, famous in ſong for its vicar, who, having been twice a Papiſt, and twice a Proteſtant, in the reigns of Henry VIII., Edward VI., Mary, and Elizabeth, and therefore taxed with being a turncoat, ſaid, he always kept to his principle, which was, to live and die vicar of Bray. It is ſeated on the Thames, one mile from Maidenhead.

BRAZIL, erroneouſly ſpelt Bzazil in our original article. See Brasil.

BREAD *(Encycl.)* The following we add to our original article; viz. a method of fermenting a large body of flour with a ſmall quantity of yeaſt, invented by Mr. James Stone, of Amport, in Hampſhire. Suppoſe you want to bake a buſhel of bread, and have not more than one tea-ſpoonful of yeaſt; put the flour into a kneading-trough, and take about three quarters of a pint of warm water, and the tea-ſpoonful of yeaſt, which if thick and ſteady the better; put it into the water, and ſtir it until it is thoroughly mixed; then make a hole in the middle of the flour large enough to contain two gallons of water; pour in your ſmall quantity of yeaſt, mixed with water as above; then take a ſtick about two feet long, and ſtir in ſome of the flour until it is as thick as you would make batter for a pudding; ſtrew ſome of the dry flour over it, and let it reſt for about an hour, for in that time you will find this ſmall quantity raiſed ſo that it will break through the dry flour which you ſhook over it; then pour in about a quart more of warm water, and ſtir it with your ſtick as before, and leave it for two hours more; you will find it riſe, or break through the dry flour again; then add three quarts or a gallon more of warm water, and ſtir in the flour again; and in about three or four hours mix up the dough, and cover it warm. In four or five hours more you may put it in the oven, and you will have as light bread as though you had uſed a pint of yeaſt. It does not take above a quarter of an hour more time than the uſual way of baking; for there is no time loſt but that of adding water three or four times. When you find your body of flour ſponged large enough, before you put in the reſt of the water you ſhould, with both hands, mix that which it ſponged and the dry flour altogether, and then add the remainder of warm water, and your dough will riſe the better and eaſier. The author aſſerts, that he conſtantly bakes this way; in the morning, about ſix or ſeven o'clock, he begins his firſt operation; in an hour's time he adds more water, in two hours more a greater quantity, about noon he makes up the dough, and about ſix in the evening it is put into the oven; and that he has always good bread, never heavy nor bitter. He adds, that the cauſe of heavy bread is not owing to the ſmallneſs of the quantity of yeaſt uſed, but to its not being uſed properly, for yeaſt is to flour what fire is to fuel—a ſpark of the latter will kindle a large body by only blowing it up, ſo a thimble full of the former, by adding warm water to it, will raiſe or ſponge almoſt any quantity of flour.

Thus heavy bread is not owing to a deficiency in the quantity of yeaſt uſed, but to a deficiency of fermentation; for, if the dough be put into the oven before it is ripe, heavy bread is the natural conſequence. In regard to the difference of ſeaſons, he preſcribes that in ſummer the water ſhould be blood-warm, and in cold froſty weather as warm as you can bear your hand in it without making it ſmart; taking care in winter to cover up your dough.

In the Britiſh Magazine for 1800, we are taught how to make bread without yeaſt, as practiſed in Hungary.

Boil two good handfuls of hops in four quarts of water: pour this upon as much wheat bran as the liquor will moiſten. To this add four or five pounds of leaven: mix the whole together, ſo as to unite the parts. Put this maſs into a warm place for twenty-four hours; then divide it into pieces about the ſize of an hen's egg, which ſhould be dried in the air, but not in the ſun, and then will keep ſix months.

For ſix large loaves, ſix good handfuls of this broken ſmall, and diſſolved in eight quarts of warm water, and poured through a ſieve into one end of the bread-trough; and three quarts more of warm water are poured through the

ſieve after it, and what remains in the ſieve well preſſed out. This liquor muſt be mixed up with as much flour as will make a large loaf. This to be ſtrewed over with flour, the ſieve with its contents put upon it, and the whole covered up warm. When its ſurface begins to crack, fifteen quarts of warm water, in which ſix handfuls have been diſſolved, muſt be poured through the ſieve upon it, and the neceſſary quantity of flour added, and mixed and kneaded with the leaven; this muſt be covered up warm and left about an hour, then made up into loaves, which are kept in a warm room half an hour, and after that put into the oven till ſufficiently baked.

"The leaven," ſays Mr. Holt, of Walton near Liverpool, who relates this proceſs, "may be made in large quantities. By large loaves, I find by enquiry, in our own practice, is meant twelve pounds of flour, and to which four ounces of leaven in a dried ſtate is a proper quantity."

The following account of *ſubſtitutes for flour or bread* we extract from an excellent contemporary work, entitled The Domeſtic Encyclopædia.

We have, in the preceding analyſis, as well as on former occaſions, mentioned various ſubſtances which might advantageouſly be employed in the manufacture of this indiſpenſable article of human ſuſtenance; independently of the different kinds of grain and roots that are already made ſubſervient to this beneficial purpoſe. In order to exhibit a diſtinct view of the moſt promiſing ſubſtitutes, whether indigenous or exotic, and eſpecially ſuch as have actually been uſed, on the authority of credible evidence, we ſhall here divide them into three claſſes, having, in the courſe of the work, given a more particular account of each article, in its alphabetical order.

I. *Farinaceous Seeds*:—Wheat-graſs, or *Triticum Spelta*; millet, or *panicum meliaceum*; common buck wheat, or *polygonum fagopyrum*; Siberian buck-wheat, or *polygonum tataricum*; wild buck-wheat, or *polygonum convolvulus*; wild Feſcue graſs, or *Feſtuca fluitans*; Maize, or Indian Corn, the *Mays Zea*; Rice, or *Oryza ſativa*; Guinea Corn, or White Round-ſeeded Indian Millet; the *Holcus Sorghum*, L.; Canary-graſs, or *Phalaris Canarienſis*; Rough Dog's-tail Graſs, or *Cynoſurus echinatus*; Water Zizany, or *Zizania aquatica*; Upright Sea Lime-graſs, or *Elymus arenarius*; Sea-reed, Marram, Helme, or Sea Mat-weed, the *Calamagroſtis*, or *Arundo arenaria*.

The following mealy fruits, however, deſerve a decided preference over many of the preceding: viz. Water Caltrops, or the fruit of the *Trapa natans*, L.; Pulſe of various kinds, ſuch as Peas, Lentils, Beans, and the ſeeds of the Common Vetch, Fetch, or Tare-acorns, and eſpecially thoſe of the *Quercus cerris* and *eſculus*; the ſeeds of the White Gooſe-foot. Common Wild Orange, or the *Chenopodium album*; the ſeeds and flowers of the Rocket, or *Braſſica eruca*; the ſeeds of the Sorrel, or *Rumex acetoſa*; of the different ſpecies of Dock, or *Lapathum*; of the Yellow and White Water-lily; or the *Nymphæa lutea* and *alba*; of the Corn-ſpurrey, or *Spergula arvenſis*; of the Spinage, or *Spinacia oleracea*, L.; of the Common Gromwell, or Graymill, the *Lithoſpermum officinale*; of the Knot-graſs, or *Paniculum aviculare*; the Beech-nut; and even the huſks of the Lint-ſeed, &c.

II. *Farinaceous Roots:* namely, thoſe of the Common and Yellow Bethlem Star, or *Ornithogalum luteum* and *umbellatum*; of the well-known Yellow Aſphodel; of the Wake Robin, or *Arum maculatum* (after being properly dried and waſhed); of the Pilewort, or Leſſer Celandine, the *Ranunculus ficaria*; of the Common Dropwort, the *Spiræa filipendula*; of the Meadow-ſweet, or *Spiræa ulmaria*; of the White Bryony, or *Bryonia alba*; of the Turnip rooted Cabbage, or *Napobraſſica*; of the Great Biſtort, or Snake-weed; likewiſe of the Small, Welch, or Alpine Biſtort; of the Common Orobus, or Heath-pea; the Tuberous Vetch; the Common Reed; both the Sweet-ſmelling and Common Solomon's Seal; the Common Corn-flag, or *Gladiolus communis*; the Salt-marſh, Club-ruſh, or *Scirpus maritimus*, &c.—Indeed, ſome authors alſo include in this liſt the roots of the *Mandragora, Colchicum, Fumaria bulb, Helleborus acconitifol.* and *nigr. Lilium bulbif.*, and many others; but for theſe laſt mentioned we have not ſufficient authority.

III. *Fibrous and leſs juicy Roots:* viz. thoſe of the Couch-graſs, or Creeping Wheat-graſs; the Clown's, or Marſh Wound-wort; the Marſh Miry-gold, or Meadow Bouts; the Silver-weed, or Wild Tanſey; the Sea Seg, or *Carex arenarius*, &c.

Having thus ſtated the various ſubſtitutes for bread, which either have already been adopted with ſucceſs in this country, or which might, in times of *real* ſcarcity, be eaſily converted into proper nutriment, we cannot better conclude this article than in the words of Arthur Young, eſq. who, in his Obſervations on the late Royal Proclamation, recommending frugality in the conſumption of corn, as one of the ſureſt and moſt effectual means of alleviating the preſent preſſure of the times, eſpouſes the cauſe of the unfortunate poor, nearly in the following words: Every maſter or head of a family is in duty bound to ſecond, without compulſion, the humane views of the legiſlature. Hence, bread made of the whole produce of the wheat, excepting only ſeven pounds of the bran in each buſhel, and adding one-fourth or third part of a ſubſtitute, would probably be the moſt effective ſaving. If the conſumption of the whole kingdom be computed at 8,000,000 of quarters in twelve months, this ſaving on all the wheat conſumed in nine months would be 700,000 quarters, which would feed 875,000 perſons, at the ordinary conſumption of one quarter a head per annum; and probably be equal, under the preſent reſtrictions, to afford food to 1,000,000 of people for the next nine months. Further, if the ſaving of oats to the ſuppoſed number of 500,000 horſes of luxury, be calculated at one buſhel per week, this would, in nine months, amount to 18,000,000 of buſhels; or ſufficient to ſupport 1,000,000 of perſons for the ſame period of time, allowing to each not leſs than twenty-five buſhels per annum. With due deference to Mr. Young's ſtatiſtical information, however, we beg leave to doubt whether 500,000 fat horſes, crammed on the food of man, move about the kingdom; though it muſt be acknowledged, that *pleaſure horſes* "are ſpectacles of envy to the ſtarving poor—abominable and ſcandalous ſpectacles, which, in times like theſe, ought to be removed from the view of thoſe whoſe miſerable children might be fed on the corn thus ſaved."

BREMENWOERD, a town of Germany, in the duchy of Bremen; formerly a fortified town; but, ſince the year 1683, the fortifications have been demoliſhed. It is 27 miles N. of Bremen. Long. 8. 45. E. Lat. 53. 33. N.

BRENT, a river of Somerſetſhire which riſes in Selwood Foreſt, on the edge of Wilts, and receiving ſeveral rivulets, particularly one from Shepton-Mallet and Wells, falls into Bridgewater Bay.

BRENTE, a river which has its ſource in the biſhopric of Trent, and falls into the gulph oppoſite Venice.

BRESLE, a river of France that has its ſource above Aumale; ſeparates the late provinces of Normandy and Picardy, waters Eu, and then falls into the Engliſh Channel.

BRESSUIRE, a town of France, in the department of

the two Sevres and late province of Poitou, with a college, 35 miles N.W. of Poitiers.

BRETAGNE, a late province of France, 150 miles in length, and 112 in breadth. It is a peninsula, united on the E. to Anjou, Maine, Normandy, and Poitou. The air is temperate, and it has large forests. It is formed into five of the new departments of France; namely, the North Coast, Finisterre, Isle and Vilaine, Lower Loire, and Morbihan.

BRETEUIL, a town of France, in the department of Lower Seine and late province of Normandy, seated on the river Iton, 15 miles S. W. of Evreux. Long. 1. 0. E. Lat. 48. 56. N.

BREWING (*Encycl.*). In March, 1788, Mr. W. Ker, of Kerfield, Tweedale, received the king's patent for his improvement in brewing ale, beer, porter, and other malt liquors, so as to save a considerable portion of hops, to produce the liquors of a superior flavour and quality, and render them less liable to become acid or putrid. The steam which arises from the boiling copper, is known to be strongly impregnated with the essential oil of the hops, in which their flavour consists. Instead, therefore, of allowing it to escape and evaporate, as it does in the common mode of brewing, Mr. Ker contrives to preserve and condense it, by means of a winding-pipe fixed to the copper, similar to the worm of a still, or by a straight pipe passing through cold water, or any other cooling medium. The oil and water, thus obtained, are returned into the worts, when boiled; or the oil, after being separated from the water, along with which it had been exhaled, is returned into the worts after they are boiled; and the watery part, which, after the oil is separated, still continues impregnated with the aromatic taste and bitter of the hop, is returned into the next copper or boiling vessel, and so on, from one copper or boiling vessel into another. By this process, a considerable part of the hop and flavour, which is lost in the ordinary mode of brewing, is preserved; the flavour of the liquor is improved by the preservation of the finer parts of the aromatic oil; and the ale and beer are better secured from any tendency to acidity or putrefaction, and therefore must be fitter for home consumption and exportation.

In June 1790, Mr. John Long, of Ireland, obtained a patent for an improvement, which he calls *an entire new method*, in *all the essential parts* of brewing good malt liquor. Though his method, in one respect, is similar to that adopted by Mr. Ker, yet, as it comprehends the whole process of brewing, we shall lay it before our readers, nearly in the words of its author.

1. For the better extracting the virtues of malt, place near a mash-tun a shallow copper, or other vessel, that will readily heat, the curb of which to be on a level with the tun, and to contain from two to six hogsheads, according to the dimensions of the tun, more or less; and, at the lower end of the copper, have a cock, from two to five inches in diameter, to conduct the heated liquor from the copper into a tube, which passes down the external part of the tun, and enters it through an aperture about six inches from the bottom; then forming two revolutions, more or less, through the body of the tun, and communicating its heat to the wort as it passes through the tube; and then, at a convenient distance from the place where it first entered, it runs from the tun into a cistern or tub, situate as near as convenient to the copper or heating-vessel. In the tub or cistern is to be placed a pump, for the purpose of conveying the cooler liquor back to the copper or heating-vessel again, there to receive the heat of 208 degrees, more or less (which it will require after the first half hour), and then convey it through the mashing-tun, as before, and in the same manner, as long as the working-brewer may think necessary, to raise the mashing-tun to any degree of heat required. By adhering to the foregoing process, the first liquor may, with the greatest safety, be let upon the malt, from 20 to 30 degrees lower than the present practice; by which means it operates with gentleness, opens and expands the malt, and prepares it for the reception of sharper or warmer liquor, so as to extract the whole of the saccharine quality from the malt. By the foregoing method, the mashing-tun, instead of losing its first heat (which it does by the present practice), continues to increase in heat every moment, by conveying the heated liquor through the tube into the tun; by which means, at the end of two hours, the working-brewer can have the tun brought to any degree of heat he shall think best suited to the different qualities of the malt. Persons who would wish to save expence, may heat their mashing-tun at the side or bottom, by a large piece of metallic substance made fire-proof, and fixed therein; which, in some degree, will answer the end proposed, but with great trouble and delay.

2. To prevent the wort from receiving a disagreeable flavour, while in the under-back, a tube must be placed at the cock of the mashing-tun, to receive the wort as it comes off, and convey it to a great cistern, or refrigeratory, which is supplied with a stream of water. The wort, passing through that medium in a spiral tube, soon loses that heat which so often proves prejudical to the brewer in warm weather: it is then poured from the tube into a vessel in which pumps are placed, to return the wort into the copper, for the purpose of boiling off.

3. As the great object of long boiling the wort is remedied, by this invention of taking the extract from the hops in a separate manner from the worts, Mr. Long boils the latter no longer than from fifteen to twenty minutes; and by pursuing that method, he saves much time and fuel, and regulates the length of time accordingly.

4. He steeps his hops the preceding day to which they are to be used, in a copper or other vessel, with as much fluid, blood-warm, as will cover the hops; where it is to remain over a slow fire at least fourteen hours, close covered; the copper, at the tenth hour, not to be of a greater heat than 175 degrees, continuing slow until the last hour. Then he brings the copper gradually to a simmer, or slow boil; in which state he suffers it to remain about ten minutes, and then runs off the fluid; and this he does at the same time the first wort is boiled off, that they may both pass together through the refrigeratory, into the fermentation or working-tun. After the foregoing operation, he covers the hops again with other liquor, brings the copper to boil as soon as convenient, and lets it remain in that state a considerable time, until the second worts are boiled off. Then he passes the hop-fluid with the wort, the same as in the first instance; and, if there is a third wort, he boils the hops a third time with small worts, and drains off the liquid as before; by which means he gradually obtains the whole of the essential oil and pleasant bitter from the hops, which is effectually preserved in the beer.

5. When the wort is boiled off, it is conducted from the cock of the copper or boiler into a tube of a proper dimension, which passes the wort from the cock to the large cistern or refrigeratory, and there performs several revolutions, in a spiral manner, through the same tube; which is immersed in a constant supply of cold water, where it loses the greatest part of its heat in a short time, and thence continues a straight course through the tube, a little elevated, and some suitable length, placed in brick-work, until it meets a small

refrigeratory, ſupplied with colder water from a reſervoir made for that purpoſe, at the head of the works; whence a continual ſtream runs on the ſurface of the tube down to the great refrigeratory, cooling the wort as it paſſes, in order to enable the working-brewer to ſend it into the backs, or working-tuns, at whatever degree of heat he may think proper. The tube may be made of lead, or any other metallic ſubſtance.

6. To enable him to brew in the warm ſummer months, Mr. Long ſinks the backs, or working-tuns, at leaſt to a level with the ground, but if deeper the better, and covers them cloſely by an arch made of bricks, or other materials, that will totally exclude the atmoſpheric air. He then places them as near as poſſible to a ſpring or ſand-drain, as their depth will naturally draw the water thence, which muſt be ſo contrived as to paſs or flow round the backs or tuns. Next, he introduces a large tube, which paſſes through the tuns, and keeps the wort ſeveral degrees lower than can poſſibly be done by the preſent practice; by which means he produces a complete fermentation, even in the dog-days.

7. In cold or froſty weather, if the tun and backs ſhould loſe the firſt heat, intended to be conducted through the proceſs by the foregoing method, a ſupply of warm or boiling water may be conveyed by the tube, which paſſes through the body of the backs or tun, communicating its heat, which riſes to any degree the working-brewer ſhall think proper: by purſuing this method, in the coldeſt ſeaſon, a fermentation may always be procured.

In February 1798, Dr. Richard Shannon obtained a patent for his method of improving the proceſſes of brewing, diſtilling, boiling, evaporating, raiſing, applying, and condenſing ſteam or vapour from aqueous, ſpirituous, ſaccharine, ſaline, and other fluids. The principle of his invention conſiſts chiefly in the following arrangement: By covering and making the maſh-tun air-tight, and caſing it round, under and over, with a ſteam-tight caſing, ſo that, during the maſhing and ſoaking of the malt and grain uſed, the heat may be preſerved, or raiſed and regulated to any pitch, by the application of ſteam, both in and between the caſing of the maſh-tun; by which contrivance, the whole of the *farina* and ſubſtance of the grain may be as effectually extracted in one, or at moſt in two maſhings, as is now done in three or four. The ſteam, conducted by a proper tube or pipe, is to be alſo employed for ſweetening and cleanſing all the brewing, diſtilling, and vinegar-making utenſils, and caſks employed in each, &c. ſo as in future to prevent furring, foxing, &c. even in the inmoſt crevices.

In June 1798, the ſame patentee, in partnerſhip with Mr. Robert Burnett, of Vauxhall, procured another patent, for the diſcovery of a principle and invention of a method of improving the proceſs of fermentation, by which porter, beer, ale, malt and molaſſes waſh, wine, cyder, and all other ſaccharine and fermentable fluids, may be conducted with certainty through the vinous proceſs of fermentation in mild, warm, hot, and cold weather, without being materially injured as heretofore, by the different changes of the atmoſphere, &c. But as theſe improvements depend on the application of an expenſive *pneumatic apparatus*, which does not appear to us adapted to the uſe of families, we refer the reader to the tenth and fourteenth volumes of the Repertory of Arts and Manufactures, where he will find a detailed ſpecification of both patents.

The laſt patent we ſhall mention, is that of Mr. Thornton, of Eaſt Smithfield; which, being dated April 15, 1778, is earlier than either of the preceding, and does not ſtrictly relate to the proceſs of brewing, as his invention conſiſts in a new method of reducing *malt* and *hops* to an eſſence or *extract*, from which beer may be made either at ſea or in diſtant countries. The whole is managed by the tranſmitted heat of compreſſed vapour of boiling water, and a proper apparatus for that purpoſe. This apparatus may be made of iron, tin, or copper: it conſiſts of a boiler of any dimenſions, a double veſſel, and conducting tubes. The double veſſel conſiſts of one veſſel placed within another, and fitted tight at their rims. The upper veſſel forms the upper part of the under veſſel, and contains the liquor to be evaporated. The under veſſel is every-where incloſed, except at an aperture communicating with the boiler, and at another aperture communicating with the conducting tubes; and is conſtructed ſo as not to allow any part of the vapour condenſed into drops within it to eſcape, except back again into the boiler: it is not ſo extenſive as to act as a common refrigeratory, and yet is capacious enough to prevent the liquor boiling over. The aperture communicating with the boiler is large enough to freely admit the vapour from the boiler into the under veſſel; and the aperture communicating with the conducting tubes is of a proper ſize to allow of the vapour in the under veſſel being compreſſed, to a degree capable of tranſmitting to the liquor to be evaporated a proper heat, and at the ſame time to ſerve as a paſſage for more heat than is neceſſary to keep up that degree of compreſſion. The conducting tubes are to convey this ſuperfluous heat or vapour, to be uſed for farther purpoſes, or immediately out of the building.

Thoſe of our readers who are deſirous of further information on the ſubject, may conſult the laſt edition of *Philoſophical Principles of Brewing*," by Mr. Richardſon, of Hull; a work of acknowledged merit, and practical utility.

BRICKS (*Encycl.*). In addition to what has been ſaid under that article, it is neceſſary briefly to notice the patent of Mr. Sandford, of Hartford, in Connecticut, North America. On the 20th of January, 1800, he received the king's patent for a method communicated to him by Dr. A. Kinſley, of the ſame place, for manufacturing bricks, tiles, and pottery-ware in general; and for diſcharging the moulds uſed therein. The principle of this invention is amply detailed in the ſpecification, a copy of which is inſerted in the 13th volume of the Repertory of Arts, &c. p. 148, and following, illuſtrated by a plate. From the ſubjoined extract, however, the reader may form a tolerable idea of the nature and utility of this invention, which chiefly conſiſts in a newly-contrived apparatus, for expediting the tedious proceſs of making bricks, and other earthen-ware. The moulds uſed in this machine may be various, either with falſe or fixed bottoms, ſides, or ends; or open at top, bottom, ſides, or ends: but ſuch as are uſed by the original inventor, Dr. Apollos Kinſley, are the moſt convenient, and contain from one to ſix bricks in each mould, according to their ſize. Each frame, or mould, has a fixed bottom; and, when more than one brick is moulded in the ſame frame, or mould, the diviſion between them is made in three parts. The middle piece is made a little tapering, and ſerves as a wedge to confine the other two parts in their places, while the mould is filling; and, when diſcharged, the wedge or middle part is lifted out, which liberates the other two: by that means the moulds are diſcharged with eaſe. Moulds for large ſingle bricks and ornaments, have one ſide, bottom, or end, taken off by means of ſteady pins, joints, or cramps, which will confine them while filling, and may be opened in any way that will allow them to diſcharge. The moulds may be made of metal, or of wood and lined with metal. The foot of the ſpindle may ſtand in, and be ſupported by a bar, made faſt to the platform, at the bottom of the tub; or it may be ſupported by a collar, incloſing the ſpindle above the ſemi-circular ſections, and made faſt to the tub; by that mean the whole ſpace under the forcers will be open, and free to form

bricks and ornaments of any ſize or ſhape. The friction-rollers are placed in a frame which may be raiſed or lowered by ſcrews, according to the thickneſs of the bricks or ornaments; and, by means of the ſcrews, the moulds may be liberated from any foul matter that may obſtruct their paſſage through the machine. Clay for bricks, ornaments, potters-ware, and tiles, of all deſcriptions, may be tempered and moulded, of any ſize or ſhape, in the above-deſcribed apparatus. The clay being put into the tub, is, by the action of the ſections, perfectly tempered and moulded at the ſame time, &c.

The reaſons why the modern bricks are ſo very inferior to thoſe made by the ancients; which, in their monuments, after having withſtood the ravages of time for many centuries, are ſtill in perfect preſervation, appear to be principally the following: in the preſent expenſive ſtate of ſociety, the price of manual labour, though far from being adequate to the preſſure of the times, is ſo conſiderable, that the manufacturer is under a kind of neceſſity to make choice of thoſe materials which are the cheapeſt and moſt eaſily procured: thus, a mixture of the moſt improper earths and clay is often employed in the manufacture of bricks, without reflecting that two bodies ſpecifically different in their nature, muſt neceſſarily require different degrees of heat in the kiln, in order to produce an uniform hardneſs, and an intimate combination of parts. On the contrary, the ancients not only ſelected the very beſt ſort of clay, but combined it with other ingredients well adapted to form the moſt complete cement, ſuch as coarſely powdered charcoal and old mortar added to the clay. Of this deſcription, likewiſe, were the bricks which Profeſſor Pallas, on his laſt journey through the ſouthern provinces of Ruſſia, diſcovered in the ſtupendous Tartar monuments, and which would ſcarcely yield to the force of a hammer. Another advantage peculiar to the bricks and tiles manufactured by our forefathers, aroſe from their method of burning them uniformly, after being thoroughly dried. There is no doubt, that if all the defects before pointed out were removed, and modern brick-makers were to pay more attention to their art, by digging the clay at proper ſeaſons, working it better than is done at preſent, beſtowing more care on the burning of them, and particularly by making them much thinner than what is preſcribed by the ſtandard form, we might produce bricks of an equal ſtrength and durability to thoſe of our leſs enlightened, but more provident and induſtrious, anceſtors.

BRIDGE (*Encycl.*). A patent was granted to Mr. Naſh, of Dover-ſtreet, in 1797, for an invention ſomewhat ſimilar to that acroſs the Wear. He provides hollow maſſes of caſt or wrought iron, which are to be filled with earth, ſand, &c. and have the appearance of ſolid bodies. According to this plan, the arch of the bridge is formed by hollow frames, or boxes, each conſiſting of four ſides and a bottom. Theſe boxes, after being properly arranged in the manner ſtated by the patentee, are then to be filled with ſand, ſtones, &c. by which means the arch becomes like one ſolid body caſed with iron. A further explanation of this invention may be ſeen in the 6th volume of the *Repertory of Arts and Manufactures*.

The lateſt patent for bridges, was that granted in June 1800, to Mr. Samuel Wyatt, of Chelſea College, for his invention of a new method of conſtructing bridges, warehouſes, &c. without the uſe of wood, as a conſtituent part. The principle of his diſcovery conſiſts in the combination of pipes, tubes, or hollow pieces of caſt-iron, in a longitudinal direction, and plates or pieces of the ſame material, having ſockets in them to receive the ends or ſhoulders of the pipes, placed tranſverſely, and extending from one ſide of the bridge to the other, ſo that when the requiſite number of pipes, &c. are put together, they form the arch ſo firmly as not to require the aid of ſcrews, bolts, cramps, or any iron faſtening whatever; but the joints ſhould be cloſed with lead or cement.

When applied to warehouſes and other buildings, Mr. Wyatt's invention conſiſts in forming arched ceilings of caſt-iron, and ſupporting them and the floors by hollow pillars, or cylinders, of the ſame material. It ought to be remarked, that the number of ſockets in the tranſverſe iron plates, ſhould always correſpond with the number of ribs in the arch.

BRIDGE-END, a town of Glamorganſhire, with a market on Saturday. It is ſeated on the river Ogmore, which divides it into two parts, joined by a ſtone bridge. It is ſeven miles W. by N. of Cowbridge, and 178 W. of London. Long. 3.38. W. Lat. 51. 30. N.

BRIENTZ, a lake of the canton of Bern, in Switzerland, three leagues long and one broad. It is well ſtored with fiſh; with a very delicate kind eſpecially, which is peculiar to this lake, and which is ſalted and dried like red-herrings. The river Aar runs through the whole extent of this lake, and unites it to that of Thun. Beſide the Aar, the lake of Brientz receives the Lutſchinen. See LUTSCHINEN.

BRIEY, a town of France, in the department of Moſelle and late province of Lorraine, ſeated near the river Manſe, 30 miles N.E. of St. Michael.

BRIGANTIA, or BRIGANTIUM (anc. geog.), a town of Vindelicia; now *Bregentz*, in Tyrol, at the eaſt end of the lake of Conſtance. Another *Brigantium* in the Alpes Cottiæ; which laſt is probably Briancon, a town on the borders of Dauphiny.

BRIGANTINUS LACUS (anc. geog.), a lake of Rhætia, or Vindelicia, which Tacitus includes in Rhætia. Ammian calls the lake *Brigantia*. It took its name either from the Brigantii, the people inhabiting on it, or from the adjoining town. Now the lake of *Conſtance*, or *Bodenzee*.

BRIGANTINUS *Portus* (anc. geog.), a port of the hither Spain; ſo called from Flavium Brigantium. Now *El Puerto de la Corunna*, commonly the *Groyne*.

BRIGGS (William), an eminent phyſician in the latter end of the 17th century, was the ſon of Auguſtin Briggs, eſq. four times member for the city of Norwich, where our author was born. He ſtudied at the univerſity of Cambridge; and his genius leading him to the ſtudy of phyſic, he travelled into France, where he attended the lectures of the famous anatomiſt M. Vieuſſens, at Montpellier. After his return, he publiſhed his *Opthalmographia* in 1676. The year following he was created doctor of medicine at Cambridge, and ſoon after was made fellow of the College of Phyſicians at London. In 1682 he quitted his fellowſhip to his brother; and the ſame year, his *Theory of Viſion* was publiſhed by Hooke. The enſuing year he ſent to the Royal Society a continuation of that diſcourſe, which was publiſhed in their Tranſactions; and the ſame year he was, by King Charles II., appointed phyſician to St. Thomas's hoſpital. In 1684 he communicated to the Royal Society two remarkable caſes relating to viſion, which were likewiſe printed in their Tranſactions; and in 1685 he publiſhed a Latin verſion of his *Theory of Viſion*, at the deſire of Mr. Newton, afterwards Sir Iſaac, profeſſor of mathematics at Cambridge, with a recommendatory epiſtle from him prefixed to it. He was afterwards made phyſician in ordinary to King William, and continued in great eſteem for his ſkill in his profeſſion till he died, September 4th, 1704.

BRIMPSFIELD, a village of Glouceſterſhire, on the river Stroud. Here are the foundations of a caſtle long deſtroyed. It had alſo a nunnery. The river Stour riſes here, and the turnpike road from Glouceſter to Cirenceſter (the Ermine-ſtreet of the Romans) extends along the ſide of this pariſh, and divides it from Cowley. It is ſeven miles from Glouceſter.

BRINN, a ſtrong town of Moravia, where the aſſembly of the ſtates meet. It was inveſted by the Pruſſians in 1742; but they were obliged to raiſe the ſiege. It is ſeated at the confluence of the Zwitta and Swart, 53 miles N. of Vienna, and 27 S.W. of Olmultz. The caſtle of Spielberg is its principal defence, and is ſeated on an eminence. Long. 16. 40. E. Lat. 49. 6. N.

BRISSAC, a town of France, in the department of Maine and Loire and late province of Anjou, ſeated on the river Aubence, 13 miles S. of Angers. Long. 0. 27. W. Lat. 47. 20. N.

BRISTOL (*Encycl.*). The "croſs" deſcribed in that article as "ſtanding in the College Green," ſhould not have been mentioned. It was removed ſeveral years ago, and is now in the garden of Sir Richard Hoare, at Sturton.

BRITAIN, New, an iſland to the north of New Guinea. By whom this land was firſt diſcovered is uncertain. Dampier firſt ſailed through the ſtrait which ſeparates it from New Guinea; and Captain Carteret, in 1767, ſailed through another ſtrait which divides it into two iſlands, the northernmoſt of which he called *New Ireland*. New Britain lies in long. 152. 19. E. and lat 4. 0. S. The ſhores of both iſlands are rocky, the inland parts high and mountainous, but covered with trees of various kinds, among which are the nutmeg, the cocoa-nut, and different kinds of palm. The inhabitants are black and woolly-headed, like negroes, but have not their flat noſes and thick lips.

BRITANNICA, in botany, the trivial name of the rumex aquaticus. See Rumex.

BRITANNICUS, ſon to the Emperor Claudius by Meſſalina, was excluded from the empire after his father had married Agrippina; who put her ſon Nero on the throne, and cauſed Britannicus to be poiſoned, A D. 55

Britannicus, an Italian, one of the beſt humaniſts of the 15th century, was born at Breſcia. He publiſhed notes on Perſius, Juvenal, Terence, Statius, and Ovid. He died in 1510.

BRIVA Isaræ (anc. geog.), a town of Gallia Belgica on the river Iſara or Oyſe: now *Poyntoyſe*.

BRIVATES (anc. geog.), a port of Gallia Celtica: now *Breſt*, in Britany.

BRIXIA (anc. geog.), a town of the Cenomani in the Regio Tranſpadana: now *Breſcia*, capital of the Breſciano.

BRIZEN, or Brietzen, a town of Germany, in the Middle Marche of Bradenburg, ſeated on the river Adah, 12 miles N.E. of Wirtemberg.

BROAD-TENNESSE, a noble river of N. America, which riſes in N. Carolina, and croſſes the parallel of 35°. N. lat. into the ſtate of Georgia, juſt before it paſſes through Cumberland or Laurel Mountains. Its paſſage through theſe mountains occaſions a remarkable whirl. The ſtream, which a few miles above is half a mile wide, is here compreſſed to the width of about 100 yards. Juſt as it enters the mountain, a large rock projects from the northern ſhore, in an oblique direction, which renders the bed of the river ſtill narrower, and cauſes a ſudden bend: the water of the river is thrown, conſequently, with great rapidity, againſt the ſouthern ſhore, whence it rebounds around the point of the rock, and produces the whirl, which is about 80 yards in circumference. Canoes have been often carried into this whirl, and eſcaped unhurt. Near a mile below, the river ſpreads into its common width, and, except the interruption of ſome muſcle ſhoals, flows in a beautiful and placid ſtream, till it mingles with the Ohio; before it reaches which, it is called the Cherokee river.

BROD-NEMEKI, or Treutch-Brod, a town of Bohemia, on the river Sozawa, 20 miles S. by E. of Czazlaw. Long. 15. 40. E. Lat. 49. 33. N.

BRODZIEC, a town of Lithuania, on the river Berezina, 100 miles S. of Poloczki. Long. 28. 5. E. Lat. 54. 8. N.

BROEK, a town of Germany, in the circle of Weſtphalia and duchy of Berg; the capital of a county of the ſame name, ſeated on the river Roer, 11 miles N. of Duſſeldorp. Long. 6. 53. E. Lat. 51. 23. N.

Broek, in North Holland, ſix miles from Amſterdam, one of the moſt ſingular and picturesque villages in the world. "The inhabitants," ſays Madame de Sillery (late Counteſs de Genlis), "though peaſants only, are all rich. The ſtreets are paved in moſaic work, with variegated bricks, and diſplay the greateſt neatneſs. The houſes are painted on the outſide, and are as freſh and bright as if quite new. Each has a garden and terrace, incloſed by a low railing, that permits every thing to be ſeen. The terrace is in the front of the houſe, and from this we deſcend into the garden, which forms the ſeparation between each houſe. The ſtreets on both ſides are laid out in the ſame manner. The gardens are adorned with china vaſes, grottoes of ſhell-work, trees, and flowers; with borders compoſed of minute particles of glaſs of different colours, of a dazzling brightneſs, and diſpoſed into a variety of forms. There are likewiſe other borders formed of ſmall ſhells, and arranged with as much ſkill and care as thoſe in a muſeum. Behind the houſes and gardens are extenſive meadows, full of cattle grazing. The outhouſes are likewiſe behind; ſo that waggons, carts, and cattle, never enter theſe neat ſtreets. The floor of the houſes are paved with ſhining ſtones, in equal ſquares, commonly black and yellow. The principal apartments are wainſcotted. This wainſcot is of its natural colour, ornamented with the prettieſt ſculpture imaginable. In the beſt room is a large buffet, with glaſs folding-doors, through which are ſeen the moſt beautiful china, and quantities of plate perfectly bright. One would imagine, from their uniformity, that the fortunes of the reſpective owners were equal. In every houſe are two doors, one of which is called *the door of ceremony*, being never opened but for the event of marriage or death. The new-married couples enter at this door, and never paſs through it again but to their graves: in the interval it is conſtantly ſhut up. They have alſo a chamber, which is never made uſe of but on their wedding-day; and it is ever after conſidered as a temple, in which it would be a profanation to ſleep. This chamber is more ſplendid than the others, and the bed is profuſely ornamented with lace. On a table is a pretty baſket, which contains the finery worn by the bride on her wedding-day. In a word, they never enter this ſacred retreat but to adorn it with vaſes of flowers, or to ſhew it to ſtrangers. The dreſs of the men is very plain, and that of the women as ſtudied. They wear the moſt beautiful ſilks, the fineſt linen, and many trinkets of gold and pearls. A hood of white cambric conceals their hair, faſtened on the two ſides by large gold pins ſet with fine pearls. Many ſervants are dreſſed in this manner: their miſtreſſes excel them only in finer necklaces, rings, and more expenſive linen. The manners of theſe people are irreproachable: they live together in perfect harmony; but are very uncivil to ſtrangers. The moment they ſee ſuch arrive, they ſhut themſelves up, and refuſe to open their doors; but they have a natural gallantry, or, to ſpeak more properly, a certain reſpect for women, that makes them behave very differently to them. They no ſooner ſee them, than they haſten to ſhew them every mark of politeneſs; and although the fair ſtrangers were accompanied by men, this would not prevent their conducting them to the houſes, and ſhewing them every thing. Their wives never ſtir from Broek, and a young woman would find it difficult to marry, if ſhe went to another village a ſmall diſtance from it. Amſterdam is as little known to them as London or Conſtantinople. They

find their happineſs at home; Broek is the whole world to them; and they preſerve, in courſe, their manners and their virtue. They marry invariably among themſelves. Many nobles of this country have been deſirous of eſpouſing young women of Broek, on account of their riches; but the overtures of none have proved ſucceſsful. The inhabitants pride themſelves in their ſimplicity, and in their ſtates as peaſants. They lead a frugal life. To adorn their houſes is the greateſt pleaſure they know: to live in peace the only happineſs they court. Handſome as the natives are throughout all Holland, they are particularly ſo at Broek. The children are all charming; the men robuſt; and the women tall, well-made, and generally pretty, with a ſurpriſing freſhneſs of complexion. In a word, this village exhibits a very ſingular picture. Every thing in it delights the eye and heart: not one diſagreeable object appears to ſpoil the piece. Not only not a ſingle beggar is to be ſeen, but not a perſon, moreover, who is not perfectly at eaſe; not a cripple, not one infirm old perſon, nor a ſingle decayed houſe. Health; all that affluence can wiſh; the elegance of induſtry and neatneſs; ſimplicity, humanity, virtue, and happineſs; theſe are the ineſtimable advantages, theſe the delightful objects that we find at Broek; and which, added to the ſtriking ſingularity of their dreſs, their houſes, and their manners, render it altogether a very extraordinary place."

BROKEN Bay, a bay of New South Wales, on the E. coaſt of New Holland. It is formed by the mouth of a great river called the Hawkeſbury. Long. 151. 27. E. Lat. 33. 34. S.

BROMPTON, a populous village, in the pariſh of Kenſington, in Middleſex. Here is the public botanical garden and library of Mr. William Curtis, the author of Flora Londinenſis and other botanical works.

Brompton, a village in Kent, delightfully ſituated on an eaſy aſcent from Chatham, and containing the fine barracks for the accommodation of the military of that garriſon.

BROOM-Gall (*Encycl.*), in natural hiſtory. This gall is of a very ſingular kind: it is round and prickly; the ſtalk of the broom always grows directly through it, as if thruſt through its middle; and, when nicely examined, the whole gall appears to be formed of a congeries of leaves much larger than thoſe of the broom naturally are, and twiſted into a ſort of horns or cornets, ending in a point: theſe leaves are all hollowed in the middle; and are ſo thick ſet and nicely fixed to one another, that they make up the ſubſtance of the gall, which is nevertheleſs a conſiderably hard one, and their points make the appearance of ſpines or prickles on the outſide. Sometimes there is a ſort of fleſhy or pulpy ſubſtance within it, which ſupports the leaves; and the worms are ſometimes found in this, ſometimes in the hollows of the leaves, and ſometimes between them: they are ſo numerous, that there are often ſome hundreds of them in one gall. The origin of this gall is not from the eggs of the parent animal lodged in the tree; but they are depoſited on the ſurface of the branches, and the young worms, while very ſmall, almoſt as ſoon as hatched from them, go in company to ſome bud on the ſide of the branch: they get into the folds of this bud, and wounding it in ſeveral parts, cauſe a wrong derivation of the juices into it; the conſequence of which is, that inſtead of forming a branch ſhooting out from the other, it only yields a congeries of leaves which everywhere ſurround it. Theſe galls are of various ſizes, the largeſt ſeldom exceeding that of a nut; and there are often three or four of them ſeen on one branch, placed at an inch or a little more diſtance from one another.

Broom, *Loch*, a great lake and arm of the ſea, in Roſsſhire, on the W. coaſt of Scotland. It has long been noted for herrings of peculiar excellence, and is eſteemed one of the beſt fiſhing ſtations on the coaſt.

BRORA, a ſeaport of Scotland, on the E. coaſt of Sutherlandſhire. Here is a coal mine, which was lately worked, and the coal was uſed in the manufacture of ſalt. But this coal cannot be exported, or carried to any diſtance, as it takes fire on being expoſed to the air. The lime-ſtone quarry, above this place, is an intereſting fund of ſpeculation: the variety of ſhells contained in the heart of the ſtone is equally ſurpriſing and beautiful. Brora is forty miles N. by E. of Inverneſs.

Brora, a river of Scotland, in Sutherlandſhire, which iſſues from a beautiful lake of the ſame name. Above Brora, it forms ſeveral fine caſcades; and below that village it falls into the Britiſh Ocean. Many precipices on the banks of this river are full of ſhells, as in the lime-ſtone quarry near it.

BROUCA, a town of Sicily, on the S. ſide of the gulf of Catania; fifteen miles S. of Catania. Long. 15. 30. E. Lat. 37. 25. N.

BROUCK, a town of Switzerland, in Argow, of which it is the third free city. It is ſeated on the river Aar, over which is a handſome bridge. There is likewiſe a college, with a public library. It is twenty-two miles S.E. of Baſil. Long. 8. 4. E. Lat. 47. 21. N.

BROWNE (William), an old Engliſh poet of conſiderable excellence. As the peculiar fate of unmerited oblivion which attended this great genius precludes any minute diſquiſition, ſo his entire hiſtory may be compriſed in a very ſmall ſpace; and it will be ſcarcely credited that we can find no trace of an edition of his works (excepting one) ſince the uſurpation of Cromwell, although he had been highly commended by the learned Selden, and was an adopted favourite of the proud, but judicious, Ben Jonſon. Mr. Dermody relates the particulars of our poet's life and writings in the following terms:

"William Browne, ſays he, was born at Taviſtock in Devonſhire, in the year 1590; his father, according to Prince, in his Worthies of Devon, being probably of the knightly family of Browne, of Browne's-Iſlaſh, in the pariſh of Langtree, near Great-Torrington. After he had paſſed through the grammar-ſchool, we find him at Exeter College in the univerſity of Oxford, about the beginning of the reign of King James the Firſt, where he became celebrated for claſſical erudition, and for his knowledge in the belles-lettres nearly unequalled; from thence, however, before he had taken any academical degree, he removed to the Inner-Temple, London, where he more aſſiduouſly devoted himſelf to the muſe. In the beginning of the year 1624, he returned again to the college, was appointed tutor to Robert Dormer, who was afterwards Earl of Carnarvon, and loſt his life at Newbury fight, on the 20th of September, 1643. On the 25th of March, 1624, our author received permiſſion to be actually created a maſter of arts, although the degree was not conferred upon him till the November following. In the public regiſter of the univerſity he is ſtyled thus: Vir omni humanâ literatura, et bonarum artium cognitione inſtructus.

"After he had left college with his pupil, he was gladly received into the family of the munificent Earl of Pembroke, who entertained a great regard for him, and in that ſituation he made his fortune ſo well, that he had it in his power to purchaſe a comfortable independence. The preciſe period of his death cannot be aſcertained, but according to Wood, author of the Athenæ Oxonienſes, it may be affixed with moſt certainty to the year 1645.

"His Shepherd's Pipe conſiſts of ſeven eclogues, among

which is an admirable monody, entitled *Philarete*, written upon the death of his friend Mr. Thomas Manwood, which, whether equally excellent or not, was certainly the model from which Milton did not diſdain to borrow the charming idea of Lycidas, one of the moſt beautiful pieces of paſtoral poeſy that, perhaps, ever appeared in any language. There is another production of Browne, The Inner Temple Maſque, to which I imagine the world of taſte may eſteem themſelves equally indebted for the birth of Comus. Even this very diſtinction ought to have placed Browne in a more favourable light, for, aſſuredly, the divine framer of Paradiſe Loſt would not condeſcend to copy an indifferent original at any time.

"But as I mean to confine myſelf more particularly to the notice of this author's chief performance, Britannia's Paſtorals, I ſhall waſte no ſpeculation upon ſuch miſcellaneous pieces as occur, but juſt take the liberty of recommending them, indiſcriminately, to the attention of the reader, and purſue my main ſubject with leſs deviation from the regular rules of criticiſm. The deſign, then, of thoſe paſtorals is original and perfect in the higheſt degree; they profeſs no imitation of any ancient or foreign writer; and are meant ſolely as a compliment to our own country, which is ſet in happy competition with that famous haunt of demi-gods, Arcadia itſelf. The ſtyle is harmonious and flowing, diverſified with a pleaſing aſſemblage of new and captivating imagery; and even the meaſure is ſometimes changed, not for the worſe, as it adminiſters a kind of metrical relaxation, that relieves the fancy by variety without violence.

"To exemplify this aſſertion, I muſt beg leave to tranſcribe a few paſſages, which, conſidering the time they were compoſed, will be found not deſtitute of elegant thought, and poliſhed verſification. The following addreſs to a river deity contains both thoſe requiſites, in my humble opinion:

———May firſt
(Quoth Marine) ſwaines give lambs to thee;
And may thy floud have ſeignorie
Of all flouds elſe; and to thy fame
Meete greater ſprings, yet keep thy name.
May never euet, nor the toade,
Within thy bankes make their abode!
Taking thy journey from the ſea,
Maiſt thou ne'er happen in thy way
On niter or on brimſtone myne,
To ſpoil thy taſte! this ſpring of thine
Let it of nothing taſte but earth,
And ſalt conceived, in their birth
Be ever freſh! let no man dare
To ſpoile thy fiſh, make locke or ware,
But on thy margent ſtill let dwell
Thoſe flowres which have the ſweeteſt ſmell:
And let the duſt upon thy ſtrand
Become like Tagus' golden ſand.
Let as much good betide to thee,
As thou haſt favour ſhew'd to me.

Booke I. Song 2.

Nor do I think this other ſhort extract inferior to any of our old poets in point of conception:

Neare to this wood there lay a pleaſant meade,
Where fairies often did their meaſures treade,
Which in the meadow made ſuch circles greene,
As if with girlands it had crowned beene,
Or like the circle where the ſigns we tracke
And learned ſhepheards call't the zodiacke:
Within one of theſe rounds was to be ſeene
A hillocke riſe, where oft the fairie queene
At twilight ſate, and did command her elves,
To pinch thoſe maides that had not ſwept their ſhelves:
And further if by maidens over-ſight,
Within doores water were not brought at night:
Or if they ſpread no table, ſet no bread,
They ſhould have nips from toe unto the head:
And for the maid that had performed each thing,
She in the water-pale bade leave a ring.

Ibid.

"The ſublimity of this exclamation will be a ſufficient excuſe for its inſertion.

What muſe! what powre! or what thrice ſacred herſe,
That lives immortall in a wel tun'd verſe,
Can lend me ſuch a ſight that I might ſee
A guilty conſcience true anatomie;
That wel kept regiſter wherein is ſwrit
All ils men doe, all goodneſſe they omit?
His pallid feares, his ſorrowes, his affrightings,
His late wiſht had-I-wiſts, remorceful bitings:
His many tortures, his heart-renting paine:
How were his griefs compoſed in one chaine,
And he by it let downe into the ſeas,
Or, through the center, to the antipodes,
He might change climates, or be barr'd heav'n's face,
Yet finde no ſalve, nor ever change his caſe.

Ibid.

The preceding extracts are intentionally quoted to convey ſome idea of the general tenor of the work, we ſhall next introduce a few unconnected ſketches of more than ordinary beauty; and then preſume on no further intruſion, but a curſory critique, written in the moſt conciſe manner. A muſical concert of birds is thus moſt fancifully, though quaintly, depicted:

Two nights thus paſt: the lilly-handed morne
Saw Phœbus ſtealing dewe from Ceres' corne,
The mounting lark (daie's herauld), got on wing,
Bidding each bird chuſe out his bough and ſing.
The lofty treble ſung the little wren;
Robin the meane, that beſt of all loves men;
The nightingale the tenor, and the thruſh
The counter-tenor ſweetly in a buſh:
And that the muſicke might be full in parts,
Birds from the groves flew with right willing harts:
But (as it ſeem'd) they thought (as do the ſwaines,
Which tune their pipes on ſack'd Hibernia's plaines)
There ſhould ſome droaning part be, therefore willed
Some bird to flie into a neighbouring field,
In embaſſie unto the king of bees,
To aide his partners on the flowres and trees:
Who condiſcending gladly flew along
To beare the baſe to his wel tuned ſong.
The crowe was willing they ſhould be beholding,
For his deepe voice, but being hoarſe with ſkolding,
He thus lends aide, upon an oake doth climbe,
And nodding with his heade, ſo keepeth time.

Booke I. Song 3.

"No mind, ſuſceptible of the charms of natural deſcription, but will coincide with my ſentiments on the excellence of the ſubſequent two very oppoſite, but equally well-delineated, landſcapes.

Theſe pitchy curtaines drew 'twixt earth and heaven,
And as night's chariot through the air was driven,

Clamour grew dumb, unheard was ſhepherde's ſong,
And ſilence girt the woods; no warbling tongue
Talk'd to the echo; ſatyres broke their dance,
And all the upper-world lay in a trance.
Onely the curled ſtreams ſoft chidings kept,
And little gales that from the greene leaf ſwept
Dry ſummer's duſt, in fearfull whiſp'rings ſtir'd,
As loath to waken any ſinging bird.

Booke II. Song 1.

The muſe's friend (grey eyde Aurora) yet
Held all the meadows in a cooling ſweat,
The milk-white goſſamores not upwards ſnow'd,
Nor was the ſharpe and uſeful ſteering goad
Laid on the ſtrong-neckt oxe; no gentle bud
The ſun had dryde; the cattle chew'd the cud
Low level'd on the graſſe; no flyes quicke ſting
Inforc'd the ſtone-horſe in a furious ring
To teare the paſſive earth, nor laſh his taile
About his buttockes broad; the ſlimy ſnayle
Might on the wainſcot (by his many mazes
Winding meanders and ſelfe-knitting traces)
Be follow'd, where he ſtucke, his glitt'ring ſlime
Nor yet wipt off. It was ſo earely time
The carefull ſmith had in his ſooty forge
Kindled no coale; nor did his hammers urge
His neighbour's patience: owles abroad did flye,
And day as then might plead his infancy.

Ibid. Song 2.

"Theſe are only the "disjecta membra poetæ;" for, indeed, to do any diffuſe performance proper juſtice, it ſhould be never taken by piecemeal, or expoſed to public inſpection by lines and ſentences; yet as there is no other method, at firſt, of reſcuing its merit from immediate obſcurity, even this mode of ſelecting a few ſpecimens may be not unworthy of approbation. The good taſte of the preſent day has been highly favourable to thoſe pieces executed in the ſimple ſtyle of paſtoral, as the liberal reception which The Farmer's Boy has deſervedly received very amply teſtifies. It contains a profuſion of exquiſite images, enriched with the higheſt colouring, though perfectly chaſte, and never diſtorted by a gaudy extravagance. I may be ſuſpected by many of having a whimſical turn for hypotheſis, but I declare I have fancied various inſtances of a correſponding genius between William Browne and Robert Bloomfield, not forgetting this one material difference and advantage, that the former was a profound and accompliſhed ſcholar. But what I remark as a coincidence in both promiſcuouſly, is an unaffected felicity of calling forth new objects from the level ſcene of life; and an harmony of ſtyle and expreſſion peculiarly fortunate. The poets of Elizabeth's reign down to that of James, piqued themſelves on a pompous diſplay of learned acquiſition, nearly approaching to pedantry; it was an eſtabliſhed cuſtom to bring in the heathen mythology on every occaſion; and even ſo late as Waller and Lonſdowne, we can trace the progreſs of this abſurd faſhion, which, in the infancy of Engliſh poeſy, was more pardonable. Now, in our enlightened era, a perſon who ſhould crowd his pages with a motley contexture of Grecian demi-gods and heroes, would juſtly merit the deriſion of the judicious; and even the frequent invocation of the muſe, a being whom we acknowledge merely ideal, having loſt its primary attraction, though not yet entirely diſcarded, is unnatural and unhappy; unnatural, from the improbability it caſts on any grave ſubject; and unhappy, from the obſolete inſipidity of the fiction.

"Browne's paſtorals are not very faulty in this reſect; the ancient fables which he does, at times, allude to, are not the moſt hackneyed, and his main ſtory is, at any rate, as I mentioned before, entirely his own. His allegories are not ſo intricate as thoſe of his contemporaries; they are pictureſque without perplexity, and ſavour more of the ſchool of Taſſo than that of Spenſer. Yet two of his imaginary perſonifications would not, perhaps, diſgrace the ſublime pencil which daſhed out the wild horrors of the Cave of Deſpair; namely, Riot, in Book I. Song 4; and Limos, or Famine, in Book II. Song 1. We there deſcry all the bold and poetical conceit of Ovid, in the favourite parts of his Metamorphoſes, without thoſe minute and laborious touches which ſeldom come from the hand of a very great maſter. Salvator Roſa might have here ſatiated the luxuriancy of his imagination, without reſtraining his enthuſiaſm. It is certain that our moſt inſpired children of fancy did not dwell in patient apathy on the niceties of compoſition. What can be more fervid and engaging than the irregular graces of Collins, who was a profeſt admirer of our old bards, who made them his chief ſtudy, and even forfeited the eſtimation of all but the congenial few through a deſire of indulging in theſe rapturous excurſions! There are ſome, and thoſe by far the moſt delicious of his odes, which to a common plodding reader would appear verging cloſely on the confines of abſolute inſanity; but I am miſtaken much, if they appear ſo to the man whoſe "eye in a fine frenzy rolling, glances from heav'n to earth, from earth to heav'n!" I have likewiſe to aſſert, that one of the moſt exquiſite little poems we can boaſt, entitled A Hymn to May, was written by William Thompſon, whoſe fancy was fed with the pure honey of Browne, and who reviſed the only modern edition of his works. This hymn, ſo much deſerving the notice of every elegant reader for the voluptuous tenderneſs of its language, although compoſed after the ancient model, is to be found in the Poetical Calendar, publiſhed periodically, ſome time ago, by Fawkes and Woty; wherein ſome other pieces of conſiderable value are included.

"I know of no two productions more worthy of revival by ſome man of influence and fortune, than this, which I have attempted to draw into a fainter degree of obſervation from its long unmerited darkneſs of receſs; and The Piſcatory Eclogues of Phineas Fletcher, whoſe Purple Iſland, though inferior, has been favourably regarded by ſome late commentators of literary eminence. I am conſcious this ſlight effuſion of applauſe, ſecretly nouriſhed ſince my earlieſt days, is both deſultory and incorrect: yet I wiſhed to diſcover a mine to which I have been indebted for much intellectual treaſure; and the rich ore extracted from which ſource, I have ſo publicly prefixed as the very motto to my firſt poetical exertion.

"I quit my taſk thus, far from being finiſhed, with particular regret, transferring it to the care and abilities of ſome abler hand, with another concluding quotation.—

Looke as a lover with a lingring kiſſe,
About to part with the beſt half that's his,
Faine would he ſtay but that he feares to do it,
And curſeth time for ſo faſt haſtning to it;
Now takes his leave, and yet begins anew
To make leſſe vowes than are eſteemed true,
Then ſayes he muſt be gone, and then doth finde
Something he ſhould have ſpoke that's out of minde,
And whilſt he ſtands to looke for't in her eyes,
Their ſad ſweet glance ſo tye his faculties,
To thinke from what he parts, that he is now
As farre from leaving her, or knowing how,
As when he came; begins his former ſtraine,
To kiſſe, to vow, and take his leave againe,

Then turnes, comes backe, ſighes, parts, and yet doth goe,
Apt to retyre, and loath to leave her ſo.

BRUCHUS (*Encycl.*). To that article add the words, "See Plate 61."

BRUGGE, or BRUGGEN, a town of Germany, in the circle of Lower Saxony and biſhopric of Hildeſheim, ſix miles from the city of that name. Long. 10. 5. E. Lat. 52. 6. N.

BRUGNETO, an epiſcopal town of Italy, in the territory of Genoa, at the foot of the Apennines, thirty-five miles ſouth-eaſt of Genoa. Long. 9. 30. E. Lat. 44. 15. N.

BRUN (Anthony le), an ambaſſador of Spain, famous for his ſkill in negociating, was of an ancient and noble family, and born at Dole in the year 1600. He was attorney-general in the parliament of Dole; during which time he had a hand in all the ſtate negotiations which concerned the provinces. He was ſent afterwards by Philip IV. to the diet of Ratiſbon, and from thence to the court of the emperor Ferdinand III. He was one of the plenipotentiaries of his Catholic majeſty, at the conferences of Munſter held in 1643; where, though all the other plenipotentiaries took place of him, yet it is ſaid that he far exceeded them all in capacity. The king of Spain was particularly beholden to him for the peace which the Dutch made at Munſter, excluſively of France; and the intriguing turn which he ſhewed upon this occaſion made him dreaded ever after by French ambaſſadors. He was a man of letters, as well as of politics; and therefore employed his pen, as well as his tongue, in the ſervice of his maſter. He died at the Hague, during his embaſſy, in the year 1654.

BRUNDISIUM, or BRUNDUSIUM (anc. geog.), a town of Calabria, with the beſt harbour in Italy. It was a very ancient town, and belonged originally to the Salentines; but was taken by the Romans about 256 years before Chriſt. Now *Brindiſi*; which ſee.

BRUNETTO, a ſtrong and important place in Piedmont, near Suſa, which it defends.

BRUTTII, an ancient people of Italy, inhabiting the country now called *Calabria Ultra*; different from the ancient Calabria, or Meſſapia, to the eaſt on the Adriatic or Ionian ſea.

BRUTUS (Lucius Junius), the avenger of the rape of Lucretia, and founder of the Roman republic, flouriſhed 509 years before Chriſt.

BRUTUS (Marcus), the paſſionate lover of his country, and chief conſpirator againſt Cæſar, ſlew himſelf on loſing the battle of Philippi, forty-two years before Chriſt.

BRUTUS (Stephen Junius), the diſguiſed author of a political work intitled *Vindiciæ contra tyrannos*.

BRYENNIUS (Nicephorus), a prince diſtinguiſhed by his courage, probity, and learning, was born at Oreſtia in Macedonia; where his father by rebellion provoked the emperor to ſend his general Alexis Comnenus againſt him, who ordered his eyes to be pulled out: but being charmed with his ſon Bryennius, he married him to Anne Comnenus his daughter, ſo famous by her writings. When Alexis came to the throne, he gave Bryennius the title of *Cæſar*; but would not declare him his ſucceſſor, though ſolicited to it by the empreſs Irene; and was therefore ſucceeded by his ſon John Comnenus, to whom Bryennius behaved with the utmoſt fidelity. Being ſent, about the year 1137 to beſiege Antioch, he fell ſick; and returning, died at Conſtantinople. This prince wrote the *Hiſtory of Alexis Comnenus*, which he compoſed at the requeſt of his mother-in-law the empreſs Irene.

BUCHORN, a free and imperial town of Germany, in the circle of Suabia, on the lake of Conſtance, 18 miles E. of Conſtance. Long. 9. 42. E. Lat. 47. 41. N.

BUEN RETIRO, a palace of the king of Spain, on the E. ſide of Madrid: it is a perfect ſquare, and at each angle is a pavilion. It is generally the reſidence of the king in the ſpring, and part of the ſummer.

BUCK-BEAN (*Encycl.*), read *Buck*-BEAN.

BUILDING (*Encycl.*). From the deſcription given in the 493d number of the *Philoſophical Tranſactions*, by Mr. ARDERON, it appears that the ruins of two old towers, belonging to the Roman camp at Caſtor, in Norfolk, were built in the following ingenious manner: they began firſt with a layer of bricks, laid flat as in pavements; on that they placed a layer of clay and marl mixed together, and of the ſame thickneſs with the bricks; then a layer of bricks, afterwards of clay and marl, then of bricks again; making in the whole three layers of bricks, and two of clay. Over this were placed bricks and lime twenty-nine inches, the outſide being faced with bricks cut in ſquares; then brick and clay alternately, as high as the old ruins now remain ſtanding. He adds ſome remarks on the hardneſs of the mortar, and durableneſs of the bricks, the length of which laſt is found to be 17,4-tenths inches, or a Roman foot and a half; their breadth 11,6-tenths inches, or preciſely a Roman foot; and their thickneſs only 1,3-tenths of an inch.

Many compoſitions have, with more or leſs ſucceſs, been deviſed for making mortar impenetrable to moiſture. The following we believe is one of the moſt ſimple and effectual: mix thoroughly one-fourth of freſh unſlaked lime with three-fourths of ſand; and let five labourers make mortar of theſe ingredients, by pouring on water, with trowels, to ſupply one maſon, who muſt, when the materials are ſufficiently mixed, apply it inſtantly as cement or plaſter, and it will become hard as ſtone. This recipe is given by Mr. R. DOSSIE, in his ſecond volume of "Memoirs of Agriculture and other Economical Arts," 1771. The author, on this occaſion, obſerves that the lime uſed ſhould be ſtone-lime; that previous to its uſe, it ſhould be preſerved from the acceſs of air or wet, and the plaſter ſcreened for ſome time from the ſun and wind. He juſtly remarks, that its excellence ariſes from the particular attraction between lime and ſand, which would be deſtroyed by ſlacking the lime. Skimmed milk (ſays he) is preferable to water; and for the ſimilarity of this mortar to that of the ancients, he refers us to Pliny, Vitruvius, &c.

Another very durable and cheap cement in building, which is particularly deſigned as a handſome coping of walls, is that of the late P. Wych, Eſq. Take four or five buſhels of ſuch plaſter as is commonly burnt for floors about Nottingham (or according to Mr. Doſſie, a ſimilar quantity of any tarras, plaſter, or calcined gypſum); beat it to fine powder, then ſift and put it into a trough, and mix with it one buſhel of pure coal aſhes, well calcined. Pour on the water, till the whole becomes good mortar. Lay this in wooden frames of twelve feet in length on the walls, well ſmoothed with common mortar and dry, the thickneſs of two inches at each ſide, and three inches in the middle. When the frame is moved to proceed with the work, leave an interval of two inches for this coping to extend itſelf, ſo as to meet the laſt frame-work.

In December 1780, Dr. R. Williams obtained the king's patent for his invention of a mortar or ſtucco for the purpoſe of buildings. As the term of the excluſive privilege of uſing this compoſition is now expired, we ſhall give the following particulars: take of ſharp, rough, large grained ſand, ſifted, waſhed dried, and freed from all impurities; of well-burnt lime, ſlaked and finely ſifted; of curd, or cheeſe, pro-

duced from milk; (the firſt, freſh made and ſtrongly preſſed, to diveſt it of its whey; the ſecond, whilſt perfectly ſound, raſped into powder with a grater, or brought into a very light ſubſtance with ſcrapers, or fine-toothed plane-irons, in a turner's lathe); and laſtly, of water in its natural ſtate, in the following proportions, viz. of the cheeſe, or curd, four pounds; the lime twelve pounds; the ſand eighty-four pounds; the water ten pounds. If the ſand is not thoroughly dried, or the lime has got damp from the air, the quantity of water muſt be leſs than the above proportion; and, on the contrary, when the lime is uſed immediately, it may require more; ſo that the proper ſtiffneſs of the mortar, under thoſe circumſtances, will regulate the making of the compoſition.

As the goodneſs of this mortar depends on the preſervation of the natural properties of the cheeſe, or curd, made uſe of, all thoſe parts the leaſt tainted or rotten muſt be rejected; and as the cheeſe, like the curd produced from ſkim-milk, is diveſted of its buttery and oily particles, and on that account poſſeſſes a powerful coheſive quality, which makes it better for this work than that made of milk in its rich and pure ſtate; it is at all times to be bought of the wholeſale cheeſe-mongers at a lower price than any other; and being more convenient than the curd, as that will require frequent making, is to be preferred to it, as well as to every other ſort of cheeſe; for leſs of it is ſufficient, only four pounds being allowed to the nett hundred weight of all the ſolid ingredients; more than which might make mortar too lively to keep in its place without bagging, but leſs ſhould not be uſed; as that, on the other hand, would endanger its drying looſe and gritty within its ſurface, hinder it from adhering properly to the walls, and thus reduce it to the level of common mortar. Many tedious and trivial rules are ſtated by the patentee, relative to the manner of applying this cement, and its preſervation in boxes for ready uſe. Thoſe who wiſh to acquire additional information concerning this ſubject, may find the ſpecification of the patent, at full length, in the third volume of the "Repertory of Arts and Manufactures."

In July, 1796, Mr. H. Walker, of Thurmaſton, Leiceſterſhire, procured a patent for his invention of a method, by which houſes and other buildings, of any deſcription or dimenſions, might be erected in one entire maſs or body, at a much eaſier expence, eſpecially in the articles of timber, lime, and workmanſhip, and which would be equally as durable in themſelves, and leſs liable to accidents by fire, than buildings erected upon the common conſtruction. His proceſs is as follows:

1. The patentee takes an argillaceous earth or natural clay, which he purifies by the uſual well-known methods, and compounds it with ſand, or broken or pounded pottery or brick, coal-aſhes, charcoal, or, in ſhort, with any other of thoſe ſubſtances which are adapted to form a good, firm, and durable brick, when properly baked; and he varies the compoſition according to the nature of the component parts themſelves, and the purpoſes which they are intended to anſwer; but, for common conſtructions, he uſes the ſame proportions as brick-makers in general. He then proceeds to mix, knead, and incorporate the ſaid materials, till they are brought to the requiſite firmneſs and tenacity for building; which is nearly ſuch, that the parts of any lump or maſs of the ſame may be readily incorporated with, or joined to, any other ſimilar maſs, by moderate blows with a wooden mallet, and the occaſional addition of a very ſmall portion of water: this compoſition he calls the prepared material.

2. He conſtructs floors, walls, and all other buildings, according to this invention, in ſuch a manner that the power of fire, from wood, coal, charcoal, cork, or other combuſtible matters, may be applied to the external and interior ſurfaces of the floors, walls, and other parts, by means of fires maintained in cavities left within, which he calls by the name of furnaces.

3. With reſpect to the particular forms, dimenſions, and relative poſitions of the ſaid floors, walls, and other parts of buildings, and the furnaces left or formed within the ſame, together with the apertures or communications, for the purpoſes of ventilating the fires, of ſuffering the volatile matters to eſcape, and of converting the whole into one entire maſs of brick, by a due communication and continuance of heat, Mr. Walker ſays, the ground muſt be rendered ſolid, and the foundation laid in the uſual manner; after which he applies a quantity of the prepared material before alluded to, and beats, rams, or preſſes it down to the thickneſs of about ſix inches; and in width, correſponding with the intended dimenſions of the wall, regulated by boards or framing. He then plants upright, at a diſtance of about thirty inches aſunder, in the ſaid layer or bed of prepared material, a number of cylindrical pieces of wood, of about nine inches in diameter each, and eighteen or more inches in length, to ſerve as moulds for the cavities of the furnaces; and between each of ſuch moulds he places, in the longitudinal direction of the wall, a number of pipes of wood, or other materials, or rods, of combuſtible or incombuſtible matter, for the purpoſe of forming communications between all the ſeveral furnaces, or as many of them as he thinks proper. Then he proceeds to form another layer or bed of the material, to the ſame height, namely, about ſix inches, and diſpoſes a number of ſuch pipes, or rods for the purpoſe of forming ſimilar communications. In this manner he conſtructs the whole, or ſo much of the wall as he apprehends, all the time, may be conveniently formed, in the raw or unburnt ſtate; taking care, as the work advances, to raiſe the wooden cylinders, or moulds, that a ſufficient portion of them may remain above the ſurface of the work to admit the reception and proper faſhioning of each ſubſequent layer; or he forms the communications between the furnaces, by perforating the wooden moulds, in various places, at right angles to their reſpective axes; and through the ſaid perforations he paſſes a bar of iron, or other material, which ſerves to connect three or more of the ſaid furnace-moulds, and being afterwards withdrawn, as the work proceeds, leaves cavities of communication, ſimilar to thoſe formed by pipes, rods, &c. in the manner before deſcribed. Further, he opens ſuch a number of horizontal or oblique apertures, or flues, into all the furnaces, and likewiſe into all the cavities, as may be requiſite for admitting, on all ſides, the exceſs of atmoſpheric air. In ſome inſtances, he forms horizontal or oblique apertures or flues, by diſpoſing, along with the pipes, a ſuitable number of taper rods, which are afterwards extracted.

4. When the wall is built, he either ſuffers it ſpontaneouſly to dry, or promotes this effect by moderate fires in the furnaces. Sometimes by increaſing the heat within, and at others by ſuitable applications of fire externally, he converts the whole into one entire maſs of brick. By occaſional cloſing or opening of the furnaces at top, or any of the other apertures, in various parts, the intelligent operator will eaſily underſtand how to regulate the progreſs, communication, and effect of the heat, that the converſion into brick may be uniform through the entire maſs.

5. The dimenſions of the furnaces, the poſitions and relative diſtances of the pipes of communication and lateral apertures, and the thickneſs of the layers of the prepared material, are each ſuſceptible of great variation, according to the nature of this preparation, the activity of the fuel, the propoſed ſolidity or figure of the work, &c.

6. He then forms the remaining parts of the wall, or edifice, by applying additional portions of the prepared material in contact with that already baked; while he alſo avails himſelf of proper and ſuitable external and internal moulds, ſupports, frames, and other occaſional contrivances, well known to builders, for ſuſtaining works, or forming arches, or determining the figure and poſitions of ſoft plaſtic ſubſtances.

7. The ground-floor is likewiſe formed of the prepared material, leaving hollow ſpaces between the ſupports beneath, for making fires, ventilated by ſide apertures, which are provided with numerous holes. When the floor is of conſiderable thickneſs, it will require the conſtruction of furnaces in every reſpect ſimilar to thoſe before deſcribed.

8. The firſt above the ground floor is made upon ſuitable temporary framing, in ſuch a manner that the upper ſurface ſhall be plane, and the lower concave, ſo that it may, when baked, ſupport itſelf upon the principle of a low arch.

9, and 10. The patentee conſtructs, bakes, or burns other floors above the firſt, and alſo the roof, &c.; he cloſes the apertures, fills up the furnaces, amends the deficiences, adorns the walls, floors, ceilings, or other parts, with his prepared material, according to the taſte and direction of the proprietor.

Various plans have lately been deviſed for ſecuring buildings, and ſhips, againſt fire. We ſhall, however, mention only that of David Hartley, Eſq. who, in April, 1773, obtained a patent for his invention of applying plates of metal and wire, varniſhed or unvarniſhed, to the ſeveral parts of buildings or ſhips, ſo as to prevent the acceſs of fire, and the current of air; ſecuring to the ſeveral joints by doubling in, over-lapping, ſoldering, rivetting, or in any other manner cloſing them up; nailing, ſcrewing, ſewing, or otherwiſe faſtening, the ſaid plates of metal in, to, and about, the ſeveral parts of buildings, and ſhips, as the caſe may require.

BULAM, or BULAMA, as it is more uſually called, forms part of the Archipelago, or cluſter of Iſlands, lying on the weſtern or windward coaſt of Africa, and known by the name of the *Biſſuos* or *Biſſagos*, which are ſuppoſed to have been celebrated by the ancients under the appellation of the *Heſperides*. It is ſituated at the mouth of the Rio Grande, in 11° N. Lat. and 15° W. Long. from the meridian of London; and is between ſeventeen and eighteen leagues long, and from four to five broad.

This iſland has become an intereſting object to the inhabitants of Great Britain, in conſequence of its having been purchaſed in the year 1792 by a ſociety inſtituted for the ſame humane purpoſes with thoſe which gave riſe to the Sierre Leone Company. The Bulam aſſociation was formed towards the latter end of the year 1791; and they were induced to pitch upon that iſland as the moſt eligible tract for their intended colony, in conſequence of the flattering deſcription given of its climate, ſoil, and harbours, by M. Brue, formerly director-general of the French African companies.

The original truſtees for managing the concerns of the aſſociation at home were, Paul Le Meſurier, M. P.; James Kirkpatrick, eſq. George Hartwell, eſq. Moſes Ximenes, eſq. Sir John Riggs Miller, Bart. and David Scott, eſq. M. P.; and for eſtabliſhing the colony, and conducting the affairs of the ſociety abroad, the following gentlemen were nominated, viz. Meſſrs. H. H. Dalrymple, John Young, Sir William Halton, Bart. John King, Philip Beaver, Peter Clutterbuck, Nicholas Bayly, Francis Brodie, Charles Drake, John Paiba, Richard Hancorne, Robert Dobbins, and Iſaac Ximenes.

A ſum of 9000*l.* being quickly ſubſcribed for the eſtabliſhment of the intended colony, this committee ſailed from Spithead in three ſhips on the 11th of April, 1792; and landing in due time at Bulama, they purchaſed that iſland from the kings of Canabac, who claimed it as their property. They purchaſed likewiſe from the kings of Ghinala the neighbouring iſland Arcas, and the adjacent land on the continent; and theſe ſeveral purchaſes being taken poſſeſſion of in the uſual form, a body of ſettlers, conſiſting of forty-nine men, thirteen women, and twenty-nine children, were left at Bulama under the ſuperintendence of Mr. Beaver, with a temporary ſupply of proviſions, ſtores, plantation-tools, and merchandize, for trading with the neighbouring natives. It is from the diſpatches of theſe ſettlers, after having lived ſome time in Bulama, that the following account of the iſland was drawn up by Mr. Johanſen.

"The climate, on the whole, may be deemed ſalubrious, and will become more ſo in proportion to the increaſe of cultivation. The mornings and evenings are temperate and pleaſant; the middle of the day is hot, but the fine ſea breeze which then ſets in tends greatly to cool and refreſh the air. The heat of the ſun is not either ſo exceſſive or intolerable as has been generally ſuppoſed; indeed nature has moſt admirably adapted our mechanical and phyſical qualities to the exigencies of different regions; and man, who is the inhabitant of every climate, may, in ſome meaſure, render himſelf indigenous to every ſoil. Here the only danger ariſes from too ſudden an expoſure to the operation of the vertical rays of the ſun, or an exceſs of labour; both of which the firſt ſettlers ought moſt ſtudiouſly to avoid.

"It appears from Mr. Beaver's obſervations at noon, between the 20th of July, 1792, and the 28th of April, 1793, that the thermometer, when loweſt, was at ſeventy-four; the medium heat eighty-five; and that it never exceeded ninety-ſix, except at one time when it roſe to 100, during a calm that occurred in the interval between the north-eaſt breeze in the morning, and the ſouth-weſt in the evening of the 19th of February, 1793. The difference between the heat of noon and that of the morning and evening is from twenty to thirty degrees. On the 23d of October, 1792, hail of the ſize of a pin's head fell during two minutes, although not a cloud was to be ſeen during this phenomenon. The mercury in the thermometer then ſtood at eighty-five; the wind was at north-eaſt in the morning, and ſouth-weſt in the evening.

"Immediately after ſun-ſet a dew conſtantly begins to fall, which induces ſome to light a fire in their houſes; they at the ſame time put on warmer clothing. There is little or no twilight; and night and day are nearly equal: the earth has therefore time to cool during twelve hours abſence of the ſun.

"None of thoſe terrible and deſtructive hurricanes ſo frequently experienced in the Weſt Indies are to be met with here. The *tornadoes*, which ariſe chiefly from the eaſtern point of the compaſs, are but of ſhort duration, ſeldom laſting above an hour, and may be readily foreſeen ſome time previouſly to their commencement. They occur at the beginning and cloſe of the wet ſeaſon, and are highly beneficial, as they purify the air, and diſpel the noxious vapours with which it would otherwiſe abound.

"The rains ſet in about the latter end of May or the beginning of June, and diſcontinue in October or November. They do not fall every day, for there is often a conſiderable interval of clear weather, during which the atmoſphere is beautifully ſerene; the ſhowers in the firſt and laſt month occur but ſeldom, and are far from being violent; while, on the other hand, they ſometimes reſemble torrents, more eſpecially towards the middle of the ſeaſon. During the whole of this period, Europeans ſhould, if poſſible, confine themſelves to their habitations, as the rains prove injurious to health,

more eſpecially if thoſe expoſed to them neglect to wipe their bodies dry, and to change their clothes immediately on their return home. It is deemed prudent alſo not to dig the earth until the expiration of a month after the return of fair weather, as this is conſidered to be unhealthy.

" During the continuance of the dry ſeaſon, a dew falls during the night, in ſufficient quantity to anſwer all the purpoſes of vegetation.

" Every ſtranger is generally here, as well as in the Weſt Indies, ſubject to a fever or *ſeaſoning* on his arrival. This is not infectious; it proceeds perhaps from an increaſed perſpiration and a ſudden extenſion of the pores of the human body, in conſequence of the heat, by which means it is rendered more liable to imbibe the abundant exhalations that ariſe from the animal, vegetable, and mineral kingdoms; but even this, ſlight as it is, might doubtleſs be avoided by means of a proper regimen, and a ſhort ſecluſion from the full action of the open air, more eſpecially at noon, and during the evening, until the climate has been rendered familiar.

" Bulama is admirably adapted for all the purpoſes of an extenſive commerce, being not only happily ſituated at the mouth of the Rio Granda, but in the vicinity of ſeveral other navigable rivers; ſo that a trade with the internal parts of Africa is thereby greatly facilitated. The landing is remarkably eaſy and ſafe, there being no ſurge; the ebb and flow is regular, and there is an increaſe of ſixteen feet of water at ſpring tide. The bay oppoſite the Great Bulama is adorned with a number of iſlands, covered with trees, and forms a moſt excellent harbour, ſufficiently capacious to contain the whole navy of Great Britain, which might ride there in ſafety. The ſettlement in general is well ſupplied with water. A number of ſprings have lately been diſcovered in different places; and beſides a draw-well in the fort, which was erected for the defence of the colony, there is a ſmall ſtream, which runs into Elewſis Bay, near the new ſettlement called Heſper Elewſis: this is admirably ſituated for the ſupply of ſhipping.

" The iſland is beautifully ſurrounded, and interſperſed with woods: lofty fruit and foreſt trees, moſtly free from underwood and brambles, form a verdant belt, in ſome places two or three miles broad, which entirely encircles it, in ſuch a manner as to repreſent a plantation artificially formed around a park. Within this the fields are regularly divided by trees, ſo as to reſemble the hedge-rows in England. The beach has in ſome places the appearance of gravel walks; it is fringed with mangrove trees, which forming a line with the high-water mark, dip their branches into the ſea, and thus afford nouriſhment to the oyſters that often adhere to their extremities.

" Several parts of Bulama have been occaſionally cultivated by the neighbouring blacks, though they did not conſtantly reſide on it.

" The land in general riſes gradually towards the middle of the iſland, where the higheſt ſpot is from ſixty to 100 feet above the level of the ſea. The ſmall hill on which the fort is ſituated is nearly of the ſame altitude.

" The ſoil is abundantly rich and deep; ſtones do not here impede the labours of the farmer; and indeed none have hitherto been diſcovered, but a ſmall ſort, reſembling pieces of ore, which are to be met with on the ſhore. There are many *ſavannahs* or natural meadows, ſo extenſive that the eye can ſcarcely deſcry their boundaries. Theſe are admirably adapted for the rearing of ſtock and feeding of cattle of every kind.

" Cotton, indigo, rice, and coffee, grow ſpontaneouſly on this coaſt; the ſugar-cane is indigenous to many parts of Africa, and might be cultivated here by the labour of freemen, in equal perfection, and to much greater advantage, than in the exhauſted iſlands of the Weſt Indies. All kinds of tropical productions, ſuch as pine-apples, limes, oranges, grapes, plums, caſſada, guava, Indian wheat, the papaw, water-melon, muſk-melon, the pumpkin, tamarind, banana, and numbers of other delicious fruits, alſo flouriſh here. The adjoining territories produce many valuable ſorts of ſpices, gums, and materials for dying: all of which, it is but fair to ſuppoſe, might be readily cultivated in a kindred climate and a congenial ſoil.

" The neighbouring ſeas abound with a variety of fiſh, highly agreeable to the palate. The lyon, tyger, jackhall, &c. are natives of the continent; but in Bulama no animals have been diſcovered, the wolf, ſome buffaloes, a few elephants, and a ſpecies of the deer excepted.

" The woods abound with doves, guinea-fowls, and a variety of birds, celebrated for the beauty of their plumage.

" The natives of this part of Africa, like all ſavages, are entirely under the dominion of their paſſions: hence the violence of their attachment to their friends, and the exceſs of their reſentment againſt their enemies. Their notions of property are very obſcure and confuſed: they have no idea of any right ariſing from occupancy or improvement. What they want, they either receive or take wherever they may happen to meet with it, and they permit others to do the ſame. They have been taught by experience, that the Europeans will not agree to this: againſt them therefore they employ every artifice that it is in the power of cunning to ſuggeſt,

" The coloniſts need not fear any attack on the part of the negroes, provided their own conduct be juſt and peaceable: for Mr. Beaver, who was indeed admirably calculated by nature and habit for the ſtation he occupied, could inſure both ſafety and reſpect when the ſettlers under him were reduced to four white men, although the neighbouring nations knew that he was in poſſeſſion of commodities, for the acquiſition of which many of them had become day-labourers. He often kept from twenty to forty gromittos, or black cultivators in pay, at that very period, at about four or five bars each per month. A bar is about the value of three ſhillings and ſix pence. Theſe are eaſy to be procured, to almoſt any number that can poſſibly be wanted.

" Until a ſufficient quantity of ſtock and proviſions can be raiſed in the company's ſettlements, the adjacent iſlands will furniſh abundance of cattle, hogs, fowls, &c. at a very cheap rate. A horſe may be purchaſed at Goree for 1*l.* 10*s.* a bullock may be had from 12*s.* to 18*s.* ſterling: proviſions of all kinds are equally reaſonable. Honey is alſo to be procured in great plenty, and bees-wax may be rendered an advantageous object of commercial ſpeculation.

" In ſhort, the acquiſition of Bulama, Areas, and the adjacent territories, preſents the faireſt opportunity of furniſhing Europe with many valuable articles that have hitherto been brought from more remote countries, with much greater hazard, and at an increaſed expence. The intercourſe with England is eaſy, ſafe, and expeditious; for the voyage may be performed in the ſpace of three or four weeks: and by the terms of the firſt ſubſcription, a ſettler on Bulama might purchaſe 500 acres of land for 30*l.* ſterling, by the terms of the ſecond, which we ſuppoſe are the terms at preſent, he might purchaſe on the iſlands of Bulama and Arcas, or on that part of the adjacent coaſt which was ceded to the ſociety by the kings of Ghinala, 200 acres for 50*l.* ſterling.

" The colonization of Africa opens a noble and extenſive field to nations and to individuals. To people thoſe fertile territories, deſpoiled of their inhabitants by the ſlave-trade; to

rear the productions of the climes between the tropics, by the aſſiſtance of free men; to give ample ſcope to the induſtry and exertions of thoſe who may be inclined to remove from Great Britain; and to extend the commerce and the manufactures of our native country—theſe are ſubjects which have excited the attention of the Bulama aſſociation, and now claim the aſſiſtance of the ingenious, the ſupport of the rich, and the concurrence and good wiſhes of all."

BULLER (Sir Francis), one of the judges of the court of Common Pleas, long celebrated for the extent and correctneſs of his juriſprudential knowledge, was the ſecond ſon of James Buller, Eſq. member of parliament for Cornwall, by his ſecond wife Jane, daughter of Allen, Earl of Bathurſt.

Sir Francis Buller received a claſſical education at a private ſchool in the weſt of England, and having elected the law for his profeſſion, was entered in the Temple, under the pupilage of Mr. (afterwards judge) Aſhurſt. He was early diſtinguiſhed for great depth of knowledge, and profeſſional accuracy; and for ſome years before he was called to the bar, practiſed with great ſucceſs as a ſpecial pleader. Faſhion, and the indiſcriminate uſe of a phraſe which is little underſtood, have occaſioned ſomewhat of contempt to be attached to the reputation of a ſpecial pleader: by ſome, ſpecial pleading is underſtood to mean nothing more than a proficiency in the ſcience of chicane, and a facility of exerting technical knowledge in enabling iniquity and injuſtice to triumph over candour and good faith; by others it is conſidered as a mere accumulation of jargon without any exact meaning, and without any other reſult than the increaſe of expence, and the delay of juſtice. Thoſe who make theſe applications of the term, ſpeak from the abuſe againſt the ſcience. Special pleading, or rather the art of drawing pleas, is founded on the ſtricteſt, and, at the ſame time, moſt liberal rules of logic. It implies not only a correct and minute, but a vigorous and comprehenſive, mind; not only a talent for perceiving the ſhades of difference which are found between the extremes of right and wrong, but a great degree of readineſs in applying them to a particular caſe. The nervous exerciſe of vigorous and manly eloquence obtains greater applauſe, and produces a more perceptible effect on the minds of juries; but in vain does the advocate obtain a verdict at Niſi Prius, if the correctneſs of the ſpecial pleader has not laid the foundation on which the ſuperſtructure of ultimate ſucceſs muſt be raiſed; nor is the ſupport of the throne of juſtice, and the final adjudication of the law, ordinarily committed to thoſe orators whoſe talents have been moſt admired at Niſi Prius, but to thoſe who, by their ſkill in ſpecial pleading have evinced that laborious attention and preciſe information, without which juſtice may be perverted, and the judgment led captive by the imagination.

While Mr. Buller practiſed as a ſpecial pleader, Mr. Erſkine was numbered among his pupils. In Eaſter term, 1772, he was called to the bar, and in the ſame year publiſhed his "Introduction to the Law of Niſi Prius;" a work which reflects the greateſt honour on his learning, judgment, and ability; it ſtill remains in high repute, and although Mr. Eſpinaſſe has publiſhed a very laborious and ſucceſsful work on the ſame ſubject, Buller's Niſi Prius is, and perhaps always will be, a book in great demand and high eſtimation.

Mr. Buller's progreſs at the bar was extremely rapid: he is ſaid to have owed much of his ſucceſs to parliamentary connection; but this appears to be one of thoſe fictions by which dunces attempt to depreciate genius when it has met its due reward. Mr. Buller was never in parliament, nor was he ever a conſpicuous ſupporter of any miniſters or their meaſures. Lord Mansfield, though an active and able politician, was not ſubject to be biaſſed on the judgment-ſeat by his political predilections; at leaſt, not in ſuch a way as make coincidence a motive of perſonal preference. In Michaelmas term, 1777, he was honoured with a ſilk gown, and in three days after his promotion (27th November) made ſecond judge of Cheſter. In the enſuing Eaſter term, a vacancy ariſing by the death of Sir Richard Aſhton, Mr. Buller was, at the expreſs and earneſt recommendation of Lord Mansfield, advanced to the bench.

In this court, judge Buller ſat for ſixteen years, and his conduct abundantly verified the high hopes entertained of his abilities. Lord Mansfield ſupported his early exertions with all the weight of his authority, all the perſuaſion of his irreſiſtible eloquence: and when in the evening of his days that truly great character was frequently obliged to ſeek a temporary receſs from the fatigues of his ſtation, his place was ſupplied by Judge Buller, with a degree of ability and integrity which left little room for regretting the abſence of the principal. Lord Mansfield was ſo entirely convinced of his ability, that he is ſaid to have exerted all his influence, and to have even held his office after the power to execute its functions had ceaſed, for the purpoſe of obtaining the ſucceſſion to Sir Francis Buller.

His efforts failed, but this was not the only inſtance in which a marked predilection was ſhewn for Buller's talents: he was often deputed by Lord Thurlow to ſit in the Court of Chancery; and during the interval between the reſignation of Lord Thurlow and the appointment of Lord Loughborough, Judge Buller was one of the commiſſioners of the great ſeal.

In Trinity term, 1794, finding the buſineſs of the court of King's-bench too multifarious for his ſtate of health, he exchanged ſituations with Sir Soulden Lawrence, who had recently been made a judge, and ſat in the court till the end of his days.

Sir Francis was always celebrated for his ready perception of the real point in a cauſe, his penetration in detecting the fallacies of advocates, and the equivocations of witneſſes, and his clearneſs in explaining his opinions to the jury. His integrity is not commended, becauſe no Britiſh judge has been known ſince the revolution to want that quality. The detractors of Buller, and detractors every man in an exalted ſituation muſt expect, have imputed to him ſomewhat too much of ſeverity in criminal caſes; but this inſinuation is not founded on any cogent proof: one caſe alone is cited, but the public ſeems long ſince to have acquieſced in the juſtice of Donnellan's ſentence. In the year 1785, Judge Buller encountered much obloquy on account of an altercation with Mr. Erſkine, on the trial of the Dean of St. Aſaph; but the heat of political diſpute had conſiderable effect, and the judge was unfairly balanced in the public mind againſt an able and popular advocate in a popular cauſe. In 1798 he was at the head of the commiſſion for trying the ſtate priſoners at Maidſtone, and conducted himſelf with the moſt exemplary dignity, prudence, and moderation. This was the laſt conſpicuous act of his public life. He died on Wedneſday, the 4th of June, 1800.

In private he was amiable, gay, and benevolent; in perſon remarkably handſome, his complexion florid, his eye brilliant, and replete with ſagacity and penetration. His health, during his latter years, was undermined by continual attacks of the gout; and at the time of his death, he intended to have reſigned his ſituation of judge in a few days. His death was remarkably ſudden; he fell from his chair while playing a game at picquet, and expired inſtantaneouſly. He was in his 55th year.

BULNESS, a village in Cumberland, at the end of the Picts wall, on the Solway Frith, whence Antoninus began his Itinerary, and whence the people ſay a paved cauſeway ran formerly along the ſhore of Elenborough, of which, though few tokens appear, yet tracks of ſtreets, pieces of old

walls, and Roman coins, are often diſcovered in ploughing the fields.

BUNDELA, or BUNDELCUND, a territory of Hindooſtan Proper, on the S.W. of the river Jumna, and ſeparated from it by a narrow tract of low country. It is inhabited by a tribe of Rajpoots, and is ſurrounded by the dominions of Oude, Benares, and the Mahrattas. It was formerly ſubject to a rajah of the name of Hindooput, but is now equally divided among his ſons, or their deſcendants. It is a mountainous tract, of more than 100 miles ſquare, and contains the celebrated diamond mines of Panna, or Purna, with ſome ſtrong fortreſſes. Chatterpour, which is reckoned the capital, lies in the parallel of 25° N.

BUNGO, a kingdom of Japan, in the iſland of Ximo, whoſe capital is Lunay. The king of this country was converted to Chriſtianity, and ſent an embaſſy to pope Gregory, in 1683; but there is not now one Chriſtian in all Japan.

BUNIVA, a mountain of Greece, between Janna and Achaia, extending as far as the gulf of Zeiton. The ancient name was Œta; and it is famous for the narrow paſs of Thermopylæ (ſo called from the hot baths in the neighbourhood) where Leonidas, and his gallant 300 Spartans, reſiſted, for three days, the whole Perſian army. This is the place, feigned by the ancients to be the ſcene of the death of Hercules.

BURAGRAG, a river of Barbary, in the kingdom of Fez, which falls into the Atlantic ocean, at the town of Sallee.

BURGAW, a town and caſtle of Germany, in the circle of Suabia, capital of a margravate of the ſame name. It belongs to the houſe of Auſtria, and is 26 miles W. of Augſburg. Long. 10. 15. E. Lat. 48. 28. N.

BURG-CLERE, a village of Hampſhire, ſituated on the W. of King's-Clere, at the foot of a hill, which has a military camp on the top, and an extenſive proſpect.

BURGH-UPON-SANDS, a village of Cumberland, near Solway Frith, where the victorious Edward the Firſt died, in 1307, as he was preparing for an expedition againſt Scotland. It is five miles N.W. of Carliſle.

BURHANPOUR, a city of Hindooſtan, in the Deccan, the capital of Candeiſh, and, at one period, of the Deccan alſo. It is ſtill a flouriſhing city, ſituated in the midſt of a delightful country, 225 miles E. by N. of Surat. Long. 76. 19. E. Lat. 21. 25. N.

BURKE (Edmund), a writer, orator, and ſtateſman, of ſuperior eminence, was born at Dublin on January 1, 1730. His father was an attorney of reputation, of the proteſtant perſuaſion. Edmund received the early part of his education under Abraham Shackleton, a quaker, who kept a ſchool or academy at Ballytore near Carlow. If in this ſeminary he did not acquire that exactneſs of claſſical inſtruction, which is the pride of the public ſchools, it is probable that he was indebted to it for the rudiments of a larger plan of intellectual purſuit, which is often the advantage of a private inſtitution. It is to the honour both of the maſter and the ſcholar, that for near forty years, the latter, in his viſits to Ireland, uſed to travel many miles to pay his reſpects to the former, who lived to an advanced age. In 1746 Edmund entered at Dublin College as a ſcholar of the houſe. It does not appear that he diſtinguiſhed himſelf in the ſtudies and exerciſes of the place; but his mind was by no means unoccupied. He cloſely purſued a plan of ſtudy of his own choice, of which the principal objects were logic, metaphyſics, morals, hiſtory, rhetoric, and compoſition. He ſeems to have left Dublin College after taking a bachelor's degree in 1749; and it has been commonly reported that he finiſhed his ſtudies in the Jeſuits' College at St. Omer's. This circumſtance, which has illiberally been made a ſort of *charge* againſt him, has been denied, apparently on good grounds, by his biographers. Nothing, however, is recorded of him about this period of his life, but that he made an unſucceſsful application for the vacant profeſſorſhip of logic at the univerſity of Glaſgow. In 1753 he firſt entered upon the great theatre of London, as a law-ſtudent at the Temple. He ſoon became the wonder of his acquaintance for the brilliancy of his parts, and variety of his acquiſitions; but, like many other nominal ſtudents of the law, he directed the force of his mind rather to general literature, than to ſtudies properly profeſſional. Indeed it appears probable that he was obliged to depend upon his pen for a ſupport; for, ſoon after his ſettling in London, he became a regular writer in newſpapers and magazines, which was a drudgery his genius would ſcarcely have ſubmitted to, but for its emoluments. He was always induſtrious, and never waſted his time or ſpirits on the purſuits of faſhionable diſſipation. Yet he was not ſo much a recluſe as to be a ſtranger to the ſocieties of the gay and polite; and an intimacy with the celebrated actreſs Mrs. Woffington, whoſe converſation was at that time courted by men of wit as well as by men of pleaſure, contributed to form his manners and expand his ſocial talents. A ſtate of ill health, into which aſſiduous application threw him, rendered him a gueſt in the houſe of Dr. Nugent, a phyſician, and was eventually the cauſe of his marriage with the doctor's daughter. This lady retained his eſteem and affection during the whole of a long union. As ſhe was a Roman-catholic, additional force was given by that connection to the prevailing notion of Mr. Burke's good-will towards that communion.

His firſt avowed work appeared in 1756. It was a pamphlet entitled, "A Vindication of natural Society; or, a View of the Miſeries and Evils ariſing to Mankind from every Species of artificial Society; in a Letter to Lord * * * *, by a late noble Writer." This ſuppoſed noble writer was Lord Bolingbroke, whoſe manner of writing and reaſoning Mr. Burke in this piece ironically imitated, in order to ſhow, as he afterwards aſſerted, that the ſame arguments from abuſe, with which that nobleman had attacked religion, might be equally employed againſt all civil and political inſtitutions: and thereby to infer their fallacy. In ſo ſerious and forcible a ſtrain, however, did Mr. Burke argue upon the evils of ſociety, proceeding from the tyranny, injuſtice, and ambition of kings and governors, that the irony to many eyes was inviſible; and the work has actually been republiſhed in late times for the purpoſe of aiding the cauſe of a radical reform in human inſtitutions. Whatever the author really meant by it, he certainly diſplayed great powers of writing and extenſive knowledge; yet the work excited little notice, and it is only his ſubſequent fame that has made it an object of curioſity. For this diſappointment, however, he was fully compenſated by the reception of his next literary performance, the "Eſſay on the Sublime and Beautiful," publiſhed in 1757. The elegance of its language, and the ſpirit of philoſophical inveſtigation it diſplayed, at once raiſed its author to the firſt claſs among writers on topics of taſte and criticiſm. The hypotheſis he maintained concerning the objects of his enquiry was, that the principal ſource of the ſublime is terror, or ſome ſenſation analogous to it; and that beauty is that quality, or the reſult of thoſe qualities in objects, by which they excite love, or ſome ſimilar affection. This theory is ſupported with much acuteneſs, and felicity of illuſtration; and though, like many other ingenious men, he has ſhewn too great a propenſity to generaliſing, it is certain that many of his obſervations are not leſs ſolid than elegant. The ſame acquired by this work ſoon introduced the author to the beſt literary acquaintance. He became intimate in the houſe of Reynolds, afterwards Sir Joſhua; and this connection, which laſted for life, was equally ſerviceable to the reputation of the one, and the pecuniary circumſtances of the other.

Even the great Johnſon courted his ſociety, and there was no man of whoſe exalted talents he was more ſenſible. "Burke," ſaid he, in his ſtrong manner, "is one, with whom if you were to take ſhelter from a ſhower under a gateway, you would ſay you had been in company with the moſt extraordinary man you had ever ſeen." This praiſe implies not only uncommon qualifications, but as uncommon a readineſs of diſplaying them; which, in fact, was one of Burke's ſtriking diſtinctions. It is alſo ſaid, that Johnſon would more readily bear contradiction in opinion from Burke than from any other perſon; and that if he did not fear him, he was at leaſt held by him in reſpect. In 1758 Burke ſuggeſted to Dodſley the bookſeller the plan of that valuable and entertaining work, the "Annual Regiſter," and he took upon himſelf the writing of the hiſtorical part, which he continued for a number of years, greatly to the credit of the publication. It is allowed, that in no periodical work the narrative of the current tranſactions was ever given in a manner ſo nearly approaching to the dignity and conſequence of hiſtory.

He was thus gradually forming for a ſtateſman and orator; and his career may be ſaid to have commenced in 1761, when he went over to Ireland as confidential friend to Mr. Hamilton, ſecretary to the lord-lieutenant, Lord Haliſax. That gentleman, commonly known by the name of *ſingle ſpeech*, from a brilliant but ſole diſplay of his oratorical powers in the Engliſh Houſe of Commons, was poſſeſſed of leſs induſtry than ability; and Mr. Burke is thought to have rendered him and the miniſtry ſome uſeful political ſervices in Ireland, which were rewarded with a penſion of 300l. on the Iriſh eſtabliſhment. Soon after his return from that country in 1765, he was introduced by Mr. Fitzherbert to the Marquis of Rockingham, then appointed firſt lord of the treaſury, who made him his private ſecretary; and through the intereſt of Lord Verney, he was elected repreſentative for the borough of Wendover. The marquis, reſolving durably to attach to himſelf a man of ſuch firſt-rate talents, raiſed him at once to affluence by a nominal loan, but real gift, of a large ſum, with which he was enabled to clear off incumbrances, and to purchaſe the elegant ſeat near Beaconsfield, where he thenceforth conſtantly reſided. Mr. Burke was thus completely enliſted into party, under an ariſtocratical influence, but at that time exerted in favour of popular meaſures. Before his political conduct is more particularly conſidered, it will be candid to furniſh the reader with a kind of clue, which is contained in the character given of him by his early friend Mr. Hamilton. "Whatever opinion Burke, from any motive, ſupports, ſo ductile is his imagination, that he ſoon conceives it to be his right." This may be ſuppoſed chiefly applicable to the earlier part of his political life; yet it is ſufficiently evident that his imagination had a great ſway over his judgment to the laſt moment of his exiſtence.

At this period the riſing diſcontents in America were the great objects of intereſt to the nation. The ſtamp-act, impoſed by the Grenville miniſtery, had kindled a flame among the coloniſts which threatened very ſerious conſequences. Mr. Burke's firſt ſpeech in parliament was on this ſubject, and it was much admired as a piece of eloquence. It was from his advice that the Rockingham adminiſtration took the middle and indeciſive courſe of repealing the ſtamp-act, and paſſing a declaratory act, aſſerting the right of Great Britain to tax America; thus getting rid, indeed, of the preſent difficulty, but leaving to their ſucceſſors the temptation of renewing a project which it was evident would be attended with a renewal of all the hazard and contention. The repeal, however, was an extreme popular meaſure at the time; and the miniſtery proceeded to other popular acts, as the repeal of the cyder-tax, and the reſolution againſt general warrants, when, after a very ſhort reign, they were turned out to make room for a new adminiſtration under the auſpices of Mr. Pitt. It is allowed that Burke, though exhibiting great ſplendor of talents, was at this time too ſpeculative and refined for real practice. He had, indeed, gone through a very different courſe of preparation for public life from that uſually purſued. He had taken a wide range through all the ſtudies which teach the nature, fortune, opinions, and principles, of mankind, and had employed himſelf in laying up thoſe rich ſtores of knowledge, which he afterwards poured forth in ſuch aſtoniſhing profuſion. It was about this period that the character drawn for him by the poet Goldſmith, in the ſet of imaginary epitaphs compoſed for the ſeveral members of their celebrated literary club, appear to have been particularly applicable:

Here lies our good Edmund, whoſe genius was ſuch,
We ſcarcely can praiſe it or blame it too much;
Who born for the univerſe, narrow'd his mind,
And to party gave up what was meant for mankind.
Though fraught with all learning, yet ſtraining his throat
To perſuade Tommy Townſend to lend him a vote;
Who too deep for his hearers ſtill went on refining,
And thought of convincing, while they thought of dining;
Though equal to all things, for all things unfit;
Too nice for a ſtateſman; too proud for a wit;
For a patriot too cool; for a drudge diſobedient;
And too fond of the *right* to purſue the *expedient*,
In ſhort, 'twas his fate, unemploy'd or in place, ſir,
To eat mutton cold, and cut blocks with a razor.

It is not intended in this biographical ſketch to enter minutely into the political tranſactions of the time; it will ſuffice for our purpoſe to give a ſuccinct view of the principles ſupported by Mr. Burke in that long warfare of oppoſition to miniſterial meaſures in which he paſſed his beſt days. After concluding his official labours by a Short Account of a late ſhort Adminiſtration, written with force and ſimplicity, he took his ſtation, along with his diſcarded brethren, as a guardian of the people's rights and the public welfare, and a vigilant cenſor of the conduct of his ſucceſſors. In the proceedings againſt Mr. Wilkes, and the caſe of the Middleſex election, Burke found large ſcope for blaming and ridiculing the policy of miniſters; and he ſtrenuouſly joined his efforts to thoſe of the remonſtrants againſt the violation of the rights of electors. About that time he publiſhed one of his moſt remarkable political works, entitled, Thoughts on the Cauſes of the preſent Diſcontents, which contains a large and explicit declaration of his ideas of the Engliſh conſtitution, and the mode by which power ſhould be adminiſtered. He attributes all the evils and miſgovernment of the reign to a plan formed by the court for governing by the private influence of its favourites, thus eſtabliſhing a ſecret cabinet, always controlling the operations of the oſtenſible miniſters, and diſmiſſing them when not compliant with its deſigns. He ſhews in ſtrong terms the incompatibility of ſuch a ſecret influence with the principles of a free ſtate; and ſupports ſome extremely popular notions concerning the Houſe of Commons, which he ſays was originally deſigned as a "control, iſſuing immediately from the people, and ſpeedily to be reſolved into the maſs whence it aroſe." Democratical as theſe ſentiments may appear, his propoſed remedy for the prevailing evils was perfectly ariſtocratical; ſince it conſiſted eſſentially in placing the government in the hands of the great whig families which had been the ſupporters of the revolution and its conſequent meaſures;—in other words, the Rockingham party. This narrow concluſion from enlarged principles gave great offence to many friends of freedom; and the celebrated Mrs. Macaulay wrote a pamphlet expreſsly in anſwer

to it, in which with much force and ſpirit ſhe maintained her ſpeculative notions on the great ends of government, and the equal rights of all citizens to participate in it. If it be of importance to acquit Mr. Burke of the charge of ever having been inclined to democracy in practice, certainly this publication may be confidently adduced as a proof of very different views. He was uniformly, however, the ſupporter of liberty, and the cauſes connected with it; freedom of the preſs, the rights of juries, and religious toleration: nor would his ſincerity in theſe points ever have been queſtioned, had he not in his laſt years appeared as the champion of principles ſuppoſed directly adverſe to them.

But the moſt laſting, as well as the ſtrongeſt and nobleſt, of his parliamentary exertions, was his oppoſition to the train of miniſterial meaſures antecedent and conſequent to the American war. The whole powers of his eloquence, and the whole reſources of his political wiſdom, were employed firſt to prevent, and then to heal, the fatal breach between the mother country and her colonies; and to expoſe the miſconduct and imbecility of thoſe whom he conſidered as the authors of the calamity. And as this period compriſed the full maturity of his oratorical abilities, it ſeems the proper place to deſcribe the peculiar character of his oratory.

In all the records of eloquence an example probably is not found of a ſpeaker ſo full of mind as Burke. Ideas and images crowd in upon him from all quarters. On every topic he not only takes in the whole compaſs of matter belonging to it, but makes excurſions to a vaſt variety of ſubjects connected by the ſlighteſt aſſociations. His diction is equally rich and varied with his matter. Figure riſes after figure, image after image, in endleſs profuſion; often ſplendid, ſublime, and beautifully illuſtrative; not ſeldom coarſe, diſguſting, and puerile; for the rapidity of the current allowed him no time to ſelect or purify. When he got up, it was ſcarcely poſſible for the audience to divine whither he would carry them; but they were ſure of hearing nothing trite or common-place, and generally repaid for a patient attention, by ſtriking and original ſentiment, or deep and ingenious obſervation. From his ſpeeches may be collected maſterly diſcuſſions of almoſt every point intereſting to human ſociety, together with a great fund of hiſtorical narration and delineation of eminent characters. In argument he is often cloſe and cogent, ſometimes lax and ſophiſtical. In praiſe and invective he is equally fervid and exuberant, exhauſting all the tropes and epithets of language. In him feeling and fancy were alike potent, and daring vigour was allied with playful ingenuity. But oratory, as it was his forte, was alſo his foible. He loved too much to talk, and got the habit both of riſing too often and ſtaying up too long. His copiouſneſs degenerated into prolixity: and after charming and convincing hearers with the beginning of his ſpeech, he would tire them with the end. His vivacity and irritability rendered him not enough maſter of himſelf for a ſenatorial debator. He was ſometimes hurried into violations of prudence and decorum, and ſaid raſh things in heat which he could not recal, and which could not be forgotten. His own party trembled to ſee him riſe, and on many occaſions would have preferred his ſilence to his aid. On the whole, he was not the moſt effective ſpeaker of the houſe, though certainly the greateſt genius. It may be added, that his manner was little in his favour; his voice was harſh, his tone natural, his action forcible, but ſtrained and inelegant.

Mr. Burke's principles were ſuppoſed ſo favourable to liberty, that in 1774 he was choſen member for Briſtol, by the zealous and ſpontaneous efforts of the whigs and diſſenters of that opulent city. It does not appear, however, that, even in the great American conteſt, he ever explicitly declared himſelf concerning the fundamental rights of men in ſociety. He was accuſtomed expreſsly to ſhun all ſuch abſtract queſtions, which he ſeemed to think dangerous and incapable of poſitive deciſion; and his attacks upon the meaſures of miniſters were chiefly directed againſt their inexpediency, ſeverity, and partial injuſtice. He very early propoſed conciliation on the ground of renouncing future taxation, without diſcuſſing the queſtion of right; though indeed he argued ſtrongly againſt the aſſumed right of taxing *Britiſh ſubjects* who were unrepreſented. It is needleſs here to ſay, that all the efforts of Burke and his friends were ineffectual. The war even became popular, and Burke ſeemed to loſe ground in the public eſteem by his oppoſition to it. He further gave offence to many, particularly his Briſtol conſtituents, by his ſupport of the Iriſh petitions for a free trade, and of a bill for taking off ſome hardſhips and penalties to which the Roman-catholics were expoſed. He, however, recovered a large ſhare of popularity by his famous bill of reform in the national expenditure, introduced in February 1780. In the framing of this bill, it was wonderful what minute accuracy of reſearch he had employed; thus uſefully proving, as he alſo did by the general tenor of his life, that the moſt brilliant imagination is not in the leaſt incompatible with plodding induſtry. His ſpeech on the bill was likewiſe remarkable by an extraordinary mixture of wit and humour with financial detail; an alliance no one but himſelf could or would have made. But though the idea of retrenchment was very grateful to the nation, it was not likely to be ſo to miniſters and courtiers; and Burke's propoſed bills were rejected.

In March 1782, an end was put to the miniſtry of Lord North, which was ſucceeded by the return of the Marquis of Rockingham and his party to power. Burke in this change obtained the lucrative poſt of paymaſter to the forces, and a ſeat at the council-board One of the firſt meaſures was the re-introduction of his reform bill, which paſſed, though not without conſiderable modifications. The death of the marquis, however, very ſoon put a period to this miniſtry; for upon the appointment of Lord Shelburne to ſucceed him as head of the treaſury, inſtead of the Duke of Portland, ſeveral of the duke's friends reſigned, and among them Mr. Burke. The Shelburne adminiſtration did not long ſurvive the peace; and it was ſucceeded by that known by the name of the *Coalition*, as being compoſed in part of thoſe former miniſters who had been the objects of ſuch a long and violent oppoſition, and in part of that oppoſition itſelf. The coalition was projected by Burke, who appears little to have calculated the effect upon the public mind of ſuch a violent ſhock to all ideas of ſincerity and conſiſtency. It was, however, conformable enough to his old notion of governing by great families, and certainly ſtill further abſolves him from the charge of democratical principles. This aſſociation of power was diſſolved by Mr. Fox's India bill, which had the warm ſupport of Burke, but united againſt it both king and people. Mr Pitt ſucceeded to the helm, and diſſolved the parliament. This meaſure was attacked by Burke with great acrimony, and he moved a ſet of repreſentations to the crown on the ſubject, one of which ſeems to go further in aſſerting the right of innovating upon eſtabliſhed conſtitutions, than his uſual latitude. He ſays, "Neceſſary reformations may hereafter require, as they have frequently done in former times, limitations and abridgments, and, in ſome caſes, *an entire extinction in ſome branch of prerogative.*" The grand deſideratum of ſo many friends of freedom, parliamentary reform, was not however a ſpecies of alteration which he approved; and he oppoſed the plan for that purpoſe introduced by Mr. Pitt in 1785. Such a conduct was

conſiſtent enough with the partiſans of an ariſtocracy of borough-holding nobles.

The impeachment of the celebrated Eaſt-India governor, Mr. Haſtings, was one of the great events of Burke's public life. He was the original promoter of it; and private motives of reſentment were thought to have united with a regard to public juſtice in his purſuit of that national cauſe. He employed uncommon induſtry in collecting and arranging the materials of the charge, and followed it up with diſtinguiſhed perſeverance and ardour. His principal ſpeech in ſupport of the charge, was remarkable for violence and exaggeration; and upon the whole he was no gainer in the public eſtimation by this memorable impeachment, though perhaps the enormous length of the proceedings contributed more to render it unpopular than any well-grounded conviction of the innocence of the culprit.

The ſettling of the regency on the king's malady in 1788 was another ſubject in which Burke took a warm and active part. He contended vigorouſly againſt the miniſter's purpoſe of limiting the powers of the regent (the Prince of Wales), and his principle that the regency was elective and not hereditary. It is well known that the efforts of the oppoſition on this occaſion were neither ſucceſsful nor popular; and Burke expoſed himſelf to particular cenſure in conſequence of ſome very unfeeling and irreverent expreſſions concerning the king, which eſcaped him in the vehemence of debate.

The laſt great act of Burke's political life was the part he took with reſpect to that mighty event, the French revolution. Though it might be ſuppoſed that one who had ſo long acted with the avowed friends of liberty at home, and had ſhewn ſuch countenance to ſubjects whom oppreſſion had driven into actual rebellion, would applaud the efforts of a great nation to found a free conſtitution out of the wrecks of abſolute monarchy; yet, on the other hand, his conſtant unwillingneſs to reſort to firſt principles, his reverence for eſtabliſhed forms, and all the honours and ſplendors of civiliſed ſociety, his contempt for the vulgar, and, it may be fairly added, his ſtrong feelings of juſtice and humanity, might reaſonably be expected to cauſe him to regard firſt with ſuſpicion, and then with deteſtation, a revolution which ſoon betrayed ſymptoms of violence and a profligate ſpirit. He early manifeſted his diſlike to it; and in February 1790, on a debate in the Houſe of Commons concerning the reduction of the army, in which Mr. Fox recommended a generous confidence of this country towards the new rulers of France, he broke out into a virulent declamation againſt the original principles and the conduct of the French revolutioniſts, renounced perſonal friendſhip with Mr. Fox and thoſe who ſupported the ſame opinions, and took his decided ſtand of hoſtility againſt every thing connected with the new order of things. From that time he ſat down to the compoſition of his famous Reflections on the Revolution in France; on which he bent the utmoſt powers of his mind. It appeared in October, and no work perhaps ever excited more attention, or produced more effect. It is, in reality, a performance of wonderful vigour, diſplaying every characteriſtic excellence of the writer, and not a few of his defects. A liberal antagoniſt will not deny that it contains much juſtneſs of argument, much profundity of obſervation, with extraordinary beauties of language; while a judicious advocate will confeſs that it is not free from ſophiſm and miſrepreſentation, and betrays a heated and ungoverned imagination. The moſt reprehenſible circumſtance is, that the writer, in his zeal to deviate as far as poſſible from principles which he thinks hurtful, uſes arguments which would be applicable to the defence of the moſt tyrannical eſtabliſhment, and to the condemnation of every ſtruggle in favour of liberty. This work had a ſale almoſt unprecedented; and its author received the moſt unbounded praiſe from all thoſe who were engaged in the ſupport of eſtabliſhments, and from many others, who were convinced by his arguments, and with him were ſhocked by the character the French revolution was daily aſſuming. On the other hand, it met with ſevere and formidable critics, and affixed, in the opinion of a numerous party, the ſtain of *apoſtacy* on the writer. It produced, among other replies, Paine's celebrated Rights of Man, which, for a time, ſeemed fully to balance its effects; but in the end, events, and the efforts of power and property, threw the preponderance in the ſcale of Burke; and it is not doubted that the turn he gave to the national opinions was an efficacious preparative to the enſuing war. He followed up his attack on the French principles, with A Letter to a Member of the National Aſſembly, in 1791; An Appeal from the New Whigs to the Old; Letter to a noble Lord on the Subject in Diſcuſſion with the Duke of Bedford; and Thoughts on a Regicide Peace; with ſeveral Memorials, &c. privately circulated; in all of which he diſplayed unabated powers of mind, together with ſuch an earneſt and inflamed zeal in the cauſe, as muſt remove all doubts of his ſincerity. Indeed, enmity to the French revolution became the leading paſſion of his ſoul. He could not hear it named without violent irritation, and its ſucceſſes certainly embittered and diſquieted all the concluding years of his life Yet it muſt be allowed that his zeal was alſo invigorated by emolument. His hoſpitable diſpoſition, and careleſſneſs with regard to expence, had always rendered him a needy man; and the large penſions which were conferred upon him by the crown doubtleſs animated his love of royalty. Theſe penſions were made a ſubject of ſevere animadverſion in parliament, but he defended himſelf on their account with great vigour and ſpirit in his Letter to a noble Lord, above mentioned. The only other political object which occupied him during this period, was the emancipation of the Roman-catholics in Ireland from the diſabilities they lay under, which he urged in A Letter to Sir Hercules Langriſhe, on the Propriety of admitting the Roman-catholics to the Elective Franchiſe, 1792. He withdrew from parliament in 1794, and his ſeat for New Malton was occupied by his only ſon, a riſing young man, whom his father viewed with the higheſt admiration as well as affection. The death of that ſon, ſoon after, was a moſt ſevere ſtroke upon him, and haſtened the decline of nature he was beginning to feel. This, by gradual approaches, brought on a tranquil termination of his life on July 8, 1797, in the ſixty-eighth year of his age. He preſerved his ſenſes to the laſt, and a few hours before his death cauſed to be read to him Addiſon's paper in the Spectator, on the immortality of the ſoul.

Mr. Burke was a very admirable man in private life, exemplary in his domeſtic and ſocial relations, and greatly beloved by his friends, from ſeveral of whom he received ſubſtantial tokens of regard. His converſation was delightful, when not exaſperated by inflammatory topics. He loved praiſe to a degree of weakneſs, and was not ſparing in returning it. He had a very elegant taſte for the fine arts, and was much attached to rural improvements, and the purſuits of agriculture. He was highly charitable and benevolent in his private capacity, and promoted many beneficent plans in his neighbourhood. The ſtream of his bounty latterly was directed to the relief of the ſufferers from the French revolution, and he founded a ſchool for the children of emigrants, the permanent ſupport of which ſeems to have been one of his latett cares.

In addition to his literary exertions, it ſhould be mentioned, that one of his biographers has aſſerted with the greateſt confidence, that he was the real writer of Sir Joſhua Reynolds's

Academical Diſcourſes, that great artiſt having only contributed to the general plan, and the profeſſional obſervations; and indeed the finiſhed excellence of the compoſition, together with the great pecuniary favours he received from his friend, might render the ſuppoſition probable; yet it is ſtrenuouſly denied by other authority. It is more certain that he had a great ſhare in the compoſition of an admired account of the European ſettlements in America, undertaken by his couſin William Burke. The celebrated Letters of Junius were by many aſcribed to Edmund Burke, at leaſt as a leading aſſociate in the deſign, and plauſible arguments have been adduced for the opinion: but this literary myſtery is yet unravelled. Other anonymous pieces of the political kind are known to have employed the maſterly pen of Burke, as a principal or an auxilliary.——We are indebted to the popular work of Dr. AIKIN, for the foregoing particulars.

BURKHAUSEN, a town of Germany, in Lower Bavaria, on the river Saltz, twenty-ſeven miles N. by W. of Saltzburg. Long. 12. 50. E. Lat. 40. 17. N.

BURMAH, an extenſive kingdom of Aſia, to the E. of the Ganges; ſometimes, but erroneouſly, called Ava, from the name of its capital. It is bounded by Pegu on the S. and occupies both ſides of the river Ava, as far as the frontiers of China. On the W. it has Aracan; and on the E. Upper Siam. This country, which is very little known to Europeans, produces ſome of the beſt teek timber in India. Ships built of teek, upward of forty years old, are no uncommon objects in the Indian ſeas, while an European-built ſhip is ruined there in five years. The foreſts which produce this valuable wood (which may be ſtyled the *Indian oak*), are ſituated between the W. bank of the river Ava, and the country of Aracan, and are only 250 miles from the ſea, by the courſe of the river.

BURNS (Robert). Scarcely any of the *ſelf-taught* poets in any country have diſplayed ſo much real genius, or attained ſo much excellence, as the ſubject of the preſent article, who was the ſon of a gardener and ſmall farmer, a native of the northern part of Scotland, but finally ſettled in the county of Ayr. Near the town of Ayr, Robert was born on January 29, 1759. He was brought up to ruſtic labour; but ſuch a deſtination was not thought incompatible with that degree of literary education which is ſo general among the natives of Scotland. It appears that his father, a man of ſuperior underſtanding, as well as of uncommon worth, exerted himſelf extraordinarily to procure inſtruction for his children; for, joining with ſome other heads of families of his own ſtation, they engaged a maſter of conſiderable ability, under whom Robert became a very good Engliſh ſcholar, well grounded in the grammar, and poſſeſſed of a remarkable copiouſneſs of words and expreſſions. His memory was retentive; and his love of reading, in proportion as proper objects were preſented to him, became ardent. There was no great variety or choice among the books he firſt procured, nor does it appear that poetry was his earlieſt taſte. The Life of Hannibal, and the Hiſtory of Sir William Wallace, were his firſt favourites; and even polemical divinity, a topic of peculiar intereſt among his countrymen, was not without its attractions to him. In the mean time his imagination received a vigorous though homely food, from the converſation of an old woman reſident in the family, who was plentifully ſtocked with the popular ſtories of fairies, witches, ghoſts, and goblins, all which ſhe piouſly believed. His father's circumſtances did not permit Robert to enjoy a regular and unbroken courſe of inſtruction. It was interrupted by the neceſſity of early and hard labour; which, with poor diet, and melancholy proſpects, fixed upon him a hypochondriacal tendency, that found its ſpeedieſt cure in ſociety and diſſipation. The ſum of direct inſtruction he received, included a ſmattering of the French language, and ſome leſſons in practical mathematics; but his own ſtrong ſenſe, with the aid of obſervation and caſual reading, was continually making important additions to his mental ſtock. As he grew towards manhood, ſome of the beſt Engliſh poets came under his peruſal; and he derived very eſſential benefit from a collection of letters by the moſt eminent writers, which by a lucky miſtake fell into his hands, inſtead of a common introduction to the art of letter-writing.

His firſt poetical inſpirer was Love, a paſſion of which he was ever ſingularly ſuſceptible, and which formed much of the pleaſure and pain of his life. A harveſt companion gave him at fifteen the earlieſt impreſſions of this delicious emotion. She had ſeveral ſucceſſors; but for a conſiderable time no other conſequences enſued than the change of a topic for his verſes. As he began to be known in the neighbourhood for ſtrength of underſtanding and powers of converſation, his company was courted, and he too ſoon became initiated into riotous conviviality, though the love of company was long more prevalent over him than the love of drink. He has juſtly remarked, that his great misfortune at this period was the want of a fixed aim in life. His ſpirit roſe above the meanneſs of his ſtation. Though active in body, he could not ſubmit to the thought of paſſing his whole exiſtence in corporeal labour; yet no mode of elevating his condition preſented itſelf. He made a trial at manufacture, and aſſociated himſelf with a flax-dreſſer in the neighbouring town of Irvine; but the ſcheme ended in nothing but giving him a ſtronger reliſh for a town life. His reception among the fraternity of free-maſons was an additional ſtep towards his acquiſition of convivial habits. After his father's death he joined his ſecond brother in a ſmall farm; but a courſe of bad ſeaſons cauſed it to prove a loſing concern, and they were obliged to give it up with the loſs of their ſtock. During this period, he formed a connection with a young woman, which his circumſtances, or his roving diſpoſition, prevented him from improving into a legal union. When conſequences enſued which could not be concealed, he endeavoured to eaſe his partner's mind by giving her an acknowledgment of a private marriage, which, upon information of his ruined condition, her parents induced her to reſign. Poor Burns, now driven to utter deſpair, and having in proſpect the horrors of a gaol, reſolved to quit his native country, and actually engaged himſelf as aſſiſtant-overſeer to a plantation in Jamaica. But he had for a conſiderable time been known in his neighbourhood as a maker of verſes, and his compoſitions had become popular. Of theſe, ſome of the firſt were ſatirical effuſions againſt the rigid calviniſtical clergy of the diſtrict, which, while they rendered the writer ſuſpicious to the godly, were favourably received by thoſe of a freer caſt. Other pieces, humorous, deſcriptive, tender, and bacchanalian, were handed about and admired, and Burns himſelf began to think that he might lay ſome claim to the envied title of a poet. With the double view, therefore, of obtaining fame, and ſome pecuniary ſupply for his neceſſities, he reſolved before his departure to publiſh a collection of ſuch of his poems as he moſt approved; and in 1786 he printed a ſmall volume at Kilmarnock, of which about 350 copies were ſubſcribed for. When it is known that Halloween, the Addreſs to the De'el, the Field Mouſe, Mountain Daiſy, and, above all, the Cotter's Saturday Night, were in this collection, it will not be wondered at, that they not only excited ruſtic admiration, but were peruſed with wondering applauſe by perſons of the moſt refined taſte. The local ſucceſs was prodigious. The Ayrſhire plowman became the pride of the country; and the labourer and maid-ſervant were impatient to convert a portion of their hard-earned gains into a copy of the delightful productions of the Scottiſh muſe.

Burns, however, perſiſted in his purpoſe of quitting his native land; and with part of the ſum his publication yielded, actually paid for his paſſage to the Weſt Indies in a ſhip from the Clyde. "I had taken," ſays he, "the laſt farewel of my few friends; my cheſt was on the road to Greenock; I had compoſed the laſt ſong I ſhould ever meaſure in Caledonia, 'The gloomy night is gathering faſt;' when a letter from Dr. Blacklock to a friend of mine, overthrew all my ſchemes, by opening new proſpects to my poetic ambition." That amiable poet, in common with ſome other perſons of taſte in Edinburgh, had been ſtruck with the extraordinary merit of Burns, and had given his opinion that a viſit to that capital would prove highly advantageous to him. Burns embraced the propoſal with rapture, and poſted to Edinburgh in November, 1786, relying ſolely on his fame, as he did not poſſeſs a ſingle acquaintance in the place. His reception ſurpaſſed his moſt ſanguine hopes. He was introduced to men of the firſt rank in letters, and to others of title and fortune; he was invited to all parties, praiſed, careſſed, feaſted, and more ſolidly encouraged by large ſubſcriptions for a new edition of his poems. An ingenious periodical paper, entitled The Lounger, being about to conclude, one of its laſt numbers was devoted to a critique on the poetry of Burns, in which their peculiar excellences were amply diſplayed. In this new ſcene Burns exhibited a fund of manly ſenſe and enlarged underſtanding, which rendered the *man* as much the object of admiration, as his *works* had been. The ſtrength, purity, and fluency of his language in converſation, were thought particularly remarkable in one of his rank and education. His manners were ſimple and independent; he was above all the affected ſingularities of pretenders to genius: and though he ſufficiently diſplayed a conſciouſneſs of his value, he was neither vain nor aſſuming. Nature had given him a countenance expreſſive and dignified, and a free caſt of ſentiment had taught him to hold up his head in the preſence of his fellow-men; ſo that ſtrangers who thought they were going to confer an honour on the peaſant by their notice, were involuntarily awed by the firſt interview. The firmneſs of his mind, however, was not proof againſt the temptations to exceſs which aſſailed him from every quarter at Edinburgh. His ſocial propenſities were under continual ſtimulation, and the worſt of company obtained as eaſy a poſſeſſion of him as the beſt. He paſſed the bounds of moderation in all his enjoyments, and his abode of two winters in the Scotch metropolis irretrievably fixed his unfortunate habits.

In February 1788, he found himſelf maſter of 500l. the fruits of that extraordinary encouragement which his new edition of poems had met with. Of this ſum he advanced 200l. to his brother, the farmer; and with the remainder he took a conſiderable farm of a gentleman in Dumfrieſſhire, upon terms intended to be much in his favour. But it is evident that he himſelf at this time ſuſpected that he ſhould be unequal to the conſtant attention and induſtry which are abſolutely requiſite to produce ſucceſs in the laborious and anxious occupation of agriculture. As a kind of *dernier reſort*, he had employed all his intereſt to procure an appointment to the humble poſt of an exciſeman, the higheſt, it ſeems, which the favour of the great could obtain for him. We may be ſurpriſed that a man of his character ſhould be ambitious of an office which could not but hurt his generous feelings in its exercite, and completely deſtroyed his independence; and the fact can only be attributed to his melancholy forebodings with reſpect to the other plan. But his propoſed union of the two employments was an abſurdity which ſo obviouſly led to ruin, that his friends ſhould have interfered to prevent it. Before ſettling, he took the honourable ſtep of legaliſing, by a declaration of marriage, his connection with the female above mentioned, who had been abſolutely turned out of doors by her father.

Burns for a time ſeemed to enjoy his rural and domeſtic pleaſures, and worked cheerfully at his plough; but his fame and his habits drew him too often from his ſolitude to convivial company, and the unhappy exciſe buſineſs gave him too good a plea to quit his farm, and take up his abode at ale-houſes. After three years and a half, he found it neceſſary to reſign his leaſe into his landlord's hands, and remove to a ſmall houſe in the town of Dumfries as a mere exciſeman. One of the firſt troubles that followed him was a charge of diſloyalty. Like moſt other ardent and ingenuous ſpirits, he had been warmed to admiration of the beginning of the French revolution, and to concurrence in the principles on which it was founded. Theſe he expreſſed with his uſual freedom of ſpeech, and his incautious language was reported to the *board*. This offence was much more heinous than the jacobiniſm of his younger days, which, indeed, was no more than a harmleſs play of romantic ſentiment. A ſupervifor was appointed to enquire into his delinquency; and it was not without the interceſſion of a reſpectable friend, and promiſe of more guarded behaviour, that he was ſuffered to retain his ſituation. He afterwards wiped off all ſtain of diſloyalty, ſo as to be placed on the liſt of expecting ſupervifors, though he did not live to attain his advancement. It would be painful to dwell upon the poor remnant of his life, in which he ſunk into the habitual ſot, forgetful of reputation, health, virtue, and the claims of thoſe who ought to have been dearеſt to him. Even in this ſtate of degradation, however, he exhibited admirable powers of the imagination, and his mind was vigorous while his body was daily becoming more feeble and diſeaſed. He retained, too, a principle of honour in pecuniary matters, which preſerved him from meanneſs even when oppreſſed with poverty. He was jealous of all offers of aſſiſtance, and long declined even the fair recompence of literary ſervices. The latter years of his life were much occupied in lyric compoſitions, which he undertook at the requeſt of a Mr. Thomſon in Edinburgh, who was making an ample collection of Scottiſh ſong tunes, to many of which there exiſted either no words, or poor and improper ones. Burns engaged with ardour in this national work, waving all propoſals of remuneration; and he poured forth a ſurpriſing number of pieces, many of them exquiſite ſpecimens of deſcriptive and ſentimental beauty, clothed in language of touching ſimplicity and delicacy. He continued alſo to write to his correſpondents letters full of fancy and energy. Several of theſe contain expreſſions of the keeneſt remorſe for the faults he was daily committing; though neither that compunction, nor the religious ſentiments with which he was permanently imbued, had power to overcome the force of habits, now become part of his nature. With reſpect to religion, though his mind had been early ſhocked with the horrors of the calviniſtic faith, and he had been thrown into a ſtate of doubt concerning revelation, yet he always cheriſhed the hope and belief of a future life, as the only true ſolace under poverty and adverſity; and many noble and pathetic declarations to this purpoſe are to be found in his letters. After much ſuffering from pain and depreſſion, he died of the conſequences of irregularities, in July 1796, in his thirty-eighth year. He left his wife and four children with no other proviſion than the intereſt inſpired by a name endeared to the lovers of poetry, by performances never to be forgotten. This proviſion has proved not unfruitful. A conſiderable ſum was raiſed for his family by ſubſcription ſoon after his death; and Dr. Currie, an eminent phyſician at Liverpool, generouſly undertook to prepare for their benefit a complete edition of his works, which appeared in 1800, in 4 vols. 8vo. enriched with an ample account of his life, and

a criticiſm on his writings, with ſome obſervations on the character and condition of the Scottiſh peaſantry; the whole forming a highly valuable addition to Engliſh literature.

The poems of Burns conſiſt of pieces, none of conſiderable length, upon a great variety of ſubjects, and in very different ſtyles. Moſt of them are written in the old Scottiſh dialect, and in ſingular meaſures, of which he found the examples in Allan Ramſay's works. The beſt of them poſſeſs a vigour of imagination, a warmth of feeling, a happy ſimplicity and force of expreſſion, that render them irreſiſtibly engaging. It is difficult to determine whether he excels moſt in the ſublime, the tender, or the humorous. In fact, in all theſe modes he drew his ideas immediately from nature, and animated them with the fire of genius. Though he can only rank among the minor poets, he will continue to be read and admired as long as poetry is reliſhed, unleſs his productions ſhould be prematurely hurried into oblivion by the uſe of an obſcure and decaying dialect. His letters will by many be thought as extraordinary proofs of literary talents, ſuperior to his ſituation, as his poems. They are in general written with a purity and command of language which would be admired in any condition; and they abound with paſſages of elegance, variety, and vigour, which genius alone could produce. With one of theſe, which may ſerve as a ſketch of his own character drawn by himſelf, we ſhall conclude this article: "Take a being of our kind, give him a ſtronger imagination and more delicate ſenſibility, which between them will ever engender a more ungovernable ſet of paſſions than are the uſual lot of man; implant in him an irreſiſtible impulſe to ſome idle vagary, ſuch as, arranging wild flowers in fantaſtic noſegays, tracing the graſshopper to his haunt by his chirping ſong, watching the friſks of the little minnows in the ſunny pool, or hunting after the intrigues of butterflies; in ſhort, ſend him adrift after ſome purſuit which ſhall eternally miſlead him from the paths of lucre, and yet curſe him with a keener reliſh than any man living for the pleaſures that lucre can beſtow; laſtly, fill up the meaſure of his woes by beſtowing on him a ſpurning ſenſe of his own dignity;—and you have created a wight nearly as miſerable as the poet."——We are indebted to the popular biographical work of Dr. AIKIN, for the foregoing particulars.

BURNT ISLAND, a borough of Scotland, on the Frith of Forth, in Fifeſhire. It has an excellent harbour, in form of a baſin, where ſhips ſometimes perform quarantine. It has a ſugar-houſe, and ſome beginning manufactures. Near this place are found ſtones that appear to have been thrown out by a volcano. It is ſeated under a ſtupendous rock, ten miles N. W. of Edinburgh. Long. 3. 5. W. Lat. 56. 8. N.

BURRAMPOOTER, a river of Aſia, which riſes near the head of the Ganges, in the mountains of Thibet. Of theſe two rivers it is remarkable, that, iſſuing from oppoſite ſides of the ſame ridge of mountains, they direct their courſe towards oppoſite quarters, till they are more than 1200 miles aſunder; meeting in one point beyond the ſea, after it has performed a winding courſe of more than 2000 miles. From its ſource, the Burrampooter proceeds eaſterly through Thibet, where it is named Sanpoo, or Zancin, that is, the *River*. After waſhing the border of the territory of Laſſa, it takes a ſouth-eaſterly courſe, and approaches within 220 miles of Yunan, the weſternmoſt province of China. It then turns ſuddenly to the W. and proceeding through Aſſamp, aſſumes the name of Carampooter. It enters Bengal on the N. E. makes a circuit round the weſtern point of the Garrow Mountains, and then, altering its courſe to S. meets the Ganges about forty miles through Bengal. This river bears ſo intimate a reſemblance to the Ganges, except in one particular, that the ſame deſcription might ſerve for both. The exception is, that during the laſt ſixty miles before its junction with the Ganges, it forms a ſtream which is regularly from four to five miles wide; and, but for its freſhneſs, might paſs for an arm of the ſea.

BUTRAGO, a town of Spain, in New Caſtille, formerly a biſhop's ſee. It is ſeated on the river Lozoya, thirty miles N. by E. of Madrid. Long. 3. 5. W. Lat. 40. 46. N.

BUTTERMERE-WATER, a lake in Cumberland, about eight miles S. W. of Keſwick. It is two miles long, and not quite one broad. On the W. ſide it is terminated by a mountain, called, from its ferruginous colour, the Red Pike. A ſtrip of cultivated ground adorns the E. ſhore. A group of houſes, called Gateſgarth, is ſeated on the S. extremity, under a very extraordinary amphitheatre of mountainous rocks. Here Homiſter Crag is ſeen riſing to a vaſt height, flanked by two conical mountains, Fleetwith on the E. and Scarf on the W. ſide. A hundred mountain torrents form never-failing cataracts, that thunder and foam down the centre of the rock, and form the lake below. Here the rocky ſcenes and mountain landſcapes are diverſified and contraſted with all that aggrandize the object in the moſt ſublime ſtyle. This lake is called the Upper Lake; and, near a mile from it, to the N. E. is the Lower Lake, called alſo Cromack-water. The river Cooker flows through both theſe lakes to Cockermouth.

BYRON'S ISLAND, an iſland in the S. Pacific Ocean, diſcovered by Commodore Byron in 1765. It is low, full of wood, and very populous. On his approach to the iſland, ſeveral natives put off to the ſhip. After gazing at it ſome time, one of them ſuddenly ſprung out of his canoe, into the ſea, ſwam to the ſhip, ran up the ſide like a cat, and ſitting down, when he got on deck, burſt into a violent fit of laughter; then ſtarting up, he ran all over the ſhip, attempting to ſteal whatever he could lay his hands upon, but being quite naked, he was always foiled. The ſeamen put a jacket and trowſers on him, which cauſed great diverſion, as he diſplayed all the antics of a monkey; at laſt he leaped overboard in this dreſs, and ſwam to his canoe. His ſucceſs led ſeveral others to ſwim to the ſhip, and whatever they could ſeize they carried off with aſtoniſhing agility. Theſe people are tall, well proportioned, and clean; their features good, and their countenance expreſſive of a ſurpriſing mixture of intrepidity and cheerfulneſs. Long. 173. 46. E. Lat. 1. 18. S.

BYZANTIUM. See CONSTANTINOPLE.

C.

CAE

CABALLINUM (anc. geog.), a town of the Ædui in Gallia Celtica: now *Chalon ſur Saone*, which ſee.

CABALLINUS (anc. geog.), a very clear fountain of mount Helicon in Bœotia; called *Hippocrene* by the Greeks, becauſe opened by Pegaſus on ſtriking the rock with his hoof, and hence called *Pegaſius*.

CABALLIO, or CABELLIO (anc. geog.), a town of the Cavares in Gallia Narbonnenſis, ſituated on the Druentia. One of the Latin colonies, in the Notitiæ called *Civitas Cabellicorum*. Now *Cavaillon* in Provence. See CAVAILLON.

CABRERIA, a ſmall iſland in the Mediterranean, about ſeven miles to the S. of Majorca. It has a large harbour, defended by a caſtle.

CABUL, the capital of the province of Cabul, and of the dominions of the king of Candahar, ſituated near the foot of the Indian Caucaſus, not far from the ſource of the Attock, which runs near it. Its ſituation is ſpoken of by the Indian hiſtorians in terms of rapture; it being no leſs romantic than pleaſant; and having within its reach, the fruits and other products both of the temperate and torrid zone. It is conſidered as the gate of India toward Tartary, as Candahar is with reſpect to Perſia. It is 680 miles N. W. of Delhi. Long. 68. 58. E. Lat. 34. 36. N.

CACACA, a town of Africa, in the kingdom of Fez, near Malilla. The moors retook it from the Spaniards in 1534; and it has a fort upon a rock. Long. 2. 55. W. Lat. 35. 2. N.

CACERES-DE-CAMARINHA, a town of Aſia, in the iſle of Luconia, with a biſhop's ſee, ſubject to Spain. Long. 124. 0. E. Lat. 14. 35. N.

CACONGO, a ſmall kingdom of Africa, on the river Zaire, whoſe inhabitants are great traders. Their manners, religion, and government, are the ſame as in Loango. It lies in Lat. 5. 0. S.

CACORLA, a town of Spain, in Andaluſia, on the rivulet Vega, between two mountains. It belongs to the Archbiſhop of Toledo, and is fifteen miles E. S. E. of Ubeda. Long. 2. 55. E. Lat. 37. 40. N.

CADURCI, CADURCUM, *Cadurcus*, and *Cadurx* (anc. geog.), a town of the Cadurcii, a people of Aquitania; ſituated between the rivers Oldus running from the north, and the Tarnis from the ſouth, and falling into the Garumna: now *Cahors*, capital of the territory of the Querci, in Guienne. A part of the Caduci, to the ſouth next the Tarnis, were called *Eleutheri*.

CADURCII (anc. geog.), a people of Media Atropatene, ſituated to the weſt in the mountains, and reaching to the Caſpian ſea; between whom and the Medes perpetual war and enmity continued down to the time of Cyrus.

CÆRE (anc. geog.), a town of Etruria, the royal reſidence of Mezentius. Its ancient name was *Argyllæ*. In Strabo's time not the leaſt veſtige of it remained, except the baths called *caretana*. From this town the Roman cenſor's tables were called *cærites tabulæ*. In theſe were entered the names of ſuch as for ſome miſdemeanor forfeited their right of ſuffrage, or were degraded from a higher to a leſs honourable tribe. For the people of Cære hoſpitably receiving thoſe Romans who, after the taking of Rome by the Gauls, fled with their gods and the ſacred fire of Veſta, were, on the Romans recovering themſelves from this diſaſter, honoured with the privilege of the city, but without a right of voting.

CAERWENT, a village of Monmouthſhire, famous for a beautiful moſaic pavement, diſcovered in 1777; and aſſerted to be ſuperior to any ſuch diſcovered on this ſide of the Alps, and equal to thoſe preſerved by the king of Naples at Portici.

CÆSAR *Auguſta*, or *Cæſarea Auguſta* (anc. geog.), a Roman colony ſituated on the river Iberus in the hither Spain, before called *Salduba*, in the territories of the Edetani. Now commonly thought to be *Saragoſa*. See that article.

CÆSARODUNUM (anc. geog.), a town of the Turones in Celtic Gaul: now *Tours*, the capital of Touraine. See TOURS.

CÆSAROMAGUS (anc. geog.), a town of the Trinobantes in Britain; by ſome ſuppoſed to be *Chelmsford*, by others *Brentford*, and by others *Burſlet*.

CÆSENA (anc. geog.), a town of Gallia Ciſpadana, ſituated on the rivers Iſapis and Rubicon: now *Cæſena*, which ſee.

CÆSIA SYLVA (anc. geog.), a wood in Germany, part of the great Sylva Hercynia, ſituated partly in the duchy of Cleves, and partly in Weſtphalia between Weſel and Kesfield.

CÆTOBRIX (anc. geog.), a town of Luſitania, near the mouth of the Tagus on the eaſt ſide; now extinct. It had its name from its fiſhery; and there are ſtill extant fiſh-ponds on the ſhore, done with plaſter-of-Paris, which illuſtrate the name of the ruined city.

CAIETA (anc. geog.), a port and town of Latium, ſo called from Æneas's nurſe; now *Gacta*, which ſee.

CAIN, eldeſt ſon of Adam and Eve, killed his brother Abel; for which he was condemned by God to baniſhment and a vagabond ſtate of life. Cain retired to the land of Nod, on the eaſt of Eden; and built a city, to which he gave the name of his ſon Enoch.

CAIRNGORM, a mountain of Scotland, in the eaſt of Inverneſsſhire; the lofty top of which is patched with ſnow. It is famous for its beautiful rock-cryſtals of various tints. They are much eſteemed by lapidaries; and ſome of them, having the luſtre of fine gems, bring a high price.

CALAGORINA, or CALAGURIS, diſtinguiſhed by the ſurname *Naſica* (anc. geog.), a city of the Vaſcones in the Hither Spain: now *Calahorra*.

CALAMATA (*Encycl.*). Erroneouſly ſpelt CALAMAIA.

CALAMIANES, three ſmall iſlands of Aſia, between Borneo and the Philippines, and N. of Parago. They are famous for their edible bird-neſts. Long. 118. 5. E. Lat. 11. 0. N.

CALAURIA (anc. geog.), an iſland of Greece in the Saronic bay, overagainſt the port of Troezen, at the diſtance of forty ſtadia. It was thirty ſtadia in compaſs, and had a temple of Neptune held in great veneration. It was alſo an aſylum, and the place of the convention or aſſembly of the ſeven cities of the Amphictyons. To this place Demoſthenes went twice into baniſhment.

CALBEN, a town of Germany, in the Old Marche of Brandenburg, with a good caſtle, thirty-two miles N. of Magdeburg.

CALES (anc. geog.), a municipal city of ſome note in

CAL

Campania, at no great diſtance from Caſilinum. The epithet *Calenus* is by Horace and Juvenal applied to a generous wine which the territory produced.

CALETES (anc. geog.), a people of Gallia Celtica, on the confines of Belgica, ſituated between the ſea and the Sequana. Now called *le Pais de Caux*, in Normandy,

CALLE (anc. geog.), a town of Hither Spain, ſituated on an eminence which hangs over the river Durius; whoſe port was at the mouth of the river. Now *Porto, Oporto*, or *Pont a Port*. See OPORTO.

CALLIRRHOE (anc. geog.), ſurnamed *Enneaerunos*, from its nine ſprings or channels; a fountain not far from Athens, greatly adorned by Piſiſtratus, where there were ſeveral wells, but this only the running ſpring. Callirrhoe was alſo the name of a very fine ſpring of hot water beyond Jordan near the Dead Sea, into which it empties itſelf.

CALORIMETER, an inſtrument or apparatus, invented by the celebrated Lavoiſier, for meaſuring the eſcape of heat. See CHEMISTRY, pages 376 and 480.

CALVADOS, a department of France, including part of the late province of Normandy. It is ſo called from a rock of the ſame name. Caen is the capital city.

CALVARY, MOUNT, a hill near Jeruſalem, on which JESUS CHRIST was crucified.

CALYDON (anc. geog.), a town of Ætolia, ſituated ſeven miles and a half from the ſea, and divided by the river Evenus: the country was anciently called *Æolis*, from the Æolians its inhabitants. This country was famous for the ſtory of Maleager and the Calydonian boar.

CAM, or GRANTA, a river which riſes in Hertfordſhire, runs N.E. by Cambridge, and N. to the Iſle of Ely, where it falls into the Ouſe.

CAMARAT, a ſea-port of France, in the department of Finiſterre and late province of Britany. In an expedition againſt Breſt in 1694, the Engliſh landed here, and loſt a great number of men. It ſtands on a bay of the ſame name.

CAMBERWELL, a fine village of Surrey, two miles S.S.E. of London. Its pariſh includes the villages of Dulwich and Peckham.

CAMPBELL (Archibald), earl and marquis of Argyle, was the ſon of Archibald earl of Argyle, by the Lady Anne Douglas, daughter of William earl of Morton. He was born in the year 1598; and educated in the profeſſion of the Proteſtant religion, according to the ſtricteſt rules of the church of Scotland, as it was eſtabliſhed immediately after the reformation. During the commonwealth he was induced to ſubmit to its authority. Upon the reſtoration, he was tried for his compliance; a crime common to him with the whole nation, and ſuch a one as the moſt loyal and affectionate ſubject might frequently by violence be induced to commit. To make this compliance appear the more voluntary and hearty, there were produced in court, letters which he had wrote to Albemarle, while that general governed Scotland, and which contained expreſſions of the moſt cordial attachment to the eſtabliſhed government. But, beſides the general indignation excited by Albemarle's diſcovery of this private correſpondence, men thought, that even the higheſt demonſtrations of affection might, during jealous times, be exacted as a neceſſary mark of compliance from a perſon of ſuch diſtinction as Argyle; and could not, by any equitable conſtruction, imply the crime of treaſon. The parliament, however, ſcrupled not to paſs ſentence upon him, and he ſuffered with great conſtancy and courage.

CAMPBELL (Archibald), earl of Argyle, ſon to the former, had from his youth diſtinguiſhed himſelf by his loyalty, and his attachment to the royal family. Though his father was head of the covenanters, he himſelf refuſed to concur in any of their meaſures; and when a commiſſion of colonel was given him by the convention of ſtates, he forbore to act upon it till it ſhould be ratified by the king. By his reſpectful behaviour, as well as by his ſervices, he made himſelf acceptable to Charles when that prince was in Scotland; and even after the battle of Worceſter, all the misfortunes which attended the royal cauſe could not engage him to deſert it. Under Middleton he obſtinately perſevered to haraſs and infeſt the victorious Engliſh; and it was not till he received orders from that general, that he would ſubmit to accept of a capitulation. Such jealouſy of his loyal attachments was entertained by the commonwealth and protector, that a pretence was ſoon after fallen upon to commit him to priſon; and his confinement was rigorouſly continued till the reſtoration. The king, ſenſible of his ſervices, had remitted to him his father's forfeiture, and created him Earl of Argyle; and when a moſt unjuſt ſentence was paſſed upon him by the Scots parliament, Charles had anew remitted it. In the ſubſequent part of this reign Argyle behaved himſelf dutifully; and though he ſeemed not diſpoſed to go all lengths with the court, he always appeared, even in his oppoſition, a man of mild diſpoſitions and peaceable deportment.

A parliament was ſummoned at Edinburgh in the ſummer of 1681, and the duke was appointed commiſſioner. Beſides granting money to the king, and voting the indefeaſible right of ſucceſſion, this parliament enacted a teſt, which all perſons poſſeſſed of offices, civil, military, or eccleſiaſtical, were bound to take. In this teſt the king's ſupremacy was aſſerted, the covenant renounced, paſſive obedience aſſented to, and all obligations diſclaimed of endeavouring any alteration in civil or eccleſiaſtical eſtabliſhments. This was the ſtate of the teſt as propoſed by the courtiers; but the country party propoſed alſo a clauſe of adherence to the Proteſtant religion, which could not with decency be rejected. The whole was of an enormous length, conſidered as an oath; and, what was worſe, a confeſſion of faith was there ratified which had been impoſed a little after the reformation, and which contained many articles altogether forged by the parliament and nation. Among others, the doctrine of reſiſtance was inculcated; ſo that the teſt being voted in a hurry, was found on examination to be a medley of abſurdity and contradiction. Though the courtiers could not reject the clauſe of adhering to the Proteſtant religion, they propoſed, as a requiſite mark of reſpect, that all princes of the blood ſhould be exempted from taking that oath. This exception was zealouſly oppoſed by Argyle; who obſerved that the ſole danger to be dreaded for the Proteſtant religion muſt proceed from the perverſion of the royal family. By inſiſting on ſuch topics, he drew on himſelf the ſecret indignation of the Duke of York, of which he ſoon felt the fatal conſequences.

When Argyle took the teſt as a privy-counſellor, he ſubjoined, in the duke's preſence, an explanation which he had beforehand communicated to that prince, and which he believed to have been approved by him. It was in theſe words: "I have conſidered the teſt, and am very deſirous of giving obedience as far as I can. I am confident that the parliament never intended to impoſe contradictory oaths: therefore I think no man can explain it but for himſelf. Accordingly I take it as far as it is conſiſtent with itſelf and the Proteſtant religion. And I do declare that I mean not to bind myſelf, in my ſtation, and in a lawful way, from wiſhing and endeavouring any alteration, which I think to the advantage of church or ſtate, and not repugnant to the Proteſtant religion and my loyalty: and this I underſtand as a part of my oath." The duke, as was natural, heard it with great tranquillity: no one took the leaſt offence: Argyle was admitted to ſit that

day in council: and it was impoſſible to imagine that a capital offence had been committed where occaſion ſeemed not to have been given ſo much as for a frown or reprimand.

Argyle was much ſurpriſed a few days after, to find that a warrant was iſſued for committing him to priſon; that he was indicted for high-treaſon, leaſing-making, and perjury; and that from the innocent words above mentioned an accuſation was extracted, by which he was to forfeit life, honours, and fortune. It is needleſs to enter into particulars, where the iniquity of the whole is ſo evidently apparent. Though the ſword of juſtice was diſplayed, even her ſemblance was not put on; and the forms of law were preſerved to ſanctify, or rather aggravate, the oppreſſion. Of five judges, three did not ſcruple to find the guilt of treaſon and leaſing-making to be incurred by the priſoner: a jury of fifteen noblemen gave verdict againſt him; and the king being conſulted, ordered the ſentence to be pronounced, but the execution of it to be ſuſpended till further orders. Argyle, however, ſaw no reaſon to truſt to the juſtice or mercy of ſuch enemies: he made his eſcape from priſon, and, till he could find a ſhip for Holland, he concealed himſelf during ſome time in London. The king heard of his lurking place, but would not ſuffer him to be arreſted. All the parts, however, of his ſentence, ſo far as the government in Scotland had power, were rigorouſly executed; his eſtate confiſcated, his arms reverſed and torn. Having got over to Holland, he remained there during the remaining part of the reign of Charles II. But thinking himſelf at liberty, before the coronation of James II. to exert himſelf in order to recover the conſtitution by force of arms, he concerted meaſures with the Duke of Monmouth, and went into Scotland to aſſemble his friends: but not meeting with the ſucceſs he expected, he was taken priſoner; and being carried to Edinburgh, was beheaded upon his former unjuſt ſentence, June 30, 1685. He ſhewed great conſtancy and courage under his misfortunes: on the day of his death he ate his dinner very cheerfully; and, according to his cuſtom, ſlept after it a quarter of an hour or more, very ſoundly. At the place of execution he made a ſhort, grave, and religious ſpeech; and, after ſolemnly declaring that he forgave all his enemies, ſubmitted to death with great firmneſs.

Campbell (John), duke of Argyle and Greenwich, grandſon of the former, was born on the 10th of October, 1680; and, on the very day when his grandfather ſuffered at Edinburgh, fell out of a window three pair of ſtairs high, without receiving any hurt. At the age of fifteen, he had made a conſiderable progreſs in claſſical learning. His father then perceived and encouraged his military diſpoſition, and introduced him to King William, who, in the year 1694, gave him the command of a regiment. In this ſituation he remained till the death of his father, in 1703; when becoming Duke of Argyle, he was ſoon after ſworn of Queen Anne's privy-council, made captain of the Scotch horſe-guards, and appointed one of the extraordinary lords of ſeſſion. In 1704, her majeſty reviving the Scottiſh order of the Thiſtle, his grace was inſtalled one of the knights of that order, and was ſoon after appointed high-commiſſioner to the Scotch parliament; where, being of great ſervice in promoting the intended union, he was on his return created a peer of England, by the titles of Baron of Chatham and Earl of Greenwich, and in 1710 was made knight of the Garter. His grace firſt diſtinguiſhed himſelf in his military capacity at the battle of Oudenard; where he commanded as brigadier-general, with all the bravery of youth, and the conduct of a veteran officer. He was preſent under the Duke of Marlborough at the ſiege of Ghent, and took poſſeſſion of the town. He had alſo a conſiderable ſhare in the victory obtained over the French at the battle of Malplaquet, by diſlodging them from the wood of Sart, and gaining a poſt of great conſequence. In this ſharp engagement, ſeveral muſket-balls paſſed through the duke's clothes, hat, and peruke. Soon after this hot action, he was ſent to take the command in Spain; and after the reduction of Port Mahon, he returned to England. His grace having now a ſeat in the Houſe of Lords, he cenſured the meaſures of the miniſtry with ſuch freedom, that all his places were diſpoſed of to other noblemen: but at the acceſſion of George I. he recovered his influence. At the breaking out of the rebellion in 1715, he was made commander-in-chief of his majeſty's forces in North Britain; and was the principal means and cauſe of the total extinction, at that time, of the rebellion in Scotland, without much bloodſhed. In direct oppoſition to him, or that part of the army he commanded, at the head of all his Campbells was placed Campbell earl of Braidalbin, of the ſame family and kindred, by ſome fatal error, that ever miſguided and miſled that unhappy family of the Stuarts and all its adherents. The conſequence was, that both ſets of Campbells, from family affection, refuſed to ſtrike a ſtroke, and retired out of the battle. He arrived at London, March 6th, 1716, and was in high favour: but, to the ſurpriſe of people of all ranks, he was in a few months diveſted of all his employments; and from this period, to the year 1718, he ſignalized himſelf in a civil capacity, by his uncorrupted patriotiſm and manly eloquence. In the beginning of the year 1719 he was again admitted into favour, appointed lord-ſteward of the houſehold, and in April following was created Duke of Greenwich. He continued in the adminiſtration during all the remaining part of that reign; and, after his late majeſty's acceſſion, till April 1740; when he delivered a ſpeech with ſuch warmth, that, the miniſtry being highly offended, he was again diſmiſſed from his employments. To theſe, however, on the change of the miniſtry, he was ſoon reſtored; but not approving of the meaſures of the new miniſtry more than thoſe of the old, he gave up all his poſts for the laſt time, and never after engaged in affairs of ſtate. He now enjoyed privacy and retirement; and died of a paralytic diſorder, on the 4th of October, 1743. To the memory of his grace a very noble monument was erected in Weſtminſter-abbey, executed by the ingenious Roubilliac.

The Duke of Argyle, though never firſt miniſter, was a very able ſtateſman and politician, moſt ſteadily fixed on thoſe principles he believed to be right, and not to be ſhaken or changed. His delicacy and honour were ſo great, that it hurt him to be even ſuſpected; witneſs that application ſaid to be made to him by one of the adherents of the Stuart family before the laſt rebellion in order to gain his intereſt, which was conſiderable both in Scotland and England. He immediately ſent the letter to the ſecretary of ſtate; and it vexed him much even to have an application made to him, leſt any perſon ſhould think him capable of acting a double part. When he thought meaſures wrong or corrupt, he cared not who was the author, however great or powerful he might be; witneſs his boldly attacking the great Duke of Marlborough in the Houſe of Lords, about his forage and army contracts in Flanders, in the very zenith of his power and popularity, though in all other reſpects he was the moſt able general of his time. The Duke of Argyle, on all occaſions, ſpoke well, with a firm, manly, and noble eloquence; and ſeems to deſerve the character given of him by Pope:

Argyle, the ſtate's whole thunder born to wield,
And ſhake alike the ſenate and the field.

CAMPI (Bernardine) of Cremona, an Italian painter, author of an admired treatiſe on the art, flouriſhed in the 12th century.

CAMPSEY HILLS, a ridge of hills in Stirlingſhire, which extend from E. to W. and occupy the centre of the county.

CANAL (*Encycl.*). The following is the ſpecification of a patent granted to Mr. Hudleſton, of Shafteſbury, for a method of conveying boats or barges from a higher level to a lower, and *vice verſâ*, on canals, by the immerſion of a plunger or plungers. "I aſſume and propoſe," ſays the inventor, "that in order to put in practice ſuch my method of conveying boats or barges from a higher level to a lower, and *vice verſâ*, on canals, by the immerſion of a plunger or plungers, there ſhall be or be ſuppoſed a lock (conſtructed of the uſual and proper materials, with which locks on canals are uſually or may be conveniently made to contain water), of a proper form and dimenſion, placed in a line between, and connecting together, the upper and lower parts of a canal and navigation, and furniſhed at each end with a gate or ſluice, ſufficiently wide to allow, when opened, the paſſage of the boat or veſſel about to be conveyed; ſuch gates or ſluices to be adapted in their reſpective depths, the one to the upper, the other to the lower level of the canal or navigation; the upper part or coping of ſuch lock muſt be made of a height ſufficient to contain the water of the upper line, and the bottom of ſuch lock muſt be of a depth to correſpond with that of the lower line of navigation. The horizontal ſuperficies or form of the boat or barge intended to be conveyed, ought to correſpond with that of the lock, with the allowance of ſufficient ſpace for the free riſe and fall of the veſſel, within the ſides and bounds of the lock, the depth of ſuch boat being neceſſarily regulated by that of the navigation.

"I next propoſe that there be a reſervoir building or excavation made (and prepared with ſtone, brick, wood, or any other proper material capable of containing water), the upper part or coping of which ſhould be level with that of the ſaid lock; and that the area of the ſaid reſervoir ſhould be equal to (or rather in practice ſomewhat exceeding) the area of the ſaid lock. In this caſe the perpendicular depth of the reſervoir ſhould be equal to double the intended riſe or fall of the veſſel within the lock; but where the areas of the lock and reſervoir are unequal, this proportion varies: for as in all caſes the quantity of water to be diſplaced out of the reſervoir into the lock, muſt be equal in cubical content to that of the ſpace in the ſaid lock between the ſurface of the lower line and that of the upper, it follows, that if the area of the reſervoir be greater than that of the lock, the neceſſary depth of the water to be diſplaced will be ſo much the leſs than in the caſe before ſtated; and, *e contra*, if the area of the reſervoir be leſs than that of the lock, the neceſſary depth of water to be diſplaced will be ſo much the greater: ſo that whether this proportional quantity of water ſhall be obtained by the greater depth or the greater area of the reſervoir, is a point for the conſideration of the artiſt. A communication ſufficient for the free paſſage of water at or near the bottoms, or in the lower parts of ſuch lock and reſervoir, is in all caſes eſſentially neceſſary. The diſtance between the ſaid lock and reſervoir or reſervoirs (where more than one) is diſcretional, provided there be ſuch level and communication: the ſhape of the reſervoir is alſo diſcretional, though for the better adaptation of the plunger or plungers, hereafter to be deſcribed, I regard an angular form as the moſt convenient; and to obviate the poſſibility of damage or obſtruction to the free motion of the plunger, by the falling of ſtones or other ſubſtances, between the ſides of the reſervoir and plunger, it may be practically expedient to give to the plunger or plungers a ſhape ſomewhat diminiſhing downwards, in the nature of a reverſed pyramid, in order to enable them on aſcending to clear themſelves from the obſtructing ſubſtance.

"Aſſuming the ſaid lock and reſervoir to be formed to communicate as aforeſaid, and to be ſupplied with water from the lower line, whence of courſe it would follow, that whatever may be the depth of the reſervoir, the water contained in it, and the water in the lock, and of ſuch lower line, would have one common level: ſuppoſing a veſſel floated into ſuch lock, the lower gate or ſluice ſhut, and that ſome ſolid body or bodies, equal or nearly ſo in cubical content to that of the reſervoir itſelf, be plunged downwards (whether falling by ſuperior ſpecific gravity to that of water, or forced by mechanical means) to the lower part or bottom of ſuch reſervoir, it is obvious that the water (if not all at leaſt nearly all) in ſuch reſervoir would be diſplaced, and by paſſing into the lock would, in addition to the water therein-before contained, fill or nearly fill the ſaid lock; and the ſmall quantity of water remaining in the ſaid reſervoir would ſurround the immerſed body or bodies up to a level with the water in the lock; and if ſuch ſolid body or bodies were withdrawn from ſuch reſervoir, then the water in the lock would ſubſide to its original level, reoccupying the ſpace in the reſervoir, lately held by the body or bodies now raiſed and before immerſed, which I call a plunger or plungers.

"My ſaid invention therefore conſiſts in the practical application of the two following laws of Hydroſtatics, for the purpoſes of conveying boats or barges from a higher level to a lower, and *vice verſâ*. 1ſt, That two columns of water, however different in lateral dimenſions, will, if there be a communication between them, always maintain one and the ſame level: and 2dly, That the immerſion of any ſolid body in water will diſplace a portion of the fluid, equal in quantity to the bulk or ſolid contents of the body immerſed.—And to obviate any objection reſpecting the above application of the term *ſolid*, I beg to be underſtood as uſing it hypothetically only; being well aware, that in order to produce the propoſed effect by immerſion, it is not neceſſary that the body immerſed ſhould be a ſolid one.

"Therefore I apply to the reſervoir above predicated (and to more reſervoirs than one where neceſſary, and in any poſition relative to the lock, ſo as the lock and reſervoirs have ſuch levels, capacities, convenient forms, and communications, as above deſcribed) one or more plunger or plungers, fitted to and nearly filling ſuch reſervoir or reſervoirs, and freely moving up and down therein (but not water-tight, or acting as piſtons or forcers in the common acceptation of thoſe terms), formed of ſuch materials, be they ſtone, wood, brick, copper, iron, or any other ſuitable material or combination of materials, as may be moſt conveniently applied to and uſed in ſuch reſervoir or reſervoirs. The means of raiſing or depreſſing ſuch plunger or plungers, whether by levers, balancing-weight, ropes, chains, pulleys, tooth and pinion, wheel, capſtan, windlaſs, winch, crank, ſcrew, animal force, ſteam, or other engine or engines, or other mechanical or ſtatical contrivances, muſt according to ſituations, circumſtances, and expediency, be left to the choice of the perſon or perſons applying ſuch plunger or plungers.

"The ſaid invention may alſo be executed by cauſing one or more ſuch plunger or plungers, in reſpect to height and ſolid content, to deſcend or riſe within the area of a lock capable of containing, with the allowance of free motion up and down, both the propoſed boat or veſſel, and the propoſed plunger or plungers, and of a depth or depths adapted in its ſeveral parts to the neceſſary riſe and fall of each of them reſpectively, ſuch plunger or plungers being underſtood to be alſo of ſuch a figure or figures, as to permit the ſaid boat or veſſel to aſcend and deſcend freely within the ſaid lock, and along ſide of ſuch plunger or plungers: but conſidering, as I do at preſent, a partition between the plunger and the lock as more eligible, I notice ſuch an application of my ſaid method principally with a view to prevent evaſion.

"My preſent model conſiſts of a lock and boat as already deſcribed (ſaving a certain exceſs in the depth of each of them), a reſervoir near to and parallel with ſuch lock, oblong and rectangular, a ſub-communication as ſpecified, a ſingle plunger, oblong and rectangular, fitting, and ſubject to free motion, filling ſuch reſervoir, having two large guiding-wheels or pulleys raiſed by two other correſponding wheels ſecured upon a windlaſs or axis, by means of lines repreſenting chains faſtened to ſuch windlaſs-wheels, and paſſing under and round the ſaid plunger-wheels, the ends of ſuch lines or chains being brought up and faſtened to a beam and frame, ſupported on the ſpace or partition dividing the reſervoir and lock; which frame and the upper part of the windlaſs-wheels have an elevation ſufficient to allow of the aſcent of the plunger, till raiſed above the ſurface-water of the reſervoir. The plunger is counter-balanced by a weight ſuſpended by a line, repreſenting a rope or chain, fixed to the extremity of a curved or ſpiral lever (as I term it, though perhaps not with ſtrict propriety, it being analogous to the fuſee of a time-piece), which lever proceeds from the windlaſs axis; ſo that whilſt the plunger is raiſing from its loweſt depth to its greateſt height (*viz.* to the ſurface of the water), the ſaid curved lever, by removing the balance-weight from the axis of the windlaſs, in a ratio correſponding with, or counteracting, the increaſing weight of the plunger, facilitates and promotes the ſteady raiſing of the plunger; and when the plunger is to be depreſſed, by reverſing the action of the windlaſs, the weight is made to approach the axis of the windlaſs, and following the curve of the lever, it ſurrenders its counteracting powers in proportion, or nearly ſo, to the increaſe of the action of the diſplaced water upon the lower ſurface of the plunger, as depreſſed into the reſervoir.

"Premiſing that I conſider my ſaid method as preferably applicable, where the lifts or deſcents are ſmall or moderate, yet without ſuggeſting preciſe limits, which practice only can regulate; premiſing alſo, that boats of a moderate ſize, as recommended by Dr. Anderſon and Mr. Fulton, and exceeding rather in depth than in length or breadth, ſeem beſt adapted to the mode of conveyance, the conveying of boats or barges is effected by this invention:

"Let us ſuppoſe the reſervoir to be ſixteen feet deep, and by means of the communication with the water in the lock and lower canal to be half full of water; let us ſuppoſe the plunger to be raiſed to its greateſt height of ſuſpenſion, and to be at or above the ſurface of the water in the reſervoir; let a boat or barge be floated through the lower ſluice or gate into the lock, the lower ſluice or gate being cloſed, and the upper one remaining ſo; let the plunger be depreſſed to the bottom of the reſervoir; the water in the reſervoir (minus the ſmall quantity encompaſſing the plunger) is diſplaced into the lock through the paſſage of ſub-communication, and the ſurface of the water in the lock is raiſed as much as the plunger ſinks, *viz.* eight feet, which brings the water in the lock on a level with the upper line of navigation. The upper gate or ſluice may then be opened, and the boat floated out of the lock into the upper canal or line of navigation. For deſcending conveyance, the lock gates, plunger, and reſervoir, remaining or being put into the preſent ſuppoſed ſtate, let a boat or barge be floated into the lock from the upper canal or line, the upper gate or ſluice be cloſed, and the plunger raiſed, the water in the lock will fall as the water in the reſervoir takes place of the plunger; and when the plunger is wholly raiſed, the veſſel in the lock will have deſcended as many feet, *viz.* eight, as the plunger has aſcended, and the boat or barge being lowered to the water-level, or nearly ſo, of the lower line of navigation or canal, is ready to proceed along ſuch lower line, on the opening of the lower gate or ſluice. The lock remains in a ſituation to receive another veſſel from the lower line to be raiſed to the upper line in the courſe already deſcribed. It may be proper to obſerve, that in all caſes it is neceſſary that the height of the reſervoir ſhould be at leaſt equal to that of the lock, and that the plunger or plungers ſhould fill or nearly fill the reſervoir or reſervoirs.

"This method of conveying boats or barges from line to line, whenever it is expedient to be practiſed, ſeems, on a compariſon with other contrivances of a late invention, to be attended with the following material advantages.

"1ſt, The only machinery eſſentially neceſſary (the two ſluices excepted) is, for the purpoſe of raiſing and depreſſing the plunger or plungers.

"2d, Whilſt the machinery in other contrivances above alluded to, is either wholly or in part liable to injury from water, the machinery in this (the two ſluices excepted) is wholly exempt from that diſadvantage.

"3d, Whilſt in the other contrivances, caiſſoons, coffers, &c. require not only the opening of one or more ſluices, but alſo an adjuſtment of their ends to the mouth of the canal, to prevent the loſs of water, before each boat can enter the lock; according to this plan, on the opening of a ſingle ſluice, the boat floats at once into the lock without loſs of water, and without any ſuch delay or difficulty. When I ſay without loſs of water, it muſt be underſtood with this allowance, that if a boat goes down laden, and returns (or another goes up) unladen, the upper level gains a body of water equal to the weight of the cargo; *e contra*, the lower canal gains ſimilarly, if a boat goes down unladen, and returns laden.

"4th, By the application of this method to the common gate-lock, or by forming the lock of this invention for the eſcape of water from the higher level into the lock, and from the lock into the lower level, the properties and uſes of the common gate-lock and of this invention are united, and they may be uſed either in combination with other contrivances, or independently. So that

"5th, Whenever the water of the upper line is in plenty, ſufficient to allow of the tranſmiſſion of a lockful of water to the lower level, the machinery of this invention may be left at reſt, and veſſels may paſs and repaſs by the operation of the common lock: whereas in the other inventions alluded to, no boat or veſſel can paſs or repaſs without working the machinery, though the water be ever ſo abundant.

"6th, On the ſuppoſition that the lock uſed in this invention is conſtructed as the common gate lock for the tranſmiſſion of water, this further and important advantage ariſes, *viz.* that ſhould the machinery of the plunger or plungers be at any time diſordered, boats may ſtill paſs and repaſs as through the common gate lock; whereas, ſhould any accident embarraſs the machinery of the other locks already alluded to, the whole navigation is obſtructed."

CANDAULES, the laſt king of Lydia, of the family of the Heraclides, was ſo proud of the beauty of his wife, that he had the folly to let Giges, his favourite, ſee her naked while ſhe was bathing. The queen, enraged at this action, which, according to the opinion of the Lydians, rendered her infamous, perſuaded Giges to murder Candaules; after which ſhe married him, about 716 years before the birth of Chriſt. In him began the race of the Mermnades, which laſted till the defeat of Crœſus.

CANDLE (*Encycl.*). A patent was lately granted to Mr. Bolts, of Cannon-ſtreet, London, for an improved mode of manufacturing candles. The patentee, by means of moulds with ſpindles of proper ſhape and dimenſions in the centre, caſts hollow candles, or tubes of tallow or wax, without wicks. Theſe tubes are of various ſhapes, round, elliptical, hexagonal. The hollow in the centre of the tube is alſo of different ſhapes

and dimenſions, ſometimes round, for common purpoſes, ſometimes elliptical, to receive a broad flat wick which ſhall give a greater light. The wicks are put in at pleaſure, thicker or thinner at the choice of the perſon uſing the candles, who can thus, after having made trial of one candle for a ſhort while, ſo proportion the wicks to all the others of the ſame ſize in his poſſeſſion, that they ſhall burn equably and without waſte of tallow or wax by guttering. The wicks alſo are thus kept perfectly in the centre, without any of thoſe little projecting jags of cotton which frequently waſte and disfigure candles.

In ſome caſes, a ſolid centre of tallow or wax is inſerted into the tube above deſcribed; a ſpace being left between the centre and the tube for a circular wick, as uſed in Argand's lamp.

The wicks do not run the whole length of the candles, but are made ſometimes by means of a weight, ſometimes of a ſpring or key, to accommodate themſelves to the progreſſive conſumption of the tallow or wax, and ſeldom require to be ſnuffed.

Thin tubes of wax are alſo caſt, which are filled with a tallow inſide, adding economy to neatneſs. And whether wax or tallow be the ſubſtance employed, it is rendered more ſolid by the application of preſſure by means of an air-pump, while yet in a fluid ſtate in the moulds.

The patentee has, moreover, contrived a very ingenious and expeditious mode of manufacturing the wax or tallow tubes, which conſiſts in forcing, by means of an air-pump, a conſtant ſtream of the melting ſubſtance through a mould open at both ends, from which it falls, in proper candle lengths, into a veſſel of water placed beneath to receive them.

CANE, Grotta del, a celebrated grotto, on the banks of the Lake d'Agnano, ſeven miles from Puzzoli, in the kingdom of Naples. Here many dogs have been cruelly tortured and ſuffocated, to ſhew the effect of a vapour, which riſes a foot above the bottom of this little cave, and is deſtructive of animal life. A dog having his head held in this vapour is convulſed in a few minutes, and ſoon after falls to the earth motionleſs. The experiment is repeated for the amuſement of every unfeeling perſon who has half-a-crown in his pocket, and affects a turn for natural philoſophy. The fellows who attend at the cave, have always ſome miſerable dogs, with ropes about their necks, ready for this cruel purpoſe.

CANGERECORA, a large river of the peninſula of Hindoſtan. It deſcends from the Gaut Mountains, and flowing ſouth-weſt to the coaſt of Malabar, enters the weſtern ocean, four miles to the north of Mount Dilla; previous to which its courſe is parallel with the ſea coaſt for about eleven miles, being ſeparated only by a ſpit of ſand.

CANAADERAGO, Lake, a narrow lake of North America, in the ſtate of New York. It is about nine miles long, and lies to the Weſt of Lake Otſego. A ſtream called Oaks Creek, iſſues from it, and falls into the river Suſquehannah, five miles below Otſego. The beſt cheeſe in the ſtate of New York is made on this creek.

CANNÆ (anc. geog.), a mean hamlet of Apulia in the Adriatic, at the mouth of the river Aufidus; raiſed out of obſcurity by a moſt terrible overthrow given the Romans by the Carthaginians under Hannibal. The Roman conſuls were C. Terentius Varro, and L. Emilius Paulus. Their army was vaſtly ſuperior in numbers to the Carthaginians; but the latter were ſuperior in cavalry. Notwithſtanding, however, that the Romans were no fewer than 87,000, ſo great was the fame of Hannibal, that the conſuls were divided in their opinion as to the venturing of an engagement. Emilius was for avoiding a battle, and accordingly encamped on the eminences where the cavalry of the enemy could not act; but next day, it being Varro's turn to command, he advanced into the plain in which Cannæ was ſituated, and brought the army into ſuch a ſituation that an engagement became unavoidable. The Romans were then drawn up in the uſual manner; the *haſtadi* in the firſt line, the *principes* in the ſecond, and the *triarii* in the third. The cavalry were poſted on the wings. On the right, the Roman knights flanked the legionaries; on the left, the cavalry of the allies covered their own infantry. The two conſuls commanded the two wings, Emilius the right, and Terentius the left; and the two proconſuls Servilius and Attilius the main body. On the other hand, Hannibal, whoſe army conſiſted of 40,000 foot, and 10,000 horſe, placed his Gauliſh and Spaniſh cavalry in the left wing, to face the Roman knights; and the Numidian horſe in his right, over againſt the cavalry of the allies of Rome. As to his infantry, he divided the African battalions into two bodies; one of which he poſted near the Gauliſh and Spaniſh horſe, the other near the Numidian. Between theſe two bodies were placed on one ſide the Gauliſh, on the other the Spaniſh infantry, drawn up in ſuch a manner as to form an obtuſe angle projecting a conſiderable way beyond the two wings. Behind this line he drew up a ſecond which had no projection. Aſdrubal commanded the left wing; Maherbal the right; and Hannibal himſelf, with his brother Mago, the main body. He had alſo taken care to poſt himſelf in ſuch a manner that the wind *Vulturnus*, which riſes at certain ſtated times, ſhould blow directly in the faces of the Romans during the fight, and cover them with duſt. The onſet was begun by the light-armed infantry; the Romans diſcharging their javelins, and the *baleares* their ſtones, with pretty equal ſucceſs; nevertheleſs, the conſul Emilius was wounded. Then the Roman cavalry in the right wing advanced againſt the Gauliſh and Spaniſh in Hannibal's left. As they were ſhut in by the river Aufidus on one ſide, and by their infantry on the other, they did not fight, as uſual, by charging and wheeling off, and then returning to the charge; but continued fighting each man againſt his adverſary, till one of them was killed or retired. After they had made prodigious efforts on both ſides to overbear each other, they all on a ſudden diſmounted, and fought on foot with great fury. In this attack the Gauls and Spaniards ſoon prevailed; put the Romans to the rout; and purſuing them along the river, ſtrewed the ground with their dead bodies, Aſdrubal giving no quarter. This action was ſcarce over, when the infantry on both ſides advanced. The Romans firſt fell upon the Spaniards and Gauls, who, as already obſerved, formed a kind of triangle projecting beyond the two wings. Theſe gave ground, and, purſuant to Hannibal's directions, ſunk into the void ſpace in their rear; by which means they inſenſibly brought the Romans into the centre of the African infantry, and then the fugitives rallying, attacked them in front, while the Africans charged them in both flanks. The Romans, being by this artful retreat drawn into the ſnare and ſurrounded, no longer kept their ranks, but formed ſeveral platoons, in order to face every way. Emilius, who was on the right wing, ſeeing the danger of the main body, at the head of his legionaries, acted the part both of a ſoldier and general, penetrating into the heart of the enemy's battalions, and cutting great numbers of them in pieces. All the Roman cavalry that were left, attended the brave conſul on foot; and, encouraged by his example, fought like men in deſpair. But, in the mean time, Aſdrubal, at the head of a detachment of Gauliſh and Spaniſh infantry brought from the centre, attacked Emilius's legionaries with ſuch fury, that they were forced to give ground and fly: the conſul being all covered with wounds, was at laſt killed by ſome of the enemy who did not know him. In the main body, the Romans, though inveſted on all ſides, continued to ſell their lives dear; fighting in platoons,

and making a great ſlaughter of the enemy. But being at length overpowered, and diſheartened by the death of the two proconſuls Servilius and Attilius who headed them, they diſperſed and fled, ſome to the right, and others to the left, as they could find opportunity; but the Numidian horſe cut moſt of them in pieces: the whole plain was covered with heaps of dead bodies, inſomuch that Hannibal himſelf, thinking the butchery too terrible, ordered his men to put a ſtop to it.—There is a great diſagreement among authors as to the number of Romans killed and taken at the battle of Cannæ. According to Livy, the republic loſt 50,000 men including the auxiliaries. According to Polybius, of 6000 Roman horſe, only ſeventy eſcaped to Venuſia with Terentius Varro, and 300 of the auxiliary horſe. As to the infantry, the writer tells us, that 70,000 of the Roman foot died on the field of battle fighting like brave men; and that 13,000 were made priſoners. According to Dionyſius of Halicarnaſſus, of 6000 horſe, only 370 eſcaped the general ſlaughter, and of 80,000 foot, 3000 only were left. The moſt moderate computation makes the number of Romans killed amount to 45,000.

CANNAY, one of the weſtern iſles of Scotland, to the ſouth-weſt of the iſle of Skye. In this verdant and fertile iſland, are vaſt baſaltic columns, which riſe above each other to a great height, in many ſucceſſive ranges, each ſeparated from the other by a ſtratum of pebbly concretions, reſembling pudding-ſtone. On the eaſt ſide of the iſland, the tops of an immenſe number of theſe columns appear at low water, forming a ſort of cauſeway of ſurpriſing extent, and of which the ſurface is ſmooth and regular, like an ordinary paved ſtreet.

CANOGUE, a town of Hindoſtan Proper, in the province of Agra, ſeated on the weſt bank of the Ganges, near its confluence with the Calini. It is ſaid to have been built more than 1000 years before the Chriſtian æra, and to have been the capital of all Hindoſtan, under the predeceſſor of Porus, who fought againſt Alexander, in the year 326 before Chriſt. In the 6th century, it was ſaid to contain 30,000 ſhops, in which betel-nut (which the Indians almoſt univerſally chew, as ſome Europeans do tobacco) was ſold. It is now reduced to the ſize of a middling town. It is 127 miles ſouth-eaſt of Agra. Long. 80. 13. E. Lat. 27. 3. N.

CANOPUS, in Pagan mythology (*Encycl.*). It is ſaid, that the Chaldeans, who worſhipped fire, carried their fancied deity through other countries to try its power, in order that, if it obtained the victory over the other gods, it might be acknowledged as the true object of worſhip; and it having eaſily ſubdued the gods of wood, ſtone, braſs, ſilver, and gold, its prieſts declared, that all gods did it homage. This the prieſts of Canopus hearing, and finding that the Chaldeans had brought their god to contend with Canopus, they took a large earthen veſſel, in which they bored ſeveral holes, which they afterwards ſtopped with wax, and having filled the veſſel with water, painted it of ſeveral colours, and fitting the head of an idol to it, brought it out, in order to contend with the Chaldean deity. The Chaldeans accordingly kindled their fire all around it; but the heat having melted the wax, the water guſhed out through the holes, and extinguiſhed the fire; and thus Canopus conquered the god of the Chaldeans.

Canopus, or *Canobus*, according to Strabo, had been Menelaus's pilot, and had a temple erected to him in a town called *Canopus*, near one of the mouths of the Nile. Dionyſius mentions it.

Και τεμενος περιπυστον Αμυκλαιο Κανωβου.
There ſtands Canobus' temple known to fame;
The pilot who from fair Amycla came.

Voſſius remarks, on this occaſion, the vanity of the Greeks, who, as he conjectures, hearing of an Egyptian deity named *Canopus*, took from thence an opportunity of deifying the pilot of Menelaus who bore the ſame name, and giving out that the Egyptian god Canopus had been a Greek. F. Monfaucon gives ſeveral repreſentations of this deity. One, in alluſion to the victory above mentioned, throws out water on every ſide through little holes.

CANSTAT (*Encycl.*), erroneouſly ſpelt CONSTAT.

CANTABRIA (anc. geog.), a diſtrict of Terraconenſis, on the Oceanus Cantabricus or bay of Biſcay; now Biscay. The inhabitants were remarkable for their warlike character. In conjunction with the Aſturians, they carried on deſperate wars with the Romans; but they were ſubdued by them, about twenty-five years before Chriſt. Being impatient, however, of a foreign yoke, they in a few years revolted. Moſt of their youth had been already taken priſoners by the Romans, and ſold for ſlaves to the neighbouring nations; but having found means to break their chains, they cut the throats of their maſters; and returning into their own country, attacked the Roman garriſon with incredible fury. Agrippa marched againſt them with great expedition; but, on his arrival, met with ſo vigorous a reſiſtance, that his ſoldiers began to deſpair of ever being able to reduce them. As the Cantabrians had waged war with the Romans for upwards of 200 years, they were well acquainted with their manner of fighting, no way inferior to them in courage, and were now become deſperate; well knowing, that if they were conquered, after having ſo often attempted to recover their liberty, they muſt expect the moſt ſevere uſage, and cruel ſlavery. Animated with this reflection, they fell upon the Romans with a fury hardly to be expreſſed, routed them in ſeveral engagements, and defended themſelves when attacked by the enemy with ſuch intrepidity, that Agrippa afterwards owned, that he had never, either by ſea or land, been engaged in a more dangerous enterpriſe. That brave commander was obliged to uſe entreaties, menaces, and to brand ſome of his legionaries with ignominy, before he could bring them to enter the liſts with ſuch a formidable enemy. But having at laſt, with much ado, prevailed upon them to try the chance of an engagement in the open field, he ſo animated them by his example, that, after a moſt obſtinate diſpute, he gained a complete victory, which indeed coſt him dear, but put an end to that deſtructive war. All the Cantabrians fit to bear arms were cut in pieces; their caſtles and ſtrong holds taken and raſed; and their women, children, and old men (none elſe being left alive), were obliged to abandon the mountainous places, and ſettle in the plain.

CANTAL, a department of France, including part of the late province of Auvergne. It is ſo called from a high mountain, near St. Flour and Aurillac, almoſt always covered with ſnow. The capital is St. Flour.

CANTIUM (anc. geog.), a promontory of Britain, literally denoting a head-land, giving name to a territory called *Cantium*, now *Kent*. The promontory is now called the *North Foreland*.

CAPNOIDES, in botany, the trivial name of a ſpecies of Fumaria.

CAPPADOCIA-MAGNA (*Encycl.*). The firſt king of Cappadocia we read of in hiſtory was Pharnaces, who was preferred to the crown by Cyrus king of Perſia, who gave him his ſiſter Atoſſa in marriage. This is all we find recorded of him, except that he was killed in a war with the Hyrcanians. After him came a ſucceſſion of eight kings, of whom we know ſcarce any thing but that they continued faithful to the Perſian intereſt. In the time of Alexander the Great, Cappadocia was governed by Ariarathes II. who, notwithſtanding the vaſt conqueſts and fame of the Macedonian monarch, continued unſhaken in his fidelity to the Perſians. Alexander was

prevented by death from invading his dominions; but Perdiccas marching againſt him with a powerful and well-diſciplined army, diſperſed his forces, and having taken Ariarathes himſelf priſoner, crucified him, with all thoſe of the royal blood whom he could get into his power. Diodorus tells us that he was killed in the battle. He is ſaid to have reigned 82 years. His ſon Ariarathes III. having eſcaped the general ſlaughter of the royal family, fled into Armenia, where he lay concealed, till the civil diſſenſions, which aroſe among the Macedonians, gave him a fair opportunity of recovering his paternal kingdom. Amyntas, at that time the governor of Cappadocia, oppoſed him; but being defeated in a pitched battle, the Macedonians were obliged to abandon all the ſtrong holds. Ariarathes, after a long and peaceable reign, left his kingdom to his ſon Ariaramnes II. He applied himſelf more to the arts of peace than war, in conſequence of which Cappadocia flouriſhed greatly during his reign. He was ſucceeded by his ſon Ariarathes IV. who proved a very warlike prince, and having overcome Arſaces, founder of the Parthian monarchy, conſiderably enlarged his dominions.

He was ſucceeded by Ariarathes V. who marrying the daughter of Antiochus the Great, entered into an alliance with that prince againſt the Romans; but Antiochus being defeated, the king of Cappadocia was obliged to ſue for peace, which he obtained, after having paid 200 talents by way of fine, for taking up arms againſt the people of Rome. He afterwards aſſiſted the republic with men and money againſt Perſeus king of Macedon, on which account he was by the ſenate honoured with the title of the *friend and ally of the Roman people*. He left the kingdom in a very flouriſhing condition to his ſon Mithridates, who on his acceſſion took the name of Ariarathes VI.

This prince (ſurnamed *Philopater*, from the filial reſpect and love he ſhewed his father from his very infancy) immediately renewed the alliance with Rome. Out of mere goodnature he reſtored Mithrobuzanes, ſon to Ladriades king of the Leſſer Armenia, to his father's kingdom, though he foreſaw that the Armenians would lay hold of that opportunity to join Artaxias, who was then on the point of invading Cappadocia. The differences, however, were ſettled, before they came to an open rupture, by the Roman legates; and Ariarathes ſeeing himſelf delivered from an impending war by the mediation of the republic, preſented the ſenate with a golden crown, and offered his ſervice wherever they thought proper to employ him. The ſenate in return ſent him a ſtaff, and chair of ivory; which were preſents uſually beſtowed on thoſe only whom they looked upon as attached to their intereſt. Not long before this, Demetrius Soter king of Syria had offered Ariarathes his ſiſter in marriage, the widow of Perſeus king of Macedon: but this offer the king of Cappadocia was obliged to decline for fear of offending the Romans; and his ſo doing was in the higheſt degree acceptable to the republic, who reckoned him among the chief of her allies. Demetrius, however, being greatly incenſed at the ſlight put upon his ſiſter, ſet up a pretender to the throne, one Orophernes, a ſuppoſititious, or, as others call him, a natural ſon of the deceaſed king. The Romans ordered Eumenes king of Pergamus to aſſiſt Ariarathes with all his forces: which he did, but to no purpoſe; for the confederates were overthrown by Demetrius, and Ariarathes was obliged to abandon the kingdom to his rival. This happened about 159 years before Chriſt, and the uſurpers immediately diſpatched ambaſſadors to Rome with a golden crown. The ſenate declined accepting the preſent, till they heard his pretenſions to the kingdom; and this Orophernes, by ſuborned witneſſes, made appear ſo plain, that the ſenate decreed that Ariarathes and he ſhould reign as partners; but next year, Orophernes was driven out by Attalus brother to Eumenes, and his ſucceſſor to the kingdom of Pergamus.

Ariarathes being thus reſtored, immediately demanded of the Priennians 400 talents of gold which Orophernes had depoſited with them. They honeſtly replied, that as they had been entruſted with the money by Orophernes, they could deliver it to none but himſelf, or ſuch as came in his name. Upon this, the king entered their territories with an army, deſtroying all with fire and ſword. The Priennians, however, ſtill perſevered in their integrity; and though their city was beſieged by the united forces of Ariarathes and Attalus, not only made an obſtinate defence, but found means to reſtore the ſum to Orophernes. At laſt they applied to the Romans for aſſiſtance, who enjoined the two kings to raiſe the ſiege, under pain of being declared enemies to the republic. Ariarathes immediately obeyed; and marching his army into Aſſyria, joined Alexander Epiphanes againſt Demetrius Soter, by whom he had been formerly driven out of his kingdom. In the very firſt engagement Demetrius was ſlain, and his army entirely diſperſed, Ariarathes having on that occaſion given uncommon proofs of his courage and conduct. Some years after, a war breaking out between the Romans and Ariſtonicus, who claimed the kingdom of Pergamus in right of his father, Ariarathes joined the former, and was ſlain in the ſame battle in which P. Craſſus, proconſul of Aſia, was taken, and the Roman army cut in pieces. He left ſix ſons by his wife Laodice, on whom the Romans beſtowed Lycaonia and Cilicia. But Laodice, fearing leſt her children, when they came of age, ſhould take the government out of her hands, poiſoned five of them, the youngeſt only having eſcaped her cruelty by being conveyed out of the kingdom. The queen herſelf was ſoon after put to death by her ſubjects, who could not bear her cruel and tyrannical government.

Laodice was ſucceeded by Ariarathes VII. who, ſoon after his acceſſion, married another Laodice, daughter of Mithridates the Great, hoping to find in that prince a powerful friend to ſupport him againſt Nicomedes king of Bithynia, who laid claim to part of Cappadocia. But Mithridates, inſtead of aſſiſting, procured one Gordius to poiſon his unhappy ſon-in-law; and, on his death, ſeized the kingdom, under pretence of maintaining the rights of the Cappadocians againſt Nicomedes, till the children of Ariarathes were in a condition to govern the kingdom. The Cappadocians at firſt fancied themſelves obliged to their new protector; but, finding him unwilling to reſign the kingdom to the lawful heir, they roſe up in arms, and, driving out all the garriſons placed by Mithridates, placed on the throne Ariarathes VIII. eldeſt ſon of the deceaſed king.

The new prince found himſelf immediately engaged in a war with Nicomedes; but, being aſſiſted by Mithridates, not only drove him out of Cappadocia, but ſtripped him of a great part of his hereditary dominions. On the concluſion of the peace, Mithridates ſeeking for ſome pretence to quarrel with Ariarathes, inſiſted upon his recalling Gordius, who had murdered his father; which being rejected, with abhorrence, a war enſued. Mithridates took the field firſt, in hopes of over-running Cappadocia before Ariarathes could be in a condition to make head againſt him; but, contrary to his expectation, he was met on the frontiers by the king of Cappadocia with an army no way inferior to his own. Hereupon he invited Ariarathes to a conference; and, in ſight of both armies, ſtabbed him with a dagger, which he had concealed under his garment. This ſtruck ſuch terror into the Cappadocians, that they immediately diſperſed, and gave Mithridates an opportunity of poſſeſſing himſelf of the kingdom without the leaſt oppoſition. The Cappadocians, however, not able to endure the tyranny of his prefects, ſoon ſhook off the yoke;

and recalling the king's brother, who had fled into the province of Aſia, proclaimed him king. He was ſcarce ſeated on the throne, however, before Mithridates invaded the kingdom at the head of a very numerous army, and having drawn Ariarathes to a battle, defeated his army with great ſlaughter, and obliged him to abandon the kingdom. The unhappy prince ſoon after died of grief; and Mithridates beſtowed the kingdom on his ſon, who was then but eight years old, giving him alſo the name of *Ariarathes*. But Nicomedes Philopater, king of Bithynia, fearing leſt Mithridates, having now got poſſeſſion of the whole kingdom of Cappadocia, ſhould invade his territories, ſuborned a youth to paſs himſelf for the third ſon of Ariarathes, and to preſent to them a petition in order to be reſtored to his father's kingdom. With him he ſent to Rome Laodice, ſiſter of Mithridates, whom he had married after the death of her former huſband Ariarathes. Laodice declared before the ſenate, that ſhe had three ſons by Ariarathes, and that the petitioner was one of them; but that ſhe had been obliged to keep him concealed, leſt he ſhould undergo the ſame fate with his brothers. The ſenate aſſured him that they would at all events reinſtate him in his kingdom. But, in the mean time, Mithridates having notice of theſe tranſactions, diſpatched Gordius to Rome, to undeceive the ſenate, and to perſuade them that the youth to whom he had reſigned the kingdom of Cappadocia was the lawful ſon of the late king, and grandſon to Ariarathes, who had loſt his life in the ſervice of the Romans againſt Ariſtonicus. This unexpected embaſſy put the ſenate upon enquiring more narrowly into the matter, whereby the whole plot was diſcovered; upon which Mithridates was ordered to reſign Cappadocia, and the kingdom was declared free. The Cappadocians, however, in a ſhort time ſent ambaſſadors to Rome, acquainting the ſenate that they could not live without a king. This greatly ſurpriſed the Romans, who had ſuch an averſion to royal authority; but they gave them leave to elect a king of their own nation. As the family of Pharnaces was now extinct, the Cappadocians choſe Ariobarzanes; and their choice was approved by the ſenate, he having, on all occaſions, ſhewn himſelf a ſteady friend to the Romans.

Ariobarzanes had ſcarce taken poſſeſſion of his kingdom, when he was driven out by Tigranes king of Armenia; who reſigned Cappadocia to the ſon of Mithridates, in purſuance of an alliance previouſly concluded between the two parties. Ariobarzanes fled to Rome; and, having engaged the ſenate in his cauſe, he returned into Aſia with Sylla, who was enjoined to reſtore him to his kingdom. This was eaſily performed by Sylla, who, with a ſmall body of troops, routed Gordius who came to meet him on the borders of Cappadocia at the head of a numerous army. Sylla, however, had ſcarce turned his back, when Ariobarzanes was again driven out by Ariarathes, the ſon of Mithridates, on whom Tigranes had beſtowed the kingdom of Cappadocia. This obliged Sylla to return into Aſia, where he was attended with his uſual ſucceſs, and Ariobarzanes was again placed on the throne. After the death of Sylla, he was the third time forced by Mithridates to abandon his kingdom; but Pompey, having entirely defeated Mithridates near Mount Stella, reſtored Ariobarzanes to his throne, and rewarded him for his ſervices during the war, with the provinces of Sophene, Gordiene, and great part of Cilicia. The king, however, being now advanced in years, and deſirous of ſpending the remainder of his life in eaſe, reſigned the crown to his ſon Ariobarzanes, in preſence of Pompey; and never afterwards troubled himſelf with the affairs of ſtate.

Ariobarzanes II. proved no leſs faithful to the Romans than his father had been. On the breaking out of the civil war between Cæſar and Pompey, he ſided with the latter; but after the death of Pompey, he was received into favour by Cæſar, who even beſtowed upon him great part of Armenia. While Cæſar was engaged in a war with the Egyptians, Pharnaces king of Pontus invaded Cappadocia, and ſtripped Ariobarzanes of all his dominions; but Cæſar, having defeated Pharnaces, reſtored the kingdom of Cappadocia, and honoured him with new titles of friendſhip. After the murder of Cæſar, Ariobarzanes, having refuſed to join Brutus and Caſſius, was by them declared an enemy to the republic, and ſoon after taken priſoner and put to death. He was ſucceeded by his brother Ariobarzanes III. who was, by Marc. Anthony, deprived both of his kingdom and life; and in him ended the family of Ariobarzanes.

Archelaus, the grandſon of that general of the ſame name who commanded againſt Sylla in the Mithridatic war, was, by Marc. Anthony, placed on the throne of Cappadocia, though nowiſe related either to the family of Pharnaces or Ariobarzanes. His preferment was entirely owing to his mother Glaphyra, a woman of great beauty, but of a looſe behaviour, who, in return for her compliance with the deſires of Anthony, obtained the kingdom of Cappadocia for her ſon. In the war between Auguſtus and Anthony, he joined the latter; but, at the interceſſion of the Cappadocians, was pardoned by the emperor. He afterwards received from him Armenia the Leſſer, and Cilicia Trachæa, for having aſſiſted the Romans in clearing the ſeas of pirates, who greatly infeſted the coaſts of Aſia. He contracted a ſtrict friendſhip with Herod the Great, king of Judæa; and even married his daughter Glaphyra to Alexander, Herod's ſon. In the reign of Tiberius, Archelaus was ſummoned to appear before the ſenate; for he had always been hated by that emperor, becauſe in his retirement at Rhodes he had paid him no ſort of reſpect. This had proceeded from no averſion in him to Tiberius, but from the warning given Archelaus to his friends at Rome. For Caius Cæſar, the preſumptive heir to the empire, was then alive, and had been ſent to compoſe the differences of the Eaſt, whence the friendſhip of Tiberius was then looked upon as dangerous. But when he came to the empire, Tiberius, remembering the diſreſpect ſhewn him by Archelaus, enticed the latter to Rome by means of letters from Livia, who promiſed him her ſon Tiberius's pardon, provided he came in perſon to implore it. Archelaus obeyed the ſummons, and haſtened to Rome; where he was received by the emperor with great wrath and contempt, and ſoon after accuſed as a criminal in the ſenate. The crimes of which he was accuſed were mere fictions; but his concern at ſeeing himſelf treated as a malefactor was ſo great, that he died ſoon after of grief, or, as others ſay, laid violent hands on himſelf. He is ſaid to have reigned 50 years.

On the death of Archelaus, the kingdom of Cappadocia was reduced to a Roman province, and governed by thoſe of the equeſtrian order. It continued ſubject to the Romans till the invaſion of the eaſtern empire by the Turks, to whom it is now ſubject, but has no diſtinguiſhing modern name. In what was anciently called *Cappadocia*, however, the Turks have four beglerbeglics, called *Siwas*, *Trebizond*, *Maraſch*, and *Cogni*.

The religion of the ancient Cappadocians was much the ſame with that of the Perſians. At Comana there was a rich and ſtately temple dedicated to Bellona; whoſe battles the prieſts and their attendants uſed to repreſent on ſtated days, cutting and wounding each other as if ſeized with an enthuſiaſtic fury. No leſs famous and magnificent were the temples of Apollo Catanius, and of Jupiter: the laſt of which had 3000 ſacred ſervants, or religious votaries. The chief prieſt was next in rank to that of Comana; and, according

to Strabo, had a yearly revenue of 15 talents. Diana Perſica was worſhipped in a city called *Caſtaballa*, where women, devoted to the worſhip of that goddeſs, were reported to tread barefooted on burning coals, without receiving any hurt. The temples of Diana at Dioſpolis, and of Anias at Zela, were likewiſe held in great veneration both by the Cappadocians and Armenians, who flocked to them from all parts. In the latter were tendered all oaths in matters of conſequence; and the chief among the prieſts was no way inferior in dignity, power, and wealth, to any in the kingdom; having a royal attendance, and an unlimited authority over all the inferior ſervants and officers of the temple. The Romans, who willingly adopted all the ſuperſtitions and ſuperſtitious rites of the nations they conquered, greatly increaſed the revenues of this and other temples; conferring the prieſthood on ſuch as they thought moſt fit for carrying on their deſigns.—We are told that human ſacrifices were offered at Comana; and that this barbarous cuſtom was brought by Oreſtes and his ſiſter Iphigenia from Taurica Scythica, where men and women were immolated to Diana. But this cuſtom, if ever it obtained in Cappadocia, was aboliſhed in the times of the Romans.

CAPSA (anc. geog.), a large and ſtrong town of Numidia, ſituated amidſt vaſt deſerts, waſte, uncultivated, and full of ſerpents, where Jugurtha kept his treaſure. In his time it was taken and raſed by Marius the Roman general, who put to death all the citizens capable of bearing arms, and ſold the reſt for ſlaves. It was, however, afterwards rebuilt by the Romans, and ſtrongly fortified; but, on the decline of their empire, was taken and demoliſhed a ſecond time by Occuba, a famous Arab general. The walls of the citadel are ſtill remaining, and are monuments of the ancient glory and ſtrength of Capſa. They are 24 fathoms in height, and five in thickneſs, built of large ſquare ſtones, and have now acquired the ſolidity and firmneſs of a rock. The walls of the town were rebuilt by the inhabitants ſince their firſt demolition; but were afterwards deſtroyed by Jacob Almanzar, who ſent a governor and troops into the province. In Marmol's time Capſa was very populous, and abounded with ſtately moſques and other ſtructures of ſuperb and elegant workmanſhip; but at preſent it is occupied by a poor and indigent people, fleeced and oppreſſed by the Tuneſe government. In the very centre of the city ſtands an incloſed fountain, which both ſupplies the people with drink, and affords them an agreeable bath. The adjacent country is now cultivated, and produces ſeveral kinds of fruits; but the climate is unhealthy. The inhabitants are remarkable for their peeviſhneſs of temper. Both men and women dreſs handſomely except their feet, which they cover with coarſe ſhoes of bungling workmanſhip, and made of the rough ſkins of wild beaſts, equally inconvenient and unbecoming. E. Long. 9. 3. N. Lat. 33. 15.

CAPTION, in Scots law, a writ iſſuing under his majeſty's ſignet, in his majeſty's name, obtained at the inſtance of a creditor in a civil debt, commanding meſſengers at arms and other officers of the law to apprehend and impriſon the perſon of a debtor until he pay the debt.

CAPUA, a town of the kingdom of Naples, with an archbiſhop's ſee. It is two miles from the ancient Capua, and was built out of its ruins. It is the place where Hannibal and his officers triſled away their time in pleaſure, during which the Romans recovered from their conſternation after the battle of Cannæ. It was taken by the allies in 1707; and is ſeated on the river Volturno, 15 miles N. of Naples. Long. 14. 19. E. Lat. 41. 7. N.

CAPUA (anc. geog.), a very ancient city of Italy, in Campania, and capital of that diſtrict. It is famous for the abode of Hannibal the Carthaginian general after the battle of Cannæ, and where Livy accuſes him, but unjuſtly, of having enervated himſelf with pleaſure. It ſtill retains the name, and is the ſee of an archbiſhop. It is ſeated on the river Volturno, in E. long. 15. 5. N. lat. 41. 7.

CARACCAS (*Encycl.*). Of this diſtrict the coaſt is rocky and mountainous, interſperſed with ſmall fertile valleys; ſubject at certain ſeaſons of the year to dry north-weſt winds, but bleſſed in general with a clear air and wholeſome climate. A very great illicit trade is carried on by the Engliſh and Dutch with this province, notwithſtanding all the vigilance of the Spaniards, who have ſcouts perpetually employed, and breaſtworks raiſed in all the valleys. A vaſt number of cacao-trees are cultivated in this province; and it is reckoned that the crop of cacao produced here amounts to more than 100,000 fanegas of 110 pounds each. The country of Santa Fé conſumes 20,000; Mexico a little more; the Canaries a ſmall cargo; and Europe from 50 to 60,000. The cultivation of the plant employs 10 or 12,000 negroes. Such of them as have obtained their liberty have built a little town called *Nirva*, into which they will not admit any white people. In 1728 a company was formed at St. Sebaſtian, which obtained an excluſive right of maintaining connections with this part of the new world. Four or five ſhips, which they diſpatch every year, ſail from thence, but they return to Cadiz.

CARAITES (*Encycl.*). The Caraites paſs for the moſt learned of the Jewiſh doctors. They are chiefly to be met with in Poland, Muſcovy, and the Eaſt; and they are but few in compariſon of the bulk of the Jews who are of the party of the rabbins. The latter have ſo great an averſion to the Caraites, that they will have no alliance or even converſation with them: they treat them as baſtards; and would a Caraite turn rabbiniſt, the other Jews would not receive him. In our original article this word has been erroneouſly ſpelt GARAITES.

CARARA, a ſmall town of Italy, in the duchy of Maſſa, between the towns of Maſſa and Sarzana, five miles from each. Near this place are quarries of marble of various colours. Long. 9 55. E. Lat. 44. 5. N.

CARASU, a river of Natolia, which riſes in Caramania, croſſes part of Aladula, and falls into the Mediterranean. The water of this river is ſo cold, that when Alexander the Great bathed in it, it threw him into a dangerous diſeaſe. The emperor Barbaroſſa was killed by it on his return from the Holy Land, in 1100.

CARASU-MESTRO, a river of Romania, in Turkey in Europe, which takes its riſe in Mount Rodolpho, and falls into the Archipelago.

CARASUI, a lake in Bulgaria, ſaid to be 55 miles in circumference, and to contain ſeveral iſlands. It is formed by a branch of the Danube, not far from its entrance into the Black Sea.

CARAVACCA, or THE CROSS OF CARAVACCA, a town in Spain, among the mountains near the Segura, in Murcia. They pretend to have a croſs here, brought by an angel to a prieſt, who was going to ſay maſs to a Mooriſh king. It is 50 miles N.W. of Carthagena. Long. 2. 5. W. Lat. 38. 5. N.

CARDIGAN-BAY, on the coaſt of Cardiganſhire, at the mouth of the Tyvy, extending to Barſey iſland in Carnarvonſhire. It is 40 miles from one cape to the other, and affords good ſhelter for ſhips.

CARIGNANO, a town of Piedmont, in a diſtrict of the ſame name. It is ſeated on the river Po, three miles S. of Turin. Long 7. 45. E. Lat. 44. 57. N.

CARIMAN-JAVA, a cluſter of iſlands to the N. of Java, at the principal of which European ſhips touch for refreſh-

ments in their voyage to Borneo. Long. 110. 12. E. Lat. 5. 56. S.

CARNATIC, The, a country of the peninſula of Hindooſtan, extending from the Guntoor Circar, along the whole coaſt of Coromandel, to Cape Cormorin; including its appendages, which are Tanjore, Maravar, Tritchinopoly, Madura, and Tinevelly. It is 570 miles in length from N. to S. but no-where more than 120, and commonly 75 miles wide. The revenue of the ſovereign, who is called Nabob of Arcot, is ſtated at 1,500,000l. per annum, out of which he pays a ſubſidy of 160,000l. to the Eaſt-India Company, toward the expence of their military eſtabliſhment. The Britiſh poſſeſſions in the Carnatic are confined chiefly to the tract called the Jaghire, which extends 108 miles along the coaſt, and 47 inland in the wideſt part; its annual revenue 150,000l. There is, beſides, a land-revenue of 725,000l. dependent on Madras. The Carnatic is a rich, fertile, and populous country, and contains an incredible number of fortreſſes. Public monuments too, the unequivocal marks of civilization and opulence, are more common here than in the N. parts of India. In 1787 the Eaſt-India Company took the whole adminiſtration of the Carnatic, and the collection of the nabob's revenues, into their own hands; on which account his highneſs inſtituted a ſuit in the Britiſh Court of Chancery againſt the Company, and likewiſe preſented a petition for redreſs to the Houſe of Commons.

CAROLINA. (*Encyl.*) This country is ſeated between extremities of heat and cold, though the heat is more troubleſome in ſummer than the cold in winter; their winters being very ſhort, and the froſty mornings frequently ſucceeded by warm days. The air is generally ſerene and clear the greateſt part of the year; but in February and March, the inhabitants have a cuſtom of burning the woods, which cauſes ſuch a ſmoke as to ſtrangers would ſeem to proceed from a fog or thickneſs in the air. The ſmoke of the tar-kilns likewiſe deceives the ſtrangers, and gives them an ill opinion of the air of Carolina; to which alſo conduces a cuſtom of the Indians of ſetting fire to the woods in their huntings, for many miles round. The great rains are in winter, though they are not without heavy ſhowers at midſummer; add to theſe the conſtant dews that fall in the night, which refreſh the ground and ſupply the plants with moiſture. In North Carolina, the north-weſt winds in the winter occaſion very pinching weather: but they are not of long continuance. Weſterly winds bring very pleaſant weather; but the ſoutherly are hot and unwholeſome, occaſioning fevers and other diſorders. But this muſt be underſtood of ſummer, for in winter they are very comfortable. The depth of winter is towards the latter end of February, and then the ice is not ſtrong enough to bear a man's weight. In Auguſt and September, there are ſometimes great ſtorms and ſqualls of wind, which are ſo violent as to make lanes of 100 feet wide, more or leſs, through the woods, tearing up the trees by the roots. Theſe ſtorms generally happen once in about ſeven years; and are attended with dreadful thunder, lightning, and heavy rains. They commonly happen about the time of the hurricanes which rage ſo fatally among the iſlands between the tropics; and ſeem to be occaſioned by them, or to proceed from the ſame cauſe: but by the time they reach Carolina, their force is much abated; and the further north they proceed, ſo much the more do they decreaſe in fury. The ſoil on the coaſt is ſandy; but further up, the country is ſo fruitful, that they have not yet been at the trouble to manure their land. The grains moſt cultivated are Indian corn and rice, though any ſort will thrive well enough; they have alſo pulſe of ſeveral ſorts, little known in England. All kinds of garden-ſtuff uſual in England are cultivated here, and may be had in great plenty. They export large quantities yearly of rice, pitch, tar, turpentine, deer-ſkins, and timber for building; cypreſs, cedar, ſaſſafras, oak, walnut, and pine. Beſides theſe they alſo ſend out beef, pork, tallow, hides, furs, wheat, peas, potatoes, honey, bees-wax, myrtle-wax, tobacco, ſnake-root, cotton, ſeveral ſorts of gums, and medicinal drugs. Indigo is alſo cultivated in this province, but of an inferior quality to that which comes from the Caribbee iſlands. It hath been attempted in vain to cultivate vines, and produce ſilk, in this country; for though the froſts here do not continue long without intervals of warmer weather, they are ſufficient to check the growth of the vine, as well as olives, dates, oranges, &c. The furs are bought of the Indians with vermilion, lead, gunpowder, coarſe cloth, iron, and ſpirituous liquors. As yet they have not a ſufficient number of handicraftſmen; which renders labour very dear, and a ſupply of clothes from Europe neceſſary. The aſpect of the country is very fine, being adorned with beautiful rivers and creeks, and the woods with lofty timber, which afford delightful and pleaſant ſeats for the planters, and render the fencing their lands very eaſy. And as they have plenty of fiſh, wild fowl, and veniſon, beſides other neceſſaries which this country produces naturally, they live eaſy and luxuriouſly. The planters and their families that are born here, are troubled with few diſtempers; and are generally tall, well made, and active. The women who are not expoſed to the weather are remarkably fair and handſome, with fine eyes. They marry at thirteen or fourteen; and where there is no clergyman, the ceremony is performed by a juſtice of the peace. They are very fruitful, have eaſy labours, and the children at nine months old are able to run about the houſe. Both ſexes, as well young as old, are very dextrous in paddling and managing the canoes, being bred to it from their infancy. The religion of the planters is that of the church of England; but, as there is liberty of conſcience, here are diſſenters of all ſorts.—The moſt ſubſtantial people build their houſes with brick and lime made with oyſter-ſhells; for there is no ſtone except near the mountains. The meaner ſort make theirs with rough boards, and cover them with ſhingles. Their diet, except Indian corn, differs little from ours; and they import ſeveral ſorts of ſtrong liquors. Beſides which they have cyder, perſimon, and cedar-beer, of their own. They have likewiſe a beer made with molaſſes, wheat-bran, and hops, which is very good. There are mines of pit-coal in this country; but they have ſuch plenty of wood for firing, that there is no occaſion to work them.

Their rivers are large, and navigable a great many miles up the country. They riſe near the mountains, and abound with delicate fiſh, beſides water-fowl of different kinds. In ſome there are iſlands which yield good paſture, without the annoyance of wild beaſts. The chief mountains are the Cherokee or Allegany mountains, which are ſituated north and north-weſt, five or ſix hundred miles diſtant from the ſea. They are very high; and abound with trees, plants, ſtones, and minerals, of different kinds. The inhabitants chiefly make uſe of paper money among themſelves.

The moſt common diſeaſes are agues, cachexies, fluxes, the yaws, colics, convulſions, the hooping-cough, tetters, the prickly heat, and the itch.

The Indians, like thoſe in other parts, are well made, of a red copper colour, with black hair, and the whites of their eyes ſtreaked with red. They have no beard, nor hair on any part of the body but the head. Thoſe that are clothed and brought up among the planters, have their ſkins of a bright reddiſh colour; but thoſe that go naked are more

duſky, from a cuſtom of daubing themſelves with bears' greaſe. However, by painting themſelves with roucou, they appear more red than they naturally would be. They uſe other colours on different occaſions. They generally go quite naked, except a few who have been taught to be a little more modeſt. They are great ſmokers, and good marksmen; and will walk on the ridge of a houſe without fear of danger of falling.

This country is divided into North and South Carolina, and Georgia; each of which is under a particular governor. The North is ſubdivided into four counties, Granville, Colleton, Berkley, and Craven; and South Carolina into two, Clarendon and Albemarle. This laſt is alſo divided into fourteen pariſhes or townſhips, each of which has a brick or timber church. The former likewiſe has the ſame number of pariſhes. Charleſtown is the capital of the whole country.

Carolina was diſcovered by Sebaſtian Cabot, about the year 1500, in the reign of Henry VII. but the ſettling of it being neglected by the Engliſh, a colony of French Proteſtants, by the encouragement of Admiral Coligni, were tranſported thither; and named the place of their firſt ſettlement *Arx Carolina*, in honour of their prince, Charles IX. of France: but in a ſhort time that colony was deſtroyed by the Spaniards; and no other attempt was made by any European power to ſettle there till the year 1664, when 800 Engliſh landed at Cape-Fear in North Carolina, and took poſſeſſion of the country. In 1670 Charles II. of Britain granted Carolina to the Lords Berkley, Clarendon, Albemarle, Craven, and Aſhley, Sir George Carteret, Sir William Berkley, and Sir John Colliton. The plan of government for this new colony was drawn up by the famous Mr. Locke, who very wiſely propoſed an univerſal toleration in religious matters. The only reſtriction in this reſpect was, that every perſon claiming the protection of that ſettlement, ſhould, at the age of ſeventeen, regiſter himſelf in ſome particular communion. To civil liberty, however, our philoſopher was not ſo favourable; the code of Carolina gave to the eight proprietors who founded the colony, and to their heirs, not only all the rights of a monarch, but all the powers of a legiſlation. The court, which was compoſed of this ſovereign body, and called the *Palatine Court*, was inveſted with the right of nominating to all employments and dignities, and even of conferring nobility; but with new and unprecedented titles. They were, for inſtance, to create in each county two *caciques*, each of whom was to be poſſeſſed of 24,000 acres of land; and a *landgrave*, who was to have 80,000. The perſons on whom theſe honours ſhould be beſtowed were to compoſe the upper houſe, and their poſſeſſions were made unalienable. They had only the right of farming or letting out a third part of them at the moſt for three lives. The lower houſe was compoſed of the deputies from the ſeveral counties and towns. The number of this repreſentative body was to be increaſed as the colony grew more populous. No tenant was to pay more than about a ſhilling per acre, and even this rent was redeemable. All the inhabitants, however, both ſlaves and freemen, were under an obligation to take up arms upon the firſt order from the Palatine court.

It was not long before the defects of this conſtitution became apparent. The proprietary lords uſed every endeavour to eſtabliſh an arbitrary government; and, on the other hand, the coloniſts exerted themſelves with great zeal to avoid ſervitude. In conſequence of this ſtruggle, the whole province, diſtracted with tumults and diſſenſions, became incapable of making any progreſs, though great things had been expected from its particular advantages of ſituation. Though a toleration in religious matters was a part of the original conſtitution, diſſentions aroſe likewiſe on that account. In 1705, Carteret, now Lord Granville, who, as the oldeſt of the proprietors, was ſole governor of the colony, formed a deſign of obliging all the non-conformiſts to embrace the ceremonies of the Church of England; and this act of violence, though diſavowed and rejected by the mother-country, inflamed the minds of the people. In 1720, while this animoſity was ſtill ſubſiſting, the province was attacked by ſeveral bands of ſavages, driven to deſpair by a continued courſe of the moſt atrocious violence and injuſtice. Theſe unfortunate wretches were all put to the ſword: but, in 1728, the lords proprietors having refuſed to contribute towards the expences of an expedition, of which they were to ſhare the immediate benefits, were deprived of their prerogative, except Lord Granville, who ſtill retained his eighth part. The reſt received a recompence of about 24,000l. The colony was taken under the immediate protection of the crown, and from that time began to flouriſh. The diviſion into North and South Carolina now took place; and the ſettlement of GEORGIA commenced in 1732.

CARPATHIAN MOUNTAINS, mountains which divide Hungary and Tranſylvania from Poland.

CARSHALTON, a village in Surrey, ſituated ſouth-weſt of Croydon. It lies among many ſprings, which joining others from Croydon and Beddington, form a river, in the very ſtreet, called the Wandle.

CARRIAGE (*Encycl.*), a vehicle ſerving to convey perſons, goods, merchandizes, and other things, from one place to another. The following deſcription of an apparatus for preventing paſſengers in carriages being injured when the horſes have taken fright, by Mr. George Davis, of Windſor, is worthy of being noticed, ſince the Society for the Encouragement of Arts, Manufactures, and Commerce, deemed the inventor worthy of a bounty of thirty guineas. Having given in plate 19. a view of the apparatus as fixed to a coach, we ſhould conceive it will not be neceſſary to enter into a very particular deſcription of it. We ſhall therefore only relate the manner of operation in the inventor's words.

"It is fixed behind the ſplinter-bar," ſays he, "and the communication, by means of a copper chain, is carried through the boot to the ſide of the coach-box, that, in caſe of the horſes taking fright, or, of that more fatal accident, the reins breaking, which precludes the poſſibility of ſtopping the horſes, the coachman can diſcharge them inſtantaneouſly. There is this ſuperiority in my invention over any other method hitherto put in practice, That the horſes can be liberated, even when the pole is at right angles, or locked cloſe to the perch, a poſition which otherwiſe overturns a carriage. I have had the honour of exhibiting a trial before his majeſty, and diſcharged the horſes three times; which Mr. Vidler, of Millbank, can atteſt, having been preſent on the ſpot, and who was pleaſed to ſay, that he thought, if it was more generally known, no carriage would be without it.

"Fig. A, is the ſplinter-bar of a carriage, to which the horſes are attached by the traces fixed to the rollers B, B, B, B, and to the pole C.

"D D D, a braſs chain, extending from the coach-box to the ſplinter-bar: this chain goes under the roller F, is then wound once round the pulley G, and thence directed, by the ſmall rollers H and I to the quadrant K, to the fartheſt extremity of which it is attached.

"The quadrant K has a vertical axis, on the upper part of which is a pinion with four teeth (ſee L, figs. 2 and 3). This pinion works in two racks, M, M, fixed on two elbow-head bolt-bars N, N; and by means of theſe racks, the bolts are moved backwards and forwards by the action of the quadrant K.

Theſe bolt-bars extend from the centre of the ſplinter-bar

to its extremity, the ſtraight end of the bolts ſhooting into the rollers B, B, fig. 1, at the end of the ſplinter-bar, and the elbow-heads, *n*, *n*, ſhooting into the two centre-rollers B, B.

" On the lower part of the axis of the quadrant K is a female ſcrew, which receives a bolt O (ſee fig. 3), one end of which, when bolted, paſſes through the bolt C: the other end of it is a ſmall ſcrew.

" P, Q, are two collars fixed on the ſplinter-bar, which collars confine the axis, and prevent its being diſplaced.

" Fig. 4, ſhews the pulley G, round which the chain D paſſes: the axis of this pulley contains two female ſcrews, R, S, with threads in different directions moving the two bars, T, V, backwards or forwards, ſo as to protrude them on the conical part of the naves of the fore wheels of the carriage, and to act as a brace thereon, ſo as to retard their motion.

" Fig. 5, is a link of the chain, in order to ſhew its make or formation.

" When the horſes are to be detached, and the carriage ſtopped, the coachman, ſitting on the coach-box, draws up a handle W, fig. 1, affixed to the chain D by means of an iron bolt with a ſpring upon it, to retain it when drawn out: the chain D pulls back the quadrant K, and draws back the double bolts N, N, which paſs through ſquare holes at the lower end of the rollers B. The ſame motion of the quadrant, by means of its female ſcrew, raiſes the ſcrew-bolt O, and ſets the pole at liberty; ſo that the horſes move off with the pole and rollers. It has been before obſerved, that the chain D winds once round the pulley G; by this means, when the chain is drawing up to detach the horſes, the motion of the pulley propels, from its female ſcrew on each ſide, bolts which have ſcrew-heads at one end, and wedges at the other, which wedges, when propelled, act as braces on the conical-formed naves of the fore-wheels, and ſtop the motion of the fore-wheels.

" X is a ſquare head on the axis of the quadrant K: by means of a key applied on this head, when neceſſary to attach the horſes to the carriage, the quadrant is returned to its place, and bolts the rollers and pole, after they are replaced in their proper ſituations: the quadrant at the ſame time pulls back the chain on the pulley G, which pulley draws back the wedge-bolts from the conical naves of the fore-wheels, and ſets them free to move.

" The Committee of Mechanics, to whoſe conſideration this buſineſs was referred by the Society, appointed a trial to be made near the Magazine in Hyde Park, on Thurſday, the 27th of March, 1800, with a coach, to which the apparatus was attached. Four horſes and two poſtillions were employed for the purpoſe. A perſon ſitting on the coach-box looſed the pole and rollers from the carriage, by pulling a chain placed near the boot, which chain drew back the bolts in the ſplinter-bar, and allowed the pole and rollers to be carried off by the horſes, at a time when they were galloping at the rate of more than ten miles an hour. The experiment was repeated thrice, and the horſes diſengaged each time; but the impetus given to the carriage by the velocity of the horſes, occaſioning the coach to run forwards above twenty yards on level ground, after the horſes were detached, the committee were of opinion, that a part, but not the whole of the object of the ſociety was anſwered, as the paſſengers in the carriage might yet ſuffer injury from the motion of the carriage after the horſes were liberated. On their noticing this circumſtance to Mr. Davis, and a gripe being added to ſtop the motion of the wheels, Mr. Davis, on the 8th of May laſt, produced the preſent ingenious invention to the committee; by means of which, at one pull of the chain, the horſes may be liberated, and two bolts propelled on the nave of the fore-wheels, ſo as to retard their motion."

The following is the ſpecification of the patent granted to Mr. Reddel, of Birmingham, for a new method of conſtructing carriages for the conveyance of merchandize either by land or water; which carriages may be removed (either loaded or unloaded) from the land to the water, or from the water to the land, with eaſe, expedition, and ſafety.

" I make the bodies of the carriages," ſays Mr. Reddel, " to any form or ſize required, chiefly of wood, and ſtrengthen or faſten the parts together with iron, or any other ſuitable ſubſtance, and make the bottoms, ends, and ſides of them as water-tight as poſſible. I then fix a ſuitable number of wheels thereto, by means of an axletree, or axletrees, or in any other eligible manner (but in moſt caſes it will be beſt to place them ſo that the bottom of the carriage or carriages may not be more than ſix, or leſs than three or four inches above the level ſurface of the ground). I ſometimes place the wheels, in ſuitable receſſes, in the ſides of the boat-parts, or bodies, of the carriages, and put either a broad plank, or ſome ſtrong iron work, over their centres, in order to ſupport and protect them; or they may be fixed in narrow water-tight compartments, or boxes, in ſuitable places in the inſide of the boat-part, or body, of the carriage, but of courſe the number of the wheels, and the manner of fixing them, muſt be varied according to circumſtances. When they are in the water, a conſiderable number of the ſmall-ſized carriages may be faſtened together, in any eligible manner, and hauled by one horſe; and if they are wanted out of the water they muſt be ſeparated, and drawn up an inclined place by one or more at a time. They may then be taken up, or let down, a plane to a higher or lower level of water, as circumſtances may require, or be drawn by land (either loaded or unloaded) to any place wherever they may be wanted, very near, if not quite, as readily as a common waggon or cart. Carriages of this deſcription may be made to carry any reaſonable burden, that is to ſay, from one ton to twenty tons and upwards, according to the uſes for which they are intended; ſuch as are meant to be drawn about when on the land by two or three horſes would be beſt, if calculated to carry about two or three tons. They may be made principally with ſquare ends, and may be either linked, tied, or grappled, to each other when they are in the water, or a rope or ropes, chain or chains, may paſs through either rings, loops, or holes, made in, or attached to, each of them: and by means of a lever, weight, or ſpring, in one or both of the end carriages, they may be braced together ſufficiently tight. The foremoſt end of the body of the leading carriage, if it is deemed neceſſary, may be made in the uſual cut-water form, and the hindmoſt may have a rudder attached to it, which may be taken off, or put on, at pleaſure, and they all may be ſteered together as one boat. In canals, where the water is on different levels, if a ſufficient quantity cannot conveniently be ſpared from the upper level for the ſupply of locks, it will be extremely eligible to have carriages of the aforeſaid deſcription to carry about ſix or eight tons each, and when three of them are faſtened together in the water, they will be equal in ſize and appearance to a common canal coal-boat, and to paſs them from one level to another it would be neceſſary to have an inclined plane or planes to go down into the water at the head of the upper level, and another from thence down into the water of the lower level, and of courſe a certain degree of power would likewiſe be neceſſary to let down, and draw up, the carriages on the inclined planes. A ſmall ſteam-engine, ſomewhat like thoſe which are uſed at ſeveral of the colleries in the kingdom, to draw the coals out of the pits, if well executed, would paſs upwards of two hundred tons over the planes in an hour, if the difference in the levels was not more than twenty or thirty feet; and the expence of making the planes, and erecting the engine, would not be much more, if ſo much, as making four common

locks, with the neceſſary appendages; or any other power might be made uſe of that was thought more eligible. If ſtill greater diſpatch is required, the machinery may be made a little ſtronger, and carriages of nine or ten tons burden or more may eaſily be taken over the planes, and then may be ſo conſtructed that when two of them are faſtened together in the water, they would form but one complete boat in ſize and appearance, of courſe they may paſs the locks together as one boat, if there are any locks on the line of the canal where theſe boat-carriages may be uſed, or paſs the planes ſeparately, with expedition and ſafety."

The following duties have been laid by parliament on carriages kept for pleaſure.

By the ſtat. 38 Geo. III. c. 41. there ſhall be paid from and after April 5, 1798, in lieu of the old duties repealed by this act, the following duties for every carriage herein-after mentioned:

	£.	s.	d.
For one ſuch carriage with four wheels and no more	9	12	0
For two ſuch carriages with ditto - -	10	4	0
For three with ditto - - - -	11	4	0
For four with ditto - - -	11	8	0
For five with ditto - - -	11	11	0
For ſix with ditto - - -	11	12	0
For ſeven with ditto - - -	11	13	6
And for eight ſuch carriages with four wheels and upwards - -	11	14	0

The ſaid duties to be charged for every carriage with four wheels, or any number thereof, kept by any perſon for his own uſe, or to let out for hire.

And there ſhall be paid for every ſuch carriage with four wheels let to hire for the purpoſe of travelling poſt, by any licenſed poſtmaſter, or inn-keeper, and whereon the name and abode of the perſon licenſed ſhall be painted - 8 8 0

And for every carriage with leſs than four wheels 4 4 0

The laſt duty to be charged on every carriage with leſs than four wheels, kept by any perſon for his own uſe, or to let out to hire, to be paid by the perſon keeping or uſing ſuch carriage.

TABLE OF THE DUTY ON CARRIAGES.

No. of Carriages with 4 Wheels.	Duty per Carriage	Total Amount	No. of Carriage with 2 Wheels.	Duty per Carriage	Total Amount
	L. S. D.	L. S. D.		L. S. D.	L. S. D.
1	9 12 0	9 12 0	1	4 4 0	4 4 0
2	10 4 0	20 8 0	2		8 8 0
3	11 4 0	33 12 0	3		12 12 0
4	11 8 0	45 16 0	4		16 16 0
5	11 11 0	57 15 0	5		21 0 0
6	11 12 0	69 12 0	6		25 4 0
7	11 13 6	81 14 6	7		29 8 0
8	11 14 0	93 12 0	8		33 12 0
9		105 6 0	9		37 16 0
10		117 0 0	10		42 0 0
11		128 14 0	11		46 4 0
12		140 8 0	12		50 8 0
13		152 2 0	13		54 12 0
14		163 16 0	14		58 16 0
15		175 10 0	15		63 0 0
16		187 4 0	16		67 4 0
17		198 18 0	17		71 8 0
18		200 2 0	18		74 12 0
19		211 16 0	19		79 16 0
20		223 10 0	20		80 0 0

And ſo on, at the rate of 11l. 14s. for every carriage with four wheels, and 4l. 4s. for every carriage with two wheels.

Note, Carriages with four wheels, let to hire to travel poſt for a day, or leſs period of time, or by the mile, or from ſtage to ſtage, are chargeable only 8l. 8s. per carriage.

CART (*Encycl.*). We propoſe to extend this article, by availing ourſelves of the ſelections of our reſpectable fellow-labourer the editor of the DOMESTIC ENCYCLOPÆDIA.

In rural economy, the proper conſtruction, and adaptation of carts to different ſoils and ſituations, are objects of the firſt conſequence to every reflecting farmer. Nevertheleſs, it is ſurpriſing, that little attention has been paid to this important ſubject, previous to the late improvements in agriculture: the flouriſhing æra of which, in Britain, commenced about the middle of laſt century, or the year 1754, when that patriotic Society for the Encouragement of Arts, Manufactures, and Commerce, was inſtituted at London. Since that memorable period, numberleſs inventions have been introduced into rural economy, and the names of many other illuſtrious promoters of true national wealth, will be remembered by a grateful poſterity. In Mr. Arthur Young's Annals of Agriculture, the 18th volume, we meet with an elaborate paper, entitled *The Farmer's Cart*; by the editor; from which we ſhall extract the following particulars: Mr. Young firſt obſerves, that the moſt general farmer's carriage in England, is a waggon, drawn by four horſes, in which is conveyed corn, hay, wood, &c. but not dung or earth, which are uſually moved by carts, or tumbrils, drawn by three or four horſes:—carriers almoſt univerſally employ broad-wheeled waggons, drawn by eight horſes.

In Scotland, waggons were formerly uſed, but afterwards changed for large carts, and more lately for ſmall ones, drawn by one horſe.

In Ireland, the moſt common vehicle at preſent is the one-horſe car, with low wheels beneath the body of the machine; which has univerſally ſuperſeded the uſe of Engliſh carts and waggons, from a conviction of their inferiority. Nothing, ſays Mr. Young, exceeds the amazing expedition with which corn and hay fields are cleared in that country, by means of this uſeful, though inelegant implement. In conſequence of ſuch a deciſive encomium, as well as the very favourable account given of this machine by the late Mr. Bakewell, of Diſhley, Leiceſterſhire, in the Communications to the Board of Agriculture, we have been induced to preſent our readers with the following deſcription, of an Improved Iriſh Car. See Pl. 19.

The advantages of this vehicle, which was preferably employed, and ſtrongly recommended, by the laſt-mentioned agriculturiſt, conſiſts in the facility with which it is laden, on account of its lowneſs; and, when gate-ways and roads are narrow, much room is gained by the wheels being fixed under the body of the cart. In ſuch ſituations, therefore, it is well calculated for carrying manure, eſpecially on meadow or ploughed land; and for that purpoſe, its wheels ought to have a flat bearing, and to be at leaſt ſix inches in breadth. Another peculiarity in the conſtruction of this cart is, that its wheels are neceſſarily cylindrical; and that the facility of draught ariſing from this unobſerved circumſtance, was probably imputed to ſome other part of the machinery. But, though contrary to the generally-received opinion, Mr. Alexander Cummins (in his Obſervations on the Effect which Carriage-wheels with Rims of different Shapes have on the Roads, printed in the Communications to the Board of Agriculture), has ſatisfactorily demonſtrated, and it is likewiſe evinced by experience, that the reſiſtance to the cylindrical wheel is not increaſed, but diminiſhed, by increaſing the breadth and the flat bearing of its rim. The knowledge of this fact is of very great importance to the farmer, as well as to the waggoner;

ſer, by availing himſelf of this ſimple improvement, he may be enabled, in almoſt all ſeaſons, to drive his broad-wheeled carts, &c. on his meadow or ploughed ground, when no narrow wheel can be employed.—Hence it would be ſuperfluous to enumerate the further advantages of this implement; yet, when the width of gate-ways and the breadths of roads will admit of the wheels being placed at the ſides of the cart, without confining the width of its body, it will probably be more advantageous to have them at the ſides, than under the cart.

One of the greateſt advocates for one-horſe carts, is Lord Robert Seymour, whoſe excellent paper on this ſubject, dated Taliaris, 5th September, 1796 (inſerted in the 27th volume of the Annals of Agriculture), deſerves the thanks of all Britiſh farmers. This patriotic nobleman ſtrongly recommends the cart which he employs on theſe eſtates, as a moſt uſeful implement of huſbandry. Convinced of its ſuperior excellence, in many ſituations, we have thought proper to annex an accurate engraving of this cart, for the elucidation of which, we ſhall extract the following particulars from his lordſhip's letter, addreſſed to the editor of the laſt-mentioned work:

The advantages of ſingle-horſe carts are univerſally admitted, wherever they have been attentively compared with carriages of any other deſcription. By his own obſervation, Lord Seymour is led to conclude, that a horſe acting ſingly will do half as much more work as in conjunction with another, ſo that two horſes will, ſeparately, perform the work of three conjunctively. This difference, he believes, ariſes partly from the ſingle horſe being ſo near the load he draws, and partly from the point or line of draught being ſo much below his breaſt; as the wheels of ſingle-horſe carts are uſually made very low. When a horſe draws in conjunction with another, he is generally embarraſſed by ſome difference of rate—the horſe behind, or before him, being quicker or ſlower than himſelf: whereas a ſingle horſe has only his load to contend with, and is not inconvenienced by the greater or leſſer height of his fellow. Nor is there any neceſſity for employing additional drivers; as horſes, once in the habit of going ſingly, will follow each other as uniformly and ſteadily, as they do when harneſſed together: hence, on the moſt frequented roads in Ireland, one man conducts three, four, or five ſingle-horſe carts, without any inconvenience to the paſſenger.

Dimenſions of the body of the cart: two feet eleven inches acroſs the bottom; three feet nine inches, inſide length; one foot high; ſloping top, nine inches. It has iron wheels; two feet eight inches high; rim, three inches and a half wide, and from three-quarters to an inch thick: ſpoke, three inches and a quarter at each end, worked off to two inches at its centre. See Pl. 19.

In the introduction to the letter above alluded to, his lordſhip obſerves, that the price of iron-caſt into wheels is 16s. per cwt: and the weight of each wheel is about three-quarters of a hundred.—Two inconveniences, however, ariſe from the uſe of low caſt-iron wheels; namely, 1. That ſuch iron is very liable to break upon concuſſion; and, 2. That the courſe of a wheel of ſo ſmall a diameter, occaſions a very quick conſumption of greaſe. The firſt of theſe objections is, in a great meaſure, removed by the facility with which the rim of the wheel may be repaired by the application of wrought-iron; the latter being joined to the former by a rivet, the wheel acquires a degree of elaſticity, and thus becomes, perhaps, ſtronger than it was when new. In order to furniſh a regular ſupply of greaſe, Lord Robert has introduced four grooves or cavities in the boxes, increaſing a little towards their centres: and with a view to defend the axle-tree, which conſiſts of wrought-iron, againſt the harder body of the box, he ordered the extremity of it to be ſteeled.

Mr. Arthur Young, in the 18th volume of his Annals of Agriculture, before quoted, ſtates the following dimenſions of a ſingle-horſe cart, which he, by the teſt of experience, has found to be the moſt advantageous:

Buck.—Length, 5 feet 1 inch.
Breadth, 3 feet 7 inches.
Depth, 2 feet.
Cubical feet, 35 and a fraction.

On his farm of 350 acres, in Suffolk, Mr. Young employs only five ſuch carts; and obſerves, that he would not add more than one to the number, even though he ſhould increaſe his buſineſs to 400 or 500 acres: hay, corn in the ſtraw, faggot-wood, billets, dung, clay, marl, lime, bricks, &c. are all conveyed by them; carrying out nine, and even ten coombs of wheat in ſacks, and they are never drawn by more than one horſe or ox.—No farm of the ſame extent, in an arable country, has leſs than three waggons, three tumbrils, and a light cart: the exact price of theſe different implements, in the year 1792, amounted to 109l.; while the building of ſix carts, upon Mr. Young's plan, coſts only 63l: thus he ſaves about 40 per cent. in annual repairs. Beſides this great reduction of expence, another circumſtance deſerves particular notice.—As theſe carts had for many years been the object of ridicule, Mr. Young offered a bet to one of his prejudiced neighbours, that he ſhould load a waggon, till five horſes could not ſtir with it; and Mr. Young engaged to carry away that load with eaſe, in his carts, with four of the ſame horſes; but the confidence which his antagoniſt poſſeſſed in waggons would not allow him to accept the offer.

The infinite benefit,, concludes Mr. Young, of which theſe carts would be to the roads, if their uſe ſhould become general, may be eaſily conceived. In all the examinations before committees of the Houſe of Commons, as well as in moſt of the treatiſes publiſhed on the ſubject, it has been admitted that no police or management can keep the roads in repair, while ſuch weights are permitted to be drawn in a ſingle carriage. Parliament has been made ſo ſenſible of this fact, that repeated acts have been paſſed, by which the weight of waggons was limited, and a certain breadth of the wheels enjoined. Experience, however, has proved, that both are inſufficient, and that the only method of effecting a favourable change, would be to prohibit numerous teams. Let every man carry whatever weight he pleaſes in one-horſe carts, and pay a light toll; led the load of a two-horſe cart be limited, and the toll increaſed; further leſſening the weight, and raiſing the toll, when four horſes are employed; and thus advancing the turnpike expences for every additional horſe, till it amounts nearly to a prohibition. If ſuch a plan were to be adopted, we ſhould ſoon ſee all our roads in an improved ſtate. Rollers have, indeed, been greatly indulged both in weight and toll; but this was a prepoſterous meaſure, for a roller will cruſh a pebble to duſt, as well as a wheel, and the badneſs of roads muſt be attributed to the materials being reduced to powder, almoſt as ſoon as laid on, and either blown away in duſt, or carried off in mud. Having followed ſome of Sharp's waggons, and obſerved the effect, Mr. Young is perſuaded, that the roller is more detrimental to the road than nine-inch wheels. In ſuch an enquiry, facts only can decide the queſtion: the Iriſh roads are made at an expence beyond compariſon leſs than the Engliſh, and were at the time he viſited that country greatly ſuperior to thoſe in England. This difference, in his opinion, muſt be attributed entirely to the uſe of one-horſe carts, as he has explained in his Tour of Ireland. "Many hundred thouſands a-year would be ſaved in England, if theſe carts were ſo favoured in road-acts, as to enſure a great decreaſe of waggons." On the whole, he ventures to recommend the uſe of one-horſe carts to his brother farmers, with that confidence

which ought to arise solely from numerous and varied experiments.

Having concluded the subject of single-horse carts, we shall only observe, for the information of those who employ teams with two-wheeled carriages, that several useful implements have lately been invented, for the more effectual stopping of such carts, in descending steep hills, and likewise for taking off the increased weight thrown on the shaft horse's back in all descents. See a description of the latter contrivance, under the head of LOCKING-POLE. The WHEEL-DRAG is represented in Pl. 19. where *a, a, a, a,* is a piece of wrought-iron, curved to the exact form of a cart-wheel, with the thickest part at *b*, on which the weight of the cart rests. 1, 2, 3, 4, are shoulders, that keep the wheel within the drag, and should be about four inches high. *c*, is the wheel, made of solid iron, which is nearly as wide as the drag, seven inches in diameter; runs on its axis at *d*; has a strong shoulder; and, as it projects, resists the sudden jolts of rough roads. *e*, is the chain to be fastened to the near shaft, in order to keep the drag properly under the wheel, which, from being violently jerked, might be apt to pass over the drag, and leave it behind: this is a necessary precaution, though seldom wanted if the drag be well constructed. In the shoulders marked 1, 2, are holes, by which the drag is suspended on hooks beneath the tail of the cart when it is not employed.

In London and Westminster, carts are not permitted to carry more than twelve sacks of meal, 750 bricks, one chaldron of coals, &c. on pain of forfeiting one of the horses (stat. 6 Geo. I. c. 6).—By the laws of the city, carmen are forbidden to ride either on their carts or horses: they are to lead or drive them on foot through the streets, under the penalty of 10s.

Rolling carts are very useful machines for carrying manure on low-lands during wet seasons. According to an account given by Mr. Richard Moyle, and inserted in the 14th volume of the Transactions of the Society for the Encouragement of the Arts, &c. such a cart consists of three circular pieces of strong elm, two feet in diameter, and each eighteen inches long, through which a strong iron axis is passed, so as to protrude a few inches on each end beyond the rollers; after all, allowing an inch between each piece, for the conveniency of turning round. On the projecting part of the axis, a fixed frame is placed, for supporting the body of the cart, which, according to the nature of the soil, may be loaded to any degree, and employed simply as a roller, or for carrying manure, &c. on land where common wheels cannot be admitted.

By means of these rolling carts, the surface of the land is to be frequently compressed, in order to consolidate the soil more perfectly, so that the earthy particles may embrace the roots of the grasses, and retain their proper moisture; on which the luxuriancy of such soils in a great measure depends.

By 38 Geo. III. c. 93, there shall be paid for every carriage with less than four wheels, to be drawn by one horse, which shall be built wholly of wood and iron, without any covering other than a tilted covering, and without any lining or springs, or any ornament whatever, other than paint of a dark colour for the preservation of the wood or iron only, and which shall have the words "A TAXED CART," and also the owner's name and abode, thereon, and the price of which (repairs excepted) shall not have exceeded or which shall not at any time exceed twelve pounds, the annual sum of 1l and 4s.

But nothing herein shall authorise any person to keep any carriage as a taxed cart, who shall be liable to the duties for any four-wheel carriage, or for two male servants; but every such person shall be liable to the full duty of four pounds four shillings, imposed on carriages with two wheels.

Also all carriages, of whatever construction the same may be, which shall be let out to hire, shall be subject to the duty of 4l. 4s.

But no person assessed to this duty of 1l. 4s. shall be charged in respect thereof with the additional duties granted by the triple assessment act of this session. And if any cart shall have been assessed, the commissioners may, on appeal, cause the assessments to be vacated, but so as not to annul any payment already made, nor the collection of any arrears: but such appeals are not to be heard till after ten days' notice to the surveyor; and in case either the party, or surveyor, shall be dissatisfied, they may demand a case, in like manner, as for other assessed taxes.

Persons occupying farms, or carrying on trades, and making a livelihood solely thereby, and ecclesiastical persons not possessed of an annual income of one hundred pounds or upwards, whether arising from ecclesiastical preferment, or otherwise, who shall keep any carriage subject to the duty hereby granted, shall be charged, in respect of the horse, at the rate prescribed for horses not kept for the purpose of riding, or drawing carriages, so as such horse be not at any time used for riding or drawing carriages.

Every person to be rated as aforesaid, shall paint on a black ground in white letters, or on a white ground in black letters, on the outside of the back pannel, or back part of such carriage, or if it be constructed without a back part on which they may be painted, then on the side, or some conspicuous part on the outside, his christian and sur-names, and the place of his abode, and the words "A TAXED CART," in Roman letters, and in words at full length, each at least one inch in length, and shall, upon demand, produce such carriage to the assessor or surveyor, or at any meeting of the commissioners; and if any person shall keep any such carriage, the price whereof, or for any subsequent addition (repairs excepted), have been charged (the proof of which shall lie on the owner) at more than 12l. or if the value thereof shall appear to the commissioners, on examination, to exceed 12l. or if such carriage shall be built contrary to the provisions before mentioned, or shall not be so marked, or if such person shall neglect or refuse, upon demand, to produce the carriage, such person shall be charged with the duty of 4l. 4s.

Nothing herein shall subject to the said duty of 1l. 4s. any cart whatever which shall be kept without fraud to be used wholly in the affairs of husbandry or of trade, by reason of the owner or any of his servants riding therein, when laden, or when returning from, or going to, any place, to or from which any load shall be to be carried in the course of husbandry, or for the purpose of trade, or for conveying the owners thereof, or their families, to or from divine service, on Sundays, or for carrying persons going to or returning from the election of members of parliament.

CART, the name of two rivers of Renfrewshire, in Scotland, distinguished by the appellation of *Black* and *White*. The Black Cart issues from the lake called Lochwinnoch, or Castle Semple Loch; the White Cart descends from the north-east angle of the county; and, uniting their streams, they both flow into the Clyde, near Renfrew. Opposite this town, in the road to Port Glasgow, is a handsome bridge of ten arches, built exactly at the confluence of these two rivers. Three roads meet upon this bridge, so that it has three ends or entrances.

CARTERET ISLAND, an island of the South Pacific Ocean, seen by Captain Carteret in 1767. It is about six leagues long from east to west. Long. 159. 14. E. Lat. 8. 26. S.

CARTHAGO, a rich trading town of North America, in Mexico, with a bishop's see, 360 miles west of Panama. Long. 85. 0. W. Lat. 9. 5. N.

CARTHAMUS (*Encycl.*). Having in the article DYEING referred to CARTHAMUS, we think it necessary to speak more at large on its qualities. We shall therefore present the reader with the account given of it by Berthollet.

" *Carthamus* contains two kinds of colouring matter; the one, yellow; the other, red. The firſt alone is ſoluble in water: its ſolution is always turbid: with re-agents it exhibits the appearances commonly obſerved in yellow colouring matter: acids render it lighter, alkalies make it deeper, and more approaching to orange: both produce a ſmall portion of a fawn-coloured precipitate by means of which it becomes clearer. Alum forms with it a deep yellow precipitate in ſmall quantity: ſolution of tin, and other metallic ſolutions, precipitates which have nothing remarkable.

" Alcohol acquires but a ſlight tincture from the flowers, after all the yellow ſubſtance has been extracted by repeated waſhings. If theſe flowers be put into a ſolution of cauſtic alkali, they become yellow, and the liquor which is preſſed out is of a deep yellow colour. On ſaturating the alkali with an acid, the liquor becomes turbid, reddiſh, and gradually depoſits a very ſmall quantity of a reddiſh yellow precipitate. With ſolutions of alum, zinc, and tin, a yellow precipitate is formed; and with ſolutions of iron and copper, a precipitate inclining to green. If inſtead of a ſolution of cauſtic alkali, a ſolution of carbonat of alkali be uſed, acids produce with it a more copious precipitate of a redder hue: but the redneſs differs according to the acid employed. Alum alſo produces with the latter alkaline ſolution, a red precipitate, which is ſo light, that it generally ſwims on the ſurface of the liquor. This colouring matter is ſo delicate, and ſo eaſily changed, that if heat be employed to diſſolve it, the precipitates produced by acids will not have ſo fine a colour.

" Mr. Beckmann has obſerved, that the carthamus of Thuringia contained much more of the yellow matter, than that of the Levant: that in other reſpects the red matter of the former was by no means inferior in beauty to that obtained from the latter: yet, that to produce equal effects, half as much more of it was required. He next examined, whether this difference depended on the climate, or only on the mode of preparation.

" Haſſelquiſt relates, in his travels in Egypt, that when the flowers of carthamus are gathered, they are preſſed between two ſtones, to ſqueeze out the juice. After this they are waſhed ſeveral times with water, which in Egypt is naturally ſalt. When taken out of the water they are preſſed between the hands, and then ſpread on mats, placed on the flat roofs of their houſes; where they are covered in the day-time, that the ſun may not dry them too faſt, but left expoſed to the dew at night. They are occaſionally turned, and when ſufficiently dry, taken in, and kept for ſale under the name of *ſaffranon*.

" If the carthamus of Levant, ſuch as it is in commerce, be compared with that of Thuringia, the former will be found to be more pure, a little moiſt, and in compreſſed maſſes; the latter, drier and more elaſtic. Theſe differences depend on the preparation. Writers on agriculture, deceived by the erroneous name of *baſtard ſaffron* given to carthamus, have ſuppoſed, that it ſhould be treated like ſaffron. Hence they direct it to be gathered in a dry ſeaſon, and dried with care. Mr. Beckmann thinks, on the contrary, that the mode adopted in Egypt ought to be imitated. He adviſes even to add a little ſalt to the water uſed in preparing it, to give it the quality it has naturally in Egypt.

" The flower of carthamus has a fine colour of fire, but in drying it grows yellow. It ſhould not be gathered till it grows dry; and it is better if it has been rained upon in that ſtate, though the contrary opinion is erroneouſly held. The want of rain may be ſupplied by watering the flowers morning and evening. When they are gathered, the ſeeds may ſtill be left to ripen.

" The intention of theſe directions is, to promote the ſeparation of the yellow matter, the abundance of which conſtitutes the difference between the carthamus of our climates, and that of the Levant. Carthamus ſhould be kept in a moiſt place, as its becoming too dry would be injurious.

" There are many reaſons to induce us to enrich our agriculture with this production. The ſeeds of carthamus are very good food for wild fowl, and particularly for parrots, whence they have received the name of grain de perroquet. An uſeful oil might be expreſſed from them, and the reſidue given to cattle. The dry leaves and ſtalks would ſerve as fodder for ſheep and goats in the winter; and thoſe ſtalks which are too large might be uſed as fuel, after they had ſtripped them. Mr. Beckmann has found the carthamus ripen well at Gottingen, where the ſoil is ſandy. The ground ſhould be moderately dunged; and the plant neither tranſplanted nor watered.

" No uſe is made of the yellow ſubſtance of carthamus: but to extract that part, it is put into a bag and trodden in water, till no more colour can be preſſed out. The flowers, which were yellow, become reddiſh in this operation, and loſe nearly half their weight: it is in this ſtate they are uſed.

" The yellow ſubſtance might however be employed: and Mr. Poerner has made many experiments on the ſubject. (Vide *Chemiſche Verſuche und Bemerkungen zum Nutzen der Farbekunſt; dritter Theil.*) The principal reſults of his experiments were, that wool, without any preparation, takes from it a yellow colour, which is not permanent; but that which it takes after having been prepared with alum and tartar, though not very laſting, is better. Mr. Beckmann aſſerts, that cloth prepared with tartar, or with tartar and alum, acquires from it a good yellow colour; and that carthamus contains more yellow colouring matter than an equal weight of ſuſtic itſelf.

" To extract the red part of carthamus, and afterwards apply it on the ſtuff, recourſe is had to the property alkalies poſſeſs of diſſolving it; and it is precipitated by means of an acid. It has been found, that lemon-juice produces the fineſt colour. Mr. Beckmann ſays, that next to this, the ſulphuric acid produces the beſt effect, provided a proper quantity only be uſed."

CARWAR, a ſea-port of the peninſula of Hindooſtan, on the coaſt of Malabar. It was ſubject to Tippoo Sultan, regent of Myſore, and is ſixty miles S. by E. of Goa. Long. 74. 34. E. Lat. 15. 0. N.

CASA DEL CAMPO, a palace belonging to the king of Spain, ſeated on the weſt ſide of Madrid, oppoſite the caſtle on the other ſide of the river.

CASCO BAY, a bay on the eaſt of the province of Main, in New England, ſituated between Cape Elizabeth, and Cape Small Point. It is twenty-five miles wide; and is a beautiful bay, interſperſed with ſmall iſlands. Long. 69. 30. W. Lat. 44. 5 N.

CASBIN, or CASWIN, a conſiderable town of Perſia, in Irac Agemi, where ſeveral of the kings of Perſia have reſided. The houſes are below the ſurface of the earth. The air is ſubject to ſuch ſudden changes, from heat to cold, and the contrary, that it is very unwholeſome for ſtrangers. Nadir Shah built a palace here, incloſed by a wall a mile and a half in circumference; and the town is encircled by one four miles in circuit. It carries on a great trade, and is ſeated near the high mountain Elwend, where there are fine quarries of white marble, 180 miles north of Iſpahan. Long. 52. 16. E. Lat. 35. 30 N.

CASCHAW, or CASSOVIA, a town of Upper Hungary, on the river Horat, 115 miles north-eaſt of Buda. Long. 21. 25. E. Lat. 48. 46. N.

CASHGUR, a kingdom of Aſia, in Tartary, otherwiſe

called Little Bokharia; bounded on the north by the Calmucs and Monguls, on the eaſt by Thibet and the deſerts of Gobi, on the ſouth by Hindooſtan, from which it is ſeparated by the high mountains of Hindoo-ko, and on the weſt by Great Bukharia. This country is populous and fertile, but the air is cold, on account of the mountains. Here are rich mines of gold and ſilver, which the natives do not work, becauſe they are employed wholly in feeding cattle. The muſk-animals are found in this country; and they have ſeveral precious ſtones beſide diamonds.

CASHGUR, a town of Aſia, capital of a kingdom of the ſame name. It ſtands at the foot of the mountains, and enjoys a good trade with the neighbouring countries. The houſes are of ſtone, and very good. Both ſexes dreſs alike. Their complexion is ſwarthy, and they have all black hair, Long. 73. 25. E. Lat. 41. 30. N.

CASHNA, an extenſive empire in the centre of Africa, being part of the region called Soudan, by the Arabs, and Nigritia or Negroland by the Europeans. It is bounded on the north by the mountains of Eyre, which ſeparate it from Fezzan, and by a diſtrict of Zahara in the Deſert; on the ſouth by the Niger; and on the eaſt by the kingdom of Zamphara and the empire of Bornou. It reſembles Bornou much in climate, ſoil, and natural productions, and in the colour, genius, religion, and government of the people. The rains, indeed, are leſs violent than thoſe of Bornou. Its monkeys and parrots (but ſeldom ſeen in Bornou) are numerous and of various ſpecies. The common people are leſs courteous in Caſhna than in Bornou. A thouſand towns and villages are ſaid to be included in this empire, which, like Bornou, conſiſts of different tribes or nations, ſubject to the dominion of one ruling power.

CASHNA, the capital of the empire of Caſhna in Africa. It is 370 miles S. by W. of Meſurata, in 16. 20. N. lat.

CASSERTA, a magnificent palace of his Sicilian majeſty, ſixteen miles north of Naples. This immenſe building is of a rectangular form, 780 feet by 580; about 112 feet high, comprehending five habitable ſtories, which contains ſuch a number of apartments, as to accommodate the moſt numerous court, without any acceſſory buildings. The gardens are proportionably extenſive and magnificent.

CASSOVIA, a ſtrong town of Hungary, with the fineſt arſenal in that kingdom. It is near the river Horat, fifty-five miles north-eaſt of Agria. Long. 21. 25. E. Lat. 46.48. N.

CASTELLANE, a pleaſant town in France, in the department of the Lower Alps and late province of Provence. It is ſeated on the river Verdon, in a mountainous country, which, however, is fertile in corn and paſture. About a mile from the town, is a ſalt ſpring, from which the water iſſues in ſuch abundance as to turn the mill at the very ſource. Many of the ancient lords of Caſtellane were diſtinguiſhed among the Provençal poets, called Troubadours. It is twenty-ſeven miles S. by E. of Senez. Long. 6. 34. E. Lat. 43. 55. N.

CASTELLAZO, a town of Italy, in the duchy of Milan, remarkable for a battle fought between the French and Auſtrians in 1704. It is two miles eaſt of Alexandria. Long. 8. 50. E. Lat. 45. 3. N.

CASTELLON, a town of Spain, in Catalonia, five miles N.W. of Roſes. Long. 2. 58. E. Lat. 42. 18. N.

CASTELNAUDARY, a conſiderable town of France, in the department of Aude and late province of Languedoc, on an eminence, at the foot of which is the Royal Canal, which here forms a baſon about 3600 feet in circumference. Near this town, in 1632, Marſhal Schomberg defeated the army of Gaſton duke of Orleans, and took the unfortunate Montmorency priſoner. Caſtlenaudary is fifteen miles weſt of Carcaſſone. Long. 2. 0. E. Lat. 43. 19. N.

CASTELVETRO (*Encycl.*). Erroneouſly ſpelt CASTELVERTO.

CASTON, a town in Norfolk, with a market on Monday. It is ten miles N. by W. of Norwich, and 113 north-eaſt of London. Long. 1. 22. E. Lat. 52. 48. N.

CASTOR, a town of Lincolnſhire, with a market on Saturday. It is twenty miles north-eaſt of Lincoln, and 159 north of London. Long. 0. 9. W. Lat. 53. 30. N.

CASTRO, a town of South America, in Chili, capital of the iſland of Chiloe. It is 180 miles ſouth of Baldivia. Long. 75. 5. W. Lat. 42. 4. S.

CASTRO-DEL-REY, a town of Spain in the province of Galicia. Long. 3. 24. W. Lat. 43. 20. N.

CASTRO-MARINO, a town of Portugal, in Algarve. It is ſtrong by ſituation, and ſeated near the mouth of the Guadiana, fifty-five miles S. of Beja. Long. 7. 12. W. Lat. 37. 6. N.

CASTRO-VEREGNA, a town of South America, in Peru, remarkable for mines of ſilver, good tobacco, and wholeſome air. It is 125 miles ſouth-eaſt of Lima. Long. 74. 45. W. Lat. 12. 50. S.

CATACOUSTICS. See ACOUSTICS in this SUPPLEMENT.

CATHARINE I. Empreſs of Ruſſia, was raiſed to that dignity, from the condition of a menial ſervant, by the diſcerning Peter the Great, who married her in 1711. She attended the emperor in all his expeditions; and when he was ſurrounded by the Turks on the banks of the Pruth, his army was ſaved by her prudent advice. Peter afterwards never reſolved on any affair of conſequence without firſt conſulting her; ſucceſs attended him in every thing, and the court of Peterſburgh appeared in a new light. He inſtituted the order of St Catharine in her honour, which he gave her power to beſtow on ſuch of her ſex as ſhe judged proper; and, finally, appointed her his ſucceſſor. On the death of her huſband, ſhe took all proper means to ſecure the quiet, advance the civilization, and promote the general welfare, of her kingdom; and it is more than probable, that the late illuſtrious Empreſs Catharine II. conſidered her as a bright example: for Catharine I. eſtabliſhed the Academy of Sciences at Peterſburgh, now brought to ſuch perfection. She likewiſe increaſed the naval force of Ruſſia: and ſet on foot a deſign for diſcovering the north-eaſt paſſage to China. "The lenity of this princeſs (ſays Voltaire, in his Life of Peter the Great) was carried to a degree unparalleled in the hiſtory of any nation. She promiſed, that during her reign nobody ſhould be put to death; and ſhe kept her word: ſhe was the firſt ſovereign that ever ſhewed this reſpect to the human ſpecies. Malefactors were condemned to work in the mines, and other public works; a regulation not leſs prudent than humane, ſince their puniſhment was rendered of ſome advantage to the ſtate." She died on the 17th of May, 1727; leaving iſſue, Anne who married Frederic duke of Holſtein, and Elizabeth afterwards empreſs of Ruſſia.

CATHARINENSLAF, or ECATERRINENSLAF, one of the governments of the Ruſſian empire, being the new name of the extended government of Aſoph, which is now made to compriſe New Ruſſia and the Crimea. This government is divided into two provinces; namely, Catharinenſlaf, which includes New Ruſſia and the late government of Aſoph; and the province of Taurida, which includes the Crimea.

CATHARINENSLAF, the capital of the province of the ſame name, built by the late Empreſs of Ruſſia. It is ſeated near the ſpot where the river Kiltzin falls into the Samara. Its

name ſignifies, "The glory of Catharine;" and it is colonized by many Greeks and Armenians from Crim Tartary, and others of the nations who ſerved in the preceding war againſt the Turks. It is 178 miles N.E. of Cherſon. Long. 35. 15. E. Lat. 47. 23. N.

CATMANDU, the capital of Napaul, in Hindooſtan Proper, 445 miles E. of Delhi. Long. 84. 51. E. Lat. 28. 6. N.

CATOUCH, Cape, the N.E. promontory of Yucatan, in South America. Long. 86. 30. W. Lat. 22. 10. N.

CATTACK, or Cuttack, the capital of Oriſſa, a province of Hindooſtan, in the Deccan. It is a poſt of conſequence, as it lies on the only road between Bengal and the Northern Circars; and the poſſeſſion of the city and its dependencies gives the Berar rajah (a Mahratta prince) more conſequence in the eyes of the government of Bengal, than even his extenſive domain and central poſition in Hindooſtan. Cattack is ſeated on the river Mahanuddy, near its entrance into the bay of Bengal, and 220 miles S.W. of Calcutta. Long. 86. 1. E. Lat. 20. 51. N.

CATTARICK, a village, near Richmond, in the W. riding of Yorkſhire. It has a bridge over the river Swale, and there is a ſort of cataract near it, from which it ſeems to have derived its name. It appears to have been a great city in the time of the Romans, one of whoſe highways croſſed the river here. On the banks of it are the foundations of great walls, and a mount caſt up to a vaſt height. Many Roman coins and urns have been dug up here. The final deſtruction of this city was by the Danes.

CATTERTHUN (*Encycl.*). This Caledonian poſt is, by Mr. Pennant, deſcribed as of uncommon ſtrength. "It is (ſays he) of an oval form, made of a ſtupendous dike of looſe white ſtones, whoſe convexity, from the baſe within to that without, is 122 feet. On the outſide, a hollow, made by the diſpoſition of the ſtones, ſurrounds the whole. Round the baſe is a deep ditch, and below that about 100 yards, are veſtiges of another, that went round the hill. The area within the ſtony mound is flat; the axis, or length of the oval, is 436 feet, the tranſverve diameter 200. Near the eaſt ſide is the foundation of a rectangular building; and on moſt parts are the foundations of others ſmall and circular: all which had once their ſuperſtructures, the ſhelter of the poſſeſſors of the poſt: there is alſo a hollow, now almoſt filled with ſtones, the well of the place." There is another fortification, but of inferior ſtrength, in the neighbourhood. It it called the *Brown Catterthun*, from the colour of the ramparts, which are compoſed only of earth. It is of a circular form, and conſiſts of various concentric dikes. On one ſide of this riſes a ſmall rill, which, running down the hill, has formed a deep gully. From the ſide of the fortreſs is another rampart, which extends parallel to the rill, and then reverts, forming an additional poſt or retreat.

CAVENDISH (Margaret) ducheſs of Newcaſtle, famous for her voluminous productions, was born about the latter end of the reign of James I. and was the youngeſt ſiſter of Lord Lucas of Colcheſter. She married the Duke of Newcaſtle abroad in 1645; and on their return after the Reſtoration, ſpent the remainder of her life in writing plays, poems, with the life of her huſband, to the amount of about a dozen folios. "What gives the beſt idea of her unbounded paſſion for ſcribbling (ſays Mr. Walpole), was her ſeldom reviſing the copies of her works, leſt, as ſhe ſaid, it ſhould diſturb her following conceptions." She died in 1673.

CAUCASUS, one of the 41 governments into which the Ruſſian empire has been lately formed. It is divided into the two provinces of Aſtracan and Caucaſus, but is not yet ſubdivided into diſtricts. The province of Caucaſus is to compriſe the Cuban, and all that diſtrict to the E. and S. now in the poſſeſſion of Ruſſia, between the rivers Don and Cuban, and between the Black Sea and the Caſpian, extending as far as the confines of Georgia, and continually augmenting by the reduction and ſubmiſſion of the wandering hordes of Mount Caucaſus.

CAUNE, La, a ſmall town of France, in the department of Tarn and late province of Languedoc, ſeated near the mountains, where the river Agout has its ſource. It is 21 miles N.E. of Caſtres. Long. 2. 43. E. Lat. 43. 40. N.

CAUVERY, or Cavery, a conſiderable river of the peninſula of Hindooſtan, which riſes among the Ghauts, takes a S.E. direction through Myſore, and watering Seringapatam and Tanjore, enters the bay of Bengal, by ſeveral mouths, between Cuddalore and Tritchinopoly.

CAUSTICITY (*Encycl.*). The cauſticity of bodies depends entirely on the ſtate of the ſaline, and chiefly of the acid, matters they contain. When theſe acids happen to be at the ſame time much concentrated, and ſlightly attached to the matters with which they are combined, they are then capable of acting, and are corroſive or cauſtic. Thus fixed and volatile alkalies, although they are themſelves cauſtic, become much more ſo by being treated with quick-lime; becauſe this ſubſtance deprives them of much fat and inflammable matter, which binds and reſtrains the action of their ſaline principles. By this treatment, then, the ſaline principle is more diſengaged, and rendered more capable of action. Alſo all combinations of metallic matters with acids form ſalts more or leſs corroſive, becauſe theſe acids are deprived of all their ſuperabundant water, and are beſides but imperfectly ſaturated with the metallic matters. Nevertheleſs, ſome other circumſtance is neceſſary to conſtitute the cauſticity of theſe ſaline metalline matters. For the ſame quantity of marine acid, which, when pure and diluted with a certain quantity of water, would be productive of no harm, ſhall, however, produce all the effects of a corroſive poiſon, when it is united with mercury in *corroſive ſublimate*, although the ſublimate ſhall be diſſolved in ſo much water that its cauſticity cannot be attributed to the concentration of its acid. This effect is, by ſome chemiſts, attributed to the great weight of the metallic matters with which the acid is united: and this opinion is very probable, ſeeing its cauſticity is nothing but its diſſolving power, or its diſpoſition to combine with other bodies; and this diſpoſition is nothing elſe than attraction, which is one and the ſame thing as weight or gravitation.

The beſt method of *deſtroying the activity of corroſive ſublimate* taken into the ſtomach, is to give free and repeated doſes of a *ſolution of any alkaline ſalt*, as pot-aſh, or ſalt of tartar. By this means Dr. Houlſton ſucceeded, at Liverpool, in recovering a perſon who had ſwallowed half an ounce, with the intention of ſuicide.

CAUTERETS, a village of France, in the department of the Upper Pyrenées and late province of Bigorre, noted for its mineral water. It is 18 miles S.W. of Bagneres.

CAWOOD, a town in the E. riding of Yorkſhire, with a market on Wedneſday, 12 miles S. of York, and 186 N.W. of London. Long. 1. 0. W. Lat. 53. 47. N.

CAXTON, a town in Cambridgeſhire, with a market on Tueſday. It is 10 miles W by S. of Cambridge, and 49 N. of London. Long. 0. 10. W. Lat. 10. 0. N.

CAYA, a river of Portugal, which riſes near Portalegra, and running S.E. divides Spain from Portugal, and falls into the Guadiana, at Badajoz, in Spaniſh Eſtramadura.

CAYLUS (Count de) (*Encycl.*). We think it due to the memory of this extraordinary man to add to our original article the following particulars. The French Academy of

Painting and Sculpture adopted him an honorary member in the year 1731; and the count, who loved to realize titles, ſpared neither his labour, nor his credit, nor his fortune, to inſtruct, aſſiſt, and animate the artiſts. He wrote the lives of the moſt celebrated painters and engravers that have done honour to this illuſtrious academy; and, in order to extend the limits of the art, which ſeemed to have to move in too narrow a circle, he collected, in three different works, new ſubjects for the painter, which he met with in the works of the ancients.

Such was his paſſion for *antiquity*, that he wiſhed to have had it in his power to bring the whole of it to life again. He ſaw with regret, that the works of the ancient painters, which have been diſcovered in our times, are effaced and deſtroyed almoſt as ſoon as they are drawn from the ſubterraneous manſions where they were buried. A fortunate accident furniſhed him with the means of ſhewing us the compoſition and the colouring of the pictures of ancient Rome. The coloured drawings which the famous Pietro Sante Bartoli had taken there from antique pictures, fell into his hands. He had them engraved; and, before he enriched the king of France's cabinet with them, he gave an edition of them at his own expence. It is perhaps the moſt extraordinary book of antiquities that ever will appear. The whole is painted with a purity and preciſion that are inimitable: we ſee the livelineſs and the freſhneſs of the colouring that charmed the Cæſars. There were only 30 copies publiſhed; and there is no reaſon to expect that there will hereafter be any more.

Count de Caylus was engaged at the ſame time in an enterpriſe ſtill more favourable to Roman grandeur, and more intereſting to the French nation. Colbert had framed the deſign of engraving the Roman antiquities that are ſtill to be ſeen in the ſouthern provinces of France. By his orders Mignard the architect had made drawings of them, which Count de Caylus had the good fortune to recover. He reſolved to finiſh the work begun by Colbert, and to dedicate it to that great miniſter: and ſo much had he this enterpriſe at heart, that he was employed in it during his laſt illneſs, and warmly recommended it to M. Mariette.

In 1742 Count Caylus was admitted honorary member of the Academy of Belles-lettres; and then it was he ſeemed to have found the place for which nature had deſigned him. The ſtudy of literature now became his ruling paſſion; he conſecrated to it his time and his fortune; he even renounced his pleaſures, to give himſelf wholly up to that of making ſome diſcovery in the field of antiquity. But amidſt the fruits of his reſearch and invention, nothing ſeemed more flattering to him than his diſcovery of encauſtic painting. A deſcription of Pliny's, but too conciſe a one to give him a clear view of the matter, ſuggeſted the idea of it. He availed himſelf of the friendſhip and ſkill of M. Magault, a phyſician at Paris, and an excellent chemiſt; and by repeated experiments found out the ſecret of incorporating wax with divers tints and colours, and of making it obedient to the pencil. Pliny has made mention of two kinds of encauſtic painting practiſed by the ancients; one of which was performed with wax, and the other upon ivory, with hot punches of iron. It was the former that Count Caylus had the merit of reviving; and M. Muntz afterwards made many experiments to carry it to perfection.

In the hands of Count Caylus, literature and the arts lent each other a mutual aid. But it would be endleſs to give an account of all his works. He publiſhed about 40 diſſertations in the Memoirs of the Academy of Belles-lettres. The artiſts he was particularly attentive to; and to prevent their falling into miſtakes from an ignorance of coſtume, which the ableſt of them have ſometimes done, he founded a prize of 500 livres, the object of which is to explain, by means of authors and monuments, the uſages of ancient nations. In order that he might enjoy with the whole world the treaſures he had collected, he cauſed them to be engraved, and gave a learned deſcription of them in a work which he embelliſhed with 800 copper-plates.

The tomb erected to the honour of Count Caylus is to be ſeen in the chapel of St. Germain-l'Auxerrois, and deſerves to be remarked. It is perfectly the tomb of an antiquary. This monument was an ancient ſepulchral antique, of the moſt beautiful porphyry, with ornaments in the Egyptian taſte. From the moment he procured it, he had deſtined it to grace the place of his interment. While he awaited the fatal hour, he placed it in his garden, where he uſed to look upon it with a tranquil but thoughtful eye, and pointed it out to the inſpection of his friends.

The character of Count Caylus is to be traced in the different occupations which divided his cares and his life. In ſociety, he had all the franknefs of a ſoldier, and a politeneſs which had nothing in it of deceit or circumvention. Born independent, he applied to ſtudies which ſuited his taſte. His heart was yet better than his abilities. In his walks he uſed frequently to try the honeſty of the poor, by ſending them with a piece of money to get change for him. In theſe cafes, he enjoyed their confuſion at not finding him; and then preſenting himſelf, uſed to commend their honeſty, and gave them double the ſum. He ſaid frequently to his friends, "I have this day loſt a crown; but I was ſorry that I had not an opportunity of giving a ſecond. The beggar ought not to want integrity."

CEBU, one of the moſt ſoutherly of the Philippine iſlands in the Indian Ocean.

CEDAR CREEK, a water of James River in Virginia, in the county of Rockbridge. It is ſufficient, in the dryeſt ſeaſons, to turn a griſt-mill, though its ſource is not more than two miles above. But it is moſt remarkable for its natural bridge, which is certainly one of the moſt ſublime of Nature's works. It is on the aſcent of a hill, which ſeems to have been cloven through its length by ſome convulſion. The fiſſure, juſt at the bridge, is by ſome admeaſurements 270 feet deep, by others only 250. It is about 45 feet wide at the bottom, and 90 feet at the top. This of courſe determines the length of the bridge, and its height from the water. Its breadth in the middle is about 60 feet, but more at the ends, and the thickneſs of the maſs at the ſummit of the arch about 40 feet. A part of the thickneſs is conſtituted by a coat of earth, which gives growth to many large trees. The reſidue, with the hills on both ſides, is one ſolid rock of lime-ſtone. The arch approaches the ſemielliptical form; but the larger axis of the ellipſis, which would be the chord of the arch, is many times longer than the tranſverſe. Though the ſides of the bridge are provided in ſome parts with a parapet of fixed rocks, yet few men have reſolution to walk to them, and look over into the abyſs. You involuntarily fall on your hands and feet, creep to the parapet, and look over it. "Looking down from this height about a minute, gave me," ſays Mr. Jefferſon, "a violent headach. If the view from the top be painful and intolerable, that from below is delightful to the extreme. It is impoſſible for the emotions ariſing from the ſublime to be felt beyond what they are here: at the ſight of ſo beautiful an arch, ſo elevated, ſo light, and ſpringing as it were up to heaven, the rapture of the ſpectator is really indeſcribable! The fiſſure continuing narrow, deep, and ſtraight, for a conſiderable diſtance above and below the bridge, opens a ſhort but very pleaſing view of the North Mountain on one ſide,

and Blue Ridge on the other, at the diſtance, each of them, of about five miles." This bridge gives name to the county of Rockbridge, and affords a public and commodious paſſage over a valley, which cannot be croſſed elſewhere for a conſiderable diſtance.

CEDONGA, a town of the kingdom of Naples, with a biſhop's ſee, at the foot of the Apennines, 12 miles N.W. of Melfi. Long. 15 38. E. Lat. 41. 5. N.

CEDRIA, a reſinous liquor iſſuing from the great cedar tree, or cedar of Lebanon. The word is alſo written *cedrium*, and *cedrinum*.—Cedria, when good, yields a ſtrong ſmell, is tranſparent, and of a thick fatty conſiſtence; ſo that in pouring it out it does not fall too faſt or freely, but equally, drop by drop. It is poſſeſſed of two oppoſite qualities, *viz.* to preſerve dead bodies by its drying and conſuming ſuperfluous moiſture without damaging the ſolid parts, and to deſtroy the ſoft and tender parts of living bodies without exciting any pain. The cedria is properly the tear of the cedar; ſome call it the gum, others the pitch, of the cedar. The ſame denomination is alſo given to the *cedrelæon*, or oil of the cedars, which differs little from the reſin, except that it is of a thinner conſiſtence.

CEFALONIA, a conſiderable iſland of Greece, to the S. of Albania, and to the N.E. of the Morea. It is fertile in oil, and excellent muſcadine wine. The climate is hot, and there are bloſſoms on the trees throughout the winter. It is ſubject to the Venetians and the capital is of the ſame name. Long. 20. 36. E. Lat. 38. 22. N.

CEFALU, a town in Sicily, in the valley of Demona, with a caſtle, a harbour, and a biſhop's ſee. Long. 13. 58. E. Lat. 38. 25 N.

CELTIBERIA (anc. geog.) a county of the Hither Spain, along the right or ſouth-weſt ſide of the river Iberus: though ſometimes the greateſt part of Spain was called by the name of Celtiberia. The people were named *Celtiberi*, or the Celtæ ſeated on the Iberus. They were brave and warlike, their cavalry in particular was excellent. They wore a black and rough cloak, the ſhag of which was like goats' hair. Some of them had light bucklers like the Gauls; others hollow and round ones like thoſe of other nations. They all wore boots made of hair, and iron helmets adorned with creſts of purple colour. They uſed ſwords which cut on both ſides, and poniards of a foot long. Their arms were of an admirable temper, and are ſaid to have been prepared in the following manner: they buried their plates of iron under ground, where they let them remain till the ruſt had eaten the weakeſt part of the metal, and the reſt was conſequently hard and firm. Of this excellent iron they made their ſwords, which were ſo ſtrong and well tempered, that there was neither buckler nor helmet that could reſiſt their edge. The Celtiberians were very cruel towards their enemies and malefactors, but ſhewed the greateſt humanity to their gueſts. They not only cheerfully granted their hoſpitality to ſtrangers, who travelled in their country, but were deſirous that they ſhould ſeek protection under their roofs.

CEMENT (*Encycl.*). In July 1800 a patent was granted to Mr. John Baptiſt Denize, of Paris, chemiſt; for a new cement fit for various purpoſes. The inventor prefixes to the account of this diſcovery the following obſervations: "Convinced by repeated proofs," ſays he, "that the decay of mortars or cements in general uſe, occaſioned by the alternate or combined efforts of damp or dry weather, was owing chiefly to the bad choice and imperfect preparation of the matters they are compoſed of; that their difficulty in adhering with any ſtrength to various materials indifferently, but particularly to wood, to preſerve it from rottenneſs and worms, and to iron, to prevent its growing ruſty, was owing to the want of viſcoſity and clammineſs to reſiſt air, and to the water and ſalts which conſtitute their glutinous quality; and perſuaded therefore that ſubſtances of a more fixed and identical nature, combined and glued together by a viſcous body, unalterable in itſelf, and yet ſufficiently unctuous and penetrating, ſo as to incorporate eaſily with the various objects on which it might be applied, would, on the contrary, form a compoſition the more uſeful and valuable as it would then poſſeſs qualities entirely oppoſite, I applied myſelf in the reſearch of that object; and, after repeated eſſays (of which I ſhall hereafter give an account, as belonging to the ſubject), I ſucceeded in finding out the peculiar nature, proportions, and preparation, of theſe ſubſtances; the exact combination of which aſcertains definitively the utility of my proceedings.

"*Indication of fixed matters.*—The materials which I employ in preference to thoſe of which I ſhall afterwards give a liſt, agreeable to my foregoing obſervations, are, viz. Firſt, all the various ſpecies of ſcorious matters, metallic ſcums, or droſs of iron, and generally all other kinds of remnants or file duſt found in forges and founderies, containing a great deal of metallic ſubſtances, adulterated by the effect of combuſtibles, principally iron, in very great quantities; or, inſtead of thoſe various ſubſtances, old iron reduced to the ſame ſtate by calcination, and pulverized by the effect of heat and charcoal; and all kinds of metallic duſt and filings more or leſs reduced to that ſtate; and in general every other produce of nature or of art in which metallic ſubſtances, eſpecially iron, are found in a ſtate of calcination, and chiefly carbonate. Secondly, all volcanic products, called aſhes of volcanoes, and lava; particularly thoſe which are reduced to the greateſt ſtate of attenuation, ſuch as pozzolana and pumice-ſtone. Inſtead of thoſe volcanic matters, one may almoſt as effectually employ ochres, and other ferruginous earth, particularly yellow oxide of iron (as painters make uſe of), or reddiſh-brown oxide, when calcined by the ſame degree of heat as that of a potter's kiln, or at leaſt ſufficient to reduce thoſe ſubſtances to a ſtate of demi-vitrification; or what remains after the diſtillation of acid nitre, by the means of bolar earth, cleared of that acid by a ſtrong calcination, and mixed with ſulphat of iron, equally diſſolved by the ſame means, and known in commerce by the name of caput mortuum, of aqua fortis, and of colcothar; or alſo all aſhes produced from the incineration of vegetables, eſpecially thoſe of pit-coal, and charcoal of the hardeſt wood, from the identity of nature which ſubſiſts particularly between that ſpecies of aſhes and the above-mentioned volcanic matters; or thoſe various terreous and metallic particles which it has been proved by analizing that the above-mentioned lava and aſhes were compoſed of; ſuch for inſtance, as ſilex, or quartz, that hard vitrifiable earth alumine, or pure clay lime, or chalky clay, magneſia, and barytes, or terra-ponderoſa, and manganeſe, or any other metallic particle, eſpecially iron; the whole mixed in proportions, more or leſs conformable to thoſe which conſtitute the volcanic and vegetable aſhes which I mentioned before, and calcined the ſame as ochres by a degree of heat ſufficient to bring thoſe particles more or leſs to that ſtate in which they are by nature found, contained in thoſe two kinds of produce; and in general all other combinations, whether natural or artificial, which, from the proportions and identity, or analogy of their terreous and metallic particles with thoſe I have already mentioned, could produce the ſame effects; in this I comprehend, therefore, not only the various matters deſcribed in the liſt, ſubjoined to this ſpecification, by reaſon of their being compoſed of the particles alluded to, but which I partly exclude from the compoſition of this cement, on account of the defects which I have found in them; but alſo, all

other kinds of compoſitions whatever, of a nature more or leſs analogous with thoſe I have juſt now deſcribed. Thirdly, pit-coal of a flat hard nature, and that kind particularly which has a brightneſs in it like Kendal, or Cannel, coal: and fourthly, glaſs, or flint ſtone.

"*Indication of glutinous matters.*—Firſt, ſublimated ſulphur: ſecondly, bitumen, made of pit-coal; in lieu of it either of thoſe ſubſtances that derive therefrom, claſſed in the following order, viz. petrol, mineral, pitch, naphta, aſphaltos, or any other modification of pit-coal bitumen, equally proper to replace ſaid ſubſtances; thirdly, tallow-pitch, known alſo under the name of pitch-roſin, and white-roſin, and, in ſhort, every kind of reſinous ſubſtance, whether natural or factitious, more or leſs analogous in its conſiſtence and effects to the above ones; ſuch as pitch, and tar, and every other produce of that kind: and, fourthly, that mucilage produced by the decoction of linſeed, after it has been boiled ſufficiently to a degree of conſiſtence of about twice the thickneſs of the white of an egg. Inſtead of that mucilage, that of any other ſeed, plant, or animal ſubſtance ſuſceptible of producing the ſame, or the equivalent, either of themſelves or by the effect of their combination; or ſuch mucilage as might be made out of various kinds of indigenous or exotic gums, whether reſinous or not, with meal and feculum and other ſimilar ſubſtances: or one may uſe alſo linſeed oil, or any other kind of oil, or greaſe, of a deſiccative and mucilaginous nature, ſuch as is extracted from poppies, nuts, pinks, &c.; or other vegetable and animal oils or greaſe, that are not by nature deſiccative, but which may be rendered ſo by their combination with other ſubſtances compoſed of deſiccative principles, ſuch as the various kinds of gums, and wax, ſpermaceti, oils of turpentine, or thoſe matters from which they are extracted; oxides and acids, or any other deſiccative ſubſtance whatever.

"*Preparation of fixed matters.*—In order better to impregnate thoſe fixed matters with the gluten which is to combine and unite them together, they muſt be firſt prepared as follows: viz. the droſs of iron, the pozzolana, and pumice-ſtone, or the other kinds of metallic ſcums and volcanic matters, muſt be well cleared of all ſaline, terreous, ſulphureous, ſtony, or thoſe particles extraneous to them, and reduced to a powder as fine as that of well-calcined aſhes; and the aſhes which might be ſubſtituted to the above-mentioned volcanic products, or thoſe terreous and metallic particles which I alſo indicated as a ſubſtitute to theſe, muſt be calcined till they become white, provided they have not already undergone that operation by fire; then waſhed in lye, to extract by theſe two operations the ſulphats and ſalts which might be mixed with them, and afterwards well dried and ſifted. With regard to pit-coal, glaſs, or flint-ſtone, they muſt alſo be reduced to a very fine powder like that of aſhes, and ſifted afterwards.

"*Preparation of the gluten*—Take ſublimated ſulphur in the proportion of one-eighth more or leſs to the quantity or volume of cement which you intend to make, mix with it one-third more or leſs of pit-coal bitumen, then let it diſſolve on a ſlow gradual fire till it inſenſibly riſe up in momentary bubbles; ſtir the mixture during that time, and when it is completely diſſolved take it off the fire and add to it, whilſt you continue to ſtir, one-third more or leſs of black pitch; then ſet it on the ſame ſlow fire again till it has riſen up gradually as before; take it then once more off the fire, and add one-twentieth more or leſs of the total weight of fixed and glutinous matters, compoſed of a mixture of two equal portions of good tallow, or any other hard greaſe, and of white clear roſin or wax, and mix then the whole on the ſame fire again till it is perfectly diſſolved and combined together; or in order to render the cement more fluid, and thereby more eaſy of application, to the one-eighth in volume (not in weight) of ſublimated ſulphur well diſſolved, with the one-third of pit-coal bitumen, add one-third part, in volume alſo, compoſed of one-ſixth part of good tallow melted together; and after you have well mixed the whole on the fire, add one more third part, in volume alſo, compoſed equally of one ſixth part of pit-coal bitumen well mixed together whilſt cold; (*a ſixth part of ſome other ſubſtance appears to be omitted*); or inſtead of this a ſame third part, in volume always, of linſeed oil, or of any other deſiccative oil, and laſtly one more third part compoſed of two portions, equal in weight, of black pitch and of roſin melted together: and after you have equally well mixed theſe matters with the reſt, and ſtirred the whole on a ſlow fire for a while ſufficient to unite and combine them perfectly together, uſe this bituminous compoſition, or the one preceding, in the manner indicated hereafter.

"*Compoſition of the cement.*—To either of the two glutinous compoſitions above mentioned, made perfectly liquid by fire, add at ſeveral times, in order the better to combine them together, the following proportions of fixed matters, well mixed and ſifted together: viz. three-fourths in volume (not in weight) of droſs of iron, one-eighth of pozzolana, and one-eighth of pumice-ſtone, or the ſame quantity of two ſubſtances the moſt analogous to thoſe volcanic matters, ſuch as I have mentioned as ſubſtitutes for them, one-eighth of pit-coal before named, and one-eighth of glaſs or flint-ſtone; let the whole boil on a fire ſufficiently great to keep thoſe materials in a ſtate of fuſion, but not ſo much as to cauſe the volatile principles to evaporate, which muſt be guarded againſt. Stir now and then ſo as to bring the fixed matters up from the bottom to the ſurface in order to combine them better, and after three or four times boiling, for that cement made with the firſt kind of glutinous compoſition, or double that time for that made with the other kind, make a trial of it by laying ſome of it on wood, and paſſing the trowel with which you ſtir hard over it, to judge whether and how much it requires longer to be boiled. One ſees that it is done, when after being laid on the wood it becomes hard as it gets cold, and that though ſtill warm it does not ſtick to the hand, with which you muſt therefore preſs hard upon it. If one ſhould delay too long to make that trial, the cement might be boiled too much, which would then take from its viſcoſity, and would make it neceſſary to remedy this by the addition of one-twentieth part of the weight of it, more or leſs, according to the degree of its adulteration, of either tallow, bitumen, or pitch. But if the cement does not poſſeſs the above properties when that trial is made, it muſt then be boiled, ſtirring it always till it has acquired the ſame. In general the more equal the fire is, the better will the cement be, provided the volatile principles do not evaporate. It would on that account be adviſable to boil that compoſition by the heat reſulting from boiling water and in an uncovered veſſel, for by that means this compoſition would be rendered (even ſhould a great proportion of glutinous principles be added thereto) extremely compact, and as hard as it may be wiſhed, without depriving it (for all that) of thoſe unctuous and penetrating qualities which render it ſo valuable.

"*Manner of employing the cement.*—It is firſt broken in ſmall pieces, then you add to it one-fortieth part, more or leſs, of its weight of good tallow, or other hard greaſe, or inſtead of them not quite a fortieth of black pitch, aſphaltos, roſin, or wax, or only half that proportion of pit-coal bitumen, mineral pitch, naphta, or ſome deſiccative oil: but if it was intended to employ that cement (eſpecially that made with leſs glutinous principles) for the purpoſe of joining or cementing more quickly, it would then be proper to add one half more than

the fortieth part of the above-mentioned matters. The whole is then melted and liquified for a quarter of an hour in an earthen veſſel, or one of caſt iron, whilſt you continue to ſtir it on a ſlow fire, or what would be better, on the heat of boiling water, the ſame as it is done for glue; after which you take that compoſition from the bottom of the veſſel whilſt you ſtill continue to ſtir, and make the application of it immediately. It is neceſſary to obſerve, that when the cement appears to become too dry, from its long continuance on the fire, one muſt then add to it a ſmall portion of the matters before mentioned, in order to give it that unctuous quality again, and to keep it ſo in that ſtate during the time that you make uſe of it. Experience will however better teach what proportion of theſe matters will be required occaſionally, and their choice.

"*Secondary methods of making this cement.*—As the compoſition of this cement may be varied by the different choice and proportions of glutinous matters relatively to the more or leſs fixed nature of the others, and by the boiling it for more or leſs time, as I have myſelf aſcertained the ſame by many experiments (for inſtance, by the compoſition and application of that cement without the uſe of fire), I reſerve to myſelf the privilege of thoſe various modifications, as being a direct practice of that ſame theory and appertaining neceſſarily to this invention. With regard to the various ſubſtances which I uſed in my different eſſays, and which I found leſs proper for the compoſition of this cement, they are as follow; viz. charcoal and ſoot, and even glaſs flint, whether calcined or not, potter's earth, brick, tile, ſlate, clay, marl, the various ſpecies of gravel or ſandy ſtones, lime or calx, plaſter, ſand, oyſter-ſhells, or any other ſhells when thoſe ſubſtances are uſed excluſively or in too great proportions."

CENADA, an ancient town in Italy, in the marquiſate of Treviſana, with a biſhop's ſee. It is 18 miles N. of Trevigio. Long. 12. 26. E. Lat. 46. 2. N.

CENIS, a mountain, which is a part of the Alps, and ſeparates the marquiſate of Suſa from the Morianne.

CENU, a town in South America, in Terra Firma, eight miles S. of Carthagena. Long. 75. 24. W. Lat. 10. 19. N.

CERDAGNA, a ſmall diſtrict, partly of Spain in Catalonia, and partly of France, in the department of the Eaſtern Pyrenées and late province of Rouſſillon. Puycerda is the capital in Spain, and Mount Louis in France.

CERINTHUS, a hereſiarch, contemporary with the apoſtles, aſcribed the creation not to God, but to angels. He taught that Jeſus Chriſt was the ſon of Joſeph, and that circumciſion ought to be retained under the goſpel. He is looked upon as the head of the converted Jews, who raiſed in the church of Antioch the tumult of which St. Luke has given the hiſtory in the 15th chapter of the Acts. Some authors aſcribe the book of the Apocalypſe to Cerinthus; adding, that he put it off under the name of St. John, the better to authoriſe his reveries touching Chriſt's reign upon earth: and it is even certain that he publiſhed ſome works of this kind under the title of *Apocalypſe*. See APOCALYPSE.

CERNEY, NORTH, a village in Glouceſterſhire, near the Downs, where Cirenceſter races are run. In an adjacent field is a camp of conſiderable extent. It is four miles from Cricklade.

CHABLAIS, a province of Savoy, bounded on the N. by the lake of Geneva, on the E. by Valais, on the S. by Faucigny, and on the W. by the republic of Geneva. Thonon is the capital.

CHABLIS, a town of France, in the department of Yonne and late province of Burgundy, remarkable for white wines. It is fifteen miles from Auxerre. Long. 3. 59. E. Lat. 47. 42. N.

CHACKTOOLE BAY, a bay in Norton Sound, diſcovered by Captain Cook in 1778. It is expoſed to S. and S.W. winds. Long. 162. 47. W. Lat. 64. 31. N.

CHAIS-DIEU, a town of France, in the department of Upper Loire and late province of Velay. Its late Benedictine abbey was much celebrated. It is twelve miles E. of Brioude. Long. 3. 4. E. Lat. 45. 15. N.

CHAMB, a town of Germany, in the circle of Bavaria, capital of a county of the ſame name, and ſeated on the river Chamb, 37 miles N.E. of Ratiſbon. Long. 12. 55. E. Lat. 49. 14. N.

CHAMBORT, a late royal palace in France, nine miles E. of Blois. It was built by Francis II. and from the number and trifling minuteneſs of its parts, has been compared to a houſe of cards. It ſtands in a park, 21 miles in circumference; but has no gardens. The ſtyle of this ſtructure is Gothic, and it is built of free-ſtone. King Staniſlaus reſided here nine years; and it was the retreat of Marſhal Saxe, who died here in 1750.

CHAMOND, a town of France, in the department of Rhone and Loire and late province of Lyonois, with a caſtle, on the river Giez, ſeventeen miles from Lyons. Long. 4. 55. E. Lat. 45. 29. N.

CHANCHA, a rich town of Egypt, five miles from Cairo, at the entrance of the deſert which leads to Mount Sinai.

CHANDA, a conſiderable city of Berar, in the Deccan of Hindooſtan, ſubject to the chief of the eaſtern Mahrattas. It is ſeated on a branch of the Godavery, ſeventy miles S. of Nagpour. Long. 79. 40. E. Lat. 20. 10. N.

CHANMANNING, a city of Thibet, in Aſia, which has been the reſidence of the grand lama. It is about 130 miles W. of Laſſa. Long. 89. 45. E. Lat. 31. 0. N.

CHANNERAY, a village of Roſsſhire, in Scotland, near the frith of Murray, formerly a biſhop's ſee. It is thirty miles W. of Elgin, the fine cathedral of which town is called Channeray church, it having been intended, it is ſaid, to be built here.

CHAPARANG, or DSAPRONG, a conſiderable city of Thibet in Aſia, ſeated on the ſouthern head of the Ganges, not far weſtward from the lake Manſaroar. Long. 78. 42. E. Lat. 34. 0. N.

CHARADE (*Encycl.*). The exerciſe of charades, if not greatly inſtructive, is at leaſt innocent and amuſing. At all events, as it has made its way into every faſhionable circle, and has employed even Garrick, it will ſcarcely be deemed unworthy of attention. Indeed moſt that have appeared in the papers under this title, are not only deſtitute of pleaſantry, but formed in general of words utterly unfit for the purpoſe. They have therefore been treated with the contempt they deſerved. In trifles of this nature inaccuracy is without excuſe. The following examples are at leaſt free from this blemiſh:

I.

My *firſt*, however here abuſed,
Deſigns the ſex alone;
In Cambria, ſuch is cuſtom's pow'r,
'Tis Jenkin, John, or Joan.
My *ſecond* oft is loudly call'd,
When men prepare to fiſt it:
It's name delights the female ear;
Its force, may none reſiſt it!
It binds the weak, it binds the ſtrong,
The wealthy, and the poor;
Still 'tis to joy a paſſport deem'd,
For ſullied fame a cure:
It may inſure an age of bliſs,
Yet miſ'ries oft attend it;
To fingers, ears, and noſes too,
Its various lords commend it.

My *whole* may chance to make one drink,
Though vended in a fiſh-ſhop;
'Tis now the monarch of the ſeas,
And has been an archbiſhop. *Her-ring.*

II.

My *firſt* is plowed for various reaſons, and grain is frequently buried in it to little purpoſe. My *ſecond*, is neither riches nor honours; yet the former would generally be given for it, and the latter is often taſteleſs without it. My *whole* applies equally to ſpring, ſummer, and autumn, and winter; and both fiſh and fleſh, praiſe and cenſure, mirth and melancholy, are the better for being in it. *Sea-ſon.*

III.

My *firſt*, with the moſt rooted antipathy to a Frenchman, prides himſelf, whenever they meet, upon ſticking cloſe to his jacket. My *ſecond* has many virtues, nor is it its leaſt that it gives name to my firſt. My *whole*, may I never catch! *Tar-tar.*

IV.

My *firſt* is one of England's prime boaſts; it rejoices the ear of a horſe, and anguiſhes the toe of a man. My *ſecond*, when brick, is good; when ſtone, better; when *wooden*, beſt of all. My *whole* is famous alike for rottenneſs and tin. *Corn-wall.*

V.

My *firſt* is called bad or good,
May pleaſure or offend ye;
My *ſecond*, in a thirſty mood,
May very much befriend ye.
My *whole*, tho' ſtyled "a cruel word,"
May yet appear a kind one;
It often may with joy be heard,
With tears may often blind one. *Fare-well.*

VI.

My *firſt* is equally friendly to the thief and the lover, the toper and the ſtudent. My *ſecond* is light's oppoſite: yet they are frequently ſeen hand in hand; and their union, if judicious, gives much pleaſure. My *whole*, is tempting to the touch, grateful to the ſight, fatal to the taſte. *Night-ſhade.*

CHARCOS, Los, a province of South America, in Peru. It has the fineſt ſilver mines in the world. La Plata is the capital. See POTOSI.

CHARD, a town in Somerſetſhire, with a market on Monday. It is ſeated on the ſide of a hill, ſix miles W. of Crewkerne, and 141 W. by S. of London. Long. 3. 18. W. Lat. 50. 52. N.

CHARENTE, a department of France, which includes the late province of Angoumois. It is named from a river, which riſes in Limoſin, runs by Angouleſme and Saintes, and falls into the bay of Biſcay. Angouleſme is the capital.

CHARENTE, LOWER, a department of France, which conſiſts of the two late provinces of Aunus and Saintonge. Saintes is the capital.

CHARITE, LA, a town of France, in the department of Nievre and late province of Nivernois. It ſtands between a hill and the Loire, over which is a ſtone bridge. Its ſituation on the road from Paris to Lyons, and the canal of Briare, has made its trade very briſk. Here are forges for converting the iron in the neighbourhood into ſteel, a woollen manufactory, and another for arms, helmets, pinchbeck buckles, ſteel buttons, and hardware in general. Here is a very pretty publie walk. The ſuburb in which it is ſituated, is a kind of iſland, which forms about a fourth of the town. The ſtone bridge communicating with it was ruined by the melting of the ice in 1789. The moſt remarkable edifice in this town is the priory of the late Benedictine Cluniſtes. When we conſider the vaſt riches and prerogatives of this monaſtery (the prior commendatory of which was temporal lord of the town) we ſhould not forget, at the ſame time, that, in a ſeaſon of ſcarcity, the whole town has ſubſiſted upon the bounty of this abbey; and hence it derives its name. It is fifteen miles N. of Nevers.

CHARITY, a term applied to certain benevolent inſtitutions whoſe modes of aſſiſting the poor are incapable of any more appropriate deſignation. Thus we have CHARITIES for lying-in women, for convaleſcents, for deſtitute females, &c. The following is an account of a charity for the relief of lying-in women and ſick perſons, at Tottenham in Middleſex.

In Auguſt 1791, eight ladies of this pariſh united in a plan for the relief of their poor neighbours during the time of lying-in. They began their undertaking by ſubſcribing three ſhillings and ſixpence each, for the purchaſe of linen, and afterwards appointed one of their number treaſurer and manager; and in order to ſupply a fund for the purpoſe of allowing five ſhillings towards the payment of a midwife, and ſix ſhillings for a nurſe for each patient, they agreed to contribute ſixpence a-piece weekly. The plan being approved, met with encouragement, and the number of ſubſcribers annually increaſed. The following ſtatement of the number of perſons annually benefited by the charity is a clear demonſtration of its ſucceſs and progreſs. There were relieved in ſeven years from 1791, 416 perſons.

The ſociety finding that the ſick ſtood as much in need of aſſiſtanee as lying-in women, and deſirous of rendering the inſtitution as uſeful as poſſible, determined to extend the benefit to either, without diſtinction; and the funds having been ſince conſiderably increaſed, it has been reſolved to provide a large number of bags of linen; and the manager is authoriſed to lend them, as long as the caſe requires, to all ſick perſons who are in want, throughout the pariſh, where the diſeaſe is not of an infectious kind.

The following are the regulations and rules of the charity.

That a ſet of linen be lent to every lying-in woman, or ſick perſon, that receives a ticket from any ſubſcriber, for one month; ſuch ſet containing one pair of ſheets, twelve napkins, one bed-gown, and one ſhirt.—That eleven ſhillings be paid to ſuch lying-in woman towards defraying the expences of a midwife and a nurſe.—That the ſame ſum be laid out for each ſick perſon, according to their wants, either in procuring neceſſary food, coals, or medicines; or, at the diſcretion of the governeſs, to be paid them in a weekly allowance.—And that one of the ſubſcribers be appointed by the reſt, to preſide over, and manage the affairs of the charity, liable to the control of the annual meeting of ſubſcribers.

Every ſubſcriber to pay three ſhillings and ſixpence upon admiſſion into the ſociety, towards the purchaſe of linen; and afterwards to continue to pay ſixpence per week, to be collected annually.—Every ſubſcriber to receive a ticket inſcribed with the name, every ſix months, from the governeſs, which ſuch ſubſcriber may diſpoſe of to any object reſiding in the pariſh, whether lying-in or ſick, who ſhall appear deſerving of the bounty.—Every patient that receives a ticket ſhall preſent it to the governeſs, that the name may be ſet down for admiſſion.—If the patient be a lying-in woman, the ticket to be returned to her; that when taken ill, ſhe may ſend it to the governeſs for a bag of linen.—No linen to be delivered without a ticket, or previous to the woman's indiſpoſition.—None, but married women can receive a lying-in ticket.—No woman to keep the linen longer than a month, without leave from the governeſs, who ſhall have a diſcretionary power of prolonging the time, in caſe of unuſual circumſtanees.—Every woman to return the linen clean, and right in number.—Any woman neglecting to obſerve theſe rules, to be incapable of receiving any future benefit from the charity.—The governeſs is empowered to lend bags of linen to perſons of good cha-

racter, who have been diſappointed of obtaining tickets, if there be a ſufficient quantity to ſupply the patients. *This is a means of conſiderably extending the benefits of the inſtitution.*—None ſhall receive preſentations to this charity but ſuch as reſide in the pariſh, without regard to their being a pariſhioner.—There ſhall be an annual meeting of the ſubſcribers on the firſt of May; at which time the ſubſcriptions are to be collected.—Thoſe who are prevented from attending perſonally, are requeſted to ſend their ſubſcriptions, in order to ſave trouble.—It is earneſtly requeſted, that the ſubſcribers will be careful that the objects of their bounty do not ſuffer under any infectious diſeaſe.—Sick perſons whoſe diſeaſes are infectious, ſuch as ſmall-pox, fevers, &c. can only receive the appointed ſum, without being aſſiſted with linen.

The utility of this plan has already recommended it to the inhabitants of ſeveral other places. Charities ſimilar in deſign, though varying in ſome particulars, have been eſtabliſhed, among other places, at Cambridge, Ipſwich, Colcheſter, Needham, Halſtead, Stoke Newington, Edmonton, Cheſhunt, Ware, Hertford, Woodford, Wanſtead, and Walthamſtow.

The moſt obvious advantages of this mode of adminiſtering charity, are, that the relief is beſtowed at a time when it is particularly wanted, and when the occaſion of that neceſſity diſables the ſufferer from earning the means of procuring a ſupply: that aſſiſtance is given to a great number of perſons at a very ſmall expence; for, excluſive of thoſe who receive tickets, which entitle them to the whole benefit of the inſtitution, the comfort of change of linen in the time of ſickneſs is enjoyed by numbers, whoſe utmoſt frugality does not enable them to keep a ſufficient ſtock for that purpoſe: and that it affords relief, but by no means precludes the neceſſity of induſtry and provident care againſt a day of trouble.

Nor let it be eſteemed the leaſt of its excellencies, that it induces women of ſuperior rank to become acquainted with the temporary, as well as the habitual, diſtreſſes of their poor neighbours; that it invites them to viſit thoſe to whom they have given their tickets; and perſonally to inſpect the abodes of poverty. If the judgment of the poor may be thought worthy of conſideration, there are but few plans, upon ſo ſmall a ſcale of expence, which afford them ſuch an acceptable relief.

Charity-*Schools* (*Encycl.*). The nature of theſe ſchools in general is well known, and has been ſtated under School; but we conceive it to be of ſome importance to notice the improvements of which theſe ſeminaries have been found capable, and this will appear from the following account of the extenſion of the benefits of the charity-ſchools at Cheſter.

The income of the blue-coat-ſchool at Cheſter had for ſeveral years been applied to the maintenance and education of thirty boys, who were admitted at nine years of age, and kept in the houſe for four years. This proviſion had proved to be extremely inadequate to its object; the greater number of the poor of that city being left entirely deſtitute of inſtruction. In 1783 the truſtees adopted a beneficial extenſion of the charity: and in the courſe of that and of the enſuing year, they opened a day-ſchool, in a wing of the hoſpital, for the inſtruction of 120 boys in reading, writing, and accounts. This they call the *green-ſchool*, from the circumſtance of each of the boys wearing a green bonnet. Two maſters were engaged, one at 35l. the other at 30l. a-year; and they have proved quite equal to the care of the 120 boys. The whole expence of teaching theſe boys, including their bonnets, &c. is not more than eighty guineas, or 14s a-year, each.

In order to provide for this expence, the truſtees diminiſhed the number of boys in the blue-coat-ſchool from 30 to 25; and at the ſame time extended the benefit of that ſchool to a great increaſe of objects, by reducing the time of continuance to two years, and by ſelecting the beſt behaved and moſt deſerving boys of the *green-ſchool* for all the vacancies in the *blue-coat-ſchool*; ſo that twelve or fourteen of the beſt boys of the former ſchool are annually placed upon the foundation: the conſequence of which is, that there is hardly any poor boy in that city, but may obtain a place in the blue-coat-ſchool, if he perſeveres in a courſe of induſtry and good behaviour.

This is of the greateſt importance; as it extends the benefit, not only of inſtruction, but of (what is much more efficacious) emulation and example, to almoſt every lad in Cheſter. The boys are now admitted at nine years of age into the green-ſchool, upon the nomination of the ſubſcribers, who appoint ſcholars in rotation, according to the amount of their contributions to the charity. At the end of two years theſe boys are publicly examined for the blue-coat-ſchool: after which, if their merit does not entitle them to one of the vacancies on the foundation, they remain in the green-ſchool two years more; and are then diſmiſſed at an age proper to be placed out in ſervice. But if their progreſs has been ſuch as to entitle them to a vacancy in the blue-coat-ſchool, they are clothed and maintained there for two years, and at the expiration of that period, if they have made a competent progreſs in reading, writing, and accounts, and (in caſe the ſea is their object) in navigation, they are placed out, with an apprentice fee of three pounds each, in huſbandry, the ſea-ſervice, or in ſome uſeful trade or occupation.

Upon the former plan the funds of this charity provided, in ten years, an education for ſeventy-five children: in the preſent mode, beſides the increaſed motives for good behaviour and attention, 362 poor children of Cheſter receive an education during the ſame period. This has been attended with no additional expence: the degree of benefit, however, far exceeds any thing that could have been attained upon the former ſyſtem; for the terms of ſucceeding to the blue-coat-ſchool, offered equally to all, ſupplies that ſtimulating incentive to human exertion, without which the beſt-framed eſtabliſhments loſe their vital principle, and degenerate into viſionary and noxious theory.

Similar attention has been paid to the female children in that town. It had been aſcertained by Dr. Haygarth, and ſome others, who were in the habit of viſiting the habitations of the poor of Cheſter, that the girls there, as in many other towns, were extremely deſtitute of uſeful employment; and that thoſe from nine to thirteen years of age, in one pariſh, three-fourths could not ſew at all, and not one of them ſo well as to make a ſingle article of dreſs. They were equally ignorant of knitting and ſpinning; and ſo unſkilful in the common occupations of life, as to be diſqualified for domeſtic ſervants, and for moſt other offices in ſociety, and to have very few means of earning an honeſt livelihood.

It was calculated that four ſchools of forty girls each, to be taught for four years, from the age of nine to thirteen years, in addition to a ſchool already exiſting for maintaining and educating eight girls, would nearly provide for all the poor girls in Cheſter, who were unemployed, of a proper age for inſtruction, and in want of charitable aid for their education. It was therefore propoſed that the girls ſhould change their ſchool every year, and (beſides their being taught to read in all the ſchools, and attending the pariſh church twice on Sunday) that they ſhould learn in the firſt year to knit, in the ſecond to ſpin, in the third to ſew, and in the fourth to waſh and get up linen; the four ſchools being placed near the centre of the city, ſo that the ſcholars might, without inconvenience, go each year to a different ſchool. In this manner it was calculated that, in the whole, the education of forty-two girls would be annually completed.

The knitting, ſpinning, and ſewing ſchools had, from the time of their eſtabliſhment in 1787, been regularly attended; and no difficulty had occurred in ſupplying work for the knitters and ſpinners, though there had ſome at firſt as to the ſewing-ſchool. In procuring employment for the ſchool for waſhing and getting up linen, there has been very great difficulty; and in conſequence this part of the plan was ſoon given up. The ſchools are now reduced to two, one for knitting, the other for ſewing; theſe are very well ſupplied with work, and the children continue there for two years.

On their firſt appearance at ſchool, the children come in but ill clothed, and not well behaved; but, in a ſhort time, by their induſtry, and by the co-operating benevolence of the ladies who viſit the ſchool, they are not only improved in behaviour, but are ſupplied with uniform gowns and pettieoats, as well as with ſeveral other articles of dreſs; all their clothes, except ſhoes and ſtockings, being made at the ſewing-ſchool.

The ſubſcriptions were at firſt limited to five ſhillings each; though, among the more opulent, ſeveral perſons of the ſame family were admitted as ſubſcribers. They are at preſent not ſubject to limitation; and liberal donations have been made for ſupplying books, wheels, forms, and for other expences. A conſiderable benefit has accrued from connecting theſe girl-ſchools in ſome degree with the Sunday-ſchools of Cheſter:—for, as an encouragement to good behaviour, the moſt deſerving girls in the Sunday-ſchools are regularly elected into the working-ſchools. This has a powerful and extenſive effect in improving the morals and behaviour of all the girls in the Sunday-ſchools, and with them of almoſt all the female children in Cheſter.

It is not an unreaſonable or unfounded preſumption, that the extenſion of the ſchools at Cheſter will operate to improve the riſing generation, in ſkill, induſtry, honeſty, economy, ſobriety, and in all thoſe virtues which reſult from a proper and religious education, and which can contribute to an uſeful and happy life.—There are very few of theſe virtues that do not principally depend on education, and on the ſeeds ſown in the mind during the early period of life. A very able writer has obſerved, that "drunkenneſs is the vice of an uncultivated mind:" and, in truth, with very few exceptions, this vice, in all its beaſtly deformity, will be found to be moſt prevalent among the ignorant and uninformed; among thoſe who have had no means of improving or appreciating their faculties, and who, in reſpect of mental and moral improvement, can be placed but little above the brute creation.

In all thoſe moral virtues, which are of ſuch ineſtimable value through life—of induſtry and ſkill we ſay nothing, for it is obvious that inſtruction and habit are their vital principle—but in moral virtues, in fidelity, truth, juſtice, and integrity, every attainment is caſual and accidental, all improvement deceitful and uncertain, except that which originates in principle, and whoſe baſis firmly reſts on the ſure ground of a religious education.

The abſurd prejudices that have exiſted againſt extending the common and general benefits of education to the children of the poor, and the extraordinary ſuppoſition, that an uneducated and neglected boy will prove an honeſt and uſeful man,—that a youth of ignorance and idleneſs will produce a mature age of induſtry and virtue,—are now in great meaſure exploded. Switzerland, and Scotland, and the northern counties of England, where the education and occupation of youth are particularly attended to, afford very gratifying evidence of the contrary poſition. The individuals of thoſe counties are not only more induſtrious and more thriving, but, of all parts of Europe, peculiarly exempt from criminal habits.

If the revenues of all our charity-ſchools were applied as advantageouſly as thoſe of the blue-coat-ſchool, and the other ſchools at Cheſter, it is probable that the funds would be ſufficient to give to every individual in England, the ſame advantages of early inſtruction and good habits, as are enjoyed by our northern neighbours, and by the inhabitants of Switzerland. In order to produce this effect, ſome exiſting prejudices againſt removing ancient abuſes, and (we are ſorry to add) ſome degree of intereſt or patronage in the continuance of thoſe abuſes, muſt be given up; and the enquiry muſt be fairly and impartially entered into, how the good effects of every charity may be beſt attained, and moſt widely extended, without injuſtice to its original objects. There is hardly any charitable fund in England to which the example of Cheſter may not in ſome degree apply, and by the application of which, children may not be enabled to acquire thoſe early and principal habits of life, without which wealth and power (and even liberty itſelf) are to the poſſeſſors of but little value; too frequently the ſource of ungoverned paſſions and criminal habits; pernicious at the ſame time to other members of ſociety, and deſtructive to the welfare and exiſtence of the community.

CHARLES-LE-GROS, emperor of the Weſt in 881, king of Italy and Suabia, memorable for his reverſe of fortune; being dethroned at a diet held near Mentz, by the French, the Italians, and the Germans, in 887: after which he was obliged to ſubſiſt on the bounty of the archbiſhop of Mentz. He died in 888.

CHARLES V. (emperor and king of Spain), was ſon of Philip I. archduke of Auſtria, and of Jane queen of Caſtile. He was born at Ghent, February 24, 1500, and ſucceeded to the crown of Spain in 1517. Two years afterwards he was choſen emperor at Francfort after the death of Maximilian his grandfather. He was a great warrior and politician: and his ambition was not ſatisfied with the kingdoms and provinces he poſſeſſed; for he is ſuppoſed, with reaſon, to have aſpired at univerſal empire. He is ſaid to have fought 60 battles, in moſt of which he was victorious. He took the king of France (Francis I.) priſoner, and ſold him his liberty on very hard terms: yet afterwards, when the people of Ghent revolted, he aſked leave to paſs through his dominions; and though the generous king thus had him in his power, and had an opportunity of revenging his ill-treatment, yet he received and attended him with all pomp and magnificence. He ſacked Rome, and took the Pope priſoner; and the cruelties which his army exerciſed there are ſaid to have exceeded thoſe of the northern barbarians. Yet the pious emperor went into mourning on account of this conqueſt; forbad the ringing of bells; commanded proceſſions to be made, and prayers to be offered up, for the deliverance of the Pope his priſoner; yet did not inflict the leaſt puniſhment on thoſe who treated the holy father and the holy ſee with ſuch inhumanity. He is accuſed by ſome Romiſh writers of favouring Lutheran principles, which he might eaſily have extirpated. But the truth is, he found his account in the diviſions which that ſect occaſioned; and he for ever made an advantage of them, ſometimes againſt the Pope, ſometimes againſt France, and at other times againſt the empire itſelf. He was a great traveller, and made 50 different journeys into Germany, Spain, Italy, Flanders, France, England, and Africa. Though he had been ſucceſsful in many unjuſt enterpriſes, yet his laſt attempt on Metz, which he beſieged with an army of 100,000 men, was very juſt and very unſucceſsful.

Vexed at the reverſe of fortune, which ſeemed to attend his latter days, and oppreſſed by ſickneſs, which unfitted him any longer for holding the reins of government with ſteadineſs, or to guide them with addreſs, he reſigned his dominions to his brother Ferdinand and his ſon Philip; and retreated to the monaſtery of St. Juſtus, near Placentia, in Eſtremadura.

When Charles entered this retreat, he formed ſuch a plan of life for himſelf as would have ſuited a private gentleman of moderate fortune. His table was neat, but plain; his domeſtics few; his intercourſe with them familiar; all the cumberſome and ceremonious forms of attendance on his perſon were entirely aboliſhed, as deſtructive of that ſocial eaſe and tranquillity which he courted in order to ſooth the remainder of his days. As the mildneſs of the climate, together with his delivery from the burdens and cares of government, procured him at firſt a conſiderable remiſſion from the acute pains of the gout, with which he had been long tormented, he enjoyed, perhaps, more complete ſatisfaction in this humble ſolitude than all his grandeur had ever yielded him. The ambitious thoughts and projects which had ſo long engroſſed and diſquieted him, were quite effaced from his mind. Far from taking any part in the political tranſactions of the princes of Europe, he reſtrained his curioſity even from an enquiry concerning them; and he ſeemed to view the buſy ſcene which he had abandoned with all the contempt and indifference ariſing from his thorough experience of its vanity, as well as from the pleaſing reflection of having diſentangled himſelf from its cares.

Other amuſements, and other objects, now occupied him. Sometimes he cultivated the plants in his garden with his own hands; ſometimes he rode out to the neighbouring wood on a little horſe, the only one that he kept, attended by a ſingle ſervant on foot. When his infirmities confined him to his apartment, which often happened, and deprived him of theſe more active recreations, he either admitted a few gentlemen, who reſided near the monaſtery, to viſit him, and entertained them familiarly at his table; or he employed himſelf in ſtudying mechanical principles, and in forming curious works of mechaniſm, of which he had always been remarkably fond, and to which his genius was peculiarly turned. With this view he had engaged Turriano, one of the moſt ingenious artiſts of that age, to accompany him in his retreat. He laboured together with him in framing models of the moſt uſeful machines, as well as in making experiments with regard to their reſpective powers; and it was not ſeldom that the ideas of the monarch aſſiſted or perfected the inventions of the artiſt. He relieved his mind at intervals with ſlighter and more fantaſtic works of mechaniſm, in faſhioning puppets, which, by the ſtructure of internal ſprings, mimicked the geſtures and actions of men, to the no ſmall aſtoniſhment of the ignorant monks, who, beholding movements which they could not comprehend, ſometimes diſtruſted their own ſenſes, and ſometimes ſuſpected Charles and Turriano of being in compact with inviſible powers. He was particularly curious with regard to the conſtruction of clocks and watches; and having found, after repeated trials, that he could not bring any two of them to go exactly alike, he reflected, it is ſaid, with a mixture of ſurpriſe as well as regret on his own folly, in having beſtowed ſo much time and labour in the more vain attempt of bringing mankind to a preciſe uniformity of ſentiment concerning the intricate and myſterious doctrines of religion.

But in what manner ſoever Charles diſpoſed of the reſt of his time, he conſtantly reſerved a conſiderable portion of it for religious exerciſes. He regularly attended divine ſervice in the chapel of the monaſtery every morning and evening; he took great pleaſure in reading books of devotion, particularly the works of St. Auguſtine and St. Bernard; and converſed much with his confeſſor, and the prior of the monaſtery, on pious ſubjects. Thus did Charles paſs the firſt year of his retreat in a manner not unbecoming a man perfectly diſengaged from the affairs of this preſent life, and ſtanding on the confines of a future world, either in innocent amuſements which ſoothed his pains, and relieved a mind worn out with exceſſive application to buſineſs; or in devout occupations, which he deemed neceſſary in preparing for another ſtate.

But, about ſix months before his death, the gout, after a longer intermiſſion than uſual, returned with a proportional increaſe of violence. His ſhattered conſtitution had not ſtrength enough remaining to withſtand ſuch a ſhock. It enfeebled his mind as much as his body; and from this period we hardly diſcern any traces of that ſound and maſculine underſtanding which diſtinguiſhed Charles among his contemporaries. An illiberal and timid ſuperſtition depreſſed his ſpirit. He had no reliſh for amuſements of any kind. He endeavoured to conform, in his manner of living, to all the rigour of monaſtic auſterity. He deſired no other ſociety than that of monks, and was almoſt continually employed in chanting with them the hymns of the miſſal. As an expiation for his ſins, he gave himſelf the diſcipline in ſecret with ſuch ſeverity, that the whip of cords which he employed as the inſtrument of his puniſhment, was found, after his deceaſe, tinged with his blood. Nor was he ſatisfied with theſe acts of mortification, which, however ſevere, were not unexampled. The timorous and diſtruſtful ſolicitude which always accompanies ſuperſtition, ſtill continued to diſquiet him, and depreciating all that he had done, prompted him to aim at ſomething extraordinary, at ſome new and ſingular act of piety that would diſplay his zeal, and merit the favour of Heaven. The act on which he fixed was as wild and uncommon as any that ſuperſtition ever ſuggeſted to a diſordered fancy. He reſolved to celebrate his own obſequies before his death. He ordered his tomb to be erected in the chapel of the monaſtery. His domeſtics marched thither in funeral proceſſion, with black tapers in their hands. He himſelf followed in his ſhroud. He was laid in his coffin with much ſolemnity. The ſervice for the dead was chanted; and Charles joined in the prayers which were offered up for the reſt of his ſoul, mingled his tears with thoſe which his attendants ſhed, as if they had been celebrating a real funeral. The ceremony cloſed with ſprinkling holy water on the coffin in the uſual form, and, all the aſſiſtants retiring, the doors of the chapel were ſhut. Then Charles roſe out of the coffin and withdrew to his apartment, full of thoſe awful ſentiments which ſuch a ſingular ſolemnity was calculated to inſpire. But either the fatiguing length of the ceremony, or the impreſſion which this image of death left on his mind, affected him ſo much, that next day he was ſeized with a fever. His feeble frame could not long reſiſt its violence; and he expired on the 21ſt of September, after a life of 58 years ſix months and 21 days.

Charles XII. King of Sweden, was born in 1682. By his father's will, the adminiſtration was lodged in the hands of the Queen-dowager Eleonora with five ſenators, till the young prince was 18: but he was declared major at 15, by the ſtates convened at Stockholm. The beginning of his adminiſtration raiſed no favourable ideas of him, as he was thought both by Swedes and foreigners to be a perſon of mean capacity. But the difficulties that gathered round him, ſoon afforded him an opportunity to diſplay his real character. Three powerful princes, Frederic king of Denmark, Auguſtus king of Poland and elector of Saxony, and Peter the Great, czar of Muſcovy, preſuming on his youth, conſpired his ruin almoſt at the ſame inſtant. Their meaſures alarmed the council, they were for diverting the ſtorm by negociations; but Charles, with a grave reſolution that aſtoniſhed them, ſaid, "I am reſolved never to enter upon an unjuſt war, nor to put an end to a juſt one but by the deſtruction of my enemies. My reſolution is fixed: I will attack the firſt who ſhall declare againſt me; and when I have conquered him, I

may hope to ſtrike a terror into the reſt." The old counſellors received his orders with admiration; and were ſtill more ſurpriſed when they ſaw him on a ſudden renounce all the enjoyments of a court, reduce his table to the utmoſt frugality, dreſſed like a common ſoldier, and, full of the ideas of Alexander and Cæſar, propoſe thoſe two conquerors for his models in every thing but their vices. The King of Denmark began by ravaging the territories of the Duke of Holſtein. Upon this, Charles carried the war into the heart of Denmark; and made ſuch a progreſs, that the King of Denmark thought it beſt to accept of peace, which was concluded in 1700. He next reſolved to advance againſt the King of Poland, who had blocked up Riga. He had no ſooner given orders for his troops to go into winter-quarters, than he received advice, that Narva, where Count Horne was governor, was beſieged by an army of 100,000 Muſcovites. This made him alter his meaſures, and move towards the czar; and at Narva he gained a ſurpriſing victory, which coſt him not above 2000 men killed and wounded. The Muſcovites were forced to retire from the provinces they had invaded. He purſued his conqueſts till he penetrated as far as where the diet of Poland were ſitting; when he made them declare the throne of Poland vacant, and elected Staniſlaus their king: then making himſelf maſter of Saxony, he obliged Auguſtus himſelf to renounce the crown of Poland, and acknowledge Staniſlaus by a letter of congratulation on his acceſſion. All Europe was ſurpriſed with the expeditious finiſhing of this great negociation, but more at the diſintereſtedneſs of the King of Sweden, who ſatisfied himſelf with the bare reputation of this victory, without demanding an inch of ground for enlarging his dominions. After thus reducing the King of Denmark to peace, placing a new king on the throne of Poland, having humbled the Emperor of Germany, and protected the Lutheran religion, Charles prepared to penetrate into Muſcovy in order to dethrone the czar. He quickly obliged the Muſcovites to abandon Poland, purſued them into their own country, and won ſeveral battles over them. The czar, diſpoſed to peace, ventured to make ſome propoſals; Charles only anſwered, "I will treat with the czar at Muſcow." When this haughty anſwer was brought to Peter, he ſaid, "My brother Charles ſtill affects to act the Alexander, but I flatter myſelf he will not in me find a Darius." The event juſtified him: for the Muſcovites, already beaten into diſcipline, and under a prince of ſuch talents as Peter, entirely deſtroyed the Swediſh army at the memorable battle of Pultowa, July 8, 1709; on which deciſive day Charles loſt the fruits of nine years' labour, and of almoſt 100 battles! The king, with a ſmall troop, purſued by the Muſcovites, paſſed the Boriſthenes to Oczakow in the Turkiſh territories; and from thence, through deſert countries, arrived at Bender; where the Sultan, when informed of his arrival, ſent orders for accommodating him in the beſt manner, and appointed him a guard. Near Bender, Charles built a houſe, and intrenched himſelf; and had with him 1800 men, who were all clothed and fed, with their horſes, at the expence of the grand-ſignior. Here he formed a deſign of turning the Ottoman arms upon his enemies; and is ſaid to have had a promiſe from the vizier of being ſent into Muſcovy with 200,000 men. While he remained here, he inſenſibly acquired a taſte for books: he read the tragedies of Corneille and Racine; with the works of Deſpreaux, whoſe ſatires he reliſhed, but did not much admire his other works. When he read that paſſage in which the author repreſents Alexander as a fool and a madman, he tore out the leaf. He would ſometimes play at cheſs: but when he recovered of his wound, he renewed the fatigues in exerciſing his men; he tired three horſes a-day; and thoſe who courted his favour were all day in their boots. To diſpoſe the Ottoman Porte to this war, he detached about 800 Poles and Coſaques of his retinue, with orders to paſs the Neiſter, that runs by Bender, and to obſerve what paſſed on the frontiers of Poland. The Muſcovite troops, diſperſed in thoſe quarters, fell immediately upon this little company, and purſued them even to the territories of the grand-ſignior. This was what the king expected. His miniſters at the Porte excited the Turks to vengeance; but the Czar's money removed all difficulties, and Charles found himſelf in a manner priſoner among the Tartars. He imagined the ſultan was ignorant of the intrigues of his grand-vizier. Poniatowſky undertook to make his complaints to the grand-vizier. The ſultan, in anſwer, ſome days after, ſent Charles five Arabian horſes, one of which was covered with a ſaddle and houſing of great riches; with an obliging letter, but conceived in ſuch general terms as gave reaſon to ſuſpect that the miniſter had done nothing without the ſultan's conſent: Charles, therefore, refuſed them. Poniatowſky had the courage to form a deſign of depoſing the grand-vizier; who accordingly was deprived of his dignity and wealth, and baniſhed. The ſeal of the empire was given to Numan Cuproughly: who perſuaded his maſter that the law forbad him to invade the czar, who had done him no injury; but to ſuccour the King of Sweden as an unfortunate prince in his dominions. He ſent his majeſty 800 purſes, every one of which amounted to 500 crowns, and adviſed him to return peaceably to his own dominions. Charles rejected this advice, threatening to hang up the baſhaws, and ſhave the beards of any Janiſaries who brought him ſuch meſſages; and ſent word that he ſhould depend upon the grand-ſignior's promiſe, and hoped to reenter Poland as a conqueror with an army of Turks. After various intrigues at the Porte, an order was ſent to attack this *head of iron*, as he was called, and to take him either alive or dead. He ſtood a ſiege in this houſe, with forty domeſtics, againſt the Turkiſh army; killed no leſs than 20 Janiſaries with his own hand; and performed prodigies of valour on a very unneceſſary and unwarrantable occaſion. But the houſe being ſet on fire, and himſelf wounded, he was at laſt taken priſoner and ſent to Adrianople; where the grand-ſignior gave him audience, and promiſed to make good all the damages he had ſuſtained. At laſt, after a ſtay of above five years, he left Turkey; and, having diſguiſed himſelf, traverſed Wallachia, Tranſylvania, Hungary, and Germany, attended only by one perſon; and in 16 days' riding, during which time he never went to bed, came to Stralſund at midnight, November 21, 1714. His boots were cut from his ſwollen legs, and he was put to bed; where, when he had ſlept ſome hours, the firſt thing he did was to review his troops, and examine the ſtate of the fortifications. He ſent out orders that very day, to renew the war with more vigour than ever. But affairs were now much changed: Auguſtus had recovered the throne of Poland; Sweden had loſt many of its provinces; and was without money, trade, credit, or troops. The kings of Denmark and Pruſſia ſeized the iſland of Rugen; and beſieged him in Stralſund, which ſurrendered; but Charles eſcaped to Carlſcroon. When his country was threatened with invaſion by ſo many princes, he, to the ſurpriſe of all Europe, marched into Norway with 20,000 men. A very few Danes might have ſtopped the Swediſh army; but ſuch a quick invaſion they could not foreſee. Europe was yet more at a loſs to find the czar ſo quiet, and not making a deſcent upon Sweden, as he had before agreed with his allies. This inaction was the conſequence of one of the greateſt deſigns, and at the ſame time the moſt difficult, of any that were ever formed by the imagination of man. In ſhort, a ſcheme was ſet on foot for a reconciliation with the

czar; for replacing Staniſlaus on the throne of Poland; and ſetting James the Second's ſon upon that of England, beſide reſtoring the Duke of Holſtein to his dominions. Charles was pleaſed with theſe grand ideas, though without building much upon them, and gave his miniſter leave to act at large. In the mean time, Charles was going to make a ſecond attempt upon Norway in 1718; and he flattered himſelf with being maſter of that kingdom in ſix months: but he was killed at Frederieſhall, a place of great ſtrength and importance, which is reckoned to be the key of that kingdom, as he was examining the works.—This prince experienced the extremes of proſperity and of adverſity, without being ſoftened by the one, or diſturbed for a moment at the other; but was a man rather extraordinary than great, and fitter to be admired than imitated. He was honoured by the Turks for his rigid abſtinence from wine, and his regularity in attending public devotion. In religion he was a Lutheran, and a ſtrong believer in predeſtination. He wrote ſome obſervations on war, and on his own campaigns from 1700 to 1709; but the MS. was loſt at the unfortunate battle of Pultowa

CHARLES CAPE, a promontory of N. America, on the S.W. part of the ſtrait entering into Hudſon's Bay. Long. 75. 15. W. Lat. 62. 10. N

CHARLTON, a village in Kent, on the edge of Blackheath, on the brow of an eminence that commands a fine view of the Thames. It is famous for an annual fair held here on St. Luke's day; it is called Horn Fair; horn wares of all kinds are ſold; the mob wear horns on their heads; and all that licentiouſneſs prevails which its name imports. Tradition traces the origin of this fair to the time of King John, who, being detected in an amour here, was obliged, it is ſaid, to purchaſe his ſafety of the injured huſband, by a grant of all the land from this place to Cuckold's Point; and he eſtabliſhed the fair as the tenure. In this pariſh, on Blackheath, is Morden College, a noble inſtitution for decayed merchants, founded by Sir John Morden, Bart. a Turkey merchant, ſeveral years before his death, which happened in 1708.

CHARLEVILLE, a borough of Ireland, in the county of Cork, 30 miles N. of Cork. Long. 8. 30. W. Lat. 52. 23. N.

CHARLEVILLE, a handſome town of France, in the department of the Ardennes and late province of Champagne. The ſtreets are ſtraight, and the houſes of an equal height. Here is a magnificent ſquare, and in the centre a handſome fountain. It is ſeated on the Meuſe, near Mezieres, from which it is ſeparated by a bridge and a cauſeway; 15 miles N.W. of Sedan, and 115 N.E. of Paris. Long. 4. 45. E. Lat. 49. 50. N.

CHARLEY, a town of Lancaſhire, with a market on Tueſday. It is ſeated near the ſpring-head of a rivulet called Chor, not far from the river Yarrow; ſix miles S.E. of Preſton, and 203 N.W. of London. Long. 2. 45. W. Lat. 53. 38. N.

CHARMES, a town of France, in the department of the Voſges, and late province of Lorrain, ſeated on the Moſelle, over which is a handſome bridge. It is eight miles E. of Mirecourt. Long. 6. 17. E. Lat. 48. 21. N.

CHARNWOOD, or CHARLEY FOREST, a rough open tract in the N.W. part of Leiceſterſhire, and in the neighbourhood of Bardon Hills

CHAROLLES, a town of France, in the department of Saone and Loire. It has a ruinous caſtle, and is ſeated on the river Reconce, 24 miles W.N.W. of Macon. Long. 4. 24. E. Lat. 46. 28. N.

CHASE, or CHACE, is alſo a place of retreat for deer and wild beaſts (*Encycl.*). The following hiſtory of the Engliſh chaſes is given by Mr. Pennant: "At firſt the beaſts of chaſe had this whole iſland for their range; they knew no other limits than the ocean, nor confeſſed any particular maſter. When the Saxons had eſtabliſhed themſelves in the heptarchy, they were reſerved by each ſovereign for his own particular diverſion: hunting and war, in thoſe uncivilized ages, were the only employ of the great; their active, but uncultivated minds, being ſuſceptible of no pleaſures but thoſe of a violent kind, ſuch as gave exerciſe to their bodies, and prevented the pain of thinking.

"But as the Saxon kings only appropriated thoſe lands to the uſe of foreſts which were unoccupied, ſo no individuals received any injury: but when the conqueſt had ſettled the Norman line on the throne, this paſſion for the chaſe was carried to an exceſs, which involved every civil right in a general ruin: it ſuperſeded the conſideration of religion even in a ſuperſtitious age: the village-communities, nay even the moſt ſacred edifices, were turned into one vaſt waſte, to make room for animals, the objects of a lawleſs tyrant's pleaſure. The new foreſt in Hampſhire is too trite an inſtance to be dwelt on; ſanguinary laws were enacted to preſerve the game; and in the reigns of William Rufus, and Henry I. it was leſs criminal to deſtroy one of the human ſpecies than a beaſt of chaſe. Thus it continued while the Norman line filled the throne; but when the Saxon line was reſtored under Henry II. the rigour of the foreſt laws was immediately ſoftened.

"When our barons began to form a power, they claimed a vaſt, but more limited, tract for a diverſion that the Engliſh were always fond of. They were very jealous of any encroachments on their reſpective bounds, which were often the cauſe of deadly feuds: ſuch a one gave cauſe to the fatal day of *chevy-chace*; a fact which, though recorded only in a ballad, may, from what we know of the manners of the times, be founded on truth: not that it was attended with all the circumſtances which the author of that natural but heroic compoſition hath given it; for, on that day, neither a *Percy* nor a *Douglas* fell: here the poet ſeems to have claimed his privilege, and mixed with this fray ſome of the events of the battle of *Otterbourne*.

"When property became happily more divided by the relaxation of the feodal tenures, theſe extenſive hunting-grounds became more limited; and as tillage and huſbandry increaſed, the beaſts of chaſe were obliged to give way to others more uſeful to the community. The vaſt tracts of land, before dedicated to hunting, were then contracted; and, in proportion as the uſeful arts gained ground, either loſt their original deſtination, or gave riſe to the invention of *parks*. Liberty and the arts ſeem coeval; for when once the latter got footing, the former protected the labours of the induſtrious from being ruined by the licentious ſportſman, or being devoured by the objects of his diverſion: for this reaſon, the ſubjects of a deſpotic government ſtill experience the inconveniences of vaſt waſtes, and foreſts, the terrors of the neighbouring huſbandmen; while in our well-regulated monarchy very few chaſes remain. The Engliſh ſtill indulge themſelves in the pleaſures of hunting; but confine the deer-kind to parks, of which England boaſts of more than any other kingdom in Europe. The laws allow every man his pleaſure; but confine them in ſuch bounds as prevents them from being injurious to the meaneſt of the community. Before the Reformation, the prelates ſeem to have guarded ſufficiently againſt this want of amuſement, the ſee of Norwich, in particular, being poſſeſſed, about that time, of thirteen parks.

CHATEL-CHALONS (*Encycl.*), erroneouſly ſpelt CHATER-CHALONS.

CHATILLON-LES-COMBES, a town in the department of Ain and late province of Breſſe, twelve miles W. of Bourg.

CHATILLON-SUR-INDRE, a town of France, in the department of Indre and late province of Berry, ten miles S. of Loches. Long. 0. 55. E. Lat. 47. 22. N.

CHATILLON-SUR-MARNE, a town of France, in the department of Marne and late province of Champagne, ſeventeen miles S. of Rheims. Long. 4. 5. E. Lat. 48. 58. N.

CHATOQUE, Lake, a lake of North America, in the ſtate of New York. It is the ſource of the river Conawongo, which runs into the Allegany. The lower end of it, whence the river proceeds, is in lat. 42. 10. N. From the N.W. of this lake to Lake Erie is nine miles.

CHATTESWORTH, a village in Derbyſhire, near the river Derwent, in the Peak, and reckoned one of its wonders. Here is the magnificent ſeat of the Duke of Devonſhire. It is ſix miles from Cheſterfield.

CHAUMONT, a town of France, in the department of Oiſe and late province of the Iſle of France, thirty miles N.W. of Paris. Long. 2. 7 E. Lat. 49. 18. N.

CHEADLE, a town in Staffordſhire, with a market on Saturday. It is ſeated in the moſt fertile part of the moorlands, twelve miles N.E. of Stafford. Long. 1. 56. W. Lat. 53. 0. N.

CHEAM, a village in Surrey; of which it is remarkable, that, between the years 1581 and 1624, of ſix of its rectors ſucceſſively, five became biſhops. Adjoining to this pariſh, is the ſite of the village of Codinton, or Cudington, near which Henry VIII. built the palace of Nonſuch, ſo much celebrated, by Camden and Hentzner, for its magnificence. It was a favourite reſidence of Queen Elizaheth; but being granted by Charles II. to the Ducheſs of Cleveland, ſhe pulled down the houſe, and diſparked the land. Cheam is thirteen miles S. by W. of London.

CHEBUKTO Harbour, in North America, near Halifax, in Nova Scotia. Long. 63. 18. W. Lat. 44 45. N.

CHEDDER, a large village of Somerſetſhire, famous for its cheeſes, which are the next beſt to Stilton cheeſe in England, and as large as thoſe of Cheſhire. It is three miles E. of Axbridge. Long. 2. 57. W. Lat. 51. 13. N.

CHEDWORTH, a village of Glouceſterſhire, four miles S.W. of North Leach, through which the river Coſn runs to Fairford. It is ſituated on the declivity of two hills. In this pariſh, in 1760, a Roman bath was diſcovered. The Roman Foſſe lies about two miles N.W. of this ſpot. There is a tumulus on a hill near this bath, with a remarkably large ſtone ſet upright on the top of it, on the removal of which great quantities of human bones were diſcovered.

CHEESE (*Encycl.*). Every country has places noted for this commodity: thus Cheſter and Glouceſter cheeſe are famous in England; and the Parmeſan cheeſe is in no leſs repute abroad, eſpecially in France. This ſort of cheeſe is entirely made of ſweet cow-milk: but at Rochefort in Languedoc, they make it of ewes' milk; and in other places it is uſual to add goats' or ewes' milk in a certain proportion to that of the cow. Parmeſan is made in cheeſes of 60, 80, 100, and even 180 pounds weight; the ſize depends on the number of cows in the poſſeſſion of the farmer: thoſe which weigh 60 or 80 pounds are conſidered moſt commodious for ſale.

In warm weather, and when there is plenty of milk, they make cheeſe every day: in winter the milk will keep, and the cheeſe is only made every other day. In ſummer, the evening's milk is ſkimmed the next morning, that of the morning at about three o'clock in the afternoon, when the evening's milk is ſkimmed again, both are mixed together, and the farmer immediately proceeds to manufacture his cheeſe.

All the milk intended for one boiling is put together in a large copper cauldron, large enough to contain 1000 pounds, three feet five inches deep, and nearly of the form deſcribed in the figure. The cauldron is ſuſpended by its handle on a wooden crane, ſo that it can be taken from the fire and replaced at pleaſure. The fire-place forms a kind of ſtove, between which and the cauldron the flame blazes freely; but the ſtove is open on one ſide, to leave a paſſage for the cauldron when it becomes neceſſary to turn it. The hearth, and even the bottom of the cauldron, are below the level of the earth, that the perſon employed in making the cheeſe may with eaſe plunge his hands when neceſſary to the very bottom.

When the milk is in the cauldron, the fire is kindled, the milk is heated to the temperature of about forty degrees, and kept ſtirring from the top to the bottom, in order that the temperature may be equally diſtributed through all parts of the maſs. While the milk is thus heating, the cream is churned into butter.

When the milk has attained the proper temperature, the cauldron is removed from the fire, and a large wooden ſkreen is placed for the purpoſe of preventing the milk from receiving any further heat from the fire, and that no motion may be created by it in any part of the maſs. They then wait five or ſix minutes to afford time for the calming of any internal motion, occaſioned by the different temperatures of the ſeveral ſtrata of milk; and when the whole is in a ſtate of calm, the rennet is infuſed in the following manner.

They have, in a little veſſel, a leaven, compoſed of milk curdled in the ſtomach of a calf, wheat-flour, and ſalt, all fermented together. Of this they take a ſmall lump, about the ſize of a walnut, and tie it up in the corner of a napkin, which is plunged into the milk and ſqueezed out with the hand. The linen retains, like a ſieve, all the ſubſtances in the rennet which will not diſſolve; and when theſe ſubſtances only are left, the napkin is withdrawn, and the milk well ſtirred that the rennet may be equally diſtributed; that done, the whole maſs is left to curdle without diſturbance. In this interval they finiſh churning the butter.

In three quarters of an hour, or an hour, the milk is curdled, which is made apparent when, on taking up ſome of it with a wooden ſpoon, at different places in the ſurface, it is perceived to have loſt its fluidity. Then they take away the ſkreen, and replace the cauldron on the fire, to heat the milk anew, and carry its temperature to fifty degrees. The motive for this ſecond heating is, to facilitate the ſeparation of the curd, as hereafter mentioned. During the time it is on the fire it is kept continually ſtirring, for the purpoſe of dividing it. The kind of boiling which it now undergoes renders the curd more denſe, and increaſes its ſpecific weight. They then let it cool a little, and take away about a quarter of the thin milk, that the remainder may with leſs difficulty acquire the temperature of fifty degrees. They then keep ſtirring it continually, that all the curd may be divided into very ſmall lumps. When the proper temperature is attained, they throw in a few pinches of ſaffron, for the mere purpoſe of colouring the cheeſe.

At this period the operation becomes extremely critical. The heating not only enables the maſſes of curd to adhere to each other, in the ſame manner as it hardens the white of eggs, but it enables the curd to ſeparate itſelf from the milk after the maſs is formed. It is probable that there is a nice limitation to be obſerved in this reſpect, which muſt not be exceeded, for the perſon employed in making of the cheeſe now frequently takes up handfuls of the curd, which he ſqueezes ſtrongly together to aſcertain whether it has acquired a proper conſiſtency. When he is ſatisfied in this reſpect, the cauldron is again withdrawn from the fire, and the ſkreen replaced, or the fire is extinguiſhed with water.

When the maſs is no longer ſtirred, the curd ſoon precipitates itſelf. Then with large wooden veſſels they take out

almoſt all the thin milk, and throw over the reſt about two pailfuls of cold water, to decreaſe the heat, and permit the workman to thruſt in his hands. Then, holding by his thighs to the brim of the veſſel, he bends himſelf in, to reach the bottom with his hands; he quickly gathers all the curd together to one ſide of the cauldron, and paſſes a cloth under the curd, which he gathers together, graſping the four corners of the cloth. This maſs is very heavy, and he could not draw it out immediately, but the aſſiſtants pour into the cauldron the milk they had previouſly taken out, and this enables him to raiſe, without much difficulty, the maſs of curd to the ſurface. He then carries it away in the cloth, and places it in a round wooden form, without bottom, ſtanding on an even ſolid table.

All this operation requires great readineſs in the ſervice, and even a great degree of habit; for the power of adheſion which the curd has acquired makes it harden ſpeedily, and if it were permitted to aſſume a bad ſhape it would never afterwards loſe it.

When the curd is placed in the form, the cheeſe has already acquired firmneſs, and will reſiſt a ſtrong preſſure of the finger; it hardens very rapidly, and, without any external compreſſion, ſqueezes out, by its own power of contraction, the greater part of the thin milk which is yet contained in it. The effect of this faculty would be to give the cheeſe a ſpherical form; but to flatten it at the ends, they place over it a round plate of wood, and a heavy ſtone. Thus it is left for the night; it cools, throws off the thin milk, and aſſumes the form it is intended to retain.

On the morrow they place a layer of ſalt on one of the flat ſides of the cheeſe; the next day they turn it, and ſalt the oppoſite ſurface; and continue this alternate operation for forty days, when the ſalt will melt no longer. The uſe of this operation is not only to ſalt but to dry the cheeſe, that is, to extract from it all the milk which may have remained after the cheeſe had become cool, and could no longer contract itſelf.

When, after about forty days, the cheeſe has acquired the neceſſary qualities for keeping and ſale, they ſcrape it with a flexible knife to take off the little ſoft incruſtation on the ſurface, ſo that the ſoft cheeſe is ſeen on every ſide; the ſurface is then perfectly ſleek, and they varniſh it with a ſlight layer of linſeed-oil; finally, they give to the convex ſurface only a red tint, made from vegetable ſubſtances alone, and the cheeſe is fit for ſale.

The thin milk which has been replaced in the cauldron ſtill contains a conſiderable quantity of curd, and even ſome ſerous parts, which, though they did not curdle at firſt, ought not to be loſt. The cauldron is replaced on the fire, and freſh rennet put into the milk; by theſe means a ſufficient quantity of curd is obtained to make an inferior ſort of cheeſe for family conſumption. The milk which ſtill remains ſerves to feed the live ſtock. See plate 20.

Cheese-*Rennet*. See Gallium.

CHEIRANTHUS, stock-gilliflower, or *Wallflower*; a genus of the ſiliquoſa order, belonging to the tetradynamia claſs of plants. The ſpecies are thirteen, but the following three are moſt worthy of notice: 1. The *cheiri* or common wallflower, with ligneous, long, rough roots; an upright, woody, abiding ſtalk, divided into many erect angular branches, forming a buſhy head from one to two feet high, cloſely garniſhed with ſpear-ſhaped, acute, ſmooth leaves, and all the branches terminating in long erect ſpikes of numerous flowers, which in different varieties are yellow, bloody, white, &c. 2. The *incanus*, or hoary cheiranthus, with ligneous, long, naked, white roots; and upright, ſtrong, woody, abiding ſtem, from one to three feet high, branchy at top, adorned with long, ſpear-ſhaped, obtuſe, hoary leaves; and the top of the ſtalk and all the branches terminated by erect ſpikes of flowers from one to two or three feet long, of different colours in different varieties. 3. The *annuus*, or ten-weeks-ſtock, with an upright, woody, ſmooth ſtalk, divided into a branchy head, twelve or fifteen inches high, garniſhed with ſpear-ſhaped, blunt, hoary leaves, a little indented, and all the branches terminated by long erect ſpikes of numerous flowers of different colours in different varieties.—The two firſt ſorts are very hardy evergreen biennials or perennials; but the laſt is an annual plant, ſo muſt be continued by ſeed ſown every year; and even the two firſt, notwithſtanding their being perennial, degenerate ſo much in their flowers after the firſt year, that it will be proper alſo to raiſe an annual ſupply of them. The ſeeds are to be ſaved only from the plants with ſingle flowers; for the double ones bring no ſeeds to perfection. The ſeeds are to be choſen from ſuch flowers as have five, ſix, or more petals, or from ſuch as grow near to the double ones. They may be ſown in the full ground in the ſpring, and may be afterwards tranſplanted. When fine doubles of the two firſt kinds are obtained, they may be multiplied by ſlips from the old plants.

CHEITORE, or Oudipour, one of the principal of the Rajpoot ſtates, in Hindooſtan Proper. It conſiſts, in general, of high mountains, divided by narrow valleys; or of plains environed by mountains, acceſſible only by narrow paſſes or defiles: in reality, one of the ſtrongeſt countries in the world; yet having an extent of arable land ſufficient for the ſupport of a numerous population, and bleſſed with a mild climate, being between the 24th and 28th degrees of N. latitude: in fine, a country likely to remain for ever in the hands of its preſent poſſeſſors, and to prove the aſylum of the Hindoo religion and cuſtoms. "Notwithſtanding," ſays Major Rennell, "the attacks that have been made upon it by the Gaznavide, Pattan, and Mogul emperors, it has never been more than nominally reduced. Some of the fortreſſes, with which the country abounds, were indeed taken: but the ſpirit of independent nations does not reſide in fortreſſes, nor are they to be conquered with them. Accordingly, every war on theſe people, even by Aurungzebe, ended in a compromiſe, or defeat, on the ſide of the aſſailants." The country, however, is now tributary to the Mahrattas.

Cheitore, or *Oudipour*, a town, in a province of the ſame name, in Hindooſtan Proper. It was the capital of the Rana, or chief prince of the Rajpoots, in the days of his greatneſs; and was a fortreſs and city of great extent, ſituated on a mountain; but it has been in ruins ſince the time of Aurungzebe in 1681. It is 120 miles S. by E. of Nagpour. Long. 74. 56. E. Lat. 25. 21. N.

CHEKAO, in natural hiſtory, the name of an earth found in many parts of the Eaſt Indies, and ſometimes uſed by the Chineſe in their porcelain manufactures. It is a hard and ſtony earth; and the manner of uſing it is this: they firſt calcine it in an open furnace, and then beat it to a fine powder. This powder they mix with large quantities of water: then ſtirring the whole together, they let the coarſer part ſubſide; and pouring off the reſt yet thick as cream, they leave it to ſettle, and uſe the matter which is found at the bottom in form of a ſoft paſte, and will retain that humidity a long time. This ſupplies the place of the earth called *hoache*, in the making of that elegant ſort of china-ware which is all white, and has flowers which ſeem formed by a mere vapour within its ſurface. The manner of their uſing it is this: they firſt make the veſſel of the common matter of the manufacture; when this is almoſt dry, they

paint upon it the flowers, or whatever other figures they pleaſe, with a pencil dipt in this preparation of the chekao; when this is thoroughly dry, they cover the whole veſſel with the varniſh in the common way, and bake it as uſual. The conſequence is, that the whole is white: but the body of the veſſel, the figures, and the varniſh, being three different ſubſtances, each has its own particular white; and the flowers being painted in the fineſt white of all, are diſtinctly ſeen through the varniſh upon the veſſel, and ſeem as if traced by a vapour only. The hoache does this as well as the chekao; and has beſides this the quality of ſerving for making the porcelain ware either alone, or in the place of kaolin: the chekao has not this property, nor any other ſubſtance beſides this hoache, which appears to be the ſame with our ſteatites or ſoap-rock.

CHEKE (Sir John), a celebrated ſtateſman, grammarian, and divine, of an ancient family in the Iſle of Wight, was born at Cambridge in the year 1514, and educated at St. John's College in that univerſity; where, after taking his degrees in arts, he was firſt choſen Greek lecturer, and in 1540 profeſſor of that language, with a ſtipend of 40l. a-year. In this ſtation he was principally inſtrumental in reforming the pronunciation of the Greek language, which, having been much neglected, was imperfectly underſtood. About the year 1543 he was incorporated maſter of arts at Oxford, where, we are told, he had ſtudied for ſome time. In the following year he was ſent to the court of King Henry VIII. and appointed tutor for the Latin language, jointly with Sir Anthony Cooke, to Prince Edward, about which time he was made canon of the college newly founded in Oxford; wherefore he muſt have now been in orders. On the acceſſion of his royal pupil to the crown, Mr. Cheke was firſt rewarded with a penſion of 100 marks, and afterwards obtained ſeveral conſiderable grants from the crown. In 1550 he was made chief gentleman of the privy-chamber, and was knighted the following year; in 1552, chamberlain of the exchequer for life; in 1553, clerk of the council; and ſoon after ſecretary of ſtate and privy-counſellor. But theſe honours were of ſhort duration. Having concurred in the meaſures of the Duke of Northumberland for ſettling the crown on the unfortunate Jane Grey, and acted as her ſecretary during the nine days of her reign, on the acceſſion of Queen Mary, Sir John Cheke was ſent to the Tower, and ſtript of the greateſt part of his poſſeſſions. In September 1554 he obtained his liberty, and a licence from her majeſty to travel abroad. He went firſt to Baſil, thence to Italy, and afterwards returned to Straſburg, where he was reduced to the neceſſity of reading Greek lectures for ſubſiſtence. In 1556 he ſet out in an evil hour to meet his wife at Bruſſels: but, before he reached that city, he was ſeized by order of King Philip II. hoodwinked, and thrown into a waggon; and thus ignominiouſly conducted to a ſhip, which brought him to the Tower of London. He ſoon found that religion was the cauſe of his impriſonment; for he was immediately viſited by two Romiſh prieſts, who piouſly endeavoured to convert him, but without ſucceſs. However, he was at laſt viſited by Fleckenham; who told him from the queen, that he muſt either comply or burn. This powerful argument had the deſired effect; and Sir John Cheke accordingly complied in form, and his lands, upon certain conditions, were reſtored: but his remorſe ſoon put an end to his life. He died in September 1557, at the houſe of his friend Mr. Peter Oſborne in Wood-ſtreet, London, and was buried in St. Alban's church. He left three ſons, the eldeſt of whom, Henry, was knighted by Queen Elizabeth. He wrote, 1. A Latin tranſlation of two of St. Chryſoſtom's Homilies. Lond. 1543, 4to. 2. The Hurt of Sedition. Lond. 1549, 1576, 1641. 3. Latin tranſlation of the Engliſh communion ſervice. Printed among Bucer's opuſcula. 4. De pronunciatione Græcæ. Baſil, 1555, 8vo. 5. Several letters publiſhed in his life by Strype; and a great number of other books.

CHEKIANG, a maritime province of China, to the W. of Pekin, one of the moſt fertile and trading provinces of that empire. It is interſperſed with mountains, fruitful fields, rivers, and canals. The inhabitants are famous for making gold and ſilver brocaded ſilks, which are very cheap; for they breed quantities of ſilk-worms. In the lakes of this country is to be found the golden fiſh, well known for its beauty, as alſo a tree which produces tallow. It contains eleven large cities, ſeventy-ſeven towns, and many populous villages.

CHE-KYANG, or TSEKIAN, a province of the empire of China, formerly the reſidence of the Chineſe monarchs, and one of the moſt conſiderable in the whole empire. It is bounded on the ſouth by Fo-kyen; on the north and weſt, by Kyang-nan, and Kyang-ſi; and on the eaſt by the ſea. It extends itſelf from the 27th to the 31ſt degree of north latitude, and from 116° to almoſt 120° of eaſt longitude, according to the meridian of Paris. The climate of it is ſerene and healthy, and the inhabitants very numerous, amounting, according to their regiſters, to 4,525,700 men. The country is exceedingly rich and fertile, beautifully variegated with well-cultivated mountains, fruitful valleys and plains; ſo that there is not a ſpot which is not turned to the beſt advantage. It is interſected by a multitude of rivers and canals; the laſt cut wide and deep, and lined on both ſides with hewn ſtone. The plains on both ſides have a communication with each other by a vaſt number of bridges, ſo that one may travel through the whole province either by land or water. A vaſt quantity of ſilk is manufactured in this province; which is here finer, more rich and curiouſly wrought with gold and ſilver, than in any other; and yet is ſo cheap, that a good ſilk ſuit will coſt leſs than one of the moſt ordinary cloth in Europe. The tribute of ſilk paid to the emperor is ſaid to amount to 370,466 pounds raw, and 2574 wrought, beſides ſome other quantities of the fineſt, ſent as a preſent to the court by the imperial barges. The province hath eleven capital cities, or cities of the firſt rank, and ſeventy-ſeven of the ſecond and third rank; beſides eighteen fortreſſes, moſt of them upon the ſea-coaſts, and large and populous enough to paſs in other countries for conſiderable cities. The inhabitants are ingenious, polite, and courteous to ſtrangers, but very ſuperſtitious.

CHELIDONIUM, CELANDINE, and HORNED or PRICKLY POPPY; a genus of the monogynia order, belonging to the polyandria claſs of plants. There are ſix ſpecies, none of which are remarkable for their beauty; but one of them, *viz.* the majus, is an article in the materia medica. It grows on old walls, among rubbiſh, and in waſte ſhady places. The herb is of a blueiſh-green colour; the root of a deep red; and both contain a gold-coloured juice: their ſmell is diſagreeable, the taſte ſomewhat bitteriſh, very acrid, burning and biting the mouth; the root is the moſt acrid. The juice takes off warts; cures tetters, ring-worms, and the itch; and, diluted with milk, it conſumes opake white ſpots on the eye.—Horſes, cows, goats, and ſwine, refuſe to eat the herb.

CHELIDONIUS LAPIS, in natural hiſtory, a ſtone ſaid by the ancients to be found in the ſtomachs of young ſwallows, and greatly cried up for its virtues in the falling-ſickneſs; but, from their deſcription, it appears to be only a

ſpecies of lycodontes, or bufonitæ. See LYCODONTES, and BUFONITÆ.

CHELM, a town of Poland, capital of a palatinate of the ſame name. It is ſituated in the province of Red Ruſſia. E. long. 23. 30. N. lat. 51. 25.

CHELMSFORD, the county town of Eſſex, ſituated on the river Chelmer, in E. long. 30. N. Lat. 51. 40. It ſends two members to parliament.

CHELONE, in botany, a genus of the angioſpermia order, belonging to the didynamia claſs of plants. There are three ſpecies, *viz.* the Glabra, the Hirſuta, and the Penſtemon. They are natives of North America; and are herbaceous flowery perennials, with upright ſtalks two feet high, decorated with ſpear-ſhaped leaves, and beautiful ſpikes of monopetalous, ringent flowers, red, roſe-coloured, blue, and purple. They flower from September to November, and are ſometimes ſucceeded by ripe ſeeds in this country. They are very hardy plants, and may be propagated by ſeeds ſown in any ſoil or ſituation; but the two firſt multiply ſo faſt by their creeping roots, that the ſeeds are ſeldom regarded.

CHELSEA, a fine village ſituated on the northern bank of the river Thames, a mile weſtward of Weſtminſter, remarkable for a magnificent hoſpital of invalids and old decrepit ſoldiers; and a pleaſure-houſe, called Ranelagh, to which a great deal of fine company reſort in ſummer.

CHELTENHAM, or CHILTENHAM. See CHILTENHAM.

CHELUM, a river of Hindooſtan Proper, being the weſternmoſt of the five eaſtern branches of the river Indus. It riſes above Caſhmere, waters that city, and flowing through the province of the ſame name, in a S.E. direction, unites with the Indus below Moultan. This river is the famous Hydaſpes of Alexander.

CHEMISE, in fortification, the wall with which a baſtion, or any other bulwark of earth, is lined for its greater ſupport and ſtrength: or it is the ſolidity of the wall from the talus to the ſtone-row.

Fire-CHEMISE, a piece of linen cloth, ſteeped in a compoſition of oil of petrol, camphor, and other combuſtible matters, uſed at ſea to ſet fire to an enemy's veſſel.

CHEMISTRY (*Encycl.*). In p. 479 of that article ſome mention is made of Mr. Woulfe's improvement in the receiver for diſtillation. To that as well as to what has been offered in this ſupplement under the article ACID, we wiſh to add the deſcription of a chymical apparatus reſembling that of Woulfe, and requiring no lute, by Mr. Girard. The ingenious apparatus of Woulfe, to which modern chemiſtry is ſo highly indebted, being attended with ſome ſlowneſs in the operation to which it is applied, the means of ſimplifying it have long been ſought, and various forms have been contrived to produce this apparatus hermetically cloſed, and without lute. Theſe, in general, are too difficult in the execution; but that offered by Girard to the National Inſtitute of Paris may be put together or diſmounted in a few ſeconds, and appears to be applicable to all circumſtances.

In this conſtruction nothing more is required, but to cauſe the bottles or veſſels to be made at the glaſs-houſe with one of the necks A, provided with an internal AB, which is welded in the neck itſelf, by means of a projection or prominence in the glaſs, ſee plate II. fig. 1. The oppoſite neck is firſt drawn out into a point or thin tube as uſual; but afterwards, inſtead of breaking it off near the veſſel to accommodate it to the ſubſequent fittings, it is left of the full length, and bended in ſuch a manner that it terminates in the arc of a circle, which can be introduced into the tube AB. It is unneceſſary to remark, that the tube AB, and the neck which is to be introduced, muſt have the ſame curvature. This condition is very eaſily obtained by bending the tubes and the necks on the ſame cylinder of earth or wood.

It may here be readily underſtood, that the back or neck of the firſt bottle being introduced into the tube of the ſecond, and paſſing further inwards than its extremity, and the interior tubes of each bottle being immerſed in water, no gas can iſſue from the firſt veſſel but by paſſing through its neck, and riſing in the ſecond through the aſcertained fluid.

Fig. 2. repreſents another apparatus of Woulfe, which may be ſubſtituted inſtead of the other in caſe the operator reſide at a diſtance from a glaſs-houſe. It is compoſed of wide-mouthed tubulated bottles. A tube is taken rather thick, and wide enough to contain another. In the upper part of this tube an enlargement muſt be made by blowing, and this part is to be fitted into the neck by grinding, in the ſame manner as ſtoppers are uſually adjuſted.

Another tube is then taken which can enter into the other with eaſe and freedom of motion The extremity A of this tube is to be ground in the ſame manner, that it may be fitted in the neck of another bottle, and it is bended into the uſual curve ABC. It is thus introduced into the tube EF, fig. 3. and the lower extremity D is turned upwards. Fig. 2. ſhews the manner of adjuſting the apparatus, and it may be ſeen that it is hermetically cloſed, where the lower part of the large tube is plunged in the water.

The bending or curvature of the tubes and necks of the bottles is intended, as may be readily conceived, merely to anſwer the purpoſe of directing the bubbles of the gas which eſcape from the tube, ſo that they may not again enter the orifice from which they eſcaped. It is, therefore, unneceſſary in an apparatus of any conſiderable magnitude, in which the neck is made to project an inch or more beyond the lower opening of the tube, for in this caſe the bubbles neceſſarily paſs clear of this aperture.

Fig. 4 alſo exhibits another conſtruction of this apparatus.

If an apparatus compoſed of a very long ſeries of bottles were employed, there would be reaſon to fear that the gas contained in the firſt veſſel, having a very ſtrong reſiſtance to overcome, might cauſe the fluid of this firſt bottle to riſe in the tub and eſcape; but it would be very eaſy to remedy this inconvenience, either by uſing veſſels of different ſizes, or by putting a leſs quantity of fluid in the firſt than in the ſucceeding veſſels.

The neceſſity of diſtilling the *oxygenated muriatic acid* on a large ſcale, has given riſe to the invention of different kinds of apparatus more or leſs convenient. Some of theſe have been ſpoken of under the article BLEACHING. Berthollet has propoſed matraſſes with bent tubes, which convey the oxygenated muriatic acid to the pneumatic tub, in which the bubbles, traverſing the water, are forced, by means of an agitator, to combine more or leſs with it. Pajot de Charmes recommends the uſe of tubulated retorts; but, beſides theſe veſſels being too dear, they do not anſwer the propoſed end, ſince a portion of ſulphuric acid not decompoſed, and which injuries the proceſs, always paſſes into the water.

C. Widner, at Jouay, has arranged his apparatus in ſuch a manner as to loſe the leaſt gas poſſible during the condenſation: he receives the gas under a capſule inverted at the bottom of the apparatus; above theſe are two *tours de gouttière* alſo inverted, then another capſule above theſe; then two more *tours de gouttière*, and then another capſule, which terminates the apparatus. The diſpoſition of this tub is ſuch, that he places around in his laboratory ſeveral diſtilling apparatuſes, which are going at the ſame time.

Apparatuſes conſtructed on ſimilar principles are alſo in uſe at Glaſgow and Mancheſter. Bourboulon-de-Bonneul has

likewiſe invented an apparatus conſiſting of ſeveral matraſſes, ranged as in an aqua-fortis manufactory, the tubes of which are conveyed into a chamber containing concentrating tubs. His apparatus for the bleaching of paper is very ingenious, and deſerves to be deſcribed. In the laſt place, others have arranged five or ſix large caſks, like Woulfe's apparatus, in ſuch a manner as to make each caſk perform the functions of a tubulated flaſk. The bleachers in Ireland employ a kind of leaden alembic capable of containing forty gallons of water; a capacity more than ſufficient to contain the charge, and to favour the ſwelling which takes place by the reciprocal action of the matters during the diſtillation. This alembic (ſee Plate 20.), of a conic form, and having a very broad baſe, reſts in a balnæum mariæ, in order that it may be ſubjected to progreſſive heat; and the neck is of ſuch a height, that any ſulphuric acid which happens to riſe may fall back. The cover is perforated to afford a paſſage to the handle of an agitator, which ſerves to ſtir the matters at the bottom of the alembic: this agitator is of iron as well as its arms; but the iron is covered with a pretty thick plate of lead, that the acid may not attack it; the handle goes through a leather collar, to prevent the eſcape of the gas. The ſulphuric acid, diluted with water, is introduced into the leaden apparatus by means of a ſmall glaſs or leaden funnel, the tube of which is bent to guard againſt the reaction of the gas. The apparatus is alſo furniſhed with a condenſer, into which the gas is made to paſs. This veſſel has ſeveral ſhelves and an agitator. The latter goes through a leather collar in the top of the condenſer, paſſes down through the ſhelves, and is furniſhed with arms between each of the ſhelves; by which means the gas in its aſcent is expoſed to the action of the liquid in a ſtate of great agitation, and has a long way to travel through it. (See the plate.) Mr. O'Reilly ſpeaks of an apparatus which, in his opinion, is free from thoſe faults which generally attend an apparatus of lead, which always becomes oxidated, and is at length deſtroyed. "This apparatus," ſays he, "conſiſts of a ſeries of conical matraſſes with long necks, furniſhed with bent funnels as well as tubes, both of glaſs, which are conveyed into a common reſervoir This reſervoir ought to be perforated in ſuch a manner as to leave room for the introduction of a tube of a larger ſize (two inches), communicating with the firſt condenſing caſk or cylinder, made of white wood, twenty inches in diameter, bound round by hoops made tight with ſcrews, and completely water-proof. Care muſt be taken to cover theſe hoops with a coating of japan, as it is called, or with oil paint, to prevent the oozings of the liquor from ruſting them. The height of this cylinder muſt be ſeven or eight feet, and even more, if poſſible, in order to increaſe the preſſure; and ought to have placed over it a large two-necked bottle deprived of its bottom, or a glaſs bell with two necks cemented to the upper edge of the cylinder. In one of theſe necks the large tube of the reſervoir is introduced, and made to deſcend to the bottom of the cylinder. The air bubbles, as they are diſengaged, being forced to traverſe the fluid under a preſſure equal to the height of the column of water, will combine with it until it be ſaturated; the ſecond is alſo furniſhed with a leaden tube, the orifice of which is below the ſurface of the water; the ſuperabundant gas paſſes through this tube, and, deſcending into the ſecond cylinder of wood, ſimilar in all reſpects to the preceding, ſaturates the water in it:—a third cylinder may be added, if judged neceſſary. By this arrangement the ſmalleſt portion of the gas cannot eſcape: care muſt be taken to apply a leaden cock at the bottom of each cylinder, in order to draw off the bleaching liquor as it is formed.

"The reſiduums, after the diſtillation of the oxygenated muriatic acid, may be ſold to earthen-ware manufacturers to be employed as a glazing for their coarſe articles. The manganeſe contained in it gives it a blackiſh appearance, like that of bronze, which is far from being diſagreeable to the eye. I have employed this glazing ſeveral times by way of trial; firſt fuſing it with ſand in a potter's furnace, throwing it into cold water to facilitate its diviſion, and grinding it in a mill in order that it might be diffuſed in water. This glazing is attended with the advantage of being free from thoſe dangerous qualities ſo common in all preparations made from the oxides of lead; but the moſt important object is the extraction of the ſoda from the ſulphate of ſoda, which is formed in great quantity by the proceſs, and remains in the reſiduum of the diſtillation.

"The firſt point is, to convert the ſulphate of ſoda into an alkaline ſulphuret. Malhearbe and Athenas have ſucceeded in this, by employing iron as the intermediate ſubſtance: they mixed one part of charcoal duſt with nine parts of the ſulphate of ſoda, and expoſed the mixture to the heat of a reverberating furnace: when the ſulphuret entered into combuſtion, they added from three to five parts of old iron rendered as ſmall as poſſible; and the whole being fuſed together, they obtained black paſte, compoſed of iron, ſoda, ſulphate of iron, &c. This mixture was lixiviated, and filtered through a baſket filled with lime: it was then evaporated to dryneſs, and the reſiduum was calcined in a reverberated furnace. When ſoda of a ſuperior quality is required, the waſhing and calcination muſt be repeated.

"Dizé and Le Blanc decompoſed the ſulphate of ſoda, by means of the carbonate of lime, in order to neutrallize the alkali, by ſaturating it, at a very high temperature, with carbonic acid. Their proceſs conſiſts in taking two parts of ſulphate of ſoda, dried to deprive it of its water of cryſtallization, two parts of well-ground chalk (carbonate of lime), and one part of charcoal powder, mixing them well in a muffled mortar, and then bringing the mixture to a white heat in a reverberated furnace: when the matter is fuſed it is ſtirred till the ſulphur is conſumed, and the ebullition and the jet of the flame produced by the hydrogen gas have ceaſed to appear. It is then taken from the furnace, and it may be lixiviated to obtain the ſoda very pure. In whatever manner the ſulphate is decompoſed, this object merits the greateſt attention at bleach-fields, on account of the conſiderable degree of œconomy which reſults from the different manipulations. The ley of oxygenated muriatic acid will be obtained at little or no expence by bleachers, when they ſeriouſly ſet about extracting the ſoda from the ſulphate formed during the diſtillation."

In whatever manner the muriatic acid gas may be diſtilled, the great object is to ſaturate the water with this aëriform fluid. Its action in bleaching is always ſtronger when employed alone than when in the ſtate of combination with ſalts or earths, as in the ſubſequent operations. The volatility of the acid, however, is ſuch, and the loſs of the gas ſo enormous, that, when the thread of cloth is immerſed, there is diſſipated of it a quantity which may be eſtimated at about a *third*, at leaſt, of the whole gas. The mixture of potaſh, indeed, renders the liquor inodorous; but beſides this ſalt is expenſive, and greatly weakens the deterſive quality of the liquor.

Mr. Rudd, of Mancheſter, has invented an apparatus for bleaching cloth, exceedingly ſimple in its conſtruction, of ſmall expence, and which contains the liquor in ſuch a manner as to prevent the eſcape of the oxygenated muriatic acid gas. A conſideration of no leſs importance in the arrangement of this apparatus is, the impoſſibility of the vapour injuring the health of the workmen.

CHENSI, a province in the N.W. part of China. It contains eight cities of the firſt rank, and 106 of the ſecond and third, beſides many forts on the great wall. The air is to ſtrangers temperate, and the inhabitants more civil and affable than others in the northern parts. The ſoil is fertile, and abounds in wheat and millet. They have alſo rhubarb, honey, wax, muſk, cinnabar, and coal-mines. They have a great number of deer, bears, wild bulls, and an animal reſembling a tiger, whoſe ſkin is very curious. There are alſo muſk-goats, and bats as large as hens, beſide two or three other ſorts of animals quite unknown in Europe.

CHER, a department of France, including part of the late province of Berry. It receives its name from the river Cher, which riſes in Auvergne, and watering Tours, &c. falls into the Loire, five miles above the mouth of the Indre. Bourges is the capital.

CHERSON, the capital of New Ruſſia, in the government of Catharinenſlaf. It is a new town, erected by the Empreſs Catharine II. on the north bank of the river Dnieper, 10 miles below the mouth of the Ingulec. It is not yet very large; but the church and many of the houſes are built of ſtone, in a pretty taſte. It is intended to be the principal mart of all the commodities of export and import. It has a dock for the conſtruction of large veſſels, from which ſeveral men-of-war and merchant ſhips have been already launched. It is ſupplied with fuel by reeds only, of which there is an inexhauſtible foreſt in the ſhallows of the Dnieper, oppoſite the town. Rails, and even temporary houſes, are made of them. They are tall and ſtrong, and afford ſhelter to various kinds of aquatic birds, ſome of which are very beautiful. The fortifications are made, and the plantations formed, by malefactors, who amount to ſome hundreds. In 1787 the empreſs made a triumphant journey to this capital, and here met the Emperor Joſeph II. Her intention, it is ſaid, was to be crowned here queen of Taurica, and empreſs of the Eaſt. But the deſign, whatever it was, did not take place; and Catharine was content to have inſcribed over one of the gates of the city, "Through this gate lies the road to Byzantium" In this place, in 1790, the celebrated Mr. Howard, ſo well known for his plans of reform of the different hoſpitals and priſons of Europe, fell a victim to his indefatigable humanity. Cherſon is 50 miles E. of Oczakow. Long. 33. 10. E. Lat. 46. 5. N.

CHERZ, an ancient town of Poland, in Maſovia, 15 miles from Warſaw. Long. 21. 8. W. Lat. 52. 1. N.

CHESHAM, a town in Bucks, with a market on Wedneſday. It is 12 miles S.E. of Aileſbury, and 29 W. by N. of London. Long. 0. 36. W. Lat. 51. 42. N.

CHESTER, West, the capital of the county of Cheſter, in Pennſylvania. It is ſeated on the Delaware, and has a fine harbour. Long. 75. 27. W. Lat. 39. 54. N.

CHIARENZA, a ſea-port of Turkey in Europe, in the Morea, oppoſite the iſland of Zante. Long. 21. 35. E. Lat. 37. 50. N.

CHIARO-MONTE, a town of Sicily, on a mountain, 25 miles W. of Syracuſe. Long. 14. 59. E. Lat. 37. 3. N.

CHIAVENNA, Laghetto di, a ſmall lake of the country of the Griſons, in Switzerland, near the town of the ſame name. The views of this lake are extremely wild and magnificent; ſurrounded as it is by barren rocks, craggy, and riſing into ſpires ſprinkled with ſnow. The baſes of theſe dreadful precipices are loſt in the dead and overſhadowed water, dangerous on account of its malignant vapours, and affording no aſylum, ſcarcely a landing-place, to the crews of thoſe frail boats, which are caught unwarily in the violent ſtorms to which it is ſubject.

CHIEMSEE, a lake of Germany, in Bavaria, which contains a town of the ſame name, where there is a biſhop's ſee. The iſland in which it ſtands is 17 miles in circumference, and lies 22 miles W.S.W. of Saltzburg.

CHIERI, a fortified town of Piedmont, ſeated on the declivity of a hill, in a pleaſant country, bounded on all ſides by hills covered with vines. It is eight miles E. of Turin.

CHIETI, a town of the kingdom of Naples, capital of Abruzzo Citeriore, with an archbiſhop's ſee. It is ſeated on a mountain near the river Peſcara, eight miles S.W. of Peſcara. Long. 15. 7. E. Lat. 42. 20. N.

CHIGWELL, a village in Eſſex, near Epping Foreſt. Here is a free ſchool, founded by Archbiſhop Harſnett, who had been vicar of this place. He was buried in the church; and his grave-ſtone was adorned with his figure in braſs, in his pontifical robes. This, for the better preſervation of it, has been fixed on the pedeſtal in the chancel. Chigwell is 10 miles N.E. of London.

CHIHIRI, or Port-cheer, a town in Arabia Felix, with a harbour. It carries on a conſiderable trade. Long. 49. 25. E. Lat. 14. 40. N.

CHILKA, a lake in the Deccan of Hindooſtan, which bounds the five Circars on the N. It lies on the coaſt of the bay of Bengal, and ſeems the effect of the breach of the ſea over a flat ſandy ſurface, whoſe elevation was ſomething above the level of the country within. It communicates with the ſea by a very narrow but deep opening, and is ſhallow within. It is 40 miles long from N.E. to S.W. and, in moſt places, 12 or 15 wide, with a narrow ſlip of ground between it and the ſea. It has many inhabited iſlands in it. On the N.W. it is bounded by a ridge of mountains, a continuation of that which extends from the Mahanuddy to the Godavery River, and ſhuts up the Circars toward the continent. To thoſe who ſail at ſome diſtance from the coaſt, this lake has the appearance of a deep bay; the ſlip of land not being viſible.

CHIMAY, a town of France, in the department of the North and late province of Hainault. It is ſeated on the river Blanche, 20 miles S.S.W. of Charleroy. Long. 4. 15. E. Lat. 50. 0. N.

CHIMLEIGH, a town in Devonſhire, with a market on Wedneſday. It is almoſt ſurrounded by the river Dart, and is 21 miles N.N.W. of Exeter. Long. 3. 53. W. Lat. 50. 57. N.

CHIMNEY (*Encycl.*). In the deſcription of the Staffordſhire fire-place, the reference ſhould have been to Plate 88 inſtead of 89.

CHIMNEY-SWEEPER, a miſerable little wretch, ſcarcely human in his appearance or pretenſions, employed in the drudgery of diſlodging the ſoot from the chimneys of his employers. Of all the labours of the London Society for bettering the condition of the poor, none deſerve more encomium than the methods taken to reſcue this neglected and deſpiſed claſs of beings from perdition. We ſhall here give ſome account of what has been done, from their ſecond volume of Reports. In Auguſt, 1798, a ſunday ſchool, eſtabliſhed at Kingſton, was extended to the relief and inſtruction of the chimney-ſweepers' boys in that place. They are, indeed, few in number, but they had been left (as in moſt parts of England thoſe unfortunate boys are) without the means of cleanlineſs or of education, and without either example or inſtruction to induce religious or moral habits at that age which, wherever juſtice is done to the human character, ought to be the ſeaſon of preparation for life.

They had been not only deſtitute of inſtruction, but in ſome degree, of clothing; and, when unemployed, were left

to wander, almoſt in a ſtate of nature, excluded from the advantages of rational and Chriſtian beings.—In order that they might be in proper condition to appear in the ſchool, a lady of the neighbourhood, diſtinguiſhed as much by her benevolence as her rank, clothed each of theſe poor objects in the following manner.

A jacket and pair of trowſers of coarſe blue cloth	0	10	6
Two ſhirts	0	7	0
A pair of ſhoes	0	4	0
A hat	0	2	3
	£.1	3	9

Beſides this ſhe ſent to each chimney-ſweeper's houſe,

A ſtraw paillaſſe	1	2	0
A pair of blankets	0	17	0
A waſhing tub	0	6	6
	£.2	5	6

and a weekly allowance of a quarter of a pound of ſoap.

The boys are always improving in their reading, and ſome of them are now beginning to read in the New Teſtament. They are acquiring habits of cleanlineſs and attention, and their manners and morals are already very greatly improved.

This ſchool, or rather the part that reſpects chimney ſweepers' boys, is under the direction of a committee of eight perſons, together with a maſter and miſtreſs appointed by them, in Brick-lane, Kingſton.

Observations.—The above is ſtated for the conſideration of the inhabitants of country towns; where a ſimilar proviſion for theſe unfortunate objects might be very uſefully and effectually made, with very little expence or trouble. The remedy is ſo ſimple, and ſo eaſily applied, that the example needs only be given to be gradually adopted in moſt country towns in England.

To afford that degree of attention and relief, in London, which theſe boys are entitled to, in policy, as well as in juſtice, the proviſions to be made for them will be rather more complicated, and will require ſome conſideration. But there is no great difficulty in what is to be done. Protection and education during the period of apprenticeſhip, and the means of livelihood when that period expires at the age of ſixteen, are all the eſſential parts of the plan. If theſe were attained, even in a qualified degree, the general condition of a chimney-ſweeper's boy would not be a ſituation of more ſuffering and diſadvantage, than that of perſons in many other ſituations in life; and not ſubject to more hardſhip or danger, than the initiation into that dignified and honourable profeſſion, from which the Britiſh nation does now derive ſo much ſecurity, and ſuch diſtinguiſhed glory; and in which the firſt families in this country are deſirous of inſcribing their children.

It would produce a material improvement in the condition of the chimney-ſweeper's boy, and the character of the trade, if the practice of crying the ſtreets was entirely diſcontinued, and if families could be induced, as in other trades, to employ thoſe maſters, *whoſe characters are known in the neighbourhood.* There is nearly as much reaſon for ſending round the bricklayer's lad with his hod of mortar and a few bricks, ſcreaming his maſter into that employment which neither his ſituation nor character would otherwiſe given him any pretenſion to, as the loading with his bag and implements of trade, a little child already ſuffering by dirt, hunger, cold, and the want of domeſtic comfort; and ſending him to diſturb the ſtreets by his cries, till ſome unknown perſon calls him in, and employs him in his trade. How much better would it be that reſpectable men, like the benevolent Mr. Porter (to whoſe ſuggeſtions the country are indebted for the inſtitution of the ſociety of of maſter chimney-ſweepers, which we ſhall preſently notice), ſhould be ſettled in every neighbourhood; their characters and conduct known; and that any orders for employment ſhould be ſent the day before, ſo that the maſter might arrange his boys' time for the enſuing day, in the ſame manner, and with the ſame regularity, as in other trades; inſtead of their being exhauſted and deſtroyed, in the very act of applying for employment. If, indeed, it were in the power of every maſter to ſhew ſuch boys as Mr. Porter's, we ſhould have a ſucceſſion of hardy and intrepid lads formed for the navy, and for thoſe ſituations in which early habits of activity and enterpriſe are abſolutely neceſſary.

It has been a principal object of Mr. Porter's life, that boys apprenticed to his trade ſhould in future be protected and ſecured from thoſe diſeaſes, hardſhips, and dangers, for which he, by extraordinary energy of mind and body, and by the mercy of God, has been eminently preſerved. With this view he has prepared, in concert with ſome others of his trade, a plan for its regulation; a brief detail of which will employ the remainder of this paper.

Mr. Porter commences his ſtatement by a general approbation of the act for the relief of climbing boys, as far as the proviſions extend; but obſerves, that thoſe proviſions are not complied with by a majority of the maſters in the trade, either as to the clothing, lodging, or food of their apprentices:—That ſuffering and hardſhip are not neceſſarily incident to the trade, but ariſe merely from the want of proper internal regulations, which would ſoon remedy the evil. Their diſtreſs, however, when they quit their maſters, at the expiration of their apprenticeſhip, on attaining the age of 16 years, requires ſome contributory aſſiſtance from the public; they being then without money, without friends, and without the means or capacity of occupation. To provide a general ſyſtem of relief, it is contrived, that the maſters in the metropolis ſhall (with the contribution of an annual guinea from honorary members) form themſelves into a friendly ſociety for the protection of climbing boys during their apprenticeſhips; and for raiſing a fund to place out in occupations, at the age of 16, the boys of any of the members: the buſineſs of the ſociety to be conducted by a committee, which ſhall be elected by and out of the honorary and other members; and from which a ſub-committee of maſters ſhall be appointed to inſpect the bedding, clothing, and accommodation, of the apprentices of all maſters belonging to the ſociety, and to report whether they are comformable to their indentures of apprenticeſhip, and to the regulations of the act; and to hear any complaints of the boys, to enquire as to apprenticeſhips, and to apply to the magiſtrates in thoſe caſes where the act of parliament remains unexecuted.

Such is the outline of a plan, which the ſociety have ſince given more at length; and for the furtherance of which, by contributing as honorary members, the humanity, policy, and juſtice, of the public, have been reſorted to with ſome degree of ſucceſs.

The nature of this humane inſtitution will be beſt underſtood by the following copy of the articles of agreement, of the 19th of March, 1800, between ſeveral maſter chimney-ſweepers within the liberties of Weſtminſter and the Holborn diviſion of the county of Middleſex, for forming a friendly ſociety for the protection and inſtruction of their apprentices.

1ſt. It is hereby agreed that the ſaid maſter chimney-ſweepers do form themſelves into a friendly ſociety, for the protection and inſtruction of climbing boys during their apprenticeſhip; and to raiſe a fund, with the aſſiſtance of the honorary members of the ſaid ſociety, to give premiums with them to other trades, when their terms as chimney-ſweepers

ſhall expire; in order to enable them to become uſeful to themſelves and the community, and alſo to promote the general intereſt and credit of the trade.

2d. That all chimney-ſweepers above 21 years of age, being houſekeepers within the liberties of Weſtminſter and county of Middleſex, and having one or more apprentices, be eligible as members of this ſociety, and after election capable of being admitted, when they ſhall have ſigned theſe articles; and that the ſaid ſociety do conſiſt of ſuch members, ſo elected and admitted, and of ſuch honorary members as are hereinafter mentioned.

3d. That this ſociety do annually elect ſix members, maſters in the trade, and ſix of the honorary members hereinafter mentioned, to be a committee, with the preſident, four vice-preſidents, and treaſurer, to conduct the affairs thereof: and that they meet at ſuch hour and place as they ſhall from time to time appoint; and that any three of them conſtitute a board for the diſpatch of buſineſs.

4th. That a general meeting of this ſociety be held at two o'clock preciſely, on the firſt Wedneſday in the months of January, April, July, and October, in every year, to conſider and approve the meaſures of the committee, and for other purpoſes.

5th. That this ſociety do elect, by ballot, ſome member thereof to be treaſurer, to receive the ſubſcriptions, &c. of the members; which treaſurer do give a ſecurity to ſuch amount as the committee ſhall direct; and do pay all ſubſcriptions and other monies received, into the banking-houſe of the ſociety, to be entered with the names of the ſeveral ſubſcribers, ſo as it may all paſs through that account.

6th. That the committee have full permiſſion, at all reaſonable times of the day, to inſpect the bedding, clothing, &c. of all apprentices belonging to the members of this ſociety, to ſee whether they be according to the tenor of the indenture of ſuch apprentices, and conformable to the regulations contained in the act of parliament, and alſo that they do make report thereof to the ſociety at their general meetings.

7th. That it is the duty of every member of the committee, at all times, to hear the complaints of any apprentice in the trade, within the liberties of Weſtminſter and county of Middleſex, and to ſummon before a magiſtrate any maſter or miſtreſs who may violate the act of parliament made for the relief of climbing boys.

8th. That the ſociety do place out each boy, who ſhall complete the whole term of his apprenticeſhip as a chimney-ſweeper, to ſome other trade, not a chimney-ſweeper, from the period when he ſhall be 16 years of age until he attain the age of 21; provided he does not enter into an engagement to continue with his maſter, or ſome other maſter of the trade, being a member of this ſociety, during that time; and that the ſociety do give a premium, not exceeding 10l., for that purpoſe.

9th. That this ſociety give a gratuity, not exceeding 10l. to every perſon whoſe apprenticeſhip, as a chimney-ſweeper, ſhall expire after the 1ſt day of July, 1800, in caſe he ſhall from that time continue in the ſea ſervice, or as an articled ſervant to a member or members of this ſociety, from the age of 16 to the age of 21; and that ſuch gratuity be paid him within three months after his attaining the age of 21.

10th. That this ſociety do take ſecurity from any perſon, to whom they may give a premium with an apprentice, that ſuch apprentice ſhall not follow the trade or buſineſs of a chimney-ſweeper, before he be 21 years of age.

11th. That this ſociety will countenance no perſon whatſoever who ſhall have been on his own hands, or out of employ, any ſix months, from 16 to 21 years of age, except from ſuch cauſe as the committee ſhall think reaſonable.

12th. That this ſociety give premiums to none but apprentices of the members of this ſociety; but that it do, in other caſes, lend its friendly aid to all chimney-ſweepers' apprentices.

13th. That at any time when the money in the hands of the treaſurer ſhall amount to 20l. he ſhall place the ſame, in the name of the ſociety, in the banking houſe of Meſſrs. Dorſet, Johnſon, and Co. bankers, in New Bond-ſtreet, or at ſuch other banking-houſe as the ſociety, or the committee, may appoint.

14th. That all orders for the payment of money on account of the ſociety, be ſigned by the chairman and two of the committee, at a general quarterly meeting.

15th. That every member in the trade, on admiſſion into this ſociety, pay the ſum of 10s. 6d. and from the day of ſuch admiſſion pay the ſum of 1s. per month, for every apprentice he or ſhe may keep: ſuch payment to be made once in every three months: and in caſe he or ſhe ſhall leave any arrears unpaid, for more than three months after the time ſuch reſpective ſum or ſums ſhall become due (he or ſhe having had one calendar month's notice thereof), that then he or ſhe ſhall be expelled the ſociety, and the money paid by them forfeited for the benefit of the general fund.

16th. That all perſons, not in the trade, contributing one guinea, or more, annually, or paying ten guineas at once to the funds of the ſociety, be honorary members, and have a right to vote at all meetings thereof.

17th. That this ſociety do annually chooſe a preſident, four vice-preſidents, a treaſurer, and twelve other members of the committee, for conducting the affairs of the ſociety, at their general meeting, at two o'clock preciſely, on the firſt Wedneſday of the month of April, in every year; and (her Royal Highneſs the Ducheſs of Glouceſter having been elected and declared the patroneſs of the ſociety, and Mrs. Montague the vice-patroneſs, and the Lord-biſhop of Durham the preſident of the ſociety for the enſuing year) that the ſociety do meet on the firſt Wedneſday in the month of April next, to elect four vice-preſidents, a treaſurer, and ſix honorary members, and ſix members in the trade, to be, with the preſident, a committee for the enſuing year.

18th. That nothing be admitted as a law of this ſociety, unleſs it be propoſed at one meeting of the committee, approved of by the next, and confirmed at a general quarterly meeting of the ſociety.

19th, and laſtly. That the amount of all fines awarded by a magiſtrate to any member of this ſociety, for any tranſgreſſion againſt the act of parliament made for the relief of climbing boys, be paid into the hands of the treaſurer for the general purpoſes of the ſociety; and that the expences of any complaint or proceedings before a magiſtrate, by order of the committee, be paid out of the funds of the ſociety. In witneſs whereof the ſaid parties have hereunder ſigned their reſpective names, the day and year firſt above written.

Theſe articles have been ſigned by eighteen of the principal maſters in the trade, and fifty-ſix chimney-ſweepers' boys have been thereby placed under the care of the ſociety; an example that we hope will be followed in other places.

CHINEY, a town of the Auſtrian Netherlands, on the confines of the biſhopric of Liege, eight miles E. of Dinant. Long. 4. 57. E. Lat. 50. 18. N.

CHINSURA, a neat and pretty large town of Hindooſtan Proper, in Bengal. It is a ſettlement of the Dutch, and is ſeated on the river Hoogly, nearly midway between Chandernagore, and the old town of Hoogly. It is very diſtinguiſhable at a conſiderable diſtance, and has a handſome appearance. It contains ſeveral good houſes, and a church, with a little mole projecting into the river.

CHIRK, a village S. of Wrexham, in Denbighſhire. It had formerly two caſtles, on the top of a hill, one of which

is ſtill entire in many parts, and ſeems to have been a magnificent ſtructure.

CHISLEHURST, a village of Kent, near Bromley. Here is Camden Place, the ancient ſeat of the Earl of Camden, and the reſidence of the celebrated antiquary of that name, who died here. Chiſlehurſt was alſo the birth-place of Sir Nicholas Bacon and Sir Francis Walſingham. It is 11 miles S.E. of London.

CHISME, a ſea-port of Natolia, on the ſtrait that parts the continent from the iſle of Scio. It was anciently called Cyſſus, was celebrated by the great victory which the Romans gained here over the fleet of Antiochus, in the year 191 B. C. and has been recently diſtinguiſhed by the total deſtruction of the Turkiſh fleet by the Ruſſians in 1770.

CHISWICK, a village in Middleſex, on the Thames. Here is Chiſwick-houſe, a celebrated villa of the Duke of Devonſhire, built by the Earl of Burlington, after a deſign of Palladio. In the church yard is a monument to the memory of Hogarth, with an epitaph by Garrick. Chiſwick is five miles W. by S. of London.

CHITRO, a town of Turkey in Europe, on the bay of Salonichi; the place where the mother, wife, and ſon of Alexander, were murdered by Caſſander; and where Perſeus king of Macedonia was defeated by the Romans. Long. 22. 35. E. Lat. 40. 20. N.

CHITTEDROOG, a town of the peninſula of Hindooſtan, in the kingdom of Myſore, 117 miles N. by W. of Seringapatam. Long. 76. 15. E. Lat. 14. 5. N.

CHIVALRY (*Encycl.*). In addition to what has already been offered under this article, ſome obvious circumſtances of agreement between the heroic and Gothic manners may be worth the reader's attention:

1. The military enthuſiaſm of the barons, is but of a piece with the fanaticiſm of the heroes. Hence the ſame particularity of deſcription in the accounts of battles, wounds, deaths, in the Greek poet, as in the Gothic romance. Hence that minute curioſity in the diſplay of their dreſſes, arms, and accoutrements. The minds of all men being occupied with warlike images and ideas, were much gratified by thoſe details which appear cold and unaffecting to modern readers.

We hear much of knight-errants encountering giants, and quelling ſavages, in books of chivalry. Theſe giants were oppreſſive feudal lords, and every lord was to be met with, like the giant, in his ſtrong-hold or caſtle. Their dependents of a lower form, who imitated the violence of their ſuperiors, and had not their caſtles, but lurking places, were the ſavages of romance. The greater lord was called a giant for his power; the leſs, a ſavage, for his brutality.

Another terror of the Gothic ages, was monſters, dragons, and ſerpents. Their ſtories were received in thoſe days for ſeveral reaſons: 1. From the vulgar belief of enchantments: 2. From their being reported on the faith of eaſtern tradition, by adventurers from the holy land: 3. In ſtill later times from the ſtrange things told and believed on the diſcovery of the new world.

In all theſe reſpects, Greek antiquity reſembles the Gothic. For what are Homer's Læſtrigons and Cyclops, but bands of lawleſs ſavages, with each of them a giant of enormous ſize at their head? And what are the Grecian Bacchus, Hercules, and Theſeus, but knights-errant, the exact counterparts of Sir Launcelot, and Amadis de Gaul?

3. The oppreſſions which it was the glory of the knights to avenge, were frequently carried on, as we are told, by the *charms and enchantments of women*. Theſe charms, we may ſuppoſe, are often metaphorical; as expreſſing only the blandiſhments of the ſex. Sometimes they are taken to be real, the ignorance of thoſe ages acquieſcing in ſuch conceits. And are not theſe ſtories matched by thoſe of Calypſo and Circe, the enchantreſſes of the Greek Poet?

4. Robbery and piracy were honourable in both: ſo far were they from reflecting any diſcredit on the ancient or modern *redreſſers of wrongs*. What account can be given of this, but that, in the feudal times, and in the early days of Greece, when government was weak, and unable to redreſs the injuries of petty ſovereigns, it would be glorious for private adventurers to undertake this work; and, if they could accompliſh it in no other way, to pay them in kind by downright plunder and rapine?

5. Baſtardy was in credit with both. They were extremely watchful over the chaſtity of their own women; but ſuch as they could ſeize upon in the enemies' quarter, were lawful prize. Or if, at any time, they tranſgreſſed in this ſort at home, the fault was covered by an ingenious fiction. The offſpring was reputed divine. Their greateſt heroes were the fruit of goddeſſes approached by mortals; juſt as we hear of the doughtieſt knights being born of fairies.

6. With the greateſt fierceneſs and ſavageneſs of character, the utmoſt generoſity, hoſpitality, and courteſy, was imputed to the heroic ages. Achilles was at once the moſt relentleſs, vindictive, implacable, and the friendlieſt of men. We have the very ſame repreſentation in the Gothic romances. As in thoſe lawleſs times, dangers and diſtreſſes of all kinds abounded, there would be the ſame demand for compaſſion, gentleneſs, and generous attachments to the unfortunate, thoſe eſpecially of their own clan, as of reſentment, rage, and animoſity againſt their enemies.

7. Again, the martial games celebrated in ancient Greece, on great and ſolemn occaſions, had the ſame origin, and the ſame purpoſe, as the tournaments of the Gothic warriors.

8. Laſtly, the paſſion for adventures, ſo natural in their ſituation, would be as naturally attended with the love of praiſe and glory. Hence the ſame encouragement, in the old Greek and Gothic times, to panegyriſts and poets. In the affairs of religion and gallantry, indeed, the reſemblance between the hero and the knight is not ſo ſtriking. But the religious character of the knight was an accident of the times, and no proper effect of his civil condition. And that his devotion for the fair ſex ſhould ſo far ſurpaſs that of the hero, is a confirmation of the ſyſtem here advanced. For the conſideration had of the females in the feudal conſtitution, will of itſelf account for this deference. It made them capable of ſucceeding to fiefs, as well as the men. And does not one ſee, on the inſtant, what reſpect and dependence this privilege would draw upon them?

It was of mighty conſequence who ſhould obtain the favour of a rich heireſs. And though, in the ſtrict feudal times, ſhe was ſuppoſed to be in the power and at the diſpoſal of her ſuperior lord, yet this rigid ſtate of things did not laſt long. Hence we find ſome diſtreſſed damſel was the ſpring and mover of every knight's adventure. She was to be reſcued by his arms, or won by the fame and admiration of his proweſs. The plain meaning of all which was this: That as, in theſe turbulent times, a protector was neceſſary to the weakneſs of the ſex, ſo the courteous and valorous knight was to approve himſelf fully qualified for that purpoſe.

It may be obſerved, that the two poems of Homer were intended to expoſe the miſchiefs and inconveniences ariſing from the political ſtate of Old Greece: the *Iliad*, the diſſenſions that naturally ſpring up among independent chiefs; and the *Odyſſey*, the inſolence of their greater ſubjects, more eſpecially when unreſtrained by the preſence of their ſove-

reign. And can any thing more exactly reſemble the condition of the feudal times, when, on occaſion of any great enterpriſe, as that of the cruſades, the deſigns of the confederate Chriſtian ſtates were perpetually fruſtrated, or interrupted at leaſt, by the diſſenſions of their leaders; and their affairs at home as perpetually diſtreſſed and diſordered by the rebellious uſurpations of their greater vaſſals? Jeruſalem was to the European, what Troy had been to the Grecian princes.

CHIVAS, a town of Piedmont, which has been ſeveral times taken and retaken. It is ſo advantageouſly ſituated near the river Po, that it is the key of Italy. It is 12 miles N.E. of Turin. Long. 7. 47. E. Lat. 45. 13. N.

CHIUSI, an epiſcopal town of Italy, in Tuſcany, poorly peopled, on account of the unwholeſome air, 35 miles S.E. of Sienna. Long. 10. 52. E. Lat. 43. 0. N.

CHIUTAYE, a town of Turkey in Aſia, capital of Natolia Proper, and the reſidence of the Grand-ſignior before the taking of Conſtantinople. It is ſeated on the river Ayala, 75 miles E. of Burſa. Long. 30. 47. E. Lat. 39. 30. N.

CHOCZIM, a town of Moldavia, on the Dnieſter. It was taken by the Ruſſians and Auſtrians in 1788, but reſtored to the Turks at the ſubſequent peace. It is 110 miles N.W. of Jaſſy. Long. 26. 25. E. Lat. 48 46. N.

CHOISEY, a village of France, in the department of Oiſe, and late province of the Iſle of France. It is three miles from Compiegne, on the river Aiſne, in the fine foreſt of Compiegne, on which account here was a handſome royal hunting palace.

CHOLET, a town of France, in the department of Maine and Loire, and late province of Anjou, with a caſtle, 170 miles S.W. of Paris. Long. 0. 45. W. Lat. 47. 10. N.

CHONAT, an epiſcopal town of Hungary, capital of a country of the ſame name, on the Merich, 25 miles E. of Segedin. Long. 21. 4. E. Lat. 46. 20. N.

CHORGES, a town of France in the department of the Upper Alps, and late province of Dauphiny, burnt by the Duke of Savoy in 1692. It is 10 miles E. of Gap. Long. 6. 23. E. Lat. 44. 35. N.

CHOWLE, a ſmall town of the Deccan of Hindooſtan, on the coaſt of Malabar. It has a harbour for ſmall veſſels, and is fortified. It belongs to Portugal, and was formerly noted for its fine embroidered quilts and a good trade. It is 15 miles S. of Bombay. Long. 72. 45. E. Lat. 18. 42. N.

CHRISTIANOPLE, a ſtrong ſea-port of Sweden, on the Baltic, and capital of Blekingen. It is 13 miles N.E. of Carleſcroon. Long. 15. 47. E. Lat. 56. 26. N.

CHRISTIANBURG, a fort of Africa, on the Gold Coaſt of Guinea, ſubject to the Danes. Long. 1. 55. E. Lat. 4. 10. N.

CHRONOLOGY (*Encycl.*). We record the following events in continuation of our former article:

1796 Amboyna taken by the Engliſh.—Amberg taken by the French.—Severe engagement between the Auſtrians and French at Lodi, in which the latter behaved moſt gallantly, and were ſucceſsful.—Siege of Mantua raiſed by the French.—Swiſs independence aboliſhed by the French after a moſt gallant reſiſtance.—Ceylon ſurrendered to the Engliſh.—Corſica having put herſelf under the protection of England, was relinquiſhed to the French.—Minorca taken by the Engliſh.—Peace with France concluded by Naples and Sardinia.—War between England and Spain.

1797 A trilithon and ſome upright portions of Stonehenge fell after a froſt.—Bank of England prohibited by government from paying in ſpecie.—Their 20s. and 2l. notes iſſued, and large quantities of ſtamped dollars brought into circulation.—The king's proceſſion to St. Paul's church, to return thanks for a ſeries of victories obtained by the Engliſh navy.—The moſt formidable mutiny ever known, and at a moſt critical period, in the Britiſh fleets at the Nore and at Portſmouth, headed by a deſperado of the name of Parker, afterwards hanged with ſeveral others.—Penny pieces, of copper, firſt iſſued.—Revolution effected in Venice by the French.—Corfu ſeized by the French.—A contemptible French force landed in Wales.—Mantua ſurrendered to the French.—Trinidad taken by the Engliſh.—War between Auſtria and France terminated by the peace at Leoben.—Ciſalpine republic founded by the French.—Ireland firſt invaded by the French republicans.—Venice ceded to Auſtria by the French.

1798 Two millions and a half voluntarily contributed in Britain to ſupport the war againſt the French.—Lewis XVIII. the French pretender, retired to Peterſburgh.—The Pope driven out of Rome by the French, who brought about a revolution.—Piedmont relinquiſhed by its ſovereign to the French.—Aleſſandria taken poſſeſſion of by the French.—The gates and ſluices of the canal at Bruges blown up by the Engliſh, who, prevented from re-embarking by tempeſtuous weather, after a ſevere reſiſtance, were made priſoners.—Malta and Egypt ſeized by a French force under Bonaparte.—Ireland in a ſtate of rebellion, invaded by the French, who afterwards ſurrendered themſelves priſoners.—Turin entered by the French.—War renewed between France, Naples, and Sardinia.—Habeas Corpus act ſuſpended.—Inoculation of the cow-pox diſcovered and firſt practiſed in England.—Export of Britiſh manufactured goods 34 millions in value.—The national debt of England 397,087,674l.

1799 Coin in circulation forty-four millions.—Corſica relinquiſhed by England and repoſſeſſed by the French.—The volunteer corps of London and its vicinity reviewed by the king.—Pope Pius VI. died a priſoner in France.—Acre preſerved againſt repeated aſſaults of the French army in Egypt under Bonaparte, by Sir Sidney Smith.—Aleſſandria, Ancona, and other places in Italy, ſurrendered by the French to the Auſtro-Ruſſian army.—Tippoo Saib defeated and ſlain near Periapatam by the Engliſh.—The French republicans driven out of Italy by the Ruſſian army under Suwarrow.—The French diſpoſſeſſed of Corfu by the Ruſſians.—Holland unſucceſsfully invaded by the Britiſh army under the Duke of York.—Leghorn entered by the French.—Naples taken by the French, and afterwards recovered.—The Dutch navy in the Texel ſurrendered to the Britiſh fleet under Admiral Mitchell.—Seringapatam ſtormed by the Engliſh under General Harris, and Tippoo Sultaun ſlain.—Tuſcany ſeized and afterwards evacuated by the French.—Turin abandoned by the French.—War renewed between France and Auſtria.—Zurich evacuated by the French.—Income taxed in the Britiſh dominions.

1800 Ireland united to Great Britain.—Bread one ſhilling and ten-pence halfpenny the quartern loaf in London.—9,774 French Emigrants, clergy and laity,

in England.—The Royal Inſtitution of Great Britain founded by charter.—Ineffectual conſpiracy againſt the life of the Firſt Conſul of France.—War between France and Auſtria in Italy terminated, and was followed by the treaty of Luneville.—Mr. Jefferſon elected Preſident of the United States of America.—The Britiſh army, under Sir Ralph Abercromby, landed at Aboukir, under prodigious diſadvantages, and completely routed the "*invincible* legion" of Bonaparte.—Paul I. emperor of Ruſſia, died.—War declared by Spain againſt Portugal.—A gallant and ſucceſsful attack made on Copenhagen by a diviſion of the Engliſh fleet in the Baltic, under Lord Nelſon.—Hanover entered by the Pruſſian troops.—St. Euſtatia ſurrendered to a Britiſh force.—A treaty of peace between Spain and Portugal ſigned at Badajos.—The differences between England and Ruſſia adjuſted, and a convention ſigned.—The French, at Cairo, capitulated to the army under General Hutchinſon.—A ſignal victory, gained over a greatly ſuperior force, of French and Spaniſh ſhips, near Algeſiras.—A dreadful hurricane at Barbadoes.—Madeira taken poſſeſſion of by a Britiſh force.—Alexandria, with the whole of the French forces, ſurrendered to the Britiſh and Turkiſh forces.—The French Emigrant biſhops required by the Pope to ſurrender their ſees to Bonaparte.—Preliminaries of Peace ſigned between England and France.—Peace between France and Portugal proclaimed at Paris.—Preliminaries of peace ſigned between France and Turkey.—A new conſtitution, after the French faſhion, given to Holland.—The new conſtitution of Switzerland overthrown by a French party as not ſufficiently conforming to the views of the Firſt Conſul.—Hanover evacuated by Pruſſia.—A dreadful inundation in Italy.—The intercourſe between England and France re-eſtabliſhed by Act of Parliament.

CHUDLEIGH, a town of Devonſhire, with a market on Saturday. It is ſeated near the river Teigne, nine miles S.W. of Exeter, and 183 W. by S. of London. Long. 3. 39. W. Lat. 50. 38. N.

CHUNAR, a fort of Hindooſtan Proper, in the province of Allahabad. It is ſeated on the Ganges, twenty miles above Benares, and is built on a rock, which is fortified all round by a wall, and towers at various diſtances. At the end, overlooking the river, is ſituated the citadel, which has formerly been ſtrong. This fort is ſaid to be of the higheſt antiquity, and originally built by the Hindoos. In the citadel is an altar, conſiſting of a plain black marble ſlab, on which the tutelary deity of the place is traditionally ſuppoſed to be ſeated at all times, except from ſun-riſe till nine in the morning, when he is at Benares; during which time, from the ſuperſtition of the Hindoos, attacks may be made with a proſpect of ſucceſs. Chunar has always been conſidered as a poſt of great conſequence on the Ganges, from its inſulated ſituation, projecting forward to a great extent, and being of conſiderable height. It was unſucceſsfully attempted by the Engliſh in 1764: the next year, it was ſurrendered to them: they reſtored it to the Nabob of Oude at the ſubſequent peace; but, in 1772, it was finally ceded to the Engliſh, by that prince, in exchange for Allahabad. At this place is kept the magazine of ammunition and artillery for the brigade at Cawnpore. It is 385 miles N.W. of Calcutta. Long. 83. 50. E. Lat. 25. 10. N.

CHUNAUB, or JENAUE, a river of Hindooſtan Proper, one of the five eaſtern branches of the Indus. It runs through Caſhmere and Lahore, between the Chelum and the Rauvee. It is united with both theſe rivers at ſome diſtance above Moultan; and, at their confluence with the Indus, twenty miles W. of Moultan, they form a ſtream as large as that river. The Chunaub is the Aceſines of Alexander.

CHURCH (*Encycl.*). To what has been ſaid under this head it may not be improper to add the following repreſentation of the ſtate of the Church of England.

The religion of a country always engages the cloſe attention of the enquiring obſerver. The government, laws, manners, and even literature of a people are often greatly affected by the nature and influence of their religious ſyſtem. This obſervation forcibly applies to the country in which we live; and, therefore, a particular examination of the ſtate of religion, or the exact condition of its national church, and that of the different ſects which are removed from it, muſt be not only amuſing, but uſeful. It is unneceſſary to give an hiſtorical retroſpect of the reformation in England, of the progreſs of the Anglican church from its eſtabliſhment to the preſent time. Few perſons are unacquainted with theſe points who have paid any attention to our national hiſtory. In two material articles only did our firſt reformers differ from their brethren on the Continent: I mean in adopting a national liturgy, and preſerving the epiſcopal government of the church. Theſe objects produced diſſenters, who, from their hatred of popery, wanted to be as diſſimilar to the church of Rome as poſſible. They pretended that their only motive for diſſent was a deſire of greater purity in church order and worſhip; and thence the name of *puritans* was given to them, which afterwards was loſt in the term *nonconformiſts*, on account of their pertinaciouſly refuſing the terms of conformity to the church. Within the laſt century, they have uſually been called proteſtant diſſenters, a moderate appellation, ſanctioned by acts of parliament, and originally given at the time of the revolution, when the act of toleration was juſtly extended to them.

That revolution had a wonderful and extenſive effect upon the church of England. Some of her moſt exemplary prelates, and moſt learned clergy, were thruſt out from her ſervice, becauſe they could not bring their conſciences to digeſt a new oath in violation of that which they had before ſolemnly and repeatedly taken. The convocation alſo, or that right which the clergy had for ſo many ages enjoyed, of meeting at the ſame time with parliament, to conſult upon the ſtate of the church, was taken away, or ſo far reduced as to become inſignificant. From that period the eccleſiaſtical body loſt its corporate powers, and fell into the general maſs of ſociety almoſt undiſtinguiſhed, except by being expoſed to peculiar calumny and contempt. Infidelity aroſe under the patronage of the higheſt perſonages, and the word *prieſtcraft* was invented by men of wit, in order to ſtigmatiſe all religion. Plays, novels, poems, and pictures, uſually exhibited the figure of a *parſon* in ſome contemptible manner, with a view to bring the order itſelf, and the religion of which they were miniſters, into popular diſeſteem. It muſt be admitted, that the clergy were in a conſiderable degree the authors of their own diſgrace, by adopting, in general, what was called a ſyſtem of *moderation*, or a dereliction of the conſtituent principles and doctrines of the church. Too many of our moſt eminent divines, obſerving what ſtrain of preaching, and what kind of opinions and conduct, beſt ſuited the men in power, gave way to the ſtream which led to elevated ſtations, rather than adhere to a ſyſtem which they ſaw growing every day more and more unfaſhionable. The reader, unacquainted with the fact,

would almoſt queſtion the truth of the aſſertion, that men who were not only known to have been adverſe to the radical principles of the church of England, but had even written books againſt them, were advanced to high ſtations, and puſhed on from one degree of preferment to another, as far as their own moſt ſanguine wiſhes could aſpire. While, on the other hand, their ableſt antagoniſts, the ſoundeſt and beſt of our divines, were ſuffered to remain in obſcurity, unnoticed and unrewarded. It is an incontrovertible fact, and there is no reaſon for ſuppreſſing or qualifying it, that in the two reigns immediately preceding the preſent, a marked countenance was given to the latitudinarian divines of the eſtabliſhment. We would not be underſtood to mean, that all who were elevated to epiſcopal thrones, or other dignities, were exactly of this deſcription, but they were too generally ſuch. The conſequence of this was, that the character of the church of England loſt ground conſiderably, becauſe it was obſerved that her miniſters generally ſlighted, or openly oppugned, her principal doctrines. The ſtyle of preaching adopted in almoſt all pulpits was alike dry and unedifying; and the ſubjects diſcuſſed ſuch as might with equal propriety have graced the mouth of a heathen moraliſt as a chriſtian miniſter. Hence it was that thoſe perſons who had better conceptions of religion than the generality, and began to form ſerious notions upon Chriſtianity, abandoned the churches, and betook themſelves to the meeting-houſes, where ſome regard was paid to the doctrines of the Goſpel. At that period the diſſenting intereſt flouriſhed, becauſe the greater part of its teachers adhered to the doctrinal principles of the reformation; and every man who has right ſentiments of the importance of religious worſhip will wiſh to go where he can beſt be edified. Religious inſtruction and moral inſtruction are two diſtinct things; where the former is rightly enforced and explained, the latter follows as a natural inference. But if morals only are inculcated, religion may be conſidered as an article either abſolutely unneceſſary, or as merely indifferent. In this ſtate of things ſcepticiſm and ſectarianiſm ſpread themſelves around with a powerful and extended force. Many great men ſaw the evil, but being inattentive to the cauſe, they failed in applying the proper remedy. Dr. Gibſon, the worthy biſhop of London, in his paſtoral letters, expreſſed himſelf with great energy and propriety on the increaſe of infidelity and licentiouſneſs; but though he had the hand of an acute anatomiſt, he had not ſufficient diſcernment to mark among the various ſources the grand ſeat of the malady. About this time a ſect of men aroſe, who, in the moſt irregular manner, but with the beſt intentions, produced a change in the religious aſpect of the country, which has continued to the preſent day. We allude to the riſe of the methodiſts at Oxford, of whom, and their proceedings, we ſhall ſay no more in this place, than that by calling the attention of men to the doctrinal principles of religion as the only effectual ground of moral practice, they met with uncommon ſucceſs. They aſſerted, and with truth, that the clergy of the church of England had almoſt totally rejected the articles which they had ſubſcribed, and profeſſed their reſolution to preach. Theſe men juſtly maintained that in chriſtianity *faith* was as neceſſary as *practice*, and that the latter is not truly religious unleſs it reſults from the former. So far the methodiſts were warranted by the church of which they were members, but in many other particulars they acted very reprehenſibly. However, the progreſs they made, and the zeal which they manifeſted, opened the eyes of many divines of the eſtabliſhment, and they became convinced of the neceſſity of preaching the peculiar doctrines of chriſtianity as laid down in the confeſſion of the church of England. At firſt theſe worthy men met with conſiderable oppoſition from their brethren, and contempt from thoſe who arrogated to themſelves the high-ſounding, but frivolous, appellation of rational Chriſtians. Theſe divines were ſtigmatiſed with the nickname of *Hutchinſonians*, becauſe they reſpected ſome of the opinions of *John Hutchinſon*, a philoſopher of an extraordinary caſt, but who was no ſectariſt. Hutchinſon was a great admirer of the Hebrew ſcriptures, and in the warmth of his admiration thought he had diſcovered in them all the principles of philoſophy. He ſaw that the great mathematical philoſophers of his time were either oppoſers of, or corrupters of, the chriſtian truth, and this led him to adopt a ſyſtem of ſcriptural philoſophy, which, in his judgment, was clearly revealed in the writings of Moſes. Whether he was right we ſhall not ſtay to enquire, but certain it is, that by bringing the ſtudy of the Hebrew ſcriptures into repute, the man did an inеſtimable ſervice to the cauſe of Chriſtianity. Some Oxford divines were drawn by the writings of Hutchinſon to ſtudy what had been too long neglected; and being zealous lovers of the church of England, they diſtinguiſhed themſelves by a firm adherence to her conſtituent principles and doctrines. They did not, like the *methodiſts*, erect a ſeparate ſect, although, like them, they ſuffered much obloquy from their brethren, and were counted little better than madmen by the world. Much contempt was thrown upon them even in their own univerſity; and that of Cambridge, jealous of her philoſophical and mathematical honours, treated theſe upſtarts with moſt virulent animoſity. It may be proper here to obſerve, that the controverſy ſet on foot by the profound Warburton, in his Divine Legation, induced many to ſtudy the Hebrew ſcriptures, and this led them to the writings of Hutchinſon, who certainly ſtruck out many lights of admirable utility to the biblical ſtudent. The principal of thoſe who adopted Hutchinſon's opinions were Mr. George Horne (afterwards the ſeraphic biſhop of Norwich), Dr. Patten, Dr. Wetherall (now dean of Hereford), Mr. William Jones, the late worthy rector of Nayland, and author of numerous publications, and Mr. William Romaine, whoſe praiſe is in all the churches. All theſe luminaries ſhone forth at Oxford, and by their example brought many theological ſtudents to a more rational direction of their academical labours. But Cambridge was not without ſome diſtinguiſhed perſons of the ſame ſtamp, the principal of whom was the late learned and truly primitive divine Mr. John Parkhurſt. The contumely which firſt attended the revivers of primitive learning and religion at length grew weak, for the world ſaw that the objects of it were not only moſt exemplary in their lives, but ſcriptural in their religious views, and peculiarly edifying in their public labours. Their example ſtimulated others to exert themſelves as zealous and active miniſters of the church; and in the preſent reign men of this deſcription have met with liberal encouragement from the higher powers. The jejune, ſlimſy, moral harangues, which had for ſo long a period diſgraced the pulpits of the national churches, have been generally diſcarded. Our prelates have directed their clergy to preſerve and manifeſt a doctrinal conſiſtency. Hence it has happened that the diſſenting intereſt has declined, and the churches which were wont to be empty are now crowded. Even the *methodiſts* have found it neceſſary to their intereſt to retain the liturgy of the church of England in their chapels, and the general appearance of conformity to its ceremonies, in order to preſerve their congregations. Great attempts have been made during the reign of his preſent majeſty to ſhake the foundations of the church, and the number and weight of her adverſaries once appeared to be exceedingly formidable.

The firſt direct attack was made in 1772 by the petitioning clergy to effect an abolition of ſubſcription to the thirty-nine articles. The ſtruggle made on this occaſion was very ear-

neſt, but the attempt proved abortive, and the church preſerved her beſt ſecurity. The dereliction of her ancient confeſſion would be the loſs of her moſt diſtinguiſhing and excellent characteriſtic. A trial was afterwards made in 1790, to procure a repeal of the corporation and teſt acts, in which the enemies of the national church were again foiled.

At preſent ſhe appears to have little room for fear, provided the public peace is ſecured, and ſhe is kept from any of thoſe plauſible innovations, which intriguing minds know ſo well how to mould and colour, and adapt to popular fancy, in order to effect their ſecret purpoſe. This ſhews how vigilant the governors and other friends of the eſtabliſhment ought to be over her internal and external condition. Every thing ſhould be done to encourage a learned and evangelical miniſtry. The people at large are obſerved to be pleaſed with divines of this deſcription. This is a ſpirit which ſhould be encouraged, and nothing can do it ſo effectually as giving countenance to men who are warm and animated in the cauſe of ſound Chriſtianity. But peculiar care ſeems to be neceſſary not to admit into the church offices a body of ſelf-ſufficient enthuſiaſtic ſectarics. Many lay-preachers who have flouriſhed away in conventicles, have conceived an ambitious deſire to get into the church, and it is to be lamented that, from want of ſufficient enquiry on the part of our biſhops, they have too often ſucceeded. This has brought an odium upon our eſtabliſhment in many inſtances; and as it is an evil which ſtill ſubſiſts, the caution cannot be too ſtrongly or particularly enforced. At a time when the diſſenting intereſt is evidently declining, little doubt can be entertained but that many of its miniſters will endeavour to ſhelter themſelves under the broad wing of the eſtabliſhment. Men who have their private advantage at heart, will not, on account of ſmall ſcruples, neglect an opportunity of preferment. But it is the duty of thoſe who are at the head of the church to guard againſt the intruſion of intereſted pretenders. Some doubts may be entertained whether it is proper to admit to the pulpit and to the altar of the eſtabliſhed church, men who have long been in habits of oppoſing her welfare, and weakening her influence; but if ſuch an opinion ſhould be thought too excluſive, it is not too much to aſſert, that ſuch admiſſions ought only to take place on ſtrict proof of ſincere, affectionate, and diſintereſted attachment to the national eſtabliſhment; with candour, and a diſplay of talents calculated to aid the influence of the church, to weaken her enemies, and inſpire and ſtrengthen her real friends.

Catholic Church (*Encycl.*). Of the various religious bodies oppoſed to the church of England, the Roman-catholics are entitled to the firſt place on account of their antiquity. The time was, when their church was proudly dominant in this land; and when England formed one of the moſt valuable jewels in the tiara. Providence, which uſually produces the moſt important and extenſive benefits from the moſt trifling and unlikely incidents, effected the deſtruction of the pontifical authority by the inſtrumentality of its moſt zealous defender. The inſtant that the Pope put a barrier in the way of Henry VIII. to hinder him from repudiating his conſort, and marrying Anne Boleyne, this haughty monarch, who had hitherto approved himſelf a dutiful ſon of the church, reſented the affront and ſhook off the papal yoke. A reformation begun from ſuch motives, could not well be otherwiſe than violent. Sanguinary laws were enacted againſt all the advocates of the Pope's ſupremacy; and the monaſtic orders being annihilated, their lands were diſtributed among the rapacious courtiers. It cannot be ſuppoſed that ſuch a ſtupendous change could take place without irritating the minds of thoſe who were attached to the ancient ſuperſtition, eſpecially at a time when goſpel light was but feeble, when prieſtly abſolutions were looked upon as the cleanſers of guilt, and the prayer of the church as effectual paſſports to heaven. It was natural enough for the catholics to feel a reſentment at the uſage they had met with, and for the clergy to labour earneſtly in making converts. Nor is it to be wondered at that ſome ſtruggles were made by them to regain their loſt influence, and to reſtore the church which they had ſeen deſpoiled and mutilated. For this earneſtneſs and zeal, the character of the age, and the circumſtances in which they ſtood, may furniſh ſome excuſe; but it muſt be admitted that they manifeſted a ſpirit for which no plea can poſſibly be allowed; formed conſpiracies of ſo atrocious a nature that all the ingenuity of man cannot palliate them; and had recourſe to ſubterfuges to carry on their ſchemes, irreconcileable to any ſyſtem of morality, however weak or corrupted. In proportion as knowledge increaſed, the number of Roman-catholics leſſened; and as the ſpread of truth was great during the eighteenth century, the intereſts of popery rapidly ſunk. It muſt be allowed that other cauſes have concurred to produce this declenſion. The deſire of civil diſtinctions and military employments led many perſons to renounce the creed of their anceſtors, and to embrace, at leaſt nominally, the profeſſion of proteſtantiſm. Others, having imbibed the faſhionable philoſophy of the French ſceptics, ſoon threw off a religion which was not only troubleſome, but in many reſpects degrading; as giving an authority to prieſts over the mind, which cannot but be very offenſive to libertine ſpirits. To theſe circumſtances we may well aſcribe the low ſtate into which the church of Rome has fallen with reſpect to this country. There can be little room to apprehend that ever the Roman-catholic profeſſion will riſe to a more diſtinguiſhed appearance, or that its followers will become more numerous. Such fears were once indulged, and that by men from whom more liberality of ſentiment might have been expected. A ſlaviſh obedience to prieſtly authority can never take place among perſons poſſeſſing the advantages of even a common education, unleſs they have imbibed that principle with their mother's milk. The ſlighteſt acquaintance with the ſacred writings will keep men from receiving doctrines and ceremonies which are foreign to the divine word; and if they have a turn for ſcepticiſm, we may well ſuppoſe them ſtill further remote from the ſuperſtitions of popery; on every ground, therefore, we may conclude, that the preſent waning of the church of Rome will end in a total obſcuration. It is obſervable, that ſome of the ableſt members of that church in this country are poſſeſſed of a truly liberal ſpirit. The catholic clergy in England are divided into two claſſes—the rigid and the moderate. The former maintain all the dogmata of Pope Pius's creed; all the deciſions of the Tridentine council, without any abatement or qualification; and hold the authority of the pope to be ſupreme in all caſes, and over all perſons: they moreover reject from ſalvation, or the communion of Chriſt, all who do not belong to their particular church; in ſhort, theſe catholics (improperly ſo termed), diſregarding every principle of genuine benevolence, look down upon other Chriſtians either with contempt or pity. The fact is, theſe perſons do act with moſt conſiſtency; becauſe, if their church is infallible, which muſt be the fundamental principle of their creed, they dare not differ from the deciſions which the aforeſaid council has laid down; and all that is here ſtated, is perfectly agreeable to that council. However, there are not wanting many catholics, who call themſelves diſſenters, that hold different ſentiments; and limit, in the firſt place, the pope's authority merely to ſpiritual matters; and even in theſe they will hardly allow him an abſolute freedom from error. After this grand conceſſion, it is not to be wondered at that theſe perſons ſhould give up many other articles. For inſtance, they ad-

mit the ſalvability of heretics and heathens dying unbaptiſed; they plead for a general interpretation of the ſacred word; they deny the doctrine of tranſubſtantiation in a groſs ſenſe; they wiſh to have the cup allowed to the laity; and give up many other matters of no little moment in the great difference between the Roman and Proteſtant churches. This party is viſibly increaſing, and that more particularly, in proportion as the general ſtrength of the papal power decreaſes abroad; the natural conſequence of which muſt be, that the number of Roman-catholics will ſuffer a rapid diminution. When we conſider the influence of ſuch men as Mr. Huſſey, Dr. O'Leary, and Mr. Berington, we can have little doubt but that even doctrinal popery will ultimately ſink into nothing.

The outworks of their cauſe have been abandoned as untenable and uſeleſs; and as they no longer lay the ſcriptures under a ſort of interdict, but readily allow the laity to ſtudy them, the proteſtant intereſt muſt riſe in conſequence. Infidelity tends greatly to ſhake down the towers and battlements of the Roman church, but the knowledge of truth will ſap its very foundations. It may be accounted among ſome of the prodigies of this wonderful period, that a prieſt of the Roman communion ſhould have undertaken a tranſlation of the ſcriptures into the vulgar tongue, in the preface and notes to which, he poſitively denies the inſpiration of the writers. Dr. Geddes has far outdone Dr. Prieſtley in this reſpect. The Socinian champion, not knowing how to combat the authority of St. Paul, had recourſe to this ſubterfuge, that he was not always under the divine direction, and that in many places he was an "inconcluſive reaſoner," becauſe the doctor did not approve of his argument. Here, however, the doctor was merely ſerving the cauſe of his ſect; but Dr. Geddes has not ſuch partialities. He gives up the authority of his church and his infallibility at once, by placing the ſacred writings on a footing with the profane. Nay, he does not ſcruple to ſay, that the hiſtorians of the Bible are inferior, as writers, to Thucydides and Livy. What would have been the outcry if a clergyman of the church of England had advanced ſuch aſſertions, and that too in a new verſion of the ſacred books? Would the biſhops have been to blame if they had taken particular notice of the writer? The man who endeavours to undermine the ſacred ſcriptures can make but a ſorry miniſter of the goſpel. With what face can a man addreſs his congregation, and confirm his arguments by an appeal to a book which they look upon as divine, and he regards as human? Were ſuch a caſe to happen in our church, it would be a matter of complaint if the perſon ſo offending ſhould be permitted to exerciſe his miniſtry. And yet we do not find that public diſapprobation of his conduct or ſentiments has been made by Dr. Geddes's ſuperiors and brethren. His undertaking and dreadful conceſſions tend to do more injury to revealed religion, than the impudent ribaldry of the ignorant Paine. It therefore by no means redounds to the honour of the Roman-catholic clergy, that they have ſuffered Dr. Geddes's daring attempt to injure their church in particular, and Chriſtianity in general, without ſome open manifeſtation of their diſpleaſure. God forbid that perſecution, in any degree, ſhould have an apologiſt, but the adminiſtration of juſtice is not perſecution, and every ſociety ought to declare againſt any of its members, who, by his writings, attacks the principles upon which that ſociety is founded. If the church is all, and the Bible nothing, this behaviour of Dr. Geddes is not culpable; but if it is the faith of the Roman-catholic church (as we have no doubt it is), that though the church is infallible, the Scriptures were written by inſpiration, then this ſilence with reſpect to one of their own body is highly cenſurable. We have dwelt the longer on this particular, becauſe it forms a curious article in the hiſtory of the Engliſh Roman-catholic church. We ſee, hence, what aſtoniſhing changes the lapſe of a century produces, and particularly a revolution ſo extenſive as that of France. The Roman church has been wounded in her vitals; and though we pity the baſe treatment of the venerable Pius VI. and the undeſerved ſufferings of the Gallican clergy, yet it is impoſſible for a Proteſtant not to ſee in all this a direction ſuper-human. The ſacred predictions have been unfolded herein, and are evidently fulfilling every day; ſo that the infidelity by which this is in a great part accompliſhed, muſt ſtagger and fall before the irreſiſtible evidence of prophecy.

The author of the Purſuits of Literature, and ſome other writers, have complained of the encouragement which has been given to the Roman-catholic clergy in this country. But this is unmanly and ungenerous. There can be little reaſon to apprehend that popery will gain converts in this enlightened kingdom, and the catholics themſelves can have no inducement to prompt them to make ſuch. They can have no hopes of ſeeing their church recovering its ancient ſplendour, ſince even in Italy itſelf, the peculiar ſeat of its glory, the energy of their religious orders is extinguiſhed. The fall of the Jeſuits was the prelude to the deſtruction of the papal power, which followed very faſt upon that memorable event.

The generous treatment which the perſecuted clergy of France have met with here, cannot but affect their natures, and their long reſidence among us muſt have ſoftened down what prejudices they may have once had againſt our religion. Should peace and order be reſtored in their country, a mutual good-will between the two nations muſt be the conſequence, and then Proteſtantiſm there will greatly flouriſh. Infidelity is but of temporary duration. Men may be pleaſed with it for a ſhort ſeaſon, while their paſſions are violently exerciſed; but in the cool hour of reflection, and at thoſe periods when ſtrength of mind is requiſite, they will have recourſe to religion, if it is calculated to ſupport them, and is within their reach. We ſee, therefore, much ground for expecting a great outſpread of religious truth over ſcepticiſm, hereſy, and ſuperſtition of every kind; nor is it, perhaps, too much to ſay, that this change will be materially affected by the extenſive influence of our own country.

CHURCH-STRETTON, a town of Shropſhire, with a market on Thurſday. It is fourteen miles S. of Shrewſbury. Long. 2. 46. W. Lat. 52. 32. N.

CHURCHILL FORT, on the E. ſide of Hudſon's Bay, in North America, the moſt northerly of thoſe belonging to that company. Long. 94. 3. W. Lat. 58. 48. N.

CHURN (*Encycl.*). The inferiority of the churns in common uſe has induced ſeveral ingenious mechanics to exert their ſkill in contriving others, that would render the proceſs of making butter leſs tedious and expenſive. Of theſe we have already given ſome proofs, particularly in the deſcription of Mr. Bowler's improved churn. We ſhall here preſent the reader with an account of a butter-churn, conſtructed on a new principle, by Mr. Harland, of Fenchurch-ſtreet, London.

The barrel-churn, delineated in Plate 20, is moved by the intervention of a multiplying wheel, to moderate its too violent motion. The head of the crank in the mortiſe (in the handle) effects the rotatory motion of the barrel with great facility. And if the barrel be fixed, and the axis (in the inſide), to which the daſhers are attached, be made to turn, the butter will be more ſpeedily formed. A fly-wheel is alſo affixed, by means of which the agitation of the cream is neceſſarily performed in a more uniform manner; and, conſequently, the butter will be more perfectly ſeparated from the whey.

As butter is often made in ſmall quantities, and the vertical motion of the common churn is extremely fatiguing, we con-

ſider theſe methods of applying the powers of mechaniſm, as valuable improvements. Hence we preſume to recommend the preceding improved butter-churn to be generally introduced; for the facility and expedition, with which butter is thus obtained, will amply compenſate the additional expence.

If a pump-churn be employed, it may be plunged a foot deep in a tub of cold water, and remain there during the whole time of churning, which will harden the butter in a conſiderable degree. This operation may be much facilitated by pouring into the churn a ſmall quantity of diſtilled vinegar, which will produce butter in the courſe of one hour. Thoſe who make uſe of a pump-churn, ſhould endeavour to keep up a regular motion of the machine; and by no means admit any perſon to aſſiſt them, unleſs from abſolute neceſſity: for, if the churning be irregularly performed, the butter will in winter go back; and, if the agitation be more quick and violent in ſummer, it will cauſe the butter to ferment, and thus to acquire a very diſagreeable flavour.—Where there are many cows, a barrel-churn is preferred; but unleſs it be kept very clean, the bad effects of it will be ſoon diſcovered in the butter. Particular care ſhould alſo be taken to place it in a proper temperature, according to the change of the ſeaſon; that is, to fix it in a warmer ſituation in the winter, and in the ſummer to expoſe it to a free current of air.

CHUSAN, an iſland on the E. coaſt of China, where the Eaſt-India company had once a factory. Long. 124. 0. E. Lat. 30. 0. N.

CIAMPA, a kingdom of Aſia, bounded on the E. and S. by the Indian Ocean, on the N. by Cochin-China, and on the W. by Cambodia.

CILICIA (*Encycl.*). According to Joſephus, Cilicia was firſt peopled by Tarſhiſh the ſon of Javan, and his deſcendents, whence the whole country was named *Tarſis*. The ancient inhabitants were in proceſs of time driven out by a colony of Phœnicians, who, under the conduct of *Cilix*, firſt ſettled in the iſland of Cyprus, and from thence paſſed into the country which, from the leader, they called *Cilicia*. Afterwards, ſeveral other colonies from different nations ſettled in this kingdom, particularly from Syria and Greece; whence the Cilicians in ſome places uſed the Greek tongue, in others the Syriac; but the former greatly corrupted by the Perſian, the predominant language of the country being a dialect of that tongue. We find no mention of the kings of Cilicia after their ſettlement in that country, till the time of Cyrus, to whom they voluntarily ſubmitted, continuing ſubject to the Perſians till the overthrow of that empire; but governed to the time of Artaxerxes Mnemon, by kings of their own nation. After the downfal of the Perſian empire, Cilicia became a province of that of Macedon; and, on the death of Alexander, fell to the ſhare of Seleucus, and continued under his deſcendants till it was reduced to a Roman province by Pompey. As a proconſular province, it was firſt governed by Appius Claudius Pulcher; and after him by Cicero, who reduced ſeveral ſtrong holds on Mount Amanus, in which ſome Cilicians had fortified themſelves, and held out againſt his predeceſſor. It was on this occaſion that the diviſion, formerly mentioned, into Trachæa and Campeſtris, took place. The latter became a Roman province; but the former was governed by kings appointed by the Romans, till the reign of Veſpaſian, when the family of Tracondementus being extinct, this part alſo made a province of the empire, and the whole divided into Cilicia *Prima*, Cilicia *Secunda*, and Iſauria; the firſt took in all Cilicia Campeſtris, the ſecond the coaſt of Cilicia Trachæa, and the laſt the inland parts of the ſame diviſion. It is now a province of Aſiatic Turkey; and is called *Caramania*, having been the laſt province of the Caramanian kingdom which held out againſt the Ottoman race.

That part of Cilicia called by the ancients *Cilicia Campeſtris*, was, if we believe Ammianus Marcellinus, one of the moſt fruitful countries of Aſia; but the weſtern part equally barren, though famous, even to this day, for an excellent breed of horſes, of which 600 are yearly ſent to Conſtantinople for the eſpecial uſe of the grand-ſignior. The air in the inland parts is reckoned wholeſome; but that on the ſea-coaſt very dangerous, eſpecially to ſtrangers.

The rivers of any note are the Pyramus, which riſes on the north ſide of mount Taurus, and empties itſelf into the Mediterranean between Iſſus and Magaraſus; the Cydnus ſprings from the Antitaurus, paſſes through Tarſus, and diſembogues itſelf into the Mediterranean. It is famous for the rapidity of its ſtream, and the coldneſs of its waters, which proved very dangerous to Alexander the Great.

CIMBRI (*Encycl.*). This ancient Celtic nation, about 113 years before Chriſt, left their peninſula with their wives and children; and joining the Teutones, a neighbouring nation, took their journey ſouthward in queſt of a better country. They firſt fell upon the Boii, a Gauliſh nation ſituated near the Hercynian foreſt. Here they were repulſed, and obliged to move nearer the Roman provinces. The republic being then alarmed at the approach of ſuch multitudes of barbarians, ſent an army againſt them under the conſul Papirius Carbo. On the approach of the Roman army, the Cimbri made propoſals of peace. The conſul pretended to accept it; but having thrown them into a diſadvantageous ſituation, treacherouſly attacked their camp. His perfidy was rewarded as it deſerved; the Cimbri ran to arms, and not only repulſed the Romans, but, attacking them in their turn, utterly defeated them, and obliged the ſhattered remains of their forces to conceal themſelves in the neighbouring foreſts. After this victory, the Cimbri entered Tranſalpine Gaul, which they quickly filled with ſlaughter and deſolation. Here they continued five or ſix years, when another Roman army under the conſul Silanus marched againſt them. This general met with no better ſucceſs than Carbo had done. His army was routed at the firſt onſet; in conſequence of which, all Narbonne Gaul was expoſed at once to the ravages of theſe barbarians.

About 105 years before Chriſt, the Cimbri began to threaten the Roman empire itſelf with deſtruction. The Gauls marched from all parts with a deſign to join them, and to invade Italy. The Roman army was commanded by the proconſul Cæpio, and the conſul Mallius; but as theſe two commanders could not agree, they were adviſed to ſeparate, and divide their forces. This advice proved the ruin of the whole army. The Cimbri immediately fell upon a ſtrong detachment of the conſular army commanded by M. Aurelius Scaurus, which they cut off to a man, and made Scaurus himſelf priſoner. Mallius being greatly intimidated by this defeat, deſired a reconciliation with Cæpio, but was haughtily refuſed. He moved nearer the conſul, however, with his army, that the enemy might not be defeated without his having a ſhare in the action. The Cimbri, by this movement, imagining the commanders had made up their quarrel, ſent ambaſſadors to Mallius with propoſals of peace. As they could not help going through Cæpio's camp, he ordered them to be brought before him; but finding they were empowered to treat only with Mallius, he could ſcarce be reſtrained from putting them to death. His troops, however, forced him to confer with Mallius about the propoſals ſent by the barbarians: but as Cæpio went to the conſul's tent againſt his will, ſo he oppoſed him in every thing; contradicted with great obſtinacy, and inſulted him in the groſſeſt manner. The deputies on their return acquainted their countrymen that the miſunderſtanding between the Roman commanders ſtill ſubſiſted; upon which the Cimbri attacked the camp of Cæpio, and the Gauls

that of Mallius. Both were forced, and the Romans ſlaughtered without mercy. Eighty thouſand citizens and allies of Rome, with 40,000 ſervants and ſutlers, periſhed on that fatal day. In ſhort, of the two Roman armies only ten men, with the two generals, eſcaped to carry the news of ſo dreadful a defeat. The conquerors deſtroyed all the ſpoil, purſuant to a vow they had made before the battle. The gold and ſilver they threw into the Rhone, drowned the horſes they had taken, and put to death all the priſoners.

The Romans were thrown into the utmoſt conſternation on the news of ſo terrible an overthrow. They ſaw themſelves threatened with a deluge of Cimbri and Gauls, numerous enough to over-run the whole country. They did not, however, deſpair. A new army was raiſed with incredible expedition; no citizen whatever who was fit to bear arms being exempted. On this occaſion alſo, fencing-maſters were firſt introduced into the Roman camp, by which means the ſoldiers were ſoon rendered in a manner invincible. Marius, who was at that time in high reputation on account of his victories in Africa, was choſen commander, and waited for the Cimbri in Tranſalpine Gaul: but they had reſolved to enter Italy by two different ways; the Cimbri over the eaſtern, and the Teutones and other allies over the weſtern Alps. The Roman general therefore marched to oppoſe the latter, and defeated the Ambrones and Teutones with great ſlaughter. The Cimbri, in the mean time, entered Italy, and ſtruck the whole country with terror. Catulus and Sylla attempted to oppoſe them; but their ſoldiers were ſo intimidated by the fierce countenances and terrible appearance of theſe barbarians, that nothing could prevent their flying before them. The city of Rome was now totally defenceleſs; and, had the Cimbri only marched briſkly forwards, they had undoubtedly become maſters of it; but they waited in expectation of being joined by their allies the Ambrones and Teutones, not having heard of their defeat by Marius, till the ſenate had time to recal him to the defence of his country. By their order he joined his army to that of Catulus and Sylla; and upon that union was declared commander-in-chief. The Roman army conſiſted of 52,300 men. The cavalry of the Cimbri were no more than 15,000, but their foot ſeemed innumerable; for, being drawn up in a ſquare, they are ſaid to have covered thirty furlongs. The Cimbri attacked the Romans with the utmoſt fury; but, being unaccuſtomed to bear the heats of Italy, they ſoon began to loſe their ſtrength, and were eaſily overcome. But they had put it out of their power to fly; for, that they might keep their ranks the better, they had, like true barbarians, tied themſelves together with cords faſtened to their belts, ſo that the Romans made a moſt terrible havock of them. The battle was therefore ſoon over, and the whole day employed only in the moſt terrible butchery. An hundred and twenty thouſand were killed on the field of battle, and 60,000 taken priſoners. The victorious Romans then marched to the enemy's camp; where they had a new battle to fight with the women, whom they found more fierce than even their huſband's had been. From their carts and waggons, which formed a kind of fortification, they diſcharged ſhowers of darts and arrows on friends and foes without diſtinction. Then they firſt ſuffocated their children in their arms, and afterwards put an end to their own lives. The greateſt part of them hanged themſelves on trees. One was found hanging at a cart with two of her children at her heels. Many of the men, for want of trees and ſtakes, tied ſtrings in running knots about their necks, and faſtened them to the tails of their horſes, and the horns and feet of their oxen in order to ſtrangle themſelves that way; and thus the whole multitude was deſtroyed.

The country of the Cimbri, which, after this terrible cataſtrophe, was left a mere deſert, was again peopled by the Scythians; who, being driven by Pompey out of that vaſt ſpace between the Euxine and the Caſpian ſea, marched towards the north and weſt of Europe, ſubduing all the nations they met with in their way. They conquered Ruſſia, Saxony, Weſtphalia, and other countries as far as Finland, Norway, and Sweden. It is pretended that Wodin their leader traverſed ſo many countries, and endeavoured to ſubdue them only with a view to excite the people againſt the Romans; and that the ſpirit of animoſity which he had excited operated ſo powerfully after his death, that the northern nations combined to attack it, and never ceaſed their incurſions till it was totally ſubverted.

CIMBRISHAM, a ſea-port of Schonen, in Sweden. Long. 15 30. E. Lat. 56. 40. N.

CIRCARS, Northern, five provinces on the bay of Bengal. They were originally denominated *Northern* from their poſition in reſpect to Madras, on which they depend. Of theſe Circars, Cicacole, Rajamundry, Ellore, and Condapilly, are in the poſſeſſion of the Engliſh; and Guntoor belongs to the Nizam of the Deccan. The firſt four occupy the ſea-coaſt, from the Chilka Lake, on the confines of Cattack, to the N. bank of the Kiſtna; forming a narrow ſlip of country 350 miles long, and from 26 to 75 broad. It is eaſily defenſible againſt an Indian enemy, having mountains and extenſive foreſts on one ſide, and the ſea on the other; the extremities only being open. Its greateſt defect is in point of relative ſituation to Bengal and Madras, it being 350 miles from the firſt, and 250 from the latter; ſo that the troops deſtined to protect it cannot be depended on, for any preſſing ſervice that may ariſe in either preſidency. The Engliſh Circars had been ceded to the French, by the Nizam of the Deccan, in 1753; but they were conquered by Colonel Clive in 1759, and now produce an annual revenue of 360,000l. That of Guntoor is 70,000l.

CIRCUMDUCTION, in Scots law. When parties in a ſuit are allowed a proof of allegeances; after the time limited by the judge for taking that proof is elapſed, either party may apply for circumduction of the time of proving; the effect of which is, that no proof can afterwards be brought, and the courſe muſt be determined as it ſtood when circumduction was obtained.

CIRENZA (*Encycl.*), erroneouſly ſpelt Ciremza.

CITTADELLA, a ſea-port and capital of Minorca, on the W. ſide of that iſland. Long. 3. 34. E. Lat. 39. 54. N.

CITTA-DI-CASTELLO, a populous town of Italy, capital of a county of the ſame name, in Umbria, with a biſhop's ſee. It is ſeated on the river Tiber, twenty-ſeven miles S.W. of Urbino. Long. 12. 18. E. Lat. 43. 32. N.

Citta-nuova, a town of Italy, in the marquiſate of Ancona, ſeated on the ſea-ſhore, and containing ſixteen churches and convents, within its walls, beſides fifteen without. It is ten miles from Loretto. Long. 13. 46. E. Lat. 43. 16. N.

Citta-nuova, a ſmall ſea-port of Iſtria, in the territory of Venice, with a biſhop's ſee, ſixty miles E. of Venice. Long. 14. 2. E. Lat. 45. 36. N.

Citta-nuova-cottonera, a fortified town in the iſland of Malta, including the port of St. Margarita.

Citta-vittoriosa, or Il borgo, a ſtrong town in the iſland of Malta, ſeated on a narrow neck of land in the harbour, to the left of Valetta, from which, on each ſide of the town, runs a broad canal incloſing the town, and forming an excellent harbour. It is defended by the caſtle of St. Angelo, on a high rock, joined to the town by a bridge. Long. 14. 34 E. Lat. 35. 54. N.

CIVITA, Turchino (*Encycl.*). On the ſouth-eaſt ſide of Civita Turchino runs the ridge of a hill which unites it to

Corneto. This ridge is at leaſt three or four miles in length, and almoſt entirely covered with artificial hillocks, called by the inhabitants *monti roſſi*. About twelve of theſe hillocks have at different times been opened; and in every one of them have been found ſeveral ſubterranean apartments cut out of the ſolid rock. Theſe apartments are of various forms and dimenſions: ſome conſiſt of a large outer room, and a ſmall one within; others of a ſmall room at the firſt entrance, and a large one within: others are ſupported by a column of the ſolid rock left in the centre, with openings on every part. The entrance to them all is by a door about five feet high, by two and a half broad. Some of them have no light but from the door, while others ſeem to have had a ſmall light from above, through a hole of a pyramidal form. Many of theſe apartments have an elevated port that runs all round the wall, being a part of the rock left for that purpoſe. The moveables found in theſe apartments conſiſt chiefly of Etruſcan vaſes of various forms: in ſome indeed have been found ſome plain ſacrophagi of ſtone, with bones in them. The whole of theſe apartments are ſtuccoed, and ornamented in various manners: ſome indeed are plain; but others, particularly three, are richly adorned, having a double row of Etruſcan inſcriptions running round the upper part of the walls, and under them a kind of frieze of figures in painting: ſome have an ornament under the figures, which ſeems to ſupply the place of an architrave. The paintings ſeem to be in freſco; and in general reſemble thoſe which are uſually ſeen upon Etruſcan vaſes; though ſome of them are perhaps ſuperior to any thing as yet ſeen of the Etruſcan art in painting. In general they are ſlight, but well conceived; and prove, that the artiſt was capable of producing things more ſtudied and better finiſhed; though in ſuch a ſubterraneous ſituation, the delicacy of a finiſhed work would in a great meaſure have been thrown away. It is probable, however, that among the immenſe number of theſe apartments that yet remain to be opened, many paintings and inſcriptions may be found ſufficient to form a very uſeful and entertaining work.

CLAIR, St. a lake of North America, half way between the lakes Huron and Erie, about ninety miles in circumference. It receives the waters of the great lakes Superior, Michigan, and Huron, and diſcharges them through the ſtrait called Detroit, into lake Erie.

CLAMECI, a town of France, in the department of Nievre and late province of Nivernois. Before the late revolution, the chapel of an hoſpital in the ſuburb was the proviſion for the biſhopric of Bethlehem, founded in 1180, when Guy count of Nevers gave an aſylum, in this place, to a Latin biſhop of Bethlehem, who had been driven from the Holy Land by the Saracens. Clameci is ſeated at the confluence of the Beuvron and Yonne, 112 miles S. by E. of Paris. Long. 3. 36. E. Lat. 47. 28. N.

CLAPHAM, a village in Surrey, containing many handſome villas, which chiefly ſurround a beautiful common. In the old pariſh church, divine ſervice is performed at funerals only; an elegant new church having been erected on the common, but without an adjoining cemetery. Clapham is three miles S.W. by S. of London.

CLARA, St. a ſmall iſland of South America, in Peru, in the bay of Guiaquil, ſeventy miles S.W. of Guiaquil. Long. 82. 20. W. Lat. 2. 20. S.

CLARENDON, a village three miles E. of Saliſbury, where Henry II. ſummoned a council of the barons and prelates, in 1164, who enacted the laws called the Conſtitutions of Clarendon; and here were two palaces built by King John.

CLARENS, or Chatillard, a village of Switzerland, in the Pays de Vaud, celebrated as the principal ſcene of Rouſſeau's Eloiſe. It is delightfully ſituated, not far from Vevay, on an eminence, whoſe gentle declivity ſlopes gradually toward the lake of Geneva. It commands a view of that majeſtic body of water, its fertile borders, and the bold rocks and Alps of Savoy. The adjacent ſcenery conſiſts of vineyards, fields of corn and paſture, and rich groves of oak, aſh, and Spaniſh cheſnut trees. "Although the ſituation and environs," ſays Mr Coxe, "harmoniſe with the animated ſcenery in the Eloiſe of Rouſſeau, yet the caſtle by no means accords with the deſcription in the ſame work. The traveller ſees an oblong building with ancient towers and a penthouſe roof; in the inſide, a large hall that looks like a priſon; and the whole bears rather the antiquated appearance of a feudal manſion, inhabited by ſome turbulent baron, than the reſidence of the elegant and impaſſioned Julia."

CLARIONETTE, or Clarinet, a kind of trumpet made of box-wood, whoſe tube is narrower and its tone acuter than that of the common trumpet. A patent was lately granted to Meſſrs. Goulding and Co. of Pall-Mall, for an improved clarinet. The patentees line the inſtrument with a tinned braſs tube calculated to preſerve the wood and improve the tone. To remedy the inconvenience from the leatherings of the keys being ſpoiled and out of order, they line the holes with a metal tube, ground to perfect flatneſs at the outſide orifice, and rendered air-tight by a properly contrived ſtopper.

CLARKE (Samuel), D. D. a preacher and writer of conſiderable note in the reign of Charles II. was, during the inter-regnum, and at the time of the ejection, miniſter of St. Bennet Fink in London. In November 1660, he, in the name of the Preſbyterian miniſters, preſented an addreſs of thanks to the king for his declaration of liberty of conſcience. He was one of the commiſſioners of the Savoy; and behaved on that occaſion with great prudence and moderation. He ſometimes attended the church as a hearer and communicant; and was much eſteemed by all that knew him, for his great probity and induſtry. The moſt valuable of his numerous works are ſaid to be his Lives of the Puritan Divines and other perſons of note, twenty-two of which are printed in his martyrology: the reſt are in his Lives of ſundry Eminent Perſons in this latter Age, folio; and in his Marrow of Eccleſiaſtical Hiſtory, in folio and quarto. He died in 1680.

Clarke (Samuel), the ſon of the former, was fellow of Pembroke-hall, in Cambridge; but was ejected from his fellowſhip for refuſing to take the engagements, as he was alſo afterwards from his rectory of Grendon in Buckinghamſhire. He applied himſelf early to the ſtudy of the Scriptures; and his annotations on the Bible, printed together with the ſacred text, is highly commended by Dr. Owen, Mr. Baxter, and Dr. Calamy. He died in 1701, aged ſeventy-five.

CLAUBERGE (John), a learned profeſſor of philoſophy and divinity at Duiſburg, was born at Solingen in 1622. He travelled into Holland, France, and England, and in each country obtained the eſteem of the learned. The Elector of Brandenburg gave him public teſtimonies of his eſteem. He died in 1665. His works were printed at Amſterdam in two volumes 4to. The moſt celebrated of theſe is his treatiſe entitled *Logica vetus et nova*, &c.

CLAUDE (John), a Proteſtant divine, born in the province of Angenois in 1619. Meſſ. de Port Royal uſing their utmoſt endeavours to convert M. de Turenne to the Catholic faith, preſented him with a piece calculated to that end, which his lady engaged Mr. Claude to anſwer; and his performance gave riſe to the moſt famous controverſy that was ever carried on in France between the Roman-catholics and Proteſtants. On the revocation of the edict of Nantz, he retired to Holland, where he met with a kind reception, and was honoured with a conſiderable penſion by the Prince of Orange. He died in 1687; and left a ſon Iſaac Claude, whom he lived to ſee

miniſter of the Walloon church at the Hague, and who publiſhed ſeveral excellent works of his deceaſed father.

Claude, St. a handſome town of France, in the department of Jura and late province of Franche Comté, with a biſhop's ſee. It is ſeated between three high mountains, on the river Liſon, and owes its origin to a celebrated abbey, built in the year 425, in this then barren and uninhabited country. This abbey had the pious privilege of legitimating baſtards, and could confer nobility and pardon criminals, till the year 1742, when it was erected into a biſhopric, and its Benedictine monks were metamorphoſed into noble canons. The cathedral is extremely elegant. Great numbers of pilgrims have flocked hither, to viſit the remains of the body of St. Claude, which they pretend are yet uncorrupted. In this city are many public fountains with large baſins. It is 35 miles N.W. of Geneva. Long. 6. 18. E. Lat. 46. 24. N. From Mount St. Claude, which forms part of Mount Jura, is a fine proſpect over Switzerland and Savoy, the lake and town of Geneva, and the Pays de Vaud.

CLAUDIANUS (Claudius) (*Encycl.*). It is not agreed of what country he was a native; but he came to Rome in the year of Chriſt 395, when he was about thirty years old; and there inſinuated himſelf into Stilicho's favour; who being a perſon of great abilities both for civil and military affairs, though a Gothic by birth, was ſo conſiderable a perſon under Honorius, that he may be ſaid for many years to have governed the weſtern empire. Stilicho afterwards fell into diſgrace, and was put to death; and it is more than probable that the poet was involved in the misfortunes of his patron, and ſeverely perſecuted in his perſon and fortunes by Hadrian, an Egyptian by birth, who was captain of the guards to Honorius, and ſucceeded Stilicho. There is reaſon, however, to think that he roſe afterwards to great favour; and obtained ſeveral honours both civil and military. The Princeſs Serena had a great eſteem for Claudian, and recommended and married him to a lady of great quality and fortune in Lybia. There are a few little poems on ſacred ſubjects, which through miſtake have been aſcribed by ſome critics to Claudian; and ſo have made him be thought a Chriſtian. But St. Auſtin, who was contemporary with him, expreſsly ſays, that he was a Heathen. The time of Claudian's death is uncertain, nor do we know any further particulars of his life than what are to be collected from his works, and which we have already related above. He is thought to have more of Virgil in his ſtyle than all the other imitators of that poet.

CLAUDIUS I. Roman emperor, *A. D.* 41. The beginning of his reign was very promiſing; but it was ſoon diſcovered that little better than an ideot filled the throne, who might eaſily be made a tyrant: accordingly he became a very cruel one, through the influence of his empreſs, the infamous Meſſalina: after her death, he married his niece Agrippina, who cauſed him to be poiſoned to make way for Nero, *A.D.* 54.

Claudius II. (Aurelius), ſurnamed *Gothicus*, ſignalized himſelf by his courage and prudence under the reigns of Valerian and Julian; and on the death of the latter was declared emperor in 268. He put to death Aureolus, the murderer of Galienus; defeated the Germans; and in 269 marched againſt the Goths, who ravaged the empire with an army of 300,000 men, which he at firſt haraſſed, and the next year entirely defeated: but a contagious diſeaſe, which had ſpread through that vaſt army, was caught by the Romans; and the emperor himſelf died of it a ſhort time after, aged fifty-ſix. Pollio ſays that this prince had the moderation of Auguſtus, the virtue of Trajan, and the piety of Antoninus.

CLEAR, Cape, a promontory of a little iſland on the S. of Ireland. Long. 11. 10. W. Lat. 51. 18. N.

CLEBURY, a town of Shropſhire, with a market on Thurſday. It is ſeated on the river Rea, twenty-eight miles S.E. of Shrewſbury. Long. 2. 23. W. Lat. 52. 21. N.

CLEMENS Romanus, biſhop of Rome, where he is ſaid to have been born; and to have been fellow-labourer with St. Peter and St. Paul. We have nothing remaining of his works that is clearly genuine, excepting one epiſtle, written to quiet ſome diſturbances in the church of Corinth; which, next to holy writ, is eſteemed one of the moſt valuable remains of eccleſiaſtical antiquity.

Clemens *Alexandrinus*, ſo called to diſtinguiſh him from the former, was an eminent father of the church, who flouriſhed at the end of the ſecond and beginning of the third centuries. He was the ſcholar of Pantænus, and the inſtructor of Origen. The beſt edition of his works is that in two vols. folio, publiſhed in 1715 by Archbiſhop Potter.

CLEMENT V. (Pope), the firſt who made a public ſale of indulgences. He tranſplanted the holy ſee to Avignon in France; greatly contributed to the ſuppreſſion of the knights templars; and was author of a compilation of the decrees of the general councils of Vienna, ſtyled *Clementines*. He died in 1314.

Clement VII. (Julius de Medicis), Pope, memorable for his refuſing to divorce Catharine of Arragon from Henry VIII.; and for the bull he publiſhed upon the king's marriage with Anne Boleyn; which, according to the Roniſh authors, loſt him England. He died in 1534.

Clement XIV. (Francis Laurentius Ganganelli), the late pope's predeceſſor, was born at St. Angelo in the duchy of Urbino, in 1705; and choſen pope, though not yet a biſhop, in 1769; at which time the ſee of Rome was involved in a moſt diſagreeable and dangerous conteſt with the houſe of Bourbon. His reign was rendered troubleſome by the colliſion of parties on the affairs of the Jeſuits; and it is pretended that his latter days were embittered by the apprehenſions of poiſon. Though this report was probably apocryphal, it is ſaid that he often complained of the heavy burthen which he was obliged to bear; and regretted, with great ſenſibility, the loſs of that tranquillity which he enjoyed in his retirement when only a ſimple Franciſcan. He was, however, fortunate in having an opportunity, by a ſingle act, to diſtinguiſh a ſhort adminiſtration of five years in ſuch a manner as will ever prevent its ſinking into obſcurity. His death was immediately attributed to poiſon, as if an old man of ſeventy, loaded with infirmities and diſorders, could not quit the world without violence. His proceedings againſt the Jeſuits furniſhed a plauſible pretence for this charge; and the malevolence of their enemies embelliſhed it with circumſtances. It even ſeems as if the miniſters of thoſe powers who had procured their diſſolution did not think it beneath them to countenance the report; as if falſehood was neceſſary to prevent the revival of a body which had already ſunk in its full ſtrength, under the weight of real miſconduct. The charge was the more ridiculous, as the pontiff had undergone a long and painful illneſs, which originally proceeded from a ſuppreſſion of urine, to which he was ſubject; yet the report was propagated with the greateſt induſtry: and though the French and Spaniſh miniſters were preſent at the opening of his body, the moſt horrible circumſtances were publiſhed relative to that operation. It was confidently told that the head fell off from the body, and that the ſtench poiſoned and killed the operators. It availed but little that the operators ſhewed themſelves alive and in good health, and that the ſurgeons and phyſicians proved the falſehood of every part of the report. Clement XIV. appears to have been a man of a virtuous character, and poſſeſſed of conſiderable abilities. He died much regretted by his ſubjects.

CLEOBULUS, ſon of Evagoras, and one of the Grecian ſages; he was valiant, a lover of learning, and an enemy to vice. Flouriſhed about 560 years before Chriſt.

CLERAC, or CLAIRAC, a town of France, in the department of Lot and Garonne, and late province of Guienne. It is ſeated on the river Lot, ten miles from Agen. Long. 0. 33. E. Lat. 44. 20. N.

CLERGY, BENEFIT OF. This ancient privilege having been treated too conciſely in our original article, we here propoſe to treat the ſubject more at length.

After trial and conviction of a criminal, the judgment of the court regularly follows, unleſs ſuſpended or arreſted by ſome intervening circumſtance; of which the principal is *benefit of clergy:* a title of no ſmall curioſity as well as uſe; and concerning which, therefore, it may not be improper to enquire, 1. Into its original, and the various mutations which this privilege of the clergy has ſuſtained; 2. To what perſons it is to be allowed at this day; 3. In what caſes; 4. The conſequences of allowing it.

I. Clergy, the *privilegium clericale*, or (in common ſpeech) the benefit of clergy, had its original from the pious regard paid by Chriſtian princes to the church in its infant ſtate, and the ill uſe which the popiſh eccleſiaſtics ſoon made of that pious regard. The exemptions which they granted to the church were principally of two kinds: 1. Exemption of places conſecrated to religious duties from criminal arreſts; which was the foundation of ſanctuaries: 2. Exemption of the perſons of clergymen from criminal proceſs before the ſecular judge in a few particular caſes; which was the true original and meaning of the *privilegium clericale.*

But the clergy increaſing in wealth, power, honour, number, and intereſt, ſoon began to ſet up for themſelves; and that which they obtained by the favour of the civil government, they now claimed as their inherent right, and as a right of the higheſt nature, indefeaſible, and *jure divino.* By their canons, therefore, and conſtitutions, they endeavoured at, and where they met with eaſy princes, obtained, a vaſt extenſion of thoſe exemptions; as well in regard to the crimes themſelves, of which the liſt became quite univerſal, as in regard to the perſons exempted, among whom were at length comprehended, not only every little ſubordinate officer belonging to the church or clergy, but even many that were totally laymen.

In England, however, although the uſurpations of the pope were very many and grievous, till Henry VIII. totally exterminated his ſupremacy, yet a total exemption of the clergy from ſecular juriſdiction could never be thoroughly effected, though often endeavoured by the clergy: and therefore, though the ancient *privilegium clericale* was in ſome capital caſes, yet it was not univerſally, allowed. And in thoſe particular caſes, the uſe was, for the biſhop or ordinary to demand his clerks to be remitted out of the king's courts as ſoon as they were indicted: concerning the allowance of which demand there was for many years a great uncertainty; till at length it was finally ſettled in the reign of Henry VI. that the priſoner ſhould firſt be arraigned; and might either then claim his benefit of clergy by way of declinatory plea, or, after conviction, by way of arreſt of judgment. This latter way is moſt uſually practiſed, as it is more to the ſatisfaction of the court to have the crime previouſly aſcertained by confeſſion or the verdict of a jury; and alſo it is more advantageous to the priſoner himſelf, who may poſſibly be acquitted, and ſo need not the benefit of his clergy at all.

Originally the law was held that no man ſhould be admitted to the benefit of clergy, but ſuch as had the *habitum et tonſuram clericalem.* But, in proceſs of time, a much wider and more comprehenſive criterion was eſtabliſhed; every one that could read (a great mark of learning in thoſe days of ignorance and her ſiſter ſuperſtition) being accounted a clerk, or *clericus*, and allowed the benefit of clerkſhip, though neither initiated in clerkſhip, nor trimmed with the holy tonſure. But when learning, by means of the invention of printing, and other concurrent cauſes, began to be more generally diſſeminated than formerly; and reading was no longer a competent proof of clerkſhip, or being in holy orders; it was found that as many laymen as divines were admitted to the *privilegium clericale:* and therefore by ſtatute 4 Hen. VII. c. 13. a diſtinction was once more drawn between mere lay ſcholars, and clerks that were really in orders. And, though it was thought reaſonable ſtill to mitigate the ſeverity of the law with regard to the former, yet they were not put upon the ſame footing with actual clergy; being ſubjected to a ſlight degree of puniſhment, and not allowed to claim the clerical privilege more than once. Accordingly the ſtatute directs, that no perſon, once admitted to the benefit of clergy, ſhall be admitted thereto a ſecond time, until he produces his orders: and, in order to diſtinguiſh their perſons, all laymen who are allowed this privilege, ſhall be burned with a hot iron in the brawn of the left thumb. This diſtinction between learned laymen and real clerks in orders was aboliſhed for a time by the ſtatutes 28 Hen. VIII. c. 1. and 32 Hen. VIII. c. 3.; but is held to have been virtually reſtored by ſtatute 1 Edw. VI. c. 12. which ſtatute alſo enacts, that lords of parliament and peers of the realm may have the benefit of their peerage, equivalent to that of clergy, for the firſt offence (although they cannot read, and without being burnt in the hand), for all offences then clergyable to commoners, and alſo for the crimes of houſebreaking, highway-robbery, horſe-ſtealing, and robbing of churches.

After this burning, the laity, and before it the real clergy, were diſcharged from the ſentence of the law in the king's courts, and delivered over to the ordinary, to be dealt with according to the eccleſiaſtical canons. Whereupon the ordinary, not ſatisfied with the proofs adduced in the profane ſecular court, ſet himſelf formally to make a purgation of the offender by a new canonical trial; although he had been previouſly convicted by his country, or perhaps by his own confeſſion. This trial was held before the biſhop in perſon, or his deputy; and by a jury of twelve clerks: and there, firſt, the party himſelf was required to make oath of his own innocence; next, there was to be the oath of twelve compurgators, who ſwore they believed he ſpoke the truth; then, witneſſes were to be examined upon oath, but on behalf of the priſoner only; and laſtly, the jury were to bring in their verdict upon oath, which uſually acquitted the priſoner; otherwiſe, if a clerk, he was degraded, or put to penance. A learned judge in the beginning of laſt century remarks, with much indignation, the vaſt complication of perjury and ſubornation of perjury in this ſolemn farce of a mock trial: the witneſſes, the compurgators, and the jury, being all of them partakers in the guilt: the delinquent party alſo, though convicted in the cleareſt manner, and conſcious of his own offence, yet was permitted, and almoſt compelled, to ſwear himſelf not guilty; nor was the good biſhop himſelf, under whoſe countenance this ſcene was tranſacted, by any means exempt from a ſhare of it. And yet, by this purgation, the party was reſtored to his credit, his liberty, his lands, and his capacity of purchaſing afreſh, and was entirely made a new and an innocent man.

This ſcandalous proſtitution of oaths, and the forms of juſtice, in the almoſt conſtant acquittal of felonious clerks by purgation, was the occaſion, that, upon very heinous and notorious circumſtances of guilt, the temporal courts would not truſt the ordinary with the trial of the offender, but delivered

over to him the convicted clerk, *abſque purgatione faciendo:* in which ſituation the clerk convict could not make purgation; but was to continue in priſon during life, and was incapable of acquiring any perſonal property, or receiving the profits of his lands, unleſs the king ſhould pleaſe to pardon him. Both theſe courſes were in ſome degree exceptionable; the latter perhaps being too rigid, as the former was productive of the moſt abandoned perjury. As therefore theſe mock trials took their riſe from factious and popiſh tenets, tending to exempt one part of the nation from the general municipal law, it became high time, when the reformation was thoroughly eſtabliſhed, to aboliſh ſo vain and impious a ceremony.

Accordingly the ſtatute 18 Eliz. c. 7. enacts, that, for the avoiding ſuch perjuries and abuſes, after the offender has been allowed his clergy, he ſhall not be delivered to the ordinary as formerly; but, upon ſuch allowance, and burning of the hand, he ſhall forthwith be enlarged and delivered out of priſon; with proviſo, that the judge may, if he thinks fit, continue the offender in gaol for any time not exceeding a year. And thus the law continued unaltered for above a century; except only, that the ſtatute 21 Jac. I. c. 6. allowed, that women convicted of ſimple larcenies under the value of 10s. ſhould (not properly have the benefit of clergy, for they were not called upon to read, but) be burned in the hand, whipped, or ſtocked, or impriſoned for any time not exceeding a year. And a ſimilar indulgence by the ſtatutes 3 and 4 W. and M. c. 9. and 4 and 5 W. and M. c. 24. was extended to women guilty of any clergyable felony whatever; who were allowed once to claim the benefit of the ſtatute, in like manner as men might claim the benefit of clergy, and to be diſcharged upon being burned in the hand, and impriſoned for any time not exceeding a year. All women, all peers, and all male commoners who could read, were therefore diſcharged in ſuch felonies abſolutely, if clerks in orders; and for the firſt offence upon burning in the hand, if lay; yet all liable (except peers), if the judge ſaw occaſion, to impriſonment not exceeding a year. And thoſe men who could not read, if under the degree of peerage, were hanged.

Afterwards, indeed, it was conſidered, that education and learning were no extenuations of guilt, but quite the reverſe; and that if the puniſhment of death for ſimple felony was too ſevere for thoſe who had been liberally inſtructed, it was, *à fortiori*, too ſevere for the ignorant alſo. And thereupon, by ſtatute 5 Anne, c. 6. it was enacted, that the benefit of clergy ſhould be granted to all thoſe who were entitled to aſk it, without requiring them to read by way of conditional merit. And, experience having ſhewn that ſo univerſal a lenity was frequently inconvenient, and an encouragement to commit the lower degrees of felony; and that though capital puniſhments were too rigorous for theſe inferior offences, yet no puniſhment at all (or next to none, as branding or whipping) was as much too gentle; it was enacted by the ſame ſtatute, 5 Anne, c. 6. that when any perſon is convicted of any theft or larceny, and burnt in the hand for the ſame, he ſhall, at the diſcretion of the judge, be committed to the houſe of correction or public work-houſe, to be there kept to hard labour for any time not leſs than ſix months, and not exceeding two years; with a power of inflicting a double confinement in caſe of the party's eſcape from the firſt. And it is alſo enacted by the ſtatutes 4 Geo. I. c. 11. and 6 Geo. I. c. 23. that when any perſons ſhall be convicted of any larceny, either grand or petit, or any felonious ſtealing or taking of money or goods and chattels, either from the perſon or the houſe of any other, or in any other manner, and who by the law ſhall be entitled to the benefit of clergy, and liable only to the penalties of burning in the hand, or whipping, the court, in their diſcretion, inſtead of ſuch burning in the hand, or whipping, may direct ſuch offenders to be tranſported to America for ſeven years; and if they return, or are ſeen at large in this kingdom within that time, it ſhall be felony without benefit of clergy.

In this ſtate does the benefit of clergy at preſent ſtand; very conſiderably different from its original inſtitution: the wiſdom of the Engliſh legiſlature having, in the courſe of a long and laborious proceſs, extracted, by a noble alchemy, rich medicines out of poiſonous ingredients; and converted, by gradual mutations, what was at firſt an unreaſonable exemption of particular popiſh eccleſiaſtics, into a merciful mitigation of the general law with reſpect to capital puniſhments.

From the whole of this detail, we may collect, that however, in times of ignorance and ſuperſtition, that monſter in true policy may for a while ſubſiſt, of a body of men reſiding in a ſtate, and yet independent of its laws, yet when learning and rational religion have a little enlightened men's minds, ſociety can no longer endure an abſurdity ſo groſs, as muſt deſtroy its very fundamentals. For, by the original contract of government, the price of protection by the united force of individuals, is that of obedience to the united will of the community. This united will is declared in the laws of the land: and that united force is exerted in their due, and univerſal, execution.

II. We are next to enquire, to what perſons the benefit of clergy is to be allowed at this day: and this muſt chiefly be collected from what has been obſerved in the preceding article. For, upon the whole, we may pronounce, that all clerks in orders are, without any branding, and of courſe without any tranſportation (for that is only ſubſtituted in lieu of the other), to be admitted to this privilege, and immediately diſcharged, or at moſt only confined for one year; and this as often as they offend. Again, all lords of parliament, and peers of the realm, by the ſtatute 1 Edw. VI. c. 12 ſhall be diſcharged in all clergyable and other felonies provided for by the act without any burning in the hand, in the ſame manner as real clerks convict: but this is only for the firſt offence. Laſtly, all the commons of the realm, not in orders, whether male or female, ſhall, for the firſt offence, be diſcharged of the puniſhment of felonies, within the benefit of clergy, upon being burnt in the hand, and ſuffering diſcretionary impriſonment; or, in caſe of larceny, upon being tranſported for ſeven years, if the court ſhall think proper.

III. The third point to be conſidered is, for what crimes the *privilegium clericale*, or benefit of clergy, is to be allowed. And it is to be obſerved, that neither in high treaſon, nor in petit larceny, nor in any mere miſdemeanors, it was indulged at the common law: and therefore we may lay it down as a rule, that it was allowable only in petit treaſon, and capital felonies; which for the moſt part became legally entitled to this indulgence, by the ſtatute *de clero*, 25 Edw. III. ſtat. 3. c. 4. which provides, that clerks convict for treaſon or felonies, touching other perſons than the king himſelf or his royal majeſty, ſhall have the privilege of holy church. But yet it was not allowed in all caſes whatſoever: for in ſome it was denied even in common law, viz. *inſidiatio viarum*, or lying in wait for one on the highway; *depopulatio agrorum*, or deſtroying and ravaging a country; and *combuſtio domorum*, or arſon, that is, burning of houſes; all which are a kind of hoſtile acts, and in ſome degree border upon treaſon. And further, all theſe identical crimes, together with petit treaſon, and very many other acts of felony, are ouſted of clergy by particular acts of parliament.

Upon the whole, we may obſerve the following rules. 1. That in all felonies, whether new created, or by common law, clergy is now allowable, unleſs taken away by act of par-

ſiament. 2. That where clergy is taken away from the principal, it is not of courſe taken away from the acceſſory, unleſs he be alſo particularly included in the words of the ſtatute. 3. That when the benefit of clergy is taken away from the offence (as in caſe of murder, buggery, robbery, rape, and burglary), a principal in the ſecond degree, being preſent, aiding and abetting the crime, is as well excluded from his clergy as he that is a principal in the firſt degree: but, 4. That where it is only taken away from the perſon committing the offence (as in the caſe of ſtabbing, or committing larceny in a dwelling-houſe), his aiders and abettors are not excluded, through the tenderneſs of the law, which hath determined that ſuch ſtatutes ſhall not be taken literally.

IV. Laſtly, We are to enquire what the conſequences are to the party, of allowing him this benefit of clergy. We ſpeak not of the branding, impriſonment, or tranſportation; which are rather concomitant conditions, than conſequences, of receiving this indulgence. The conſequences are ſuch as affect his preſent intereſt, and future credit and capacity: as having been once a felon, but now purged from that guilt by the privilege of clergy; which operates as a kind of ſtatute pardon. And we may obſerve, 1. That, by his conviction, he forfeits all his goods to the king; which, being once veſted in the crown, ſhall not afterwards be reſtored to the offender. 2. That, after conviction, and till he receives the judgment of the law by branding or the like, or elſe is pardoned by the king, he is, to all intents and purpoſes, a felon; and ſubject to all the diſabilities and other incidents of a felon. 3. That, after burning or pardon, he is diſcharged for ever of that, and all other felonies before committed, within the benefit of clergy; but not of felonies from which ſuch benefit is excluded: and this, by ſtatutes 8 Eliz. c. 4. and 18 Eliz. c. 7. 4. That, by the burning, or pardon of it, he is reſtored to all capacities and credits, and the poſſeſſion of his lands, as if he had never been convicted. 5. That what is ſaid with regard to the advantages of commoners and laymen, ſubſequent to the burning in the hand, is equally applicable to all peers and clergymen, although never branded at all. For they have the ſame privileges, without any burning, to which others are entitled after it.

CLERY, a village in France, nine miles S.W. of Orleans, once famous for the pilgrimages to our lady of Clery. Here was the tomb of that monſter Lewis XI. who appeared, in white marble, as the ſaint and the patriot king!

CLEYBROOK, Great and Little, two villages in Leiceſterſhire, on the N.W. ſide of Lutterworth, ſuppoſed to have been a part of Cleyceſter, ſituated one mile to the W. which was a flouriſhing city of the Romans, and where their bricks and coins have been frequently found.

CLIFFE, a town of Northamptonſhire, with a market on Tueſday; 30 miles N.E. of Northampton, and 88 N.N.W. of London. Long. 0. 37. W. Lat. 52. 33. N.

CLIFTON, a village of Weſtmoreland, three miles from Penrith, remarkable for a ſkirmiſh between the king's forces and the rebels in 1745, in which the latter had the advantage.

Clifton, a village in Glouceſterſhire, near Briſtol, noted for the hot-well in its neighbourhood, upon the Lower Avon, at the foot of St. Vincent's rock.

CLISSA, a fort of Dalmatia, taken from the Turks by the Venetians. It is ſeated on a craggy mountain, near which is a narrow valley between two ſteep rocks, through which the road lies from Turkey to Dalmatia. It is ſix miles N. of Spalatto. Long. 17. 31. E. Lat. 44. 10. N.

CLISSON, a town of France, in the department of Lower Loire and late province of Bretagne, on the river Seure, 12 miles S. of Nantz. Long. 1. 28. W. Lat. 47. 1. N.

CLITHERO, a borough in Lancaſhire, with a market on Saturday. It is ſeated near Pendil Hill, and is 36 miles S.E. of Lancaſter, and 213 N.N.W. of London. Long. 2. 21. W. Lat. 53. 54. N.

CLOSET, a well-known convenience in a houſe; calculated to depoſit ſafely ſmall articles of domeſtic economy, or conſumption, till they are wanted for uſe.

Water-Closet, a modern invention, by means of which the vileſt of animal functions may be performed in a decent and cleanly manner, and without giving offence to the feelings of others. The following is the ſpecification of the patent granted to Mr. Binns, of Great Barlow-ſtreet, Mary-le-bone, for a machine or apparatus, anſwering the ſeveral purpoſes of a portable water-cloſet, a bidet, and eaſy chair, which together are compriſed in one third of the ſpace or room occupied by portable water-cloſets now in uſe; and which, from its lightneſs and ſize, is particularly calculated for travelling or for camps or ſhips.

"The object of my invention," ſays Mr. Binns, "is, to remove the complaint made againſt a portable water-cloſet (heretofore invented and manufactured by me), on account of its being too bulky for frequent removals, and to increaſe the utility of theſe machines, by the addition of a bidet-pan. In my former portable-cloſets, the back, encloſing the water-ciſtern, was vertically fixed upon the ſeat or lower part of the caſe; in my preſent invention, the back ſhuts down upon the ſeat in the manner of a lid, and thus not only reduces its ſize to one-third of the dimenſions of the former ones, but alſo renders it more convenient for travelling, and leſs liable to be injured. This important advantage of folding down the back of the cloſet upon the ſeat, I obtain by different means, viz.

"Firſt, By a ſcrew-jointed tube, as particularly delineated in figs. 6 and 7 (ſee Plate 21.). This tube conſiſts of two angular parts, made of braſs or any other proper materials: the end of one part is inſerted and ſecured in the bottom of the water ciſtern, and the end of the other part is attached to the baſin, in the common way of manufacture. The two parts of the tube are firmly connected, by the one ſcrewing into the other, as may be ſeen in the above-mentioned figures, and ſerve as a joint for the back to turn upon, in being folded down upon the ſeat. When the back of the cloſet is raiſed, the ſcrew of the tube is perfectly cloſe or home, the extremity of the female ſcrew preſſing againſt a ſmall collar of leather which ſurrounds the ſhoulders of the male ſcrew; but when the back is folded down upon the ſeat, the ſcrew, as being the joint or hinge, relaxes a quarter turn.

"Secondly, By a jointed tube varying from the above, only in being a cock-joint inſtead of a ſcrew, as deſcribed in fig. 7.

"Thirdly, By a ſliding-jointed tube of two parts, each forming a curve of a quarter of a circle, as repreſented in fig. 5, where the back of the cloſet is ſhewn in the progreſs of being ſhut down upon the ſeat, to exhibit more clearly the manner in which the tube acts. The two parts of the tube are joined to the ciſtern and baſin as the preceding ones, but not ſo advantageouſly, for this tube cannot act as a joint or hinge, and requires an accuracy in the manufacture. The above three jointed tubes are applicable to many kinds of machinery.

"Fourthly, By a leather or other flexible or jointed tube, attached to the bottom of the water-ciſtern and to the ſide of the baſin. The object of my invention may alſo be obtained, by varying and differently combining the ſeveral means hereinbefore deſcribed; but I prefer the firſt or ſcrew-jointed tube, which includes more advantages than can be derived from any of the other methods. Theſe tubes I generally manufacture in braſs, or in what is known by the name of cock-metal. The manner in which the bidet-pan is added to the cloſet, is

ſo ſimple and obvious, as ſcarcely to require any other explanation than a reference to figs. 3, 4, and 8. The rim at each end of the bidet-pan reſts on the front and back edge of the ſeat of the cloſet, immediately over the baſin, and is ſupplied with water from the cloſet ciſtern, either by a ſeparate aqueduct from the ciſtern, or by the ſame channel through which the water is admitted into the cloſe baſin; and for this purpoſe an aperture is made in the upper part of the back end of the bidet-pan, ſufficiently large to admit the fan of the pan leading into the baſin. The latter method I deem beſt. The pans I uſually manufacture in copper, and japan them; but they may be made of other materials, though none are, in my opinion, ſo well adapted to the purpoſe as japanned copper

"In the figures which are annexed to elucidate this ſpecification, I have exhibited and deſcribed the whole cloſet, which contains many parts that are not new, and cannot be conſidered as included in my preſent patent. The parts which I claim as my invention, and for which the patent is granted, are the folding down of the back of the cloſet upon the ſeat, or by having the back to engage and diſengage, whereby the back may be laid down on the ſeat; or by folding or laying down the back of the cloſet upon the ſeat in any manner whatſoever: but more particularly by the different means herein-before deſcribed; the ſcrew-jointed tube; the cock jointed tube; the ſliding tube; the tube made of leather, or any other flexible material; the application of the bidet pan to the water-cloſet, and the arms or handles to make it ſerve as an eaſy chair. Theſe arms or handles are in two parts, joined by a ſcrew near the angle; and one part of the arm, when joined or ſcrewed together, is attached or fixed to the ſeat of the cloſet, and the other to the back by means of ſliding faſtenings; by which means theſe arms are made to engage and diſengage, for the different purpoſes the cloſet may be uſed for; and alſo for the convenience of packing in the internal part of the cloſet in travelling."

Explanation of the figures.—Fig. 1. A ſide view of the water-cloſet with the back ſhut down.

Fig. 2. A ſide view of the cloſet, with the back raiſed and ſecured by two braſs arms which ſlide into the back and ſeat: for conveniency in packing, theſe arms ſeparate at the angle or elbow. On this ſide of the bottom of the cloſet is ſhewn the door which is opened whenever the ſoil pan is removed.

Fig. 3. The ſame view on an enlarged ſcale. The ſide of the caſe is omitted for the purpoſe of exhibiting the mechaniſm. *a*. The frame or caſe containing the mechaniſm. *b*. The water-ciſtern in the back of the cloſet. *c*. The lever which raiſes the valve *f*, for the purpoſe of admitting water through the jointed tube into the baſin or bidet-pan. This lever is raiſed either by drawing up the handle *d*, on the ſeat, or by preſſing the thumb on the extremity of the lever, as appears more plainly at *e*, in fig. 4. In doing the former, not only water is admitted into the baſin or bidet, but alſo the water in the baſin is at the ſame time diſcharged into the ſoil-pan below, by means of the tumbler *e*, which opens a valve at the bottom of the baſin; but a preſſure on the lever at the top of the back produces only a ſingle motion for diſcharging water out of the ciſtern. *g*. The ſcrew-jointed tube more particularly deſcribed in figs. 6 and 7. *h*. The bidet-pan, which reſts at each end upon the edge of the ſeat over the baſin (ſee alſo figs. 4 and 8). *i*. The cloſet baſin. *j*. The water-pipe. *k*. The ſtench-trap. *l*. The ſoil-pan which contains the foul water, &c diſcharged by the baſin. The mouth of this pan is cloſely attached to the pipe at the bottom of the trap, by the angular lever *m*, which is raiſed and ſecured by the braſs ſpring catch *n*. When the pan is to be removed, a ſlight preſſure on the knob of the catch diſengages the lever, and the pan which is ſupported by it. In drawing out the ſoil-pan to diſcharge its contents, a lid is ſecured on the mouth of it to prevent the eſcape of any offenſive effluvia in the removal. *o*. The fan at the end of the pipe or tube for admitting water into the baſin and bidet-pan. *p*. The top of the back is a lid, which is opened whenever the ciſtern is ſupplied with water. The other parts of the figure are either too obvious or too well known to require explanation.

Fig. 4. A view of the ſeat of the cloſet, and of the top of the back when the lid is open. *q*. The aperture through which the water is poured into the ciſtern. *r*. The ſpring of the lever *e*. *s*. The braſs plate affixed to the lower part of the ſcrew jointed tube, and which is ſecured to the ſeat by four ſcrews as a joint. The other references are explained by the ſame letters in fig. 3.

Fig. 5. A ſection of the ſliding curved tube. *a*. The lower or external part of the tube, which is attached to the baſin. *b*. The upper or internal part of the tube, inſerted in the bottom of the ciſtern. *c*. Theſe lines delineate the bottom and front ſide of the water-ciſtern. *d*. An outline of the fore-part of the back, and of the ſeat of the cloſet. *e*. The joint which connects the back of the cloſet with the ſeat. *f*. A collar of leather, againſt which the ſhoulder of the upper part of the tube and the extremity of the lower one preſs, when the tube is cloſed by the back of the cloſet being erect. *g*. The valve in the upper or internal part of the tube, for retaining the water in the ciſtern. *h*. The leather lining to the valve. *i*. The ſcrew which binds the leather to the valve. *j*. A wire to regulate the valve in its motions. In the upper part of this wire is affixed another, which communicates to the lever at the top of the water-ciſtern. *k*. A fixed bar in which the regulator of the valve moves.

Fig. 6. A vertical ſection of the ſcrew-jointed tube. *l*. A braſs plate affixed to the lower part of the tube, and which is ſcrewed down upon the ſeat, as appears in fig. 4. The other references are explained by thoſe of the preceding figure.

N. B. This ſection is not in a direct line, but a combination of three, as ſhewn by the tranſverſe dotted lines in the following figure.

Fig. 7. A horizontal ſection of the ſcrew or cock-jointed tube. *m*. The vertical dotted lines point out the variation, in connecting the two parts of the tube by a cock-joint inſtead of a ſcrew. The other references are explained by thoſe in figs. 5 and 6.

In this ſection the upper part of the tube is more highly coloured than the lower one, for the purpoſe of delineating more obviouſly the outline of the two parts.

Fig. 8. A vertical view of the back part of the bidet-pan when fixed, as in fig. 4.

1. The upper part of the edge of the ſeat of the cloſet above the bidet-pan.

2. The rim of the end of the bidet-pan reſting on the edge of the ſeat, which for that purpoſe is levelled from the dotted line upwards.

3. The water-pipe or tube at the back of the fan.

4. The fan which diſperſes the water from all parts of its curvature; an improvement by which the bottom as well as the ſides are completely waſhed.

5. The edges of the aperture in the back part of the bidet-pan, for admitting the fan. The ſides of the aperture cloſely join to the internal ſurface of the back, and thus include the ſtyle of the fan in the bidet pan, when it is placed upon the ſeat of the cloſet, as repreſented in fig. 4.

There are water-cloſets on other principles, but the above ſeems to be calculated for every convenience that can be required.

CLOCUD, or Clun, a town of France, four miles from Laſs,

ſeated on the river Seine. Here was lately a magnificent royal palace, gardens, caſcade, &c.

CLOVIS I. the real founder of the French monarchy. For he was the firſt conqueror of the ſeveral provinces of Gaul poſſeſſed before his time by the Romans, Germans, and Goths: theſe he united to the then ſcanty dominions of France, removed the ſeat of government from Soiſſons to Paris, and made this the capital of his new kingdom. He died in 511, in the 46th year of his age, and 31ſt of his reign.

CLUSE, a town of Savoy, in the territory of Faucigny; ſeated on the river Arve, 22 miles S.E. of Geneva. Long. 6. 29. E. Lat. 45. 57. N.

CLWYD, a celebrated vale of Denbighſhire, extending from its upper end to the ſea above 20 miles; its breadth varying from three to eight, according to the approach or receſs of the high mountains incloſing it, through which, in different parts, are gaps formed by nature for entrances. This delightful ſpot is in a high ſtate of cultivation, even far up the aſcent of the hills, and is full of towns, villages, and gentlemen's ſeats. A river of the ſame name runs along this vale, the inhabitants of which are remarkable for retaining their vivacity to a very late period of life.

CLWYD, a river of Denbighſhire, which riſes in the middle of the county, and taking a compaſs to the S.E. turns to the N.W. and having entered Flintſhire, falls into the Iriſh Sea.

CLYDESDALE, a wild diſtrict in the S. part of Lanerkſhire in Scotland. Amid the mountains here, particles of gold have ſometimes been found waſhed down by the rains and ſtreams of water; but this tract is chiefly remarkable for producing metals of inferior worth. "Nothing," ſays Mr. Pennant, "can equal the gloomy appearance of the county round. Neither tree, nor ſhrub, nor verdure, nor picturesque rock, appears to amuſe the eye. The ſpectator muſt plunge into the bowels of theſe mountains for entertainment." The veins of lead lie moſtly N. and E. and their thickneſs, which ſeldom exceeds 40 feet, varies greatly in different parts. The ſcanty paſture here feeds ſome ſheep and cattle; but thoſe in the neighbourhood of the mines, ſometimes periſh by drinking the water in which the lead ore has been waſhed; for this ore communicates a deleterious quality to the water, though that liquid acquires no noxious taint from remaining in leaden pipes and ciſterns, unleſs the water contain an acid.

COADUNATÆ (*Encycl.*). Erroneouſly ſpelt COADUNATE.

COALS (*Encycl.*). To what has been ſaid under that article, we wiſh to add the following obſervations and experiments on the formation and properties of pit-coal, by Mr. Eglesfield Smith.

"Pit-coal," ſays he, "is a black, compact, brittle, and inflammable ſubſtance; of a moderate hardneſs, and laminated ſtructure, more or leſs ſhining, but incapable of taking any great degree of poliſh. It is generally found below the ſurface of the earth, where it lies in nearly horizontal ſtrata, ſometimes many yards thick. When diſtilled it yielded the following products:

"One hundred ounces of pit-coal, diſtilled in a ſtrong heat, gave fourteen ounces and a half of liquid, and fifty-nine ounces of cinder; the reſt was evolved in the form of an air, which, caught in bladders and glaſſes, upon examination ſeemed to be in part compoſed of true hydrogene, as it inflamed and went off with a degree of exploſion when mixed with the atmoſpheric air; whether azotic or other gas was evolved at the ſame time I could not determine.

"The liquid obtained from the coal by diſtillation had its ſurface covered with an empyreumatic oil, which ſeemed more or leſs fluid according to the degree of heat uſed in the diſtillation.

"In the middle of the receiver was a reddiſh fluid of an acid taſte, and which ſeemed loaded with oil. At the bottom was found a thick tenacious ſubſtance like tar.

"I ſhall now endeavour to prove that pit-coal is a vegetable ſubſtance oxygenated to a certain degree. But how the immenſe mountains of this ſubſtance which are found in the bowels of the earth are formed cannot eaſily be conceived: they cannot be produced by the decay of a few foreſts upon its ſurface, which they ſay have been buried by earthquakes or other changes which have taken place in it; a cauſe more proportionate to the magnitude of the effect is required.

"From the prints of ſhells and fiſhes which are found in the different ſtrata of coal, its formation has been evidently ſubmarine, and it is to the ſea that we are to look for the immenſe produce of vegetable matter which is required for its formation. This, together with what is brought into it by rivers, being broken by the waves and currents, and heaped together, is covered with ſand, and becomes decompoſed.

"Wood, when it has been buried under the ſurface of the earth for a length of time, acquires the hardneſs and brittleneſs of pit-coal in a great degree; and we often find pieces of coal which have the annular lines of the wood ſtrongly marked upon them. A piece of oak, when dried and diſtilled, produced the following reſults, which will be found to be nearly the ſame with thoſe obtained from the pit-coal, though differing in their qualities.

"An hundred ounces of the heart of the oak, when dried, produced on diſtillation thirty-nine ounces of liquid, and thirty-four of charcoal, the reſt being diſſipated in the form of inflammable air.

"On the ſurface of the liquid floated an oil nearly the ſame as that obtained from the pit-coal. The liquid had an acid taſte, and turned ſlips of paper, tinged blue by the purple radiſh, to a red colour. At the bottom of the receiver was found a tenacious ſubſtance, the ſame as was produced from the pit-coal, only differing in being more fluid. Other woods yielded the ſame ſubſtances, but the harder the wood it yielded more of the oil; and that oil was more or leſs thick according to the degree of heat uſed in the diſtillation.

"The following experiments will ſhew further how nearly pit-coal and wood are allied to each other.

"I took half an ounce of pit-coal, and having reduced it to a fine powder, poured upon it two ounces of the oil of turpentine: by applying to it a heat a little above that of boiling water, I diſſolved the whole into a maſs or fluid like that of tar, but more tranſparent.

"I then took an ounce of charcoal, and treated it in the ſame manner, but I found it would not diſſolve, but remained ſwimming in ſmall particles in the fluid. I added to the fluid forty drops of ſulphuric acid, and ſtill no ſolution took place. I then poured into it a quarter of an ounce of ſtrong nitrous acid, and a violent inflammation enſued. This mixture I afterwards kept in a ſand-bath of moderate heat for near half an hour, and upon examination I found the reſidue quite diſſolved, and reſembled that procured from the pit-coal ſo much, that it was impoſſible to diſtinguiſh the one from the other. I treated ſome pounded pit-coal in the ſame manner as I had done the charcoal, ſaving the circumſtance of putting it into the ſand-bath, and the only difference in the reſult was, that it reſembled pitch more than the former, being of a thicker conſiſtence.

"I then inflamed ſome oil of turpentine by means of the nitrous acid, and I found that the reſidue was a kind of tar, reſembling the reſidue obtained from the foregoing experiments. I ſhall endeavour to explain how theſe ſolutions took place.

"The *firſt* experiment was to try whether or not pit-coal was a bitumen, or a reſinous ſubſtance, which is proved by its being completely ſoluble in the oil of turpentine. The *ſecond*

experiment ſhews, that charcoal is an oxygenated wood, but not ſufficiently oxygenated to become ſoluble in the oil of turpentine, till by the addition of the nitrous acid it becomes completely ſoluble like bitumen and charcoal, and thereby ſhews that it nearly reſembles thoſe ſubſtances.

"The *third* experiment ſhews, that the nitrous acid does not alter pit-coal, otherwiſe than by thickening it.

"The *fourth* experiment ſhews, that oil of turpentine, when oxygenated to a high degree, becomes a ſort of bitumen, or rather petroleum.

"From the above we ſee how nearly wood and pit-coal are allied to each other; and that wood, when treated chemically, will yield the ſame products as pit-coal.

"I ſhall now ſhew how this proceſs takes place in the bowels of the earth. The quantities of vegetable matter which have been collected together, either by the violence of floods or other convulſions of nature, becoming in time covered with a vegetable ſward, which continues to increaſe until it entirely excludes the air, while lying in this ſtate undergoes a degree of fermentation, during which the vegetable matter attracts the oxygenating principle from the water, and becomes thereby highly oxygenated. The ſlowneſs of this proceſs gives the wood a greater degree of attraction for the oxygen, which is, perhaps, aſſiſted by the excluſion of the air. The inflammable principle of the water, or the hydrogen, is evolved, and forms that air which is ſo troubleſome to miners.

"Iron and ſulphur are formed during this decompoſition of vegetable matter, which accounts for the formation of pyrites, which are ſo often found in coal-mines.

"From the large quantities of inflammable air which are let looſe in the decompoſition of vegetable ſubſtances, we may, in ſome meaſure, account for the continual ſhowers which woody and marſhy countries are ſubject to, and why dry and ſandy countries are generally without them. Hence we may likewiſe account for thunder being ſo common in hot woody countries. In theſe countries, vegetables ſoon putrify and decay; and the large quantities of inflammable air which muſt be neceſſarily evolved during their decay, mixing with the oxygen of the air, and fired by electricity, explode and fall down in rain, and again ſerve for the growth and nouriſhment of plants. In this proceſs of vegetation the inflammable principle of the water is abſorbed by the plant, while the oxygen is evolved, and ſerves, by purifying the exhauſted atmoſphere, to ſupport animal life."

The combuſtion of this valuable fuel has been promoted, and its uſe economiſed, by a variety of excellent inventions. The following is the ſpecification of a patent granted to Mr. Chabannes, of Welbeck-ſtreet, London, for a machine for ſeparating coals, and a compoſition for making ſmall-coal into cakes or bricks to be uſed for fuel.

"Coals, conſiſting of great and ſmall mixed together, ſuch as are uſually bought in the pool in the river Thames for conſumption in the cities of London and Weſtminſter, and their environs, are to be diſcharged or thrown upon grates or gratings of the deſcription herein-after contained, which grates or gratings are to be fixed either horizontally or on an inclined plane; and, by means of ſuch diſcharge, and throwing of the ſaid coals, the ſmall coals will be ſeparated from the large. The grates or gratings are to be conſtructed either of wood or metal, and are to be of any length or breadth ſuited to the place where they are fixed, and to have bars at a diſtance from each other not leſs than a quarter of an inch, nor more than an inch and an half. The form of theſe grates or gratings is particularly deſcribed in Plate 22. The compoſition is to conſiſt of the ſmall coals ſo ſeparated as above mentioned from the large coals, and a ſmall quantity of earth, clay, cow-dung, tar, pitch, broken glaſs, ſulphur, ſaw-duſt, oil-cakes, tan, or wood, or of any other combuſtible ingredient, to be mixed together and ground with a wheel in water in a wooden veſſel. The compoſition, together with the water, is then to be conveyed by pipes, or any other conductor, into pits or holes of any dimenſions, made for that purpoſe, to be lined with tiles or bricks cemented together with water, except in the centre, where a drain or watercourſe is to be cut below the pit or hole, and ſuch drain or watercourſe is to be covered over with uncemented tiles, by which means the water will paſs off into the drain or watercourſe, and leave the compoſition in the pit or hole. The compoſition is then to be moulded into brick-cakes or balls, and put on a frame to dry; and when dry is fit for uſe as fuel."

Reference to the plate.—A. Plan of the grate or grating. B. Veſſel in which the coals are raiſed from the barge, and from whence they are thrown on the grate or grating to ſeparate them. C. The profile of the grate or grating with the coals running on it. D. is the ſtage where the ſmall coal is received.

COALLIER, a veſſel employed to carry coals from one port to another; chiefly from the northern parts of England to the capital, and more ſouthernly parts, as well as to foreign markets. This trade is known to be an excellent nurſery for ſeamen; although they are often found, from the conſtitution of their climate, not to be ſo well calculated for ſouthern navigation.

COB, a kind of mud-wall. In thoſe parts of England where ſtone is ſcarce, it is uſual to make walls and houſes of mud, or, as it is called in Devonſhire, *cob*; which is a compoſition of earth and ſtraw, wetted up ſomewhat like mortar, but well beat and trod together. When a wall is making, after being raiſed to a certain height, it is allowed time to pitch or ſettle before the work is reſumed. Some value themſelves on their ſkill in building with this compoſition; the price, when materials are found, is generally in Devonſhire 3s. per perch of 16½ feet; but a ſtone foundation coſts more. Houſes built with this, being covered with thatch, are very dry and warm: a cob-wall, if in a good ſituation, will laſt 50 or 60 years or more. When pulled down, they are uſed as manure, and new earth employed to rebuild with.

COBHAM, a village in Surrey, remarkable for Paine's Hill, the ſeat and beautiful gardens of the late Mr. Hopkins. Cobham is 19 miles S.W. by W. of London.

COCA, a town of Old Caſtile, in Spain, ſeated among mountains; and near it is a ſtrong caſtle for ſtate priſoners.

COCHEIM, a town in the electorate of Treves, formerly imperial; ſeated on the Moſelle, 25 miles S.W. of Coblentz. Long 7. 2. E. Lat. 50. 12. N.

COCHIN CHINA (*Encycl.*). Little of the hiſtory of this kingdom is known: what follows depends entirely on the credit of M. le Poivre, a French traveller.—About half a century before the French firſt arrived in theſe diſtant regions, a prince of Tonquin, as he fled from his ſovereign, by whom he was purſued as a rebel, had, with his ſoldiers and adherents croſſed the river, which ſerves as a barrier between Tonquin and Cochin-China. The fugitives, who were warlike and civilized men, ſoon expelled the ſcattered inhabitants, who wandered about without any ſociety or form of government, and founded a new kingdom, which ſoon grew rich and populous. During the reign of the firſt ſix kings, no nation could be happier than the Cochin-Chineſe. Their monarchs governed them as a father does his family, eſtabliſhing no laws but thoſe of nature, to which they themſelves were the firſt to pay obedience. They honoured and encouraged agriculture, as the moſt uſeful employment of mankind; and required from their ſubjects only a ſmall annual free-gift to defray the expence of their defenſive war againſt the Ton-

quineſe, who were their enemies. This impoſition was regulated by way of poll-tax, with the greateſt equity. Every man, able to till the ground, paid to the prince a ſmall ſum proportioned to the ſtrength of his conſtitution, and the vigour of his arm: and nothing more.

Cochin-China continued happy under theſe princes for more than a century; but the diſcovery of gold-mines put a ſtop to theſe mild regulations. Luxury immediately took place. The prince began to deſpiſe the ſimple habitation of his anceſtors, and cauſed a ſuperb palace to be built, a league in circumference, ſurrounded with a wall of brick on the model of that of Pekin, and defended by 1600 pieces of cannon. Not content with this, he would needs have a winter palace, an autumn palace, and a ſummer palace. The old taxes were by no means ſufficient to defray theſe expences; new ones were deviſed; and oppreſſion and tyranny every-where took place. His courtiers, to flatter their prince, gave him the title of the *king of heaven*, which he ſtill continues to aſſume. When ſpeaking of his ſubjects, he ſtyles them his *children*, but by no means behaves as if he was their father: for our author informs us, that he has ſeen whole villages newly abandoned by their inhabitants, who were haraſſed with toil and inſupportable exactions; the neceſſary conſequence of which was, that their lands returned to their former uncultivated ſtate.

M. le Poivre repreſents the Cochin-Chineſe as gentle, hoſpitable, frugal, and induſtrious. There is not a beggar in the country; and robbery and murder are abſolutely unknown. A ſtranger may wander over the kingdom from one end to the other (the capital excepted), without meeting with the ſlighteſt inſult. He will be every-where received with the moſt eager curioſity, but at the ſame time with the greateſt benevolence. A Cochin-Chineſe traveller, who has not money ſufficient to defray his expences at an inn, enters the firſt houſe of the town or village he arrives at, and waiting the hour of dinner, takes part with the family, and goes away when he thinks proper, without ſpeaking a word, or any perſon's putting to him a ſingle queſtion.

The country of Cochin-China is much of the ſame temperature with that of Tonquin; though rather milder, as lying nearer the ſea. Like Tonquin, it is annually overflowed, and conſequently fruitful in rice, which requires no other manure than the mud left by the inundations. They have ſugar-canes, and the ſame kinds of fruits common to other parts of India. The country produces no grapes, and therefore they drink a liquor brewed from rice. They have vaſt woods of mulberry-trees, which run up as faſt as our hemp. Their ſilk is ſtronger than that of China, but not ſo fine. They have the beſt timber in the world, particularly a ſort which abounds in the mountains, and is called the *incorruptible tree*; becauſe it never rots under earth or water, and is ſo ſolid that it ſerves for anchors. There are two kinds, black and red. The trees are very tall, ſtraight, and ſo big that two men can ſcarce fathom them. They have alſo, on the mountains of the Kemois, a tree of the moſt fragrant ſcent, which is ſuppoſed to be the ſame with lignum aloes. This, being reckoned the beſt product of the country, is engroſſed by the king, and is ſold from five to 16 ducats per pound. It is highly valued both in China and Japan, where the logs of it are ſold for 200 ducats a-pound, to make pillows for the king and nobility; and among thoſe Indians which continue to burn their dead, great quantities of it are uſed in the funeral piles. The young trees, called *aquila*, or eagle-wood, are every one's property, which makes the old ones, called *calamba*, ſo ſcarce and dear. They have oak, and large pines, for the building of ſhips; ſo that this country is of the ſame uſe to China, that Norway is to Britain. In general, they have the ſame kind of trees and plants that are to be met with in Tonquin. They have mines of gold, as well as diamonds; but the laſt they do not value ſo highly as pearl. They alſo eſteem their coral and amber very much. In all the provinces there are great granaries filled with rice, in ſome of which that grain is kept upwards of 30 years. One of the greateſt rarities in theſe parts, eſpecially in grand entertainments, is a ragout made of the eatable birds-neſts, which ſome ſay are found only in Cochin-China, and others in four iſlands that lie ſouth of its coaſt. See BIRDS-NESTS.

The merchants of Cambodia, Tonquin, China, Macao, Manila, Japan, and Malacca, trade to Cochin-China with plate, which they exchange for the commodities of the country. The Portugueſe are the moſt favoured here of any Europeans. The Cochin-Chineſe themſelves, not being inclined to travel, ſeldom fail out of ſight of their own ſhore, but purchaſe many trifles from foreigners at great rates, particularly combs, needles, bracelets, glaſs pendants, &c. They are very fond of our hats, caps, girdles, ſhirts, and other clothes; and, above all, ſet a value on coral. The country is ſaid to have 700 miles of coaſt, with many large inlets of the ſea, and above 60 convenient landing places; which, however, according to Captain Hamilton, are but ſeldom viſited by ſtrangers.

COCCINELLA (*Encycl.*). Under that head we have given the natural hiſtory of that valuable inſect called COCHINEAL; but having referred to it in our treatiſe on DYEING, it is highly neceſſary to ſpeak of its qualities in that reſpect. The following account is drawn from the celebrated Berthollet.

Two ſorts of cochineal are gathered at Mexico; the ſylveſtris, there known by the Spaniſh name of *grana ſylveſtra*, and the fine, or *grana fina*, called alſo Meſteque, from the name of a province of Mexico, and which are bred upon the nopal. The firſt is ſmaller, and covered with a cottony down, which increaſes its weight, with a ſubſtance which is uſeleſs in dyeing; an equal weight of it therefore gives leſs colour, and is of a lower price than the fine cochineal; but theſe diſadvantages are perhaps compenſated by its being reared with greater facility, and at leſs expence, and even by the effects of its down, which enables it the better to reſiſt rain and ſtorms.

The coccinella ſylveſtris, when bred upon the nopal, loſes part of its tenacity, and ſome of its cotton, and acquires double the ſize it has on the other ſpecies of opuntia. It is therefore probable that it would be improved by a continued attention to the rearing of it, and would approach more and more to the fine cochineal.

M. Thieri de Menonville was led by his patriotic ſpirit and perſonal courage, to expoſe himſelf to imminent danger, in going to obſerve the mode of rearing the cochineal in Mexico, in order to obtain from thence that valuable production, wherewith he might enrich the colony of St. Domingo. He brought back with him both ſpecies of cochineal, and nopals, the kind of opuntia which affords the beſt food for inſects.

Upon his return, he employed himſelf in the cultivation of the nopal and different kinds of opuntia, and in rearing the two ſpecies of cochineal; but death cut off that excellent citizen, and the fine cochineal ſoon periſhed.

When he returned to St. Domingo, he diſcovered the coccinella ſylveſtris upon a kind of opuntia called *perſchia*, or *patte de tortue*, which grows there. This diſcovery did not remain unprofitable: M. Bruley employed himſelf ſucceſsfully in rearing this ſpecies of cochineal; he communicated it to the Cercle des Philadelphes (now the Royal Society of Arts and Sciences at Cape Français), who do not loſe ſight of that object, and have publiſhed a poſthumous work of M. Thieri de Menonville, which contains very minute inſtructions

with regard to every thing that reſpects the cultivation of the nopal, and the other ſpecies of opuntia that may be ſubſtituted for it more or leſs ſucceſsfully, for breeding or rearing the cochineal.

Two months after the females which have been reſerved are ſown upon the nopal, the young cochineals are obſerved to iſſue from them; and then is the proper ſeaſon for gathering them: they are killed by immerſion in boiling water. The hot iron plates or ovens which are ſometimes employed may injure the cochineal by being too hot. When taken out of the water, they are carefully dried by free expoſure to the ſun. They loſe nearly two-thirds of their weight in drying.

When the fine cochineal is dry, it muſt be paſſed through a ſieve ſufficiently coarſe to allow it to go through, but capable of retaining the down and cotton of the larvæ of the males. Theſe are kept apart and ſold ſeparately, or with the coccinella ſylveſtris.

Fine cochineal, which has been well dried and properly kept, ought to be of a gray colour inclining to purple. The gray is owing to a powder which covers it naturally, a part of which it ſtill retains: the purple tinge proceeds from the colour extracted by the water in which it has been killed.

Cochineal will keep a long time in a dry place. Hellot ſays, that he tried ſome, one hundred and thirty years old, and found it produced the ſame effect as new.

It has been pretty generally ſuppoſed, that cochineal owes its colour to the nopal on which it lives, the fruit of which is red. But M. Thieri de Menonville obſerves, that the juice which ſupplies it with nutriment is greeniſh; and that it can live and propagate its ſpecies on ſuch kinds of opuntia as do not bear red fruit.

The decoction of cochineal is of a crimſon colour, inclining to violet. A ſmall quantity of ſulphuric acid made this liquor aſſume a red colour, inclining to yellow, and a ſmall quantity of a beautiful red precipitate was formed. Muriatic acid produced nearly the ſame change in the colour, but no precipitate. Solution of tartar changed the liquor to a yellowiſh red. A little precipitate of a pale red colour formed ſlowly: the ſupernatant liquor remained yellow, but on pouring in a little alkali, it became purple. The ſmall quantity of precipitate was quickly diſſolved by the alkali, and the ſolution was purple. Solution of tin formed a roſe-coloured precipitate with the yellow liquor.

Solution of alum brightened the colour of the infuſion, and gave it a redder hue: a crimſon precipitate was formed, and the ſupernatant liquor retained a crimſon colour, ſomewhat reddiſh. Alum and tartar mixed, produced a brighter colour, more lively, and inclining to a yellowiſh red. A precipitate was formed, but much leſs abundant, and much more pale, than in the preceding experiment. Solution of tin produced a copious ſediment of a beautiful red. The liquor remaining above it was as clear as water, and ſuffered no change of colour on adding alkali.

Having poured in a ſolution of tartar, and after that, ſolution of tin, a precipitate of a roſe colour inclining to black was formed more quickly than in the foregoing experiment; and, though ſolution of tin in exceſs was added, the ſupernatant liquor remained a little yellow.

Solution of muriat of ſoda rendered the colour ſomewhat deeper, but did not make the liquor turbid. Ammoniacal muriat gave a purple tinge, without occaſioning any precipitate. Sulphat of ſoda produced no perceptible change in the liquor.

Having boiled a little cochineal with half its weight of tartar, the liquor was more inclining to red, and had a colour much leſs deep than that obtained from an equal quantity of cochineal without tartar: but the former gave a more abundant precipitate with ſolution of tin, and its colour was more roſy: ſo that tartar favours the ſolution of the colouring part of the cochineal: for, though the colour of the ſolution is leſs deep, the precipitate produced from it by ſolution of tin, is of a deeper and more roſy hue. This experiment deſerves notice, in judging of the influence of tartar in dyeing ſcarlet.

Sulphat of iron formed a brown violet precipitate. The ſupernatant liquor remained clear, with a tinge of feuillemort. Sulphat of zinc formed a deep violet precipitate. The ſupernatant liquor remained clear and colourleſs. Acetite of lead produced a purple violet precipitate, leſs deep than the preceding. The ſupernatant liquor remained limpid. Sulphat of copper produced a violet ſediment, which formed ſlowly. The liquor remained clear, and of a violet colour.

If the extract which decoction of cochineal affords on evaporation be digeſted in alcohol, the colouring part diſſolves, and leaves a reſiduum of the colour of wine-lees, of which freſh alcohol cannot deprive it. This reſiduum, analyzed by fire, affords the common products of animal ſubſtances.

The alcohol of cochineal, leaves, on evaporation, a tranſparent reſiduum of a deep red, which, when dry, has the appearance of a reſin. This alſo, if diſtilled, yields the products of animal ſubſtances; which ſhews, that the colouring matter is an animal production.

Yet the decoction of cochineal does not eaſily putrefy, as ſome was kept more than two months, both in an open veſſel and in a bottle corked. At the end of that time, the former ſhewed no ſigns of putrefaction: the latter had a ſlight putrid ſmell. The firſt grew turbid in a few days, and left a brown violet ſediment on the filter: the ſecond preſerved its tranſparency a long time, and probably loſt it only from the effect of an incipient putrefaction, or rather of a ſlight combuſtion, produced by means of a little oxygen, probably united with the red particles of the cochineal. The colour of each had become crimſon: but that of the former was more weak, becauſe a greater part of the colouring matter had precipitated, in conſequence of the effects produced on it by the air, agreeably to the principles eſtabliſhed before.

M. Berthollet compared the coccinella ſylveſtris of Mexico, and ſome which had been cultivated at St. Domingo, and ſent over by Mr. Bruley, with the maſtique cochineal. The decoction of the ſylveſtris has the ſame hue as that of St. Domingo. This inclines more to crimſon than that of maſtique: but the precipitates obtained from it, either by ſolution of tin or by alum, are perfectly equal in colour to thoſe from the maſtique cochineal; and to theſe precipitates the ſtuffs with which they combine owe their colour.

To determine the proportion of colouring matter detained in decoctions of different cochineals, M. Berthollet employed oxygenated muriatic acid. Of each of the three cochineals above mentioned, he boiled an equal weight for an hour, rendering the circumſtances with regard to each as nearly ſimilar as poſſible. Having filtered the decoctions, he poured them into ſeparate graduated glaſs cylinders, and added to them oxygenated muriatic acid, from the ſame bottle, till they were all reduced to the ſame yellow hue. The quantities of acid which indicated the proportions of the colouring matter were found to be nearly as follows: for the cochineal of St. Domingo, eight; for the ſylveſtris, eleven; for the maſtique, eighteen.

It appears, then, that the cochineal of St. Domingo is not only greatly inferior to the maſtique, but even to the ſylveſtris of Mexico; and in fact it is much ſmaller and more downy; but theſe diſadvantages ought not to abate the zeal of thoſe who are engaged in its cultivation.

The obſervations of M. Thieri de Menonville have already proved, that the coccinella ſylveſtris loſes its down, and in-

creaſes in ſize, by a ſucceſſion of breeds carefully attended to, though at firſt he was obliged to uſe nopals not come to the proper growth. There is every reaſon to hope, therefore, that the St. Domingo cochineal may, by aſſiduous care, be brought to equal, or perhaps ſurpaſs, the ſylveſtris of Mexico: but ſhould it always remain inferior with reſpect to the quantity of its colouring matter, this would be by no means a ſufficient reaſon to neglect a ſubſtance ſo valuable in dyeing.

It has been ſeen, that the cochineal of St. Domingo is not inferior to the maſtique, as to the quality of its colour. If then the down with which it is covered prove detrimental, in operations on a large ſcale, to the beauty of ſcarlet, the luſtre of which is ſo eaſily injured, it might be advantageouſly employed either for ſcarlet in half grain or for crimſon, and other ſhades which are leſs delicate than that, which is the brighteſt of all colours.

To form an idea of the utility of which cochineal may be to St. Domingo, poſſeſſed of ſo many rich productions, is difficult. M. Thieri de Menonville conſiders it as a valuable reſource for thoſe parts of the iſland, the unfruitful ſoil of which is not adapted to the other produce; and for thoſe coloniſts who are unable to ſupport the expence attending the cultivation of other crops. Mr. Brulcy ſpeaks ſtill more favourably of the advantages to be expected from the culture of cochineal: but the Cercle des Philadelphes is more reſerved, and thinks, that the point is not yet to be decided upon.

The attempts that have been made deſerve ſo much the more to be purſued and encouraged, as they have for their object an important branch of commerce, and as enlightened induſtry has great advantages over ignorant indolence, it will be found leſs difficult perhaps to naturalize cochineal, at leaſt in hot countries, than it was to naturalize ſilk-worms.

A diſtinguiſhing characteriſtic between cochineal and madder, may be obſerved in the manner in which they are acted on by reagents. Both receive a yellow colour from acids: but if the colouring matter of cochineal be ſeparated by a ſubſtance which precipitates it from the acid liquor, it reappears, with its natural colour little altered; whilſt that of madder, treated in the ſame manner, retains a yellow or fawn tinge. Hence mordants abounding in acid, as ſolution of tin, are much more ſucceſsfully employed with cochineal than with madder. The cauſe of this probably is, that the colouring matter of madder united with oxyd of tin retains a portion of acid, whilſt that of cochineal combined with it retains none, or a much ſmaller quantity.

COCKER, a river which riſes in the S. of Cumberland, and flowing through the lakes of Buttermere, Cromack-water, and Lowes-water, joins the Derwent, below Cockermouth.

CODOGNO, a town of Italy, in the ducny of Milan, near the confluence of the Adda and Po, 33 miles E. of Pavia. Long. 10. 49. E. Lat. 45. 6. N.

COGGESHAL, a town in Eſſex, with a market on Saturday. It is ſeated on the river Blackwater, and has a manufactory of bays. It is 43 miles E.N.E. of London. Long. 0. 47. E. Lat. 51. 52. N.

COGNATE, in Scots law, any male relation through the mother.

COGNITIONIS CAUSA, in Scots law. When a creditor charges the heir of his debtor to enter, in order to conſtitute the debt againſt him, and the heir renounces the ſucceſſion, the creditor can obtain no decreet of conſtitution of that debt againſt the heir; but only a decreet ſubjecting the *hæreditas jacens*, or the eſtate which belonged to the debtor, to his diligence: and this is called a decreet *cognitionis cauſa*.

COHESION (*Encycl.*). This power was firſt conſidered by Sir Iſaac Newton as one of the properties eſſential to all matter, and the cauſe of all that variety we obſerve in the texture of different terreſtrial bodies. He did not, however, abſolutely determine that the power of coheſion was an immaterial one; but thought it might poſſibly ariſe, as well as that of gravitation, from the action of an ether. His account of the original conſtitution of matter is as follows: "It ſeems probable, that God in the beginning formed *matter* in ſolid, maſſy, impenetrable, moveable particles; of ſuch ſizes, figures, and other properties, and in ſuch proportion to ſpace, as moſt conduced to the end for which he formed them: and that theſe primitive particles being ſolid, are incomparably harder than any porous bodies compoſed of them; even ſo very hard as never to wear or break in pieces; no ordinary power being able to divide what God himſelf made one at the firſt creation. While the particles continue entire, they may compoſe bodies of one and the ſame nature and texture in all ages; but ſhould they wear away, or break in pieces, the nature of all things depending on them would be changed, Water and earth compoſed of old worn particles and fragments of particles, would not now be of the ſame texture with water and earth compoſed of entire particles in the beginning. And therefore, that nature may be laſting, the changes of corporeal things are to be placed in the various ſeparations and new aſſociations and motions of theſe permanent particles; compound bodies being apt to break, not in the midſt of ſolid particles, but where theſe particles are laid together and touch in a few points." It ſeems further, "That theſe particles have not only a *vis inertiæ*, accompanied with ſuch paſſive laws of motion as naturally reſult from that force; but alſo that they are moved by certain active principles, ſuch as that of gravity, and that which cauſeth fermentation and the coheſion of bodies. Theſe principles are to be conſidered not as occult qualities, ſuppoſed to reſult from the ſpecific forms of things, but as general laws of nature by which the things themſelves are formed; their truth appearing to us by phenomena, though their cauſe is not yet diſcovered."

The general law of nature, by which all the different bodies in the univerſe are compoſed, according to Sir Iſaac Newton, is that of attraction: *i. e.* "Every particle of matter has an attractive force, or a tendency to every other particle; which power is ſtrongeſt in the point of contact, and ſuddenly decreaſes, inſomuch that it acts no more at the leaſt ſenſible diſtance, and at a greater diſtance is converted into a repellent force, whereby the parts fly from each other. On this principle of attraction may we account for the coheſion of bodies, otherwiſe inexplicable.

"The ſmalleſt particles may cohere by the ſtrongeſt attractions, and compoſe bigger particles of weaker virtue; and many of theſe may cohere, and compoſe bigger particles, whoſe virtue is ſtill leſs; and ſo on for divers ſucceſſions, until the progreſſion end in the biggeſt particles, on which the operations in chemiſtry, and the colours of natural bodies, depend; and which, by cohering, compoſe bodies of a ſenſible magnitude. If the body is compact, and bends or yields inward to preſſure without any ſliding of its parts, it is hard and elaſtic; returning to its figure with a force ariſing from the mutual attraction of its parts. If the parts ſlide from one another, the body is malleable or ſoft. If they ſlip eaſily, and are of a fit ſize to be agitated by heat, and the heat is great enough to keep them in agitation, the body is fluid; and if it be apt to ſtick to things, it is humid; and the drops of every fluid affect a round figure by the mutual attractions of their parts, as the globe of the earth and ſea affects a round figure from the mutual attraction and gravity of its parts.

"Since metals diſſolved in acids attract but a ſmall quantity of the acid, their attractive force reaches but to a ſmall diſtance. Now, as in algebra, where affirmative quantities ceaſe, there negative ones begin; ſo in mechanics, where attraction ceaſes, there a repulſive virtue muſt ſucceed. That there really is ſuch a virtue ſeems to follow from the reflec-

tions and inflections of the rays of light; the rays being repelled by bodies in both theſe caſes without the immediate contact of the reflecting or inflecting body. The ſame thing ſeems alſo to follow from the emiſſion of light; a ray, as ſoon as ſhaken from off a body by the vibrating motion of the parts of the body, and got beyond the reach of attraction, being driven away with exceeding great velocity: for that force which is ſufficient to turn it back in reflection may be ſufficient to emit it. From the ſame repelling power it ſeems to be that flies walk upon the water without wetting their feet; that the object-glaſſes of long teleſcopes lie upon one another without touching; and that dry powders are difficultly made to touch one another ſo as to ſtick together, without melting them or wetting them with water, which, by exhaling, may bring them together.

"The particles of all hard homogeneous bodies which touch one another, cohere with a great force: to account for which, ſome philoſophers have recourſe to a kind of hooked atoms, which in effect is nothing elſe but to beg the queſtion. Others imagine, that the particles of bodies are connected by the reſt, *i. e.* in effect by nothing at all; and others, by conſpiring motions, *i. e.* by a relative reſt among themſelves. For myſelf, it rather appears to me, that the particles of bodies *cohere* by an *attractive force*, whereby they tend mutually to each other."

From this account of the formation and conſtitution of bodies, we can conclude nothing, except that they are compoſed of an infinite number of little particles, kept together by a *force* or power; but of what nature that power is, whether material or immaterial, we muſt remain ignorant till further experiments are made. Some of the Newtonian philoſophers, however, have poſitively determined theſe powers to be *immaterial*. In conſequence of this ſuppoſition, they have ſo refined upon attractions and repulſions, that their ſyſtems ſeem not far from downright ſcepticiſm, or denying the exiſtence of matter altogether. A ſyſtem of this kind we find adopted by Dr. Prieſtley, from Meſſrs. Boſcovich and Michell, in order to ſolve ſome difficulties concerning the Newtonian doctrine of light. "The eaſieſt method (ſays he) of ſolving all difficulties, is to adopt the hypotheſis of Mr. Boſcovich, who ſuppoſes that matter is not impenetrable, as has been perhaps univerſally taken for granted; but that it conſiſts of phyſical points only, endued with powers of attraction and repulſion in the ſame manner as ſolid matter is generally ſuppoſed to be: provided therefore that any body move with a ſufficient degree of velocity, or have a ſufficient *momentum* to overcome any powers of repulſion that it may meet with, it will find no difficulty in making its way through any body whatever; for nothing elſe will penetrate one another but *powers*, ſuch as we know do in fact exiſt in the ſame place, and counterbalance or over-rule one another. The moſt obvious difficulty, and indeed almoſt the only one that attends this hypotheſis, as it ſuppoſes the mutual penetrability of matter, ariſes from the idea of the nature of matter, and the difficulty we meet with in attempting to force two bodies into the ſame place. But it is demonſtrable that the firſt obſtruction ariſes from no actual contact of matter, but from mere powers of repulſion. This difficulty we can overcome; and having got within one ſphere of repulſion, we fancy that we are now impeded by the ſolid matter itſelf. But the very ſame is the opinion of the generality of mankind with reſpect to the firſt obſtruction. Why, therefore, may not the next be only another ſphere of repulſion, which may only require a greater force than we can apply to overcome it, without diſordering the arrangement of the conſtituent particles; but which may be overcome by a body moving with the amazing velocity of light.

"This ſcheme of the *immateriality of matter*, as it may be called, or rather the *mutual penetration of matter*, firſt occurred to Mr. Mitchell on reading *Baxter on the immateriality of the ſoul*. He found that this author's idea of matter was, that it conſiſted as it were of bricks cemented together with immaterial mortar. Theſe bricks, if he would be conſiſtent with his own reaſoning, were again compoſed of leſs bricks, cemented likewiſe by an immaterial mortar; and ſo on *ad infinitum*. This putting Mr. Mitchell upon the conſideration of the ſeveral appearances of nature, he began to perceive that the bricks were ſo covered with this immaterial mortar, that if they had any exiſtence at all, it could not poſſibly be perceived: every effect being produced, in nine inſtances of ten certainly, and probably in the tenth alſo, by this immaterial, ſpiritual, and penetrable mortar. Inſtead therefore of placing the world upon the giant, the giant upon the tortoiſe, and the tortoiſe upon he could not tell what, he placed the world upon itſelf."

Other philoſophers have ſuppoſed the powers both of gravitation and coheſion to be material; and to be only different actions of the etherial fluid, or elementary fire. In ſupport of this it hath been urged, that before we have recourſe to a ſpiritual and immaterial power as the cauſe of any natural phenomenon, we ought to be well aſſured that there is no material ſubſtance with which we are acquainted, that is capable of producing ſuch effects. In the preſent caſe, we are ſo far from having ſuch aſſurance, that the contrary is manifeſt to our ſenſes. One inſtance of this is in the experiment with the *Magdeburg hemiſpheres*, as they are called. Theſe are two hollow hemiſpheres of braſs, exactly fitted to one another, ſo as to form one globe when joined together, without admitting any air at the joining. In this ſtate, if the air within them is exhauſted by means of a pump, they will cohere with ſuch force, if they are five or ſix inches diameter, as to require a weight of ſome hundreds of pounds to ſeparate them. The preſſure of the atmoſphere, we ſee, is in this caſe capable of producing a very ſtrong coheſion: and if there is in nature any fluid more penetrating, as well as more powerful in its effects, than the air we breathe, it is poſſible that what is called the *attraction of coheſion* may ſomehow or other be an effect of the action of that fluid. Such a fluid as this is the element of fire. Its activity is ſuch as to penetrate all bodies whatever: and in the ſtate in which it is commonly called *fire*, it acts according to the quantity of ſolid matter contained in the body. In this ſtate, it is capable of diſſolving the ſtrongeſt coheſions obſerved in nature: but whatever is capable of diſſolving any coheſion, muſt neceſſarily be endued with greater power than that by which the coheſion is cauſed. Fire, therefore, being able to diſſolve coheſions, muſt alſo be capable of cauſing them, provided its power is exerted for that purpoſe. Nor will it ſeem at all ſtrange that this fluid ſhould act in two ſuch oppoſite ways, when we conſider the different appearances which it aſſumes. Theſe are three, *viz.* fire, or heat, in which it conſumes, deſtroys, and diſſolves: light, in which it ſeems deprived of all deſtructive or diſſolvent power, and to be the moſt mild, quiet, and placid being in nature. The third ſtate of this element is, when it becomes what is called the *electric fluid*; and then it attracts, repels, and moves bodies, in a vaſt variety of ways, without either burning or rendering them viſible by its light. In this ſtate it is not leſs powerful than in either of the other two; for a violent ſhock of electricity will diſplace and tear in pieces the moſt heavy and ſolid bodies. The ſeeming capricious nature of this fluid, however, probably renders it leſs ſuſpected as the cauſe of coheſion, than it otherwiſe would be, were the attractions regular and permanent, which we obſerve it to occaſion. But here we muſt obſerve, that the fluid has an exiſtence in all bodies before the experiments are tried

which make its effects visible to us, and was acting in them according to its settled and established laws. While acting in this manner it was perfectly invisible; and all we can do is, to produce some little infringement of these regular laws according to which it commonly acts. In some cases, however, the electrical attractions produced by art are found to be pretty permanent and strong. Thus, Mr. Symmer, in some experiments with silk stockings, found their attraction so strong, that it required upwards of 15 pounds weight to separate them from each other; and this attraction would continue for more than an hour. In plates of glass, too, he observed a remarkable cohesion when electrified. In the Philosophical Transactions for 1777, we find this hypothesis taken notice of, and in some measure adopted, by Mr. Henly. "Some gentlemen (says he) have supposed that the electric matter is the cause of the cohesion of the particles of bodies. If the electric matter be, as I suspect, a real elementary fire inherent in all bodies, that opinion may probably be well founded: and perhaps the soldering of metals, and the cementation of iron, by fire, may be considered as strong proofs of the truth of their hypothesis."

On this last hypothesis we must observe, that if the electric or any other fluid is supposed to be the cause of the attraction of cohesion universally, the particles of that fluid must be destitute of all cohesion between themselves; otherwise we should be at as great a loss to account for the cohesion of these particles, as for that of terrestrial matter. Philosophers, indeed, do not suppose any cohesion between the particles of the electric fluid themselves; it is generally believed that the particles of this fluid are repulsive of one another, though attracted by all other matter. If this is a fact, we cannot suppose the electric fluid to be the cause of cohesion. The probability or improbability of the hypothesis just mentioned must greatly depend on its being ascertained whether the particles of the electric fluid do really repel one another, and attract all other kinds of matter, or not; but for this we must refer to the article ELECTRICITY.

COIMBETTORE, a province and town of the peninsula of Hindoostan, in the kingdom of Mysore. It was taken by General Meadows, January 22, 1790, but retaken by a detachment of Tippoo Sultan's army, in October 1791, and confirmed to him by the peace of 1792. It is 100 miles S. by E. of Seringapatam. Long. 77. 10. E. Lat. 10. 5. N.

COIN (*Encycl.*), differs from money as the species from the genus. Money is any matter, whether metal, wood, leather, glass, horn, paper, fruits, shells, or kernels, which have currency as a medium in commerce. Coin is a particular species, always made of metal, and struck according to a certain process called coining.

The precise epocha of the invention of money is too ancient for our annals; and, if we might argue from the necessity and obviousness of the thing, must be nearly coëval with the world.

Whether coins be of equal antiquity, may admit of some doubt; especially as most of the ancient writers are so frequent and express in their mention of leathern-moneys, paper-moneys, wooden-moneys, &c. Some, however, notwithstanding this, are of opinion, that the first moneys were of metal: the reasons they give, are the firmness, neatness, cleanliness, durableness, and universality of metals; which, however, do rather conclude they ought to have been so, than that they actually were so.

In effect, the very commodities themselves were the first moneys, *i. e.* were current for one another by way of exchange; and it was the difficulty of cutting or dividing certain commodities, and the impossibility of doing it without great loss, that first put men on the expedient of a general medium. See EXCHANGE.

COLDING, a town of Denmark, in North Jutland, remarkable for its bridge, over which all the oxen and cattle pass, that go from Jutland into Holstein, and they pay a small toll. Here is a royal palace, containing a magnificent suite of 190 rooms, which have not been furnished since the time of Frederic III. The harbour is two miles in circumference, and deep enough for ships of the largest burthen. Colding, which is situated at the extremity of a bay of the Little Belt, is fifty miles S. by E. of Wiburg. Long. 10. 15. E. Lat. 55. 35. N.

COLDINGHAM, a barren heathy moor on the borders of Scotland. It is only remarkable for a convent formerly filled with most heroic nuns; who, to preserve themselves inviolate from the Danes, cut off their lips and noses; and thus rendering themselves objects of horror, were, with their Abbess Ebba, in 870, burnt in the monastery by the disappointed savages.

COLDSTREAM, a small market-town, on the Tweed (over which is a handsome bridge), in the county of Berwick, in Scotland. It had a famous monastery; and here General Monk raised the two battalions, now known by the name of the Coldstream Regiment of Guards. Long. 2. 5. W. Lat. 55. 36. N.

COLEBROOK DALE, on the banks of the Severn, in Shropshire, is a winding glen, between two vast hills, which break into various forms, being all thickly covered, and forming beautiful sheets of hanging woods. Here are the most considerable iron works in England. "The noise of the forges, mills, &c." says Mr. Young, "with all their vast machinery, the flames bursting from the furnaces, with the burning of coal, and the smoke of the limekilns, are altogether horribly sublime." Two bridges entirely made of cast-iron, which have been thrown over the Severn, give these scenes a still nearer resemblance to the ideas in romance. There is also, in the dale, a remarkable spring of fossil tar, or petroleum, which has yielded a vast quantity of that substance; but it is now much diminished. A work, for obtaining a similar kind of tar, from the condensed smoke of pit-coal, has been erected in the dale.

COLES (Elisha), author of the well-known Latin and English dictionary, was born in Northamptonshire about the year 1640; and was entered at Magdalen College, Oxford, which he left without taking a degree; and taught Latin to young people, and English to foreigners, in London, about the year 1663. He afterwards became an usher in Merchant-taylors' school; but for some great fault, no-where expressly mentioned, he was forced to withdraw to Ireland, from whence he never returned. He was, however, a good critic in the English and Latin tongues; and wrote several useful books of instruction in his profession.

COLESHILL, a town in Warwickshire, with a market on Wednesday. It is seated on the side of a hill, on the Coln, over which is a stone bridge. It is eleven miles N.W. of Coventry. Long. 1. 35. W. Lat. 52. 32. N.

COLESHILL, a village four miles W. of Rickmansworth, in Herts, and in a part of that county which is insulated in Bucks. It was the birth-place of the poet Waller.

COLFORD, a town of Gloucestershire, with a market on Tuesday. It is fourteen miles N. of Hereford. Long. 2. 40. W. Lat. 51. 48. N.

COLIGNI (Gaspard de), admiral of France, was born in 1516. He signalised himself in his youth, in the reigns of Francis I. and Henry II. and was made colonel of infantry and admiral of France in 1552. Henry II. employed him in the most important affairs; but after the death of that prince he embraced the reformed religion, and became the chief of the Protestant party: he strongly opposed the house of Guise,

and rendered this oppoſition ſo powerful, that it was thought he would have overturned the French government. On the peace made after the battles of Jarnac and Montcontour, Charles IX. deluded Coligni into ſecurity by his deceitful favours; and though he recovered one attempt on his life, when he attended the nuptials of the prince of Navarre, yet he was included in the dreadful maſſacre of the Proteſtants on St. Bartholomew's-day 1572, and his body treated with wanton brutality by a miſguided Popiſh populace.

COLLE, an epiſcopal town of Italy, in Tuſcany, ten miles N.W. of Sienna. Long. 11. 7 E. Lat. 43. 16. N.

COLLEGE (*Encycl.*). To the account of different colleges given in our original article, we have to add that of the

Veterinary College, the eſtabliſhment of which does honour to the preſent reign, reflects infinite credit on its patrons, and certainly merits the ſanction and ſupport which have been ſo liberally conferred upon it.

This college was founded in 1792, for the medical cure and treatment of horſes, and for the purpoſe of inſtructing pupils in veterinary medicinē and ſurgery.

Mr. St. Bel, an ingenious Veterinarian, who had diſtinguiſhed himſelf in France by his ſkill in the veterinary art, was appointed profeſſor, and the inſtitution was under the direction of a preſident and twenty-four governors, choſen from the nobility and gentlemen who were zealous in promoting ſo beneficial a plan. A forge and ſtabling for fifty horſes, with every convenience, were built at Pancras, about two miles on the north ſide of London. A handſome theatre was alſo erected, with a muſeum and diſſecting rooms for the purpoſe of giving lectures to the pupils, and teaching them practical anatomy. A medical committee of aſſiſtance was appointed, who undertook to examine the pupils, and grant them certificates when they had acquired ſufficient knowledge of the art, to enable them to practiſe it with ſucceſs.

The liberal ſupport afforded the inſtitution by the anatomical and medical profeſſors of London, does them great honour, and cannot be too warmly acknowledged by the pupils: they generouſly allow them to attend their lectures gratis, from which their progreſs is conſiderably promoted, and their knowledge greatly improved. The following is the preſent liſt of the committee who examine the pupils after their veterinary education is finiſhed, and alſo ſuggeſt or ſuperintend the experiments made at the college for the improvement of the art.

Dr. Fordyce	Dr. Baillie	Mr. Home
Mr. Cline	Mr. Abernethy	Mr. Houlſton
Mr. Cooper	Dr. Babington	and Dr. Relph.

M. St. Bel died ſoon after the college had been eſtabliſhed, and was ſucceeded by Mr. Coleman, who has greatly contributed to the improvement of the art, by his extenſive knowledge of anatomy and phyſiology, as well as by his attention to the pupils.

An annual ſubſcriber of two guineas has the privilege of ſending two horſes to the college when ſick or lame, where they receive every medical aſſiſtance that may be required, the proprietor paying only for keep. By paying twenty guineas at once, this advantage is made perpetual. For ſeveral years parliament has annually contributed to the ſupport of this inſtitution, and his majeſty has been pleaſed to grant commiſſions in the army to thoſe who qualify themſelves in the art, which has tended very materially to its promotion, as well as to render it reſpectable.

A conſiderable number of veterinary ſurgeons have been examined and approved of by the medical committee, who have granted to each a regular *diploma*, under which they now practiſe in different parts of the kingdom.

College *of Surgeons, London.* The Incorporated Company of Surgeons having by an accident loſt their charter, the different members were, in 1800, after ſome ſtruggles with an aſſociated body of ſurgeons practiſing pharmacy, re-united by a new charter, under the title of the *Royal College of Surgeons in London.* The new eſtabliſhment, though in ſome reſpects an improvement of the old ſyſtem, has, nevertheleſs, ſome of the defects of the latter.

COLLIER (Jeremy), a learned Engliſh nonjuring divine, born in 1650, and educated in Caius College, Cambridge. He had firſt the ſmall rectory of Ampton, near St. Edmund's Bury, in Suffolk; which in ſix years he reſigned, to come to London, in 1685, where he was made lecturer of Gray's-Inn: but the change of government that followed, ſoon rendered the public exerciſe of his function impracticable. He was committed to Newgate for writing againſt the revolution; and again, for carrying on a correſpondence which that change of events made treaſonable; but was releaſed both times, without trial, by the intervention of friends. It is obſervable that he carried his ſcruples ſo far, as to prefer confinement to the tacit acknowledgment of the juriſdiction of the court by accepting his liberty upon bail. Suitably to theſe principles, he next acted a very extraordinary part with two other clergymen of his own way of thinking, at the execution of Sir John Friend and Sir William Perkins for the aſſaſſination plot; by giving them ſolemn abſolution, and by impoſition of hands: abſconding for which, he continued under an outlawry to the day of his death in 1726. Theſe proceedings having put a ſtop to his activity, he employed his retired hours rather more uſefully in literary works. In 1698 he attempted to reform our theatrical entertainments, by publiſhing his Short view of the immorality and profaneneſs of the Engliſh ſtage; which engaged him in a controverſy with the wits of the time: but as Mr. Collier defended his cenſures not only with wit, but with learning and reaſon, it is allowed that the decorum obſerved, for the moſt part, by ſucceeding dramatic writers, has been owing to his animadverſions. He next undertook a tranſlation of Moreri's great Hiſtorical and Geographical Dictionary; a work of extraordinary labour, and which appeared in 4 vols. folio. After this he publiſhed An Eccleſiaſtical Hiſtory of Great Britain, chiefly of England, in two vols. folio; which is allowed to be written with great judgment, and even with impartiality. He was beſides engaged in ſeveral controverſies, which his conduct and writing gave riſe to, not material to mention. In Queen Anne's reign, Mr. Collier was tempted, by offers of conſiderable preferment, to a ſubmiſſion; but, as he was a nonjuror upon principle, he could not be brought to liſten to any terms.

COLLINS (Anthony), a polemical writer, born at Helſten near Hounſlow in the county of Middleſex in 1676, was the ſon of Henry Collins, a gentlemen of about 1500l. a-year. He was firſt bred at Eaton College, and then went to King's College, Cambridge, where he had for his tutor Mr. Francis Hare, afterwards biſhop of Chicheſter. He was afterwards a ſtudent of the Temple; but not reliſhing the law, ſoon abandoned that ſtudy. He was an ingenious man, and author of ſeveral curious books. His firſt remarkable piece was publiſhed in 1707, An Eſſay concerning the Uſe of Reaſon in Propoſitions, the Evidence whereof depends on human Teſtimony. In 1702 he entered into the controverſy between Mr. Clark and Mr Dodwell, concerning the immortality of the ſoul. In 1713 he publiſhed his diſcourſe on free-thinking; which made a prodigious noiſe. In 1715 he retired into the county of Eſſex, and acted as a juſtice of peace and deputy lieutenant for the ſame county, as he had done before for that of Middleſex and liberty of Weſtminſter. The ſame year he publiſhed a Philoſophical Eſſay concerning human Liberty. In 1718 he was choſen treaſurer of the county

of Eſſex; and this office he diſcharged with great honour. In 1724 he publiſhed his Hiſtorical and critical Eſſay on the 39 Articles. Soon after, he publiſhed his Diſcourſe of the Grounds and Reaſons of the Chriſtian Religion; to which is prefixed An Apology for free Debate and Liberty of Writing; which piece was immediately attacked by a great number of writings. In 1726 appeared his Scheme of literal Prophecy conſidered, in a View of the Controverſy occaſioned by a late Book entitled, A Diſcourſe of the Grounds, &c. In this diſcourſe he mentions a MS. diſſertation of his to ſhew the Sibylline oracles to be a forgery made in the times of the primitive Chriſtians, who, for that reaſon, were called *Sibylliſts* by the Pagans; but it never appeared in print. His Scheme of literal Prophecy was replied to by ſeveral writers; and particularly by Dr. John Rogers in his Neceſſity of divine Revelation aſſerted. In anſwer to which, our author wrote A Letter to the Reverend Dr. Rogers, on Occaſion, &c. His health began to decline ſome years before his death, and he was very much afflicted with the ſtone, which at laſt put an end to his life at his houſe in Harley-ſquare in 1729. He was interred in Oxford chapel, where a monument was erected to him, with an epitaph in Latin. His curious library was open to all men of letters, to whom he readily communicated all the aſſiſtance in his power; he even furniſhed his antagoniſts with books to confute himſelf, and directed them how to give their arguments all the force of which they were capable. He was remarkably averſe to all indecency and obſcenity of diſcourſe; and was, independent of his ſcepticiſm, a ſincerely good man.

Collins (John), an eminent accountant and mathematician, born in 1624, and bred a bookſeller at Oxford. Beſides ſeveral treatiſes on practical ſubjects, he communicated ſome curious papers to the Royal Society, of which he was a member, which are to be found in the early numbers of their Philoſophical Tranſactions: and was the chief promoter of many other ſcientifical publications in his time. He died in 1683; and about twenty-five years after, all his papers coming into the hands of the learned William Jones, eſq. F. R S. it appeared that Mr. Collins held a conſtant correſpondence for many years with all the eminent mathematicians; and that many of the late diſcoveries in phyſical knowledge, if not actually made by him, were yet brought forth by his endeavours.

COLLINA (*Encycl.*), placed erroneouſly between the articles Collatina and Collation.

COLLUMPTON, a town of Devonſhire, with a market on Thurſday. It is ſeated on a river near the ſea, ten miles N. of Exeter, and 150 W. by S. of London. Long. 3. 29. W. Lat. 50. 54. N.

COLN, a river of Eſſex, which riſes near Clare in Suffolk, and paſſing by Halſtead and Colcheſter, empties itſelf into the German Ocean, between Merſey Iſland and the main land. In the ſalt-water inlets and pools, at the mouth of this river, are bred the famous Colcheſter oyſters.

Coln, a river which riſes near Sevenhampton in Glouceſterſhire, flows S.E. to Fairford, and falls into the Thames at Lechlade.

Coln, a river which riſes in Herts, and dividing Middleſex from Bucks, fall into the Thames above Staines.

COLOMB, St. a town in Cornwall, with a market on Thurſday. It is ſeated on a hill, at the bottom of which is a river, which falls into the ſea at a ſmall diſtance. It is ten miles W. of Bodmin. Long. 4. 52. W. Lat. 50. 30. N.

COLOMBOTZ, a caſtle of Turkey in Europe, in Bulgaria, on a hill, under which is the ſtrong paſs of Urania.

COLOOR, a diamond mine of the peninſula of Hindooſtan, near the fort of Condavir, in the Guntoor Circar.

COLUBER (*Encycl.*), erroneouſly ſpelt Colubeb.

COLUMBANUS (St.), a Latin poet, was born in Ireland in 560. He retired from the world, and lived a ſolitary life in the mountains of Wales for ſome years. He next went over to France and built a monaſtery; but, being exiled from that country, he travelled to Italy, where he founded the abbey of Bobio, and died in it in 615.

COLUMNA, a town of the Ruſſian empire, in the government of Moſcow, with an archbiſhop's ſee; fifty miles S.E. of Moſcow. Long 38. 25. E. Lat. 55. 5. N.

COMACHIO, an epiſcopal town of Italy, in the Ferrareſe. The air is bad, for which reaſon it is inhabited by a few fiſhermen only. It is twenty-ſeven miles S.E. of Ferrara. Long. 12. 10. E. Lat. 44. 45. N.

Comachio, a lake of the Ferrareſe, in Italy, between the two mouths of the river Po, and about ten miles in circumference; but dry in ſeveral places. On one ſide of this lake the town of the ſame name is built.

COMANA, a ſea-port of South America, the capital of New Andaluſia, in Terra Firma. It is defended by a ſtrong caſtle. Long. 64. 29. W. Lat. 10. 10. N.

COMANAGOTTA, a town of South America, in Terra Firma, ten miles W. of Comana. Long. 64. 40. W. Lat. 10. 10. N.

COMB-ABBEY, a village in Warwickſhire, three miles from Coventry, once famous for a rich abbey. The church is demoliſhed, but the abbey, with ſome modern improvements, is the ſeat of Lord Craven.

COMB-MARTIN, a town of Devonſhire, with a market on Tueſday. It is ſeated on the Briſtol Channel, where it has an inlet which runs through the town. It is ſeven miles E. of Ilfracombe. Long. 4. 2. W. Lat. 51. 13. N.

COMBER, or Cumber (Thomas), an eminent divine, born at Weſtram in Kent, in 1645, was educated at Cambridge; created doctor of divinity; and, after ſeveral preferments in the church, was made dean of Durham. He was chaplain to Anne princeſs of Denmark, and to King William and Queen Mary. He was author of ſeveral works, viz. 1. A ſcholaſtical Hiſtory of the primitive and general Uſe of Liturgies. 2. A Companion to the Altar. 3. A brief Diſcourſe upon the Offices of Baptiſm, Cathechiſm, and Confirmation. He died in 1699, aged fifty-five.

COMENIUS (John Amos), a grammarian and Proteſtant divine, born in Moravia in 1592. He was eminent for his deſign to introduce a new method of teaching languages; for which purpoſe he publiſhed ſome eſſays in 1616, and had prepared ſome others, when the Spaniards pillaged his library, after having taken the city of Fulnec, where he was miniſter and maſter of the ſchool. Comenius fled to Leſna, a city of Poland, and taught Latin there. The book he publiſhed in 1631, under the title of *Janua Linguarum reſerata*, gained him a prodigious reputation, inſomuch that he was offered a commiſſion for regulating all the ſchools in Poland. The parliament of England deſired his aſſiſtance to regulate the ſchools in that kingdom. He arrived at London in 1641; and would have been received by a committee to hear his plan, had not the parliament been taken up with other matters. He therefore went to Sweden, being invited by a generous patron, who ſettled a ſtipend upon him that delivered him from the fatigues of teaching; and now he employed himſelf wholly in diſcovering general methods for thoſe who inſtructed youth. In 1657 he publiſhed the different parts of his new method of teaching. He was not only taken up with the reformation of ſchools, but he alſo filled his brain with prophecies, the fall of Antichriſt, Millenium, &c. At laſt Comenius took it into his head to addreſs Lewis XIV. of France, and to ſend him a copy of the prophecies of Drabicius; inſinuating that it was to this monarch God promiſed the empire of the world. He

became ſenſible at laſt of the vanity of his labours, and died in 1671.

COMETEAU (*Encycl.*). Erroneouſly ſpelt COMETEAN.

COMO, the largeſt lake in Italy, in the duchy of Milan. It is 88 miles in circumference, but is not above ſix miles over in any one part.

COMMANDINUS (Frederie), born at Urbino in Italy, and deſcended from a very noble family, in the 16th century. To a vaſt ſkill in the mathematies, he had added a great knowledge in the Greek tongue, by which he was well qualified to tranſlate the Greek mathematieians into Latin. Aecordingly he tranſlated and publiſhed ſeveral, which no writer till then had attempted; as Arehimedes, Apollonius, Euclid, &c.

COMMISSARY-COURT, in Scotland, a court originally conſtituted by the biſhops for executing in their name an uſurped juriſdiction; and was aneiently called the biſhop's-court, *curia Chriſtianitatis*, or conſiſtorial court. This court was modelled by Queen Mary at the reformation, and continues to this day.

COMMIXTION, in Scots law, is a method of aequiring property, by mixing or blending together different ſubſtances belonging to different proprietors.

COMMODIANUS (Gazæus), a Chriſtian author in the 4th century, who wrote a work in Latin verſe, entitled Inſtructions; the moral of whieh is excellent, but the verſe extremely heavy. M. Davies publiſhed a fine edition of it, in 1711, at the end of Minueius Felix.

COMMONTY, in Scots law, ſometimes ſignifies land belonging to two or more eommon proprietors; ſometimes a heath or muir though it ſhould belong in property to one, if there has been a promiſeuous poſſeſſion upon it by paſturage; and the act in 1695 mentions eommonties belonging in property to the king and the royal boroughs.

COMNENA (Ann) (*Encycl.*). Erroneouſly ſpelt COMMENA.

COMPIEGNE, a handſome town of France, in the department of Oiſe and late provinee of the Iſle of Franee. It is ſeated near an extenſive foreſt, at the confluenee of the Aiſne and Oiſe. Here is a palace, in whieh the kings of Franee often reſided. The Maid of Orleans was taken priſoner here in 1430. It is 45 miles N.E. of Paris. Long. 2. 55. E. Lat. 49. 25. N.

CONANT (Dr. John), a learned Engliſh divine, born in 1608. He took his degrees at Exeter College, Oxford; was, by the parliament, conſtituted one of the aſſembly of divines, though he ſeldom, if ever, ſat with them; and in 1657 was admitted vice-ehancellor of the univerſity. On the reſtoration he was one of the commiſſioners, and aſſiſted at the conferences in the Savoy: but was deprived by the act of uniformity: after eight years he was confirmed, and was made arch-deaeon of Norwich, and prebendary of Woreeſter. In 1686 he loſt his ſight; and died in 1693; leaving a number of admired ſermons, afterwards publiſhed in ſix volumes.

CONCAN, a low tract of country, on the W. eoaſt of the Deccan of Hindooſtan. From this tract riſes abruptly that ſtupendous wall of mountains ealled the Gauts. It is ſubject to the Mahrattas, and lies between 15° and 20° N. lat.

CONCATENATION, a term chiefly uſed in ſpeaking of the mutual dependence of ſecond eauſes upon each other.

CONDAVIR, a fort in the peninſula of Hindooſtan, the principal poſt of Guntoor, one of the five Northern Circars. It is ſtrongly ſituated on a mountain, 16 miles W. of Guntoor, and 20 from the S. bank of the Kiſtna.

CONDECEDO, a cape of North America, in Yueatan, 100 miles W. of Merida. Long. 91. 27. W. Lat. 20. 50. N.

CONDORE, the eapital of a number of iſlands, in the Indian Ocean, which lie in S. 40. N. lat. 60 miles S. by E. from the mouth of the river Cambodia. The mangoes grow on trees, as large as apple-trees: the fruit is of the ſize of a ſmall peach, and when ripe, has a pleaſant ſmell and taſte. Pickled mangoes are now well known in England. The inhabitants are ſmall in ſtature, well ſhaped, and of a dark olive complexion; their faces are long, with blaek ſtraight hair, ſmall blaek eyes, high noſes, thin lips, white teeth, and little mouths. They are very poor, and their ehief employment is getting tar out of the trees. When any ſhips arrive, they will bring their women on board and offer them to the ſailors. They have a little idol temple, built of wood, and thateh̃ed like their houſes, which are very mean. The Engliſh Eaſt-India eompany had a ſettlement here in 1702; but the faetors falling out with the natives, moſt of them were murdered, and the reſt driven thence in 1705. Long. 117. 26. E. Lat. 2. 40. N.

CONEOLENS, a town of France, in the department of Charente, and late province of Angoumois, on the river Vienne, 30 miles N.E. of Angouleſme. Long. 0. 43. E. Lat. 46. 55. N.

CONFUSION *of Tongues*. By this phraſe is generally underſtood that miraculous interpoſition of the Deity mentioned in the book of Geneſis, to cauſe mankind to deſiſt from their attempt to built the tower of Babel, and to make them ſeparate, and divide themſelves into different nations.

It hath been much diſputed whether there were more languages than one before the flood; and many arguments have been addueed by learned men on both ſides. This queſtion, however, it is eaſy to ſee, ean never be determined; but whether it was ſo or not, it is plain there muſt have been but one for ſome time after the flood, as all mankind were deſeended from one family. As to the confuſion of tongues and diſperſion of mankind, it is an event mentioned by profane as well as the ſacred hiſtorians. They write that mankind uſed one and the ſame language till the overthrow of the tower of Babylon; at which time a multiplieity of tongues was introdueed by the gods: whereupon wars enſued, and thoſe whoſe ſpeeeh happened to be intellible to one another, joined eompany, and ſeized the eountries they ehanced to light upon.

With regard to the manner, however, in which this confuſion was effected, there is a great variety of ſentiments. Several learned men, prepoſſeſſed with an opinion that all the different idioms now in the world did at firſt ariſe from one primitive language to whieh they may be reduced, and that the variety whieh we find among them is no other than what muſt naturally have taken place in ſo long courſe of time, have thenee been indueed to believe that there were no new languages formed at the confuſion, but that the moſt that was done at that time was only to ſet the builders of Babel at variance with one another by creating a miſunderſtanding among them. This ſome imagine to have been effected without any immediate influenee on their language; which ſeems contrary to the words and obvious intention of the ſaered hiſtorian. Others have imagined it brought about by a temporary confuſion of their ſpeeeh, or rather of their apprehenſions, cauſing them, while they continued together, and ſpake the ſame language, yet to underſtand the words differently. A third opinion is, that a variety of inflexions was introduced, and perhaps ſome new words, which diſturbed and perverted the former manner of expreſſion. But this, though it might oceaſion different dialects, yet could not ereate new languages; and ſeems not to anſwer the intention of Moſes, which was to inform us not only how mankind were at firſt diſperſed into ſo many nations, but to aecount for their different languages; a thing very difficult if not impoſſible to be done, without having reeourſe to the immediate interpoſition of divine power. For though time, intercourſe with foreign nations, commerce, the

invention and improvement of arts and ſciences, and the difference of climates, cauſe very conſiderable alteration in languages, yet the utmoſt effect we can imagine them to have will not come up to the point in queſtion. Upon the whole, therefore, it ſeems moſt probable, that on the confuſion at Babel there were new languages formed; and that theſe languages were the roots of all others that are, that have been, or that will be ſpoken while the world remains.

In what manner theſe new languages were formed, is a matter not eaſy to be determined. From the manner in which this event is related by Moſes, ſome have concluded that God effected it by immediately inducing an oblivion of their former tongue, and inſtantaneouſly infuſing others into their minds. The Jews imagined this to be done by the miniſtry of angels, 70 of whom deſcended with God, and were each of them ſet over a nation, to whom they taught a peculiar language; but that the anceſtors of the Jewiſh nation retained the primitive language. Others have ſuppoſed, that God did no more than cauſe them to forget their old language, leaving them to form new ones in the beſt manner they could: but this muſt have taken up ſome time, and could but ill have anſwered the neceſſities of mankind; and the way in which Moſes expreſſes himſelf ſeems to imply that it was done inſtantaneouſly.

As to the number of different languages formed at this time, we are no leſs in the dark than as to the manner in which they were formed. It is moſt probable, that the languages of the chief families were fundamentally different from each other, and that the ſub-languages or dialects within each branch, for the ſake of immediate intercourſe, had a mutual affinity, ſome more, and ſome leſs, according as they ſettled nearer or further from each other; which was ſufficient to bring about the deſigns of God, divide mankind into diſtinct ſocieties, and open a new ſcene of Providence, by which his wiſdom might diſplay itſelf in the government of the world.

CONGLETON, a town of Cheſhire, with a market on Saturday. It is ſeated on the river Dane, and a large mayor town, though it has nothing but a chapel of eaſe, the church being two miles diſtant. It has a manufactory of leather gloves; and a more conſiderable one in ſilk, there being a large ſilk-mill, which employs 700 hands. It is ſeven miles from Macclesfield, and 164 N.W. of London. Long. 2. 10. W. Lat. 53. 8. N.

CONGRUITY (*Encycl.*). In order to give a full view of the ſecondary relations, ſpoken of in our original article, we ſhall trace them through ſome of the moſt conſiderable primary relations. The relation of a part to the whole, being extremely intimate, demands the utmoſt degree of congruity; even the ſlighteſt deviation is diſguſtful.

Examples of congruity and incongruity are furniſhed in plenty by the relation between a ſubject and its ornaments. A literary performance intended merely for amuſement, is ſuſceptible of much ornament, as well as a muſic-room or a play-houſe; for in gaiety, the mind hath a peculiar reliſh for ſhow and decoration. The moſt gorgeous apparel, however improper in tragedy, is not unſuitable to opera-actors: the truth is, an opera, in its preſent form, is a mighty fine thing; but as it deviates from nature in its capital circumſtances, we look not for nature or propriety in thoſe which are acceſſory. On the other hand, a ſerious and important ſubject admits not much ornament; nor a ſubject that of itſelf is extremely beautiful: and a ſubject that fills the mind with its loftineſs and grandeur, appears beſt in a dreſs altogether plain.

To a perſon of a mean appearance, gorgeous apparel is unſuitable; which beſides the incongruity has a bad effect; or by contraſt it ſhews the meanneſs of appearance in the ſtrongeſt light. Sweetneſs of look and manner, requires ſimplicity of dreſs, joined with the greateſt elegance. A ſtately and majeſtic air requires ſumptuous apparel, which ought not to be gaudy, nor crowded with little ornaments. A woman of conſummate beauty can bear to be highly adorned, and yet ſhews beſt in a plain dreſs:

> ——————— For loveliness
> Needs not the foreign aid of ornament,
> But is when unadorn'd, adorned the moſt.
>
> *Thomſon's Autumn*, 208.

Congruity regulates not only the quantity of ornament, but alſo the kind. The ornaments that embelliſh a dancing-room ought to be all of them gay. No picture is proper for a church, but what has religion for its ſubject. All the ornaments upon a ſhield ought to relate to war; and Virgil, with great judgment, confines the carvings upon the ſhield of Æneas to the military hiſtory of the Romans: but this beauty is overlooked by Homer; for the bulk of the ſculpture upon the ſhield of Achilles, is of the arts of peace in general, and of joy and feſtivity in particular: the author of Telemachus betrays the ſame inattention, in deſcribing the ſhield of that young hero.

In judging of propriety with regard to ornaments, we muſt attend, not only to the nature of the ſubject that is to be adorned, but alſo to the circumſtances in which it is placed: the ornaments that are proper for a ball, will appear not altogether ſo decent at public worſhip: and the perſon ought to dreſs differently for a marriage-feaſt and for a burial.

Nothing is more intimately related to a man, than his ſentiments, words, and actions; and therefore we require here the ſtricteſt conformity. When we find what we thus require, we have a lively ſenſe of propriety: when we find the contrary, our ſenſe of impropriety is not leſs lively. Hence the univerſal diſtaſte of affectation, which conſiſts in making a ſhew of greater delicacy and refinement than is ſuited either to the character or circumſtances of the perſon.

Congruity and propriety, wherever perceived, appear agreeable; and every agreeable object produceth in the mind a pleaſant emotion: incongruity and impropriety, on the other hand, are diſagreeable; and of courſe produce painful emotions. Theſe emotions, whether pleaſant or painful, ſometimes vaniſh without any conſequence; but more frequently occaſion other emotions, which we proceed to exemplify.

When any ſlight incongruity is perceived, in an accidental combination of perſons or things, as of paſſengers in a ſtage-coach, or of individuals dining at an ordinary; the painful emotion of incongruity, after a momentary exiſtence, vaniſheth without producing any effect. But this is not the caſe of propriety and impropriety: voluntary acts, whether words or deeds, are imputed to the author; when proper, we reward him with our eſteem; when improper, we puniſh him with our contempt. Let us ſuppoſe, for example, a generous action ſuited to the character of the author, which raiſes in him and in every ſpectator the pleaſant emotion of propriety: this emotion generates in the author both ſelf-eſteem and joy; the former when he conſiders his relation to the action, and the latter when he conſiders the good opinion that others will entertain of him: the ſame emotion of propriety produceth in the ſpectators eſteem for the author of the action; and when they think of themſelves, it alſo produceth, by means of contraſt, an emotion of humility. To diſcover the effects of an unſuitable action, we muſt invert each of theſe circumſtances: the painful emotion of impropriety generates in the author of the action both humility and ſhame; the former when he conſiders his relation to the action, and the latter when he conſiders what others will think of him; the ſame emotion of impro-

priety produceth in the ſpectators contempt for the author of the action; and it alſo produceth, by means of contraſt, when they think of themſelves, an emotion of ſelf-eſteem. Here then are many different emotions, derived from the ſame action conſidered in different views by different perſons; a machine, provided with many ſprings, and not a little complicated. Propriety of action, it would ſeem, is a chief favourite of nature, when ſuch care and ſolicitude is beſtowed upon it. It is not left to our own choice; but, like juſtice, is required at our hands; and, like juſtice, is enforced by natural rewards and puniſhments: a man cannot, with impunity, do any thing unbecoming or improper; he ſuffers the chaſtiſement of contempt inflicted by others, and of ſhame inflicted by himſelf. An apparatus ſo complicated, and ſo ſingular, ought to rouſe our attention: for nature doth nothing in vain; and we may conclude with great certainty, that this curious branch of the human conſtitution is intended for ſome valuable purpoſe.

A groſs impropriety is puniſhed with contempt and indignation, which are vented againſt the offender by correſponding external expreſſions: nor is even the ſlighteſt impropriety ſuffered to paſs without ſome degree of contempt. But there are improprieties, of the ſlighter kind, that provoke laughter; of which we have examples without end, in the blunders and abſurdities of our own ſpecies: ſuch improprieties receive a different puniſhment, as will appear in what follows. The emotions of contempt and of laughter occaſioned by an impropriety of this kind, uniting intimately in the mind of the ſpectators, are expreſſed externally by a peculiar ſort of laugh, termed *a laugh of deriſion* or *ſcorn*. An impropriety that thus moves not only contempt but laughter, is diſtinguiſhed by the epithet of *ridiculous*; and a laugh of deriſion or ſcorn is the puniſhment provided for it by nature. Nor ought it to eſcape obſervation, that we are ſo fond of inflicting this puniſhment as ſometimes to exert it even againſt creatures of an inferior ſpecies: witneſs a turkeycock ſwelling with pride, and ſtrutting with diſplayed feathers; a ridiculous object, which in a gay mood is apt to provoke a laugh of deriſion.

We muſt not expect, that theſe different improprieties are ſeparated by diſtinct boundaries: for of improprieties, from the ſlighteſt to the moſt groſs, from the moſt riſible to the moſt ſerious, there are degrees without end. Hence it is, that in viewing ſome unbecoming actions, too riſible for anger, and too ſerious for deriſion, the ſpectator feels a ſort of mixed emotion, partaking both of deriſion and of anger; which accounts for an expreſſion, common with reſpect to the impropriety of ſome actions, that we know not whether to laugh or be angry.

It cannot fail to be obſerved, that in the caſe of a riſible impropriety, which is always ſlight, the contempt we have for the offender is extremely faint, though deriſion, its gratification, is extremely pleaſant. This diſproportion between a paſſion and its gratification, ſeems not conformable to the analogy of nature. In looking about for a ſolution, we muſt reflect upon what is laid down above, that an improper action not only moves our contempt for the author, but alſo, by means of contraſt, ſwells the good opinion we have of ourſelves. This contributes, more than any other article, to the pleaſure we have in ridiculing follies and abſurdities; and accordingly, it is well known, that they who put the greateſt value upon themſelves are the moſt prone to laugh at others. Pride, which is a vivid paſſion, pleaſant in itſelf, and not leſs ſo in its gratification, would ſingly be ſufficient to account for the pleaſure of ridicule, without borrowing any aid from contempt. Hence appears the reaſon of a noted obſervation, That we are the moſt diſpoſed to ridicule the blunders and abſurdities of others, when we are in high ſpirits; for in high ſpirits, ſelf-conceit diſplays itſelf with more than ordinary vigour.

With regard to the final cauſes of congruity, and impropriety; one, regarding congruity, is pretty obvious, that the ſenſe of congruity, as one principle of the fine arts, contributes in a remarkable degree to our entertainment. Congruity, indeed, with reſpect to quantity, coincides with proportion: when the parts of a building are nicely adjuſted to each other, it may be ſaid indifferently, that it is agreeable by the congruity of its parts, or by the proportion of its parts. But propriety, which regards voluntary agents only, can never be the ſame with proportion: a very long noſe is diſproportioned, but cannot be termed *improper*. In ſome inſtances, it is true, impropriety coincides with diſproportion in the ſame ſubject, but never in the ſame reſpect; for example, a very little man buckled to a long toledo: conſidering the man and the ſword with reſpect to ſize, we perceive a diſproportion; conſidering the ſword as the choice of the man, we perceive an impropriety.

The ſenſe of impropriety with reſpect to miſtakes, blunders, and abſurdities, is happily contrived for the good of mankind. In the ſpectators, it is productive of mirth and laughter, excellent recreation in an interval from buſineſs. But this is a trifle in reſpect of what follows. It is painful to be the ſubject of ridicule; and to puniſh with ridicule the man who is guilty of an abſurdity, tends to put him more upon his guard in time coming. Thus even the moſt innocent blunder is not committed with impunity; becauſe, were errors licenſed where they do no hurt, inattention would grow into a habit, and be the occaſion of much hurt.

The final cauſe of propriety as to moral duties, is of all the moſt illuſtrious. To have a juſt notion of it, the moral duties that reſpect others muſt be diſtinguiſhed from thoſe that reſpect ourſelves. Fidelity, gratitude, and the forbearing injury, are examples of the firſt ſort; temperance, modeſty, firmneſs of mind, are examples of the other: the former are made duties by the ſenſe of juſtice; the latter, by the ſenſe of propriety. Here is a final cauſe of the ſenſe of propriety, that muſt rouſe our attention. It is undoubtedly the intereſt of every man, to ſuit his behaviour to the dignity of his nature, and to the ſtation allotted him by Providence; for ſuch rational conduct contributes in every reſpect to happineſs, by preſerving health, by procuring plenty, by gaining the eſteem of others, and, which of all is the greateſt bleſſing, by gaining a juſtly-founded ſelf-eſteem. But in a matter ſo eſſential to our well-being, even ſelf-intereſt is not relied on: the powerful authority of duty is ſuperadded to the motive of intereſt. The God of nature, in all things eſſential to our happineſs, hath obſerved one uniform method: to keep us ſteady in our conduct, he hath fortified us with natural laws and principles, which prevent many aberrations, that would daily happen were we totally ſurrendered to ſo fallible a guide as is human reaſon. Propriety cannot rightly be conſidered in another light, than as the natural law that regulates our conduct with reſpect to ourſelves; as juſtice is the natural law that regulates our conduct with reſpect to others. We call propriety a law, not leſs than juſtice; becauſe both are equally rules of conduct that ought to be obeyed: propriety includes this obligation; for to ſay an action is proper, is in other words, to ſay, that it *ought* to be performed; and to ſay it is improper, is, in other words, to ſay that it ought to be forborne. It is this very character of *ought* and *ſhould* that makes juſtice a law to us; and the ſame character is applicable to propriety, though perhaps more faintly than to juſtice: but the difference is in degree only, not in kind; and we ought, without heſitation or reluctance, to ſubmit equally to the government of both.

But it muſt, in the next place, be obſerved, that to the ſenſe of propriety, as well as of juſtice, are annexed the ſanctions of rewards and puniſhments; which evidently prove the one to

be a law as well as the other. The ſatisfaction a man hath in doing his duty, joined with the eſteem and good-will of others, is the reward that belongs to both equally. The puniſhments alſo, though not the ſame, are nearly allied; and differ in degree more than in quality. Diſobedience to the law of juſtice, is puniſhed with remorſe; diſobedience to the law of propriety, with ſhame, which is remorſe in the lower degree. Every tranſgreſſion of the law of juſtice raiſes indignation in the beholder; and ſo doth every flagrant tranſgreſſion of the law of propriety. Slighter improprieties receive a milder puniſhment: they are always rebuked with ſome degree of contempt, and frequently with deriſion. In general, it is true, that the rewards and puniſhments annexed to the ſenſe of propriety, are ſlighter in degree than thoſe annexed to the ſenſe of juſtice: which is wiſely ordered, becauſe duty to others is ſtill more eſſential to ſociety, than duty to ourſelves; for ſociety could not ſubſiſt a moment, were individuals not protected from the headſtrong and turbulent paſſion of their neighbours.

CONINGTON, a village in Huntingdonſhire, near Stilton, at the head of the river which forms Ug-mere, Brick-mere, and Whittleſea-mere. It has the ruins of a caſtle; and in a pool, juſt by the village, was found the ſkeleton of a fiſh, near 20 feet long, in a perfect ſtate, ſix feet below the ſurface of the ground.

CONISTON MERE, a conſiderable lake of Lancaſhire, in the hundred of Furneſs. In affords plenty of char.

CONNER (Bernard), a learned phyſician, was born in the county of Kerry, in Ireland, about the year 1666. Having determined to apply himſelf to the ſtudy of phyſic, he went to France, and reſided ſome time in the univerſity of Montpellier. Afterwards he went to Paris; where he obtained great ſkill in medicine, anatomy, and chemiſtry. From thence he travelled toVenice, with the two ſons of the high-chancellor of Poland; and then taking a tour through great part of Germany, went to Warſaw, where he was made phyſician to King John Sobieſki. In 1695 he came to England, read a courſe of lectures in London and Oxford, and became member of the Royal Society and College of Phyſicians; afterwards, being invited to Cambridge, he read public lectures there, and made various experiments in chemiſtry. He has rendered himſelf memorable for a philoſophical and medical treatiſe in Latin, entitled, *Evangelium Medici*, i. e. "The Phyſician's Goſpel;" tending to explain the miracles performed by Chriſt, as natural events, upon the principles of natural philoſophy. He wrote alſo a hiſtory of Poland; and died in 1698, aged 32.

CONQUET, a handſome town of France, in the department of Finiſterre, and late province of Bretagne, with a good harbour and road. It is 12 miles W. of Breſt. Long. 4. 41. W. Lat. 48. 23. N.

CONRAD II. elected Emperor of Germany in 1004. He was obliged to take the field againſt moſt of the German dukes who had revolted from him; and he put Earneſt duke of Suabia under the ban of the empire. This being one of the earlieſt inſtances of ſuch a proſcription, the formula is inſerted here for its ſingularly. "We declare thy wife a widow, thy children orphans; and we ſend thee, in the name of the devil, to the four corners of the world." It was in the reign of this prince that the German fiefs became hereditary. He died in 1039.

CONRAD III. Emperor of Germany in 1138. The Duke of Bavaria oppoſed his election, and being put under the ban of the empire, and deprived of his duchy, he could not ſurvive his diſgrace. The margrave of Auſtria was ordered by the emperor to take poſſeſſion of Bavaria; but Welſti, uncle to the deceaſed duke, attacked him, and was defeated near the caſtle of Winſburgh; the battle fought upon this occaſion is famous in hiſtory, as having given riſe to the party-names of Guelphs and Gibbelines, afterwards aſſumed in Italy. The parole of the day with the Bavarians was *Welſti*, from the name of their general; that of the Imperialiſts *Werblingen*, from a ſmall village where Frederic duke of Suabia, their commander, had been nurſed: by degrees their names ſerved to diſtinguiſh the two parties; and the Italians, who could not accuſtom themſelves to ſuch rough words, formed from them their Guelphs and Gibbelines. He died in 1152.

CONRAD of Lichtenau, or Abbas Uſpergenſis, was author of an univerſal chronology from the creation to 1229, continued by an anonymous writer to Charles V. He collected a fine library, and died about the year 1240.

CONRADIN, or CONRAD *junior*, ſon of Conrad IV. was acknowledged emperor by the Gibbelines, who received him in triumph at Rome: but Pope Alexander IV. had publiſhed a cruſade againſt this orphan: and Urban VII. his ſucceſſor, gave the empire to Charles of Anjou, brother to Lewis IX. king of France: and the unfortunate youth, though powerfully ſupported, even by the Turks, loſt a battle, in which he was taken priſoner, and was beheaded, by order of his baſe opponent, publicly at Naples in 1229, in the 18th year of his age. In him ended the race of the dukes of Suabia, which had produced ſeveral kings and emperors.

CONSTANTINE, emperor of the Eaſt in 1002, left the care of the empire to his wife Helena, who loaded the people with taxes, and ſold all the offices in church and ſtate to the higheſt bidders; while the emperor employed himſelf in reading, writing, and the fine arts, till he became as good an architect and painter, as he was a bad prince. He wrote ſeveral biographical and geographical works, which would have done honour to his name, if he had not neglected his duty to compoſe them. He died in 959.

CONSTANTINE (Dracoſes), the ſon of Emmanuel Paleologus, was placed on the throne by Sultan Amurath in 1448. But Mahomet II. his ſucceſſor, reſolving to dethrone him, laid ſiege to Conſtantinople by ſea and land, and took it by aſſault in 1453, after it held out 58 days. The unfortunate emperor ſeeing the Turks enter the breaches, threw himſelf into the midſt of the enemy, and was cut to pieces; the children of the imperial houſe were maſſacred by the ſoldiers; and the women reſerved to gratify the luſt of the conqueror: and thus terminated the dynaſty of the Conſtantines, 1123 years after its eſtabliſhment at Conſtantinople.

CONSTANTINE (Robert), a learned phyſician, born at Caen, taught polite literature in that city; and acquired great reputation by his ſkill in the Greek language, in hiſtory, and in medicine. He died in 1603, aged 103. He wrote a dictionary in Greek and Latin, and other works, which are eſteemed.

CONSTANTINOW, a town of Poland, in Volhinia, on the river Selucza, 62 miles N.E. of Kaminieck. Long. 27. 20. E. Lat. 49. 58. N.

CONVALESCENT, a perſon in a progreſſive ſtate of recovery, after a fit of ſickneſs, by which his ſtrength and fleſh have been greatly reduced. The poor, who cannot, with propriety, be continued in the public hoſpitals after the diſeaſe is at an end, endure much diſtreſs on that account. In the year 1791 a ſociety was eſtabliſhed by ſome of the governors of the London hoſpital, for patients of that charity, whoſe relief was not within its general regulations. There had been many caſes of ſervants, artiſans, and labourers, who had received the benefit of the hoſpital; but, upon being diſcharged, had no ſervice or employment ready for them, or, if there had been ſuch, were not ſufficiently recovered, in point of health and ſtrength, to reſume their places or employment. There had been caſes of amputation or of ſome chirurgical operation, where the parties were diſabled from exerciſing

their former occupations. Some inſtances had occurred of young female patients, who by diſtreſs had been driven to pawn or ſell their clothing, and were peculiarly expoſed to temptation; of perſons whoſe families had been ſuffering for want of ſupport: of others belonging to remote parts of the kingdom, or to Ireland, who when diſcharged from the hoſpital, were, by lameneſs or weakneſs, rendered incapable of getting home without charitable aſſiſtance. There were ſome inſtances where the means of a journey to the charitable eſtabliſhment at Bath, or to the ſea, or the immediate ſupply of linen, of clothes, or of a truſs, might have ſaved a fellow-creature from diſtreſs, and reſtored him in health to his family.

For the relief of theſe, and of other perſons not within the proviſions of hoſpitals, the Samaritan Society was eſtabliſhed; and the following regulations were adopted, which we give at length, becauſe they may be of uſe in forming ſimilar ſocieties.—"1ſt. A donation of five guineas ſhall be a qualification for a member for life.—2d. A donation of one guinea ſhall be a qualification of an annual member.—3d. A general court ſhall be held half-yearly, on the laſt Wedneſdays in February and Auguſt, and ſhall conſiſt of not leſs than five members.—4th. A treaſurer, and a committee, to conſiſt of not leſs than twelve members beſides the treaſurer, ſhall be annually elected at the general court in February: two of the committee ſhall go out annually, and two other members be choſen in their place.—5th. A committee ſhall be held every Tueſday, at 12 o'clock; and ſhall conſiſt of not leſs than two members.—6th. Qualified perſons ſhall be propoſed at one committee, and voted for at the next.—7th. The committee ſhall appoint one or more viſitors; who ſhall make enquiries of the officers, or other perſons in the hoſpital, concerning the diſtreſsful circumſtances of the patients, and report to the next committee accordingly.—8th. No recommendation from any perſon whatever, whether a member of the ſociety or not, ſhall be regarded further than as it may be explanatory of the diſtreſs of the object under conſideration, and as it may thence aſſiſt the committee in their proceedings.—9th. The proceedings of the ſociety ſhall be exactly recorded; together with the names of all perſons relieved, their age, place of nativity, pariſh, occupation, whether they are married or ſingle, the ſtate of their family, or any circumſtance claiming the particular conſideration of the ſociety, as well as the relief granted.—10th. The names of, at leaſt, two members of the committee, by order of the committee, ſhall be ſubſcribed to drafts upon the treaſurer.—11th. An exact account of the receipts, diſburſements, and fund, of the ſociety, ſhall be laid before every committee; which ſhall audit and ſign the ſame, and ſend an abſtract thereof annually to every member.—12th. The treaſurer, and two other members, appointed at a general court, ſhall be truſtees for inveſtments in the funds.—13th. All legacies and donations, above one guinea, ſhall be added to the inveſted fund, which ſhall be inviolable.—14th. The expenditure of each year ſhall by no means exceed the annual income ariſing from the intereſt of the inveſted fund, and thoſe donations which do not exceed one guinea; nor ſhall any debts be incurred, ſo as to anticipate the receipts of the ſociety.—15th. Rules for the government of the ſociety, ſhall be approved by one general court, and confirmed by the next; the members being informed of every approved regulation, at leaſt ſix days before the general court, at which its confirmation will be conſidered.—16th. At general courts and committees, queſtions ſhall be determined by a majority, the chairman having a caſting vote; and if a ballot ſhould be demanded by two members, it ſhall be proceeded upon immediately.—17th. The treaſurer, the aſſembled committee, or any five members of the ſociety, ſhall have power to call extraordinary general courts."

The ſociety conſiſts of about 50 annual ſubſcribers of one guinea each, and about 70 members for life, who have given donations of 5 guineas each. From the firſt inſtitution of the ſociety in 1791, to 5th September, 1798, as many as 221 diſtreſſed perſons have been relieved, and put in a courſe of livelihood, who muſt otherwiſe have been driven to beggary, if not to criminal courſes, for ſubſiſtence.

In March 1795 the ſociety had the ſatisfaction to find that the good effects of this eſtabliſhment had been experienced by many poor patients in the London hoſpital; who, after they had been cured of their diſeaſes, and were in a ſtate of convaleſcence, had been ſupplied with neceſſaries, and enabled to return home, and renew their occupations. The benefit had not been leſs to their wives and families; to whom occaſional and ſeaſonable relief had been adminiſtered, during the ſickneſs and confinement of the patient. The utility and propriety of the charity ſeemed to be now unequivocally eſtabliſhed. The committee therefore determined to recommend it as an appendage not only to every hoſpital, but alſo to every county gaol; in the latter inſtance, as the means, not merely of preſerving delinquents from diſtreſs, but of reſtoring them to character, and to habits of occupation; there being frequent inſtances that perſons, though not yet confirmed in vicious courſes, might otherwiſe have been driven back to the commiſſion of crimes, for the mere protraction of exiſtence.

A circumſtance which contributed very much to the eſtabliſhment of this ſociety deſerves to be mentioned, as it exemplifies the caſes which have been relieved by it. One of the members of this ſociety paſſing along the Uxbridge road, obſerved a man of very decent appearance, reclined on a bank by the way ſide, with a pair of crutches near him. His account of himſelf was (and we have no reaſon whatſoever to queſtion the truth of it), "that he was a Glouceſterſhire manufacturer; that he had been a ſhort time in London, where he had the misfortune to break his leg, and had been admitted a patient into an hoſpital; that his leg had been very well ſet, and all proper care had been taken of him; and, upon his diſcharge that morning, ſome gentleman, he ſaid, had kindly given him a ſhilling, on part of which he had ſubſiſted ſo far; that he was going to his pariſh in Glouceſterſhire, but had not the means of paying for his carriage in the waggon." This ſtory was not related in vain.—We leave it to the reader's conſideration, what courſe of life remained to this poor man (had he not unexpectedly met with friendly aſſiſtance) but to beg,—to ſteal,—or to periſh.

Amidſt the great variety of charities, for which this age and kingdom are diſtinguiſhed, it is extraordinary, that the proviſion, which is the ſubject of this article, ſhould have experienced ſo little attention; and it is the more ſurpriſing, becauſe upon the firſt inſtitution of the charities, which were intended to provide for part of the inconveniences from the aboliſhing of monaſteries, the utility of ſuch an eſtabliſhment appears to have been ſtrongly impreſſed on the minds of the original projectors. In the declaration made to the privy-council, by the citizens of London, in the reign of Edward the Sixth, concerning the uſes to which Bridewell, and the two other great foundations of Chriſt's and St. Thomas's hoſpitals, were to be applied, one of the three objects of Bridewell is expreſſed to be, "for the ſore and the ſick when they be cured;" in order that they may be protected and employed until their entire recovery: and "not be ſuffered to wander as vagabonds in the commonwealth, as they had been accuſtomed."

This part, however, of the original intentions of the projectors of that inſtitution has not been yet carried into effect, as a committee of the governors of that hoſpital is now ſitting, for the purpoſe of enquiring "whether, and by what means, the eſtates and revenues of the houſe of Bridewell can be appropriated with greater effect than at preſent to the benefit of its original and proper objects." The following is a ſhort extract from three of a ſeries of propoſitions, made by one of the members of the committee, and ſince printed by their order, and entered as reſolutions on their minutes.

"That there are many deſerving and neceſſitous perſons, who, at the time of their being diſcharged from hoſpitals, are without the power of labour, or the means of ſupport; and who, for want of that eſtabliſhment which was one of the original objects of Bridewell, have been driven to ſolicit the charity of the public, as ſtreet beggars. That, ſuch is the infirmity of human nature, they who have firſt diſcovered a ſucceſsful and eaſy trade, are not likely, of themſelves, to diſcontinue it, and to return to a courſe of labour; and, if the pauper does not receive charitable relief in his diſtreſs, he is ſometimes induced to prey upon the public for his ſubſiſtence; and, to uſe the language of the rules of the houſe of Bridewell drawn up in 1557, *being ſet at liberty in the highways, is made of a ſick beggar a whole thief*.—Theſe perſons, it is to be obſerved, will require, and that only for a ſhort time, an aſylum, where, being many of them artiſans inſtructed in a trade, and almoſt all of them habituated to employment, their earnings would in general be more than what the coſt of their diet, if economically managed, would amount to: and there is reaſon to hope, that the number of perſons wanting this relief, would very ſoon be diminiſhed by the proper application of it; and that the hoſpitals in the metropolis would be thereby greatly relieved; as it is a known fact that many patients, for want of the means of *entire recovery* of health and ſtrength on quitting one hoſpital, have ſoon been obliged to apply for admiſſion even into another."

CONVERSANO, a town of the kingdom of Naples, with a biſhop's ſee, 10 miles from the gulf of Venice, and 12 S.E. of Bari. Long. 17. 6. E. Lat. 41. 20. N.

CONWAY, Vale of, a long and narrow tract of Carnarvonſhire. It is equally romantic and beautiful; affords rich paſturage, corn-fields, and groves; and forms a pleaſing contraſt to the bleak region of Snowdon frowning above it.

Conway, a river of North Wales, which flows through the vale of the ſame name, along the whole eaſtern border of Carnarvonſhire, and enters the Iriſh Sea at the town of Conway.

COOK'S River, a large river of North America, which flows into the N. Pacific Ocean. It was diſcovered by Captain Cook in 1778. As he left a blank for its name, it was filled up, after his death, by direction of the late Earl of Sandwich. This river was traced as high as lat. 61. 30. N. long. 150. 0. W. which is above 70 leagues from its mouth.

Cook's Strait, a ſtrait in the S. Pacific Ocean, dividing the two large iſlands of which New Zealand is compoſed: it is about four or five leagues broad.

COOPER (Samuel), a very eminent Engliſh miniature painter, born in 1609, and bred under the care of his uncle John Hoſkins. He derived, however, his principal excellence from a ſtudy of the works of Van Dyck, in whoſe time he lived; inſomuch that he was commonly ſtyled "Van Dyck in little." His pencil was chiefly confined to the head, in which with all its dependences, eſpecially the hair, he was inimitable; but if he deſcended lower, his incorrectneſs was notorious. He died in 1672; and his pieces are univerſally admired all over Europe, ſelling for incredible prices.—He had a brother, Alexander, likewiſe a good miniature painter, who became limner to Chriſtiana queen of Sweden.

Cooper (Thomas), a pious and learned prelate in the reign of Queen Elizabeth, was born at Oxford about the year 1517. He was educated in the ſchool adjoining to Magdalen College, of which he was a choriſter; where alſo, in 1539, he was elected probationer, and fellow in the following year. About the year 1546, quitting his fellowſhip, he applied himſelf to the ſtudy of phyſic, in 1556 took the degree of bachelor in that faculty, and practiſed as phyſician at Oxford. Being inclined to the Proteſtant religion, probably this was only a prudent ſuſpenſion of his final intentions, during the Popiſh reign of Queen Mary: for, on the acceſſion of Elizabeth, he reſumed the ſtudy of divinity; became a celebrated preacher, was made dean of Chriſt-church, and vice-chancellor of the univerſity, having accumulated the degrees of bachelor and doctor in divinity. In 1569 he was made dean of Glouceſter; and, the year following, biſhop of Lincoln: whence, in 1584, he was tranſlated to the ſee of Wincheſter; in which city he died on the 29th of April, 1594, and was buried in the cathedral there, on the ſouth ſide of the choir. The ſeveral writers who have mentioned Dr. Cooper, unanimouſly give him the character of an eloquent preacher, a learned divine, and a good man. He had the misfortune, while at Oxford, to marry a lady whoſe gallantries became notorious: nevertheleſs he would not be divorced from her; knowing that he could not live without a wife, he did not chooſe "to charge his conſcience with the ſcandal of a ſecond marriage."—He wrote, 1. the Epitome of Chronicles from the 17th year after Chriſt, to 1540, and thence after to 1560. 2. Theſaurus linguæ Romanæ et Britannicæ. This dictionary, which is an improvement upon Elyot's, was much admired by Queen Elizabeth, who thenceforward determined to promote the author. 3. A brief expoſition of ſuch chapters of the Old Teſtament as uſually are read in the church, at common prayer, on Sundays throughout the year. 4. An admonition to the people of England. 5. Sermons.

COOPER'S-HILL, a fine hill in Surrey, celebrated by Sir John Denham's poem of the ſame name. Its baſe extends along the edge of the famous Runnymead; its ſummit is crowned by the beautiful ſpot called Englefield-green; and it lies 19 miles W. by S. of London, on the road from Egham, through Windſor Great Park, to Reading.

COOS, an iſland in the Archipelago, 56 N.W. of Rhodes, ſubject to the Turks. Long. 27. 44. E. Lat. 37. 1. N.

COPILOWATS, a large town of Turkey in Europe, in Bulgaria. Long. 36. 35. E. Lat. 46. 40. N.

COPORIA, a town of Ingria, in the Ruſſian government of Peterſburg, at the mouth of a river of the ſame name. Long. 29. 0. E. Lat. 59. 34. N.

COQUET, a river of Northumberland, which croſſes the centre of that county, and enters the ſea at Warkworth. Celebrated for its ancient caſtle and hermitage.

CORAH, or Corahjehemabad, a ſmall city of Hindooſtan Proper, in the Doab, or country between the Ganges and Jumna, ſubject to the Nabob of Oude. It is 60 miles S.S.W. of Lucknow. Long. 79. 45. E. Lat. 26. 5 N.

CORAM (Captain Thomas), a gentleman remarkably diſtinguiſhed by his humanity, was born about the year 1668, and ſpent the early part of his life in the ſtation of maſter of a veſſel trading to our colonies. Afterwards reſiding in the eaſtern part of the metropolis, among ſeafaring people, where buſineſs often obliged him to come early into

the city and return late, he frequently ſaw young children expoſed in the ſtreets through the indigence or cruelty of their parents. This excited his compaſſion, and induced him to project the foundation of an hoſpital for foundlings. In this humane deſign he laboured with indefatigable diligence for ſeventeen years; and, by his application procured a number of the nobility and gentry to patroniſe and carry the ſcheme into execution, and at length obtained the royal charter for it. He was alſo highly inſtrumental in promoting the trade of America, by procuring a bounty upon naval ſtores imported from our colonies. He was likewiſe eminently concerned in ſetting on foot the colonies of Georgia and Nova Scotia. His laſt charitable deſign, in which he lived to make ſome progreſs, was a ſcheme for uniting the North-American Indians more cloſely to the Britiſh intereſt, by an eſtabliſhment for the education of Indian girls. In ſhort, he ſpent the greateſt part of life in labouring for the public, and experienced a fate too common in thoſe who devote their talents to ſuch laudable purpoſes; being at laſt indebted for ſubſiſtence to the voluntary ſubſcriptions of ſome public-ſpirited perſons, at the head of whom was the late Frederick prince of Wales. Captain Coram died in 1751: and was interred, at his own deſire, in a vault under the chapel of the Foundling Hoſpital.

CORBACH, a town of Germany, in the principality of Waldeck, ten miles N.W. of Waldeck. Long. 8. 58. E. Lat. 51. 20. N.

CORBECK, a town of the Auſtrian Netherlands, in Brabant, three miles S. of Louvain. Long. 4. 49. E. Lat. 50. 50. N.

CORBEIL, a town of France, in the department of Seine and Oiſe and late province of the Iſle of France, divided into two by the Seine, ſeventeen miles S. of Paris. Long. 2. 26. E. Lat. 48. 33. N.

CORBY, a town of Germany, on the confines of Weſtphalia, with a famous abbey, whoſe abbot is a ſovereign prince. It is ſeated upon the river Weſer. Long. 9. 30. E. Lat. 51. 50. N.

CORDOVA, a town of South America, in the province of Tucuman, with a biſhop's ſee, 180 miles from St. Jago. Long. 62. 5. W. Lat. 32. 10. S.

CORDUS (Valerius), a learned botaniſt, was the ſon of Ericius Cordus, a phyſician and poet of Germany. Having learnt the languages, he applied himſelf to the ſtudy of botany: in the proſecution of which, he examined the mountains of Germany, and travelled into Italy; but, being wounded in the leg by a kick of a horſe, died at Rome in 1544. He wrote Remarks on Dioſcorides, and other works.

CORINNA, a Grecian lady, celebrated for her beauty and poetic talents, was born at Theſſu, a city of Bœotia, and was the diſciple of Myrtis, another Grecian lady. Her verſes were ſo eſteemed by the Greeks, that they gave her the name of the lyric muſe. She lived in the time of Pindar, about 495 years before Chriſt; and is ſaid to have gained the prize of lyric poetry from that poet: but Pauſanias obſerves that her beauty made the judges partial.

CORITA, a town of Spain, in Leon, twenty-three miles E. of Salamanca. Long. 5. 49. W. Lat. 41. 5. N.

CORK (*Encycl.*). To our brief account of this city we add an extract from an account of a ſociety eſtabliſhed there for bettering the condition of the poor.

On the 22d of March, 1799, a meeting of ſome of the moſt reſpectable characters in Cork was held, for the purpoſe of forming a ſociety, in that city, for bettering the condition of the poor. It was preceded by an addreſs to the inhabitants of the city and neighbourhood of Cork, dated the 20th of February, referring to what has been done by the Engliſh ſociety, to the effects produced at Hamburgh, and to the unwearied and ſucceſsful labours of Count Rumford at Munich; and obſerving (what may be very general in its application) that the charities at Cork, by the mode of relief they have held out, have rather tended to encourage idleneſs and beggary, and have increaſed, inſtead of diminiſhing, the number of diſtreſſed objects in that place. Feeling the difficulties of the attempt, yet confiding in the axiom, that though all may not be effected, yet no well-directed effort of benevolence can be entirely loſt, the author, the Reverend Thomas Dix Hincks, propoſed the formation "of a ſociety, in imitation of that in London, but adapted to their own peculiar ſituation; hoping that by procuring, and, when approved of, recommending ſuch plans as have been found ſucceſsful in England, they may contribute to their adoption in that city and neighbourhood."

At the meeting, held on the 22d of March, it was reſolved, that the ſociety be immediately formed; and that the general object of it ſhould be to collect information reſpecting the circumſtances and ſituation of the poor in that city and neighbourhood, and the moſt effectual means of meliorating their condition; and to communicate this information to the public, in order than any comforts and advantages which the poor enjoy in other parts of the Britiſh empire, might be extended to that part in as great a degree as peculiar circumſtances will admit. And as it had been found impoſſible, notwithſtanding the large ſums beſtowed, to relieve all the diſtreſs that might occur in that large city, it appeared deſirable that particular attention ſhould be paid to all plans of economy, ſo as to extend the benefits of charitable inſtitutions to as great a number as poſſible.

It was further reſolved, that "the ſociety do ever keep in view the principle, that the beſt relief the poor can receive, is that which comes from themſelves; and that the moſt effectual method of improving their condition is by the encouragement of induſtry and prudence.—That the buſineſs of the ſociety be tranſacted by a committee choſen annually.—That this committee be impowered to correſpond with any other ſociety, having a ſimilar object; to purchaſe any books, which are calculated to give them information on the ſubject; and to print any plan which they think deſerving of the public attention.—That the committee be alſo impowered to offer ſuch rewards for good conduct, as the ſtate of the funds will admit, ſo as to awaken the attention of the poor, to what will promote their beſt intereſts.—That the committee conſiſt of a preſident, five vice-preſidents, and twenty-ſix members, including the treaſurer and ſecretary, to be choſen at an annual meeting of the ſubſcribers.—That no plan be printed, or any expence incurred, without the approbation of at leaſt five members of the committee aſſembled in a regular manner.—That the committee meet once each month for the tranſaction of buſineſs.—That a ſub-committee, choſen out of the general committee, and conſiſting of ſeven members of the general committee, do meet once a-week (that week excepted in which the general committee aſſembles), for the purpoſe of examining reports, and preparing plans for the inſpection of the general committee.—That every ſubſcriber be entitled to attend the meetings of the general or ſub-committee, and to give his opinion, but not to have a vote on the deciſion of any queſtion.—And that every member ſubſcribe half a guinea annually, to defray the expences of the ſociety."

The number of members already exceeds 120, and includes the moſt reſpectable inhabitants of the city of Cork. The Lord-biſhop of Cork is the preſident. The vice-preſidents are, Dr. Moylan (the titular biſhop of Cork), the Honourable Dean St. Lawrence, Sir Samuel Rowland, Mr. Serjeant Chatterton, and Mr. Anderſon.

One of their firſt objects is to encourage the eſtabliſhment

of friendly ſocieties, upon a general plan, which may require very few, if any, meetings of the ſubſcribers. For this purpoſe the increaſe of honorary members, and the holding out every poſſible advantage to the other members, have appeared to be neceſſary.

It is eſſential to the permanent peace and welfare of Ireland, to introduce among the poor in that kingdom a proper and uſeful ſyſtem of education,—habits of cleanlineſs,—a taſte for the comforts of life, as applied to food, habitation, and clothes;—and to promote the reciprocity of kindneſs and mutual good-will among the different claſſes of life; ſo as to give the maſs of the people more intereſt in the eſtabliſhed order of ſociety, and more incitement to induſtry and exertion, and to connect them by a cloſer and more ſecure bond with the welfare and happineſs of Ireland.

This can only be effected by the co-operation of the other ranks of ſociety in that kingdom: and ſuch a co-operation would be very greatly promoted by the formation of inſtitutions like that which reflects ſo much honour on the patriotiſm and public ſpirit of the city of Cork.

It muſt give infinite ſatisfaction to ſee a Proteſtant and a Roman-catholic biſhop uniting in a friendly and benevolent co-operation, for the religious and moral improvement, and for the temporal welfare and comfort, of their united flocks. If this example be followed throughout Ireland, it may produce the beſt effects, not only in meliorating the character and condition of the poor, but in removing religious prejudices, and in promoting Chriſtian charity, between the Catholics and Proteſtants in that country.

Another inſtitution well worthy of an account in this place is that of a friendly ſociety, formed in 1799, by the aſſiſtance of the Cork ſociety for bettering the condition of the poor.

The objects of this friendly ſociety are confined to a proviſionary fund for the ſupport of the ſubſcribing members in ſickneſs, and old age, and for their decent interment. Circumſtances have prevented the extenſion of it to widows and children. Perſons however of all ranks and deſcriptions, and of both ſexes, reſiding within the limits of the city of Cork, above the age of fifteen and under that of fifty, are admiſſible into this ſociety.

The ſubſcriptions are to be paid upon admiſſion, and during life to be continued monthly, by each member, as follows:

Under thirty years of age, -	1s. 1d.
Above thirty, and under forty,	1 4
Above forty, and under fifty,	1 9

Perſons who by their age would come within one of the two laſt claſſes, are admiſſible into that immediately below it, on payment of one guinea and a half upon admiſſion.

The funds of the ſociety are open to augmentation by the contributions of the benevolent, and by preſcribed forfeits in the members; viz. for neglect in payment of their monthly ſubſcription, three pence for the firſt, and ſix-pence halfpenny for the ſecond omiſſion—for ſoliciting charity, two ſhillings and eight-pence halfpenny—and for intoxication, whilſt receiving relief from the ſociety, three ſhillings and three pence.

As the funds of the ſociety are in the nature of ſhares, every member during ſickneſs is entitled to relief for each ſhare, and proportionably for half a ſhare, which he or ſhe ſhall have in the fund by a weekly allowance; and members above ſixty, preferring an annuity to weekly payments, in ſickneſs or infirmity, are entitled to progreſſive annuities during their natural lives, according to their ages. At ſixty years of age, to an annuity of five pounds;—at ſeventy years of age, of ſeven pounds ten ſhillings;—at eighty years, of ten pounds; and at the age of ninety years or upwards, to an annuity of twelve pounds a-year for life. In caſe of death, each member is entitled to a ſpecific ſum for the expence of his or her funeral.

The regulations of the ſociety ſtate exceptions to relief, and authoriſe excluſion from the ſociety. In the firſt caſe, among other ſpecified inſtances, no member ſhall be entitled to relief for any diſeaſe, diſtemper, or infirmity, which he or ſhe may have had, when admitted a member; nor for any diſtemper contracted by lewdneſs; nor for any lameneſs, misfortune, or accident, occaſioned by quarrelling, rioting, drunkenneſs, or gaming; nor if impriſoned on a charge of treaſon, or felony, until legally acquitted of the ſame.

The penalty of excluſion is inflicted on members who ſhall attempt to take any advantage, by diſſembling any ſickneſs or infirmity, or by uſing any kind of fraud towards the ſociety; or who ſhall neglect to pay his or her monthly payments for three ſucceſſive months, or, in caſe of default, the preſcribed forfeits; or who ſhall be a notorious drunkard or gambler; or who ſhall be criminally convicted. In any of which caſes the perſon is to forfeit his or her title or claim to any part of the funds of the ſociety.

Every perſon wiſhing to become a member of this ſociety, muſt produce a certificate of his or her character, according to a preſcribed rule: and every perſon admitted a member muſt, at the time of admiſſion, ſubſcribe an obligation, containing a promiſe and declaration, in all things well and truly to fulfil, keep, and obſerve, the rules, orders, and regulations of the ſociety, and to promote its intereſt to the utmoſt of his power.

The funds of the ſociety are veſted in truſtees, conſiſting of the preſident, vice-preſidents, and committee, for the time being, of the ſociety eſtabliſhed in the city of Cork, "for bettering the condition and increaſing the comforts of the poor." The direction of the ſociety is veſted in twenty-one perſons, to be appointed annually by the truſtees, from among the ſubſcribing members of the "ſociety for bettering the condition of the poor," or from among any other public inſtitution for the benefit of the poor, who, together with the treaſurer and honorary members of this friendly ſociety, are conſtituted the directors thereof.

The rules and regulations for the government of this ſociety are calculated effectually to guard againſt the inconveniences to which aſſociations of this nature are ſometimes liable. There are no meetings of the exiſting members; nor can the diſſolution of the ſociety, or any diſtribution of its funds, fraudulent in itſelf, and contrary to the true meaning of the regulations, take place, but under ſuch reſtrictions as exclude the poſſibility of any derangement of the ſociety, or the miſapplication of its funds. The regulations are equally calculated to provide for the health, and to ſecure and improve the morals and good conduct, of the members of the ſociety. A certificate of character is a preſcribed title for admiſſion. The regular payment of the monthly contributions is enforced by forfeits; whilſt the penalty of excluſion applies equally to prevent ſucceſſive failures in payment, and to check immoral conduct. In the reſpectability of the gentlemen who have voluntarily undertaken the office of truſtees and directors, the members of this friendly ſociety have a ſolid ſecurity, that their intereſts will be well managed, and the laws of the aſſociation duly enforced for the benefit of all the members.

We have given a place to theſe accounts in the hope of being the inſtruments of ſimilar good in other parts of a country where ſuch aſſociations are greatly wanted.

CORMENTIN, a fortreſs on the Gold Coaſt of Guinea, belonging to the Dutch. Below it is the town, which is large and populous. Long. 0. 15. W. Lat. 5. 30. N.

CORMERY, a town of France, in the department of Indre and Loire and late province of Touraine. It had recently a rich Benedictine abbey, and is ſeated on the Indre, eight miles from Tours. Long. 0. 28. E. Lat. 47. 30. N.

CORN (*Encycl.*). There are ſeveral ſpecies of corn, ſuch as wheat, rye and barley, millet and rice, oats, maize and lentils, peaſe, and a number of other kinds, each of which has its uſefulneſs. But of theſe ſcarcely any poſſeſs ſuch highly nutritive qualities as MAIZE or *Indian* CORN. See the article ZEA.

Count Rumford, in his fifth eſſay, publiſhed in 1796, took conſiderable pains to draw the attention of the public to this very important article of diet. Indian corn is produced in abundance and of the beſt quality in Britiſh America. It is capable of being ground into meal like any other grain, and in this ſtate admits of various kinds of culinary preparation. One ſimple and obvious way of uſing it is, to mix it with wheat, rye, or barley, in making bread; in which caſe the proportion of one-half may be employed. It makes an excellent and cheap family pudding, when mixed with molaſſes and a little ſalt*, and boiled in a bag; and may be enriched and accommodated to different taſtes by the intermixture of ſliced apples or ſmall fruits. If a good quantity is made at once, it may be very conveniently cut in ſlices and fried; theſe Indian puddings not being the worſe for ſeveral days' keeping.

Whether the making and vending this kind of pudding in its plain ſtate to the poor, along with meat ſoup, would be a means of rendering bread unneceſſary, or whether thickening the ſoup with Indian meal might be made to anſwer the ſame ſalutary purpoſe with leſs trouble, are ſubjects worthy of conſideration with thoſe who ſuperintend the public kitchens. As the Indian meal requires long boiling to free it from its raw taſte, the latter mode appears, in fact, to promiſe the greater advantages; though it is likely the poor themſelves would prefer "ſolid pudding," even at an additional charge, to a diet approaching ſo much to the fluid ſtate.

But the moſt economical way of preparing Indian meal appeared to be the ſtirring it into a quantity of water, ſo as to make haſty-pudding, in which ſtate it is eaten and univerſally approved in America, where its nutritious qualities are reckoned ſuperior even to thoſe of wheat. The manner in which this is done is the following:

A quantity of water, with an adequate proportion of ſalt diſſuſed in it, being put on the fire, repeated handfuls of Indian meal are gradually ſtirred into it, ſo as to make an uniform mixture. As the contents of the pot approach to a boiling ſtate they become thicker and thicker, and at laſt, by a due regulation of the proportion of meal, and conſtant ſtirring, the pudding becomes ſufficiently ſolid to keep the implement with which it is ſtirred, upright, when plunged into the middle of the kettle. Half an hour's further boiling finiſhes the proceſs.

This pudding, however, is ſcarcely ſavoury enough to make a meal without ſome kind of ſauce; and this perhaps may make it a leſs eligible mode of firſt introducing Indian corn to the notice of the poor as an article of diet. Count Rumford, indeed, who made the experiment, ſhews, by the following ſtatement, that, with even this diſadvantage, a comfortable meal may be made at the trifling expence of five farthings.

	Farthings
1 lb. 1½ oz. of pudding - -	2½
Sauce, conſiſting of butter, molaſſes, and vinegar	2 5/16

In Italy, where this kind of pudding is in great popular eſteem, it is very commonly eaten without any ſauce, under the name of *polenta*: ſurely the poor of this country, by gradual ſteps, and eſpecially by the example of their ſuperiors (which, by the way, is very material), may be led to avail themſelves of ſo great a benefit, and be taught to reliſh, in a country liable to occaſional deficiencies in the produce of grain, as well as to conſiderable temporary changes in the price of other neceſſaries of life, ſome of thoſe kinds of food which are known to be highly acceptable to the inhabitants of diſtant climates.

CORN-GRINDING *Machine*, an invention for which a patent has been granted to Mr. Barratt, of Gedling, in the county of Nottingham. In the ſpecification it is ſaid to be a more ſimple, conciſe, and cheap method of grinding corn, or other grain, than has been hitherto uſed. It is either moveable or immoveable, and intended to be worked by water, wind, horſes, hand, or otherwiſe.

"This mill," ſays the inventor, "may be conveniently erected in a garden or croft, wherever the wind has acceſs, and is ſo light as to be capable of being turned by the hand, or the ſails may occaſionally be affixed in a horizontal poſition to the upright ſhaft; and on taking down the ſhed over the mouth-hopper, the power of a horſe may be applied when the wind fails. It will perhaps be neceſſary, on this occaſion, to have the wheel A, Plate 22. fig. 1. enlarged, which may be readily effected by ſcrewing on an additional wheel in quadrants or octants, as may be preferred. The whole apparatus may be conveniently fixed on a centre, with a gudgeon at each end, to the gable end of a houſe, barn, or granery, a peculiar proviſion being planned in the ſails for that purpoſe. It will appear obvious, that its internal conſtruction is ſuited to any power which may be ſubſtituted for the ſails; and it will be ſuperfluous to hint to a workman, how hand-mills may be connected with the crown and ſpur-wheels at the ſame time to grind malt, ſplit beans, cut hay, ſtraw, &c.

"Fig. 1. A is a crown and ſpur wheel; it has three concentric circles, 1, 2, 3, with teeth adapted to the ſpur-wheel above, on the mill-ſhaft, the teeth in the ſecond being higher than the firſt, and in the third higher than the ſecond, to meet the elevation of the mill-ſhaft above the plane of the crown-wheel. Theſe circles are called the ſpeed-wheels, ſerving to increaſe the velocity of the ſtones, or to preſerve it when the velocity of the wind decreaſes. This wheel may be diſpenſed with, with one or two pair of ſtones, the nut on the ſpindle being made contrate inſtead of ſpur, and immediately connected with the ſpur-wheel, affixed to the axis of the mill by means of a ſliding box A (fig. 2.), and ſcrewed in its poſition by the ſcrew S (fig. 2.), by which it is adapted to each of the concentric circles, as the crown-wheel is required to move faſter or ſlower. C is the brake-wheel, which retards or ſtops the motion of the ſails by its friction with the wedge W. (See for its poſition on the axis fig. 2.) D is a circular plate of caſt-iron, belonging to, and being part of, the iron axis of the mill-ſhaft, or the upright axis of the crown-wheel. Upon this plate, on the continuation of the ſpindle (ſee *d*, fig. 2.), is placed the croſs fig. 4. to which it is faſtened by four ſcrews paſſing through the four holes of both; and the extremity of the arm of each ſail into which the ſaid croſs is inſerted at the ſlot *f* (fig. 3.), and ſecured by another ſcrew and moveable iron bandages. E is the gallows, which ſupports the gudgeon of the mill-ſhaft, which, moving on a centre at the ſmall end, permits the ſpur-wheel to be thrown in or out of gear by means of the wedge at the other end. The ſtones moved by the nut *s* are placed in a box in the frame G, fixed on a platform *m*, which, ſliding on the rails *n*, *n*, the ſpindle is thrown out of gear by the ſcrew H paſſing through the iron rod,

* Three pounds of Indian meal ſtirred into five pints of boiling water, with the addition of one ounce of ſalt and three fourths of a pound of molaſſes, the whole tied loſely in a bag and boiled ſix hours, makes ten pounds of pudding at an expence of leſs than 1d. per pound. See Count Rumford's 3d eſſay, p. 204.

which, by the ſcrew I, raiſes or depreſſes the bridge-tree. *a* is an iron axis, with ſmall wheels at each end, for turning a ſifting machine.

"Fig. 3. is the ſail-arm, into which, at the mortiſe *a*, is put the ſupporting arm D, at its end *b*, and ſcrewed by a peg: the fixed part of the ſail E falls into the ſlot C, and is kept in its poſition by the guards *d*, and a peg in the groove B. The two other fan-ſails F, F, ſlide on each ſide of the fixed one, moving on a centre at the narrow extremity, and, when expanded to the wind, are kept in their poſitions by pegs in the ſame groove catching in the notches at the other extremity: theſe ſails are made of thin boards. When the ſails are affixed to a gable-end, whence it will occaſionally be neceſſary to catch the wind on oppoſite ſides of the ſail, the ledge *e* is attached to each ſail-arm into the nicks, on which falls the ſpring *m* of the adjoining ſail, by which means the ſails are turned to oppoſite degrees of obliquity. The frame of the machinery, as depicted in the ſpecification, turns on caſtors, on a circular baſe."

The patentee has erected a mill, of the above deſcription, at his houſe at Gedling, near Nottingham, and has various models, open for the inſpection of ſuch perſons as may wiſh to ſee them. Theſe mills may be adapted to be worked either by rivulets or the wind: in the latter caſe they may be erected on the ſtem of a ſtanding tree, or the gable end or corner of a houſe, barn, or other building, in any of which ſituations the whole apparatus for grinding, &c. may be contained within the attic or other room.

The price of the above mills, adapted to gable ends, to work only one pair of grey ſtones, of not more than thirty inches diameter, is thirty-five guineas; if with a preparation for other machinery three guineas more. Thoſe to be erected on the ground, adapted either for wind or water, will be from forty-five to ſixty guineas; and if two pair of ſtones, dimenſions as above, from fifteen to twenty guineas extra; if of larger ſizes, the price will advance in proportion.

The mills on the ground may be made either portable or immoveable, on poſts, and when boarded forms a complete houſe, under the works, for the miller, and a receptacle for his flour.

Theſe mills, according to the ſize of the ſtones, will turn off as much work as any mills on the old conſtruction. The prices mentioned are excluſive of any water-works, carriage, or fixing.

CORNARIUS, or Haguenbot (John), a celebrated German phyſician, born at Zwickow in Saxony. His preceptor made him change his name of Haguenbot to that of Cornarius, under which he is moſt known. At twenty years of age he taught grammar, and explained the Greek and Latin poets and orators to his ſcholars; and at twenty-three, was licentiate in medicine. He found fault with moſt of the remedies provided by the apothecaries; and obſerving, that the greateſt part of the phyſicians taught their pupils only what is to be found in Avicenna, Rhaſes, and the other Arabian phyſicians, he carefully ſought for the writings of the beſt phyſicians of Greece, and employed about fifteen years in tranſlating them into Latin, eſpecially the works of Hippocrates, Aëtius, Æginetus, and a part of thoſe of Galen. Meanwhile he practiſed phyſic with reputation at Zwickow, Francfort, Marburg, Nordhauſen, and Gena, where he died of an apoplexy in 1558, aged fifty-eight. He alſo wrote ſome medicinal treatiſes; publiſhed editions of ſome poems of the ancients on medicine and botany; and tranſlated ſome of the works of the fathers, particularly thoſe of Baſil, and a part of thoſe of Epiphanius.

CORNET, a caſtle on the iſland of Guernſey. Long. 2. 40. W. Lat. 49. 30. N.

CORNETO, a town of Italy, in the patrimony of St. Peter, with a biſhop's ſee, ſeated on the river Marta, three miles E. of the ſea, and thirty-ſeven N.W. of Rome. Long. 11. 53. E. Lat. 42. 15. N.

CORNUS (*Encycl.*). The ſecond ſpecies, namely, the *cornus ſanguinea*, bloody-twig, or common dog-wood, hath been found capable of yielding an oil applicable to ſome uſeful purpoſes. The following account is taken from the Annales de Chimie.

"The *cornus ſanguinea* of Linnæus," ſays Citizen Marqueron, of Straſburg, who writes that article, "is a ſhrub ſo much eſteemed by ornamental gardeners, for embelliſhing clumps of trees, both on account of its beautiful form, and the fine red colour which its branches and leaves aſſume towards the cloſe of the ſummer, bears a berry, which, when ripe, is of a blackiſh colour, whoſe utility, both for the purpoſes of medicine and the arts, has never hitherto been properly eſtimated.

"The greaſy unctuous appearance which theſe berries exhibit when cruſhed between the fingers, led me to imagine that they might contain an oil, which certainly muſt poſſeſs ſome uſeful properties. Well perſuaded of this truth, that none of nature's productions are without their uſe, I prevailed upon Citizen Chevreuſe, botanical gardener at Molſheim, in the department of the Lower Rhine, where this ſhrub grows in great abundance, to collect a quantity of its berries.

"Ten kilogrammes of theſe berries were collected and ſpread out in a garret, not for the purpoſe of drying them, but in order that they might acquire a ſofter conſiſtence: in this ſtate they were reduced to a paſte, and ſubjected to the preſs, where, without the application of heat, two litres were obtained, of a greaſy unctuous liquid, poſſeſſing a degree of viſcidity ſimilar to that of oil, of a green, though very pellucid, colour; it was perfectly homogeneous, and exhibited all the phyſical properties of a real oil, without poſſeſſing either a diſagreeable ſmell or taſte, which determined Citizen Chevreuſe and me to eat a ſallad prepared with it, which we did ſeveral times without experiencing any bad effects from it. Theſe properties, however, not being ſufficient to demonſtrate that this liquid was really an oil, I undertook the taſk of ſubjecting it to various experiments, of which the reſult is as follows:

"A drop of this oily liquid, when let fall into a veſſel filled with water, extended itſelf over its ſurface in a very fine pellicle, which reflected the priſmatic colours.

"Wiſhing to know whether it were poſſible to deprive this oily ſubſtance of its green colour, I waſhed it with cold and hot water, the water being charged with ſulphate of alumine, powdered ſlate, charcoal-powder, &c. All theſe different means were of no effect, the liquids above mentioned did not receive any new tinge, and the green colour of the oil remained always the ſame.

"Alcohol was alſo employed. This menſtruum having aſſumed a greeniſh tinge, I imagined that I ſhould be able thereby to extract the colouring matter of the oily liquid; for which purpoſe I added a portion of this alcohol, tinged as above mentioned, to a certain quantity of water. The mixture immediately became white, and ſome drops of oil ſwam at the top. I evaporated, in a diſtilling apparatus, another portion of this coloured alcohol: the alcohol which I thus obtained was colourleſs, and there remained behind a quantity of oil, of the ſame colour as before: the alcohol therefore owed its colour only to the ſolution of a portion of the oil, and not to the ſeparation of the colouring principle.

"Sulphur combined completely with this oil: with the aid of caloric, there reſulted from this combination a real balſam of ſulphur, of a fine deep red colour, verging upon the brown and of an extremely fetid ſmell.

" Potaſh, ſoda, and ammonia, formed with this oil real ſoaps, poſſeſſing different degrees of ſolidity.

" The concentrated ſulphuric acid, combined with this oil, produced a real acid ſoap, of a yellowiſh colour, and the appearance of a reſin.

" The nitric and muriatic acids exhibited no perceptible operation upon the oil, when applied to it in the cold way, excepting that they aſſumed a ſlight greeniſh tinge.

" Nitric acid, when heated with this oil, cauſed it to aſſume a ſolid conſiſtence, and a yellow colour, perfectly reſembling that of yellow pomatum; during the ebullition there took place a conſiderable ſwelling in the maſs, an extrication of nitrous gas, &c. The theory of this operation being perfectly well known, it will be unneceſſary to explain it in this place.

" Not having been able to procure nitrous acid, it was impracticable for me to aſcertain the inflammability of this oil by the acids.

" By boiling for ſome time upon litharge, this oil acquired the ſiccative property, which rendered it fit for being employed in painting, a property which it poſſeſſed before its oxygenation, but in a leſs degree than afterwards.

" By continuing the ebullition, the oxyde of lead was diſoxydated, and entirely diſſolved; and the mixture acquired a conſiſtence and brown colour, perfectly reſembling that of the brown diachylon (*onguent de la mère*).

" I repeated the ſame experiment, taking care to add water, and conſtantly ſtir the liquid, in the manner which is practiſed in preparing the *diapalma* plaſter; by which means I obtained a ſubſtance of a good conſiſtence, and a colour perfectly reſembling that of the *Empl. de vigo cum mercurio:* this colour having made me believe that I had failed to obtain a plaſter, which I imagined ought to be of a whitiſh colour, I repeated the experiment ſeveral times with all poſſible attention; and every time I obtained a plaſter of the ſame colour. The theory of plaſters having been very well explained by Citizen Deyeux, it may be diſpenſed with in this place. I expoſed a quantity of this oil to the contact of the atmoſpherical air: after ſome time it was found to have acquired a ſomewhat greater degree of conſiſtence.

" The ſame experiment was repeated, but with the addition of water, and the obſervance of all the precautions directed by Citizen Berthollet: at the end of a month the oil had acquired a ſolid conſiſtence, and a white colour, ſimilar to that of wax.

" Wiſhing, finally, to know of what utility this oil might be for domeſtic purpoſes, I poured it into a lamp with cotton wicks, which being lighted threw out a bright light, without any perceptible ſmoke or ſmell: the ſame lamp, with wicks of the ſame kind, was ſucceſſively filled with oil of olives and rape ſeed oil; the latter burnt two hours, the olive-oil two hours and a quarter, and the oil of the *cornus ſanguinea* two hours and a half.

" If we add to theſe facts, the property of congealing, which belongs to this oil, we ſhall have all the characters of the oil of the *cornus ſanguinea*.

" From theſe experiments, which are all that I have had it in my power to make, I am authoriſed to conclude, that the oily juice obtained by expreſſion from the *cornus ſanguinea* is a real oil, poſſeſſing certain properties that may render it uſeful in the arts, commerce, and perhaps in medicine. I alſo think that it ought to be placed, according to Fourcroy's principles, in the ſecond claſs, which comprehends the ſiccative oils, which ſpeedily grow thick, are not congealed by the action of the cold, take fire with nitrous acid alone, and form with ſulphuric acid reſinous compoſitions.

CORO, a town of South America, in Terra Firma, ſeated at the bottom of the gulf of Venezuela, 50 miles W. of La Guaira. Long. 70. 0. W. Lat. 11. 0. N.

COROMANDEL (*Encycl.*). This eaſtern coaſt of the peninſula on this ſide the Ganges, is bounded on the north by Golconda, on the eaſt by the bay of Bengal, on the ſouth by Madura, and on the weſt by Biſnagar. This coaſt ſo much reſembles that of Orixa, that the Abbé Raynal chooſes to conſider them as one, and gives to both the general name of *Coromandel*. Here an exceſſive heat reigns from the beginning of May to the end of October. It begins at nine in the morning, and continues till nine in the evening. During the night it is allayed by a ſea-breeze from the ſouth-eaſt; and moſt commonly this refreſhing gale begins at three in the afternoon. The air is leſs inflamed during the reſt of the year, though in all ſeaſons it is very hot. It rains almoſt continually during the months of November and December. This immenſe tract is covered with a parched ſand for the extent of two miles, and ſometimes only one mile along the coaſt.

This country was at firſt neglected by the Europeans for many reaſons. It was ſeparated by inacceſſible mountains from Malabar, where theſe bold adventurers endeavoured to ſettle themſelves. Spices and aromatics, which were the principal objects of their attention, were not to be found there. In ſhort, civil diſſenſions had baniſhed from it tranquillity, ſecurity, and induſtry. At that period the empire of Biſnagar, to which this vaſt country was ſubject, was falling to ruin. The governments of Viſapour, the Carnatic, Golconda, and Orixa, threw off their dependence, and aſſumed the title of kings. Thoſe of Madura, Tanjore, Myſore, Gingi, and ſome others, likewiſe uſurped the ſovereign authority, though they retained their ancient title of *Naick*. This revolution had juſt happened when the Europeans appeared on the coaſt of Coromandel. The foreign trade was at that time inconſiderable; it conſiſted only of diamonds from Golconda, which were carried to Calicut and Surat, and from thence to Ormus or Suez, whence they were circulated through all Europe and Aſia. Maſſulipatan, the richeſt and moſt populous city of theſe countries, was the only market that was known for linens; they were purchaſed at a great fair annually holden there by the Arabian and Malayan veſſels that frequented that bay, and by caravans arrived from diſtant parts. The linens were exported to the ſame places with the diamonds. The fondneſs for the manufactures of Coromandel which began to prevail here, inſpired all the European nations trading to the Indian ſeas with the reſolution of forming ſettlements there. They were not diſcouraged either by the difficulty of conveying goods from the inland parts of the country, where there was no navigable river; by the total want of harbours, where the ſea, at one ſeaſon of the year, is not navigable; by the barrenneſs of the coaſts, for the moſt part uncultivated and uninhabited; or by the tyranny and fluctuating ſtate of the government. They thought that ſilver would be induſtriouſly ſought after; that Pegu would furniſh timber for building, and Bengal, corn for ſubſiſtence; that a proſperous voyage of nine months would be more than ſufficient to complete their ladings; and that by fortifying themſelves they ſhould be ſecure againſt the attacks of the weak tyrants that oppreſſed theſe countries.

The firſt European colonies were eſtabliſhed near the ſhore. Some of them obtained a ſettlement by force: moſt of them were formed with the conſent of the ſovereigns; and all were confined to a very narrow tract of land. The boundaries of each were marked out by a hedge of thorny plants, which was their only defence. In proceſs of time fortifications were raiſed; and the ſecurity derived from them, added to the lenity of the government, ſoon increaſed the number of coloniſts. The ſplendor and independence of theſe ſettlements ſeveral times raiſed the jealouſy of the princes in whoſe dominions they were formed; but their attempts to demoliſh

them proved abortive. Each colony increaſed in proſperity in proportion to the riches and the wiſdom of the nation that founded it. None of the companies that exerciſed an excluſive privilege beyond the Cape of Good Hope had any concern in the trade of diamonds. This was always left to private merchants, and by degrees fell entirely into the hands of the Engliſh, or the Jews and Armenians that lived under their protection. At preſent this grand object of luxury and induſtry is much reduced. The revolutions that have happened in Indoſtan have prevented people from reſorting to theſe rich mines; and the anarchy in which this unhappy country is plunged, leaves no room to hope that they will be again attended to. The whole of the commercial operations on the coaſt of Coromandel is confined to the purchaſe of cottons. The manufacturing of the white cottons bought there, differs ſo little from ours, that it would be neither intereſting nor inſtructive to enter into a minute deſcription of it. The proceſs uſed in making their printed cottons, which was at firſt ſervilely followed in Europe, has ſince been rendered more ſimple, and brought to greater perfection by our manufacturers. The painted cottons which are bought there, we have not yet attempted to imitate. Thoſe who imagine we have been prevented from undertaking this branch merely by the high price of labour among us, are miſtaken. Nature has not given us the wild fruits and drugs neceſſary for the compoſition of thoſe bright and indelible colours which conſtitute the principal merit of the Indian manufactures; nor has ſhe furniſhed us with the waters that ſerve to fix them. The Indians do not univerſally obſerve the ſame method in painting their cottons; either becauſe there are ſome niceties peculiar to certain provinces, or becauſe different ſoils produce different drugs for the ſame uſes. We ſhould tire the patience of our readers were we to trace the ſlow and painful progreſs of the Indians in the art of painting their cottons. It is natural to believe that they owe it to length of time, rather than to the fertility of their genius. What ſeems to authoriſe this conjecture is, that they have ſtopped in their improvements, and have not advanced a ſingle ſtep in the arts for many ages; whereas we have proceeded with amazing rapidity. Indeed, were we to conſider only the want of invention in the Indians, we ſhould be tempted to believe, that, from time immemorial, they have received the arts they cultivate from ſome more induſtrious nation; but when it is remembered that theſe arts have a peculiar dependence on the materials, gums, colours, and productions of India, we cannot but be convinced that they are natives of that country. It may appear ſomewhat ſurpriſing that cottons painted with all ſorts of colours ſhould be ſold at ſo moderate a price, that they are almoſt as cheap as thoſe that have only two or three. But it muſt be obſerved, that the merchants of the country ſell to all the companies a large quantity of cottons at a time; and that the demand for cottons painted with various colours makes but a ſmall article in their aſſortments, as they are not much eſteemed in Europe.

Though cottons of all ſorts are in ſome degree manufactured throughout the whole country of Indoſtan, which extends from Cape Cormorin to the banks of the Ganges; it is obſervable, that the fine ſorts are made in the eaſtern parts, the common ones in the centre, and the coarſe ones in the moſt weſtern parts. Manufactures are eſtabliſhed in the European colonies, and upon the coaſt: they are more frequent at the diſtance of five or ſix leagues from the ſea, where cotton is more cultivated, and proviſions are cheaper. The purchaſes made there are carried 30 or 40 leagues further into the country. The Indian merchants ſettled in the European factories have always the management of this buſineſs. The quantity and quality of the goods wanted are ſettled with theſe people: the price is fixed according to the patterns; and, at the time the contract is made, a third or a fourth part of the money agreed on is advanced. This arrangement is owing to the neceſſity theſe merchants themſelves are under of advancing money to the workmen, by the partners or agents who are diſperſed through the whole country; of keeping a watchful eye upon them, for fear of loſing what they have advanced; and of gradually leſſening the ſum, by calling for the cottons as faſt as they are worked off. Without theſe precautions, nothing could be depended on in an oppreſſive government, where the weaver cannot work on his own account, either becauſe his circumſtances will not permit, or becauſe he dares not venture to diſcover them for fear of exactions. The companies that have either ſucceſs, or good management, conſtantly keep the ſtock of one year in advance in their ſettlements. By this method they are ſure of having the quantity of goods they have occaſion for, and of the quality they chooſe, at the moſt convenient time: not to mention that their workmen and their merchants, who are kept in conſtant employment, never leave them. Such nations as want money and credit cannot begin their mercantile operations till the arrival of their ſhips. They have only five or ſix months at moſt to execute the orders ſent from Europe. The goods are manufactured and examined in haſte; and they are even obliged to take ſuch as are known to be bad, and would be rejected at any other time. The neceſſity they are under of completing their cargoes, and fitting out their veſſels before hurricanes come on, leaves no room for nicety of inſpection. It would be a miſtake to imagine that the country agents could be prevailed upon to order goods to be made on their account, in hopes of ſelling them without a reaſonable advantage to the company with whom they are engaged. For, beſides that the generality of them are not rich enough to embark in ſo large an undertaking, they would not be certain of finding their account in it. If the company that employ them ſhould be hindered by unforeſeen accidents from ſending the uſual number of ſhips, theſe merchants would have no vent for their commodities. The Indians, the form of whoſe dreſs requires different breadths and lengths from thoſe of the cottons fabricated for our uſe, would not purchaſe them; and the other European companies would be provided, or certain of being provided, with whatever the extent of their trade required, and their money enabled them to purchaſe. The plan of procuring loans, which was contrived to remedy this inconvenience, never has, nor can be uſeful. It has been a cuſtom, time immemorial, in Indoſtan, for every citizen who borrows money, to give a written inſtrument to his creditor. This deed is of no force in a court of judicature, unleſs it is ſigned by three witneſſes, and bears the day of the month, and the year when it was made, with the rate of intereſt agreed upon by the parties. If the borrower fails to fulfil his engagements, he may be arreſted by the lender himſelf. He is never impriſoned, becauſe there is no fear of his making his eſcape. He would not even eat, without obtaining leave of his creditor. The Indians make a three-fold diviſion of intereſt: one kind they call *vice*; another neither *vice* nor *virtue*; and a third, they ſay, is *virtue*. The firſt is four *per cent.* a month; the ſecond two; and the third one. The laſt is, in their opinion, an act of beneficence that only belongs to the moſt heroic minds. Yet, though the Europeans, who are forced to borrow, meet with this treatment, it is plain they cannot avail themſelves of the indulgence without being involved in ruin.

The foreign trade of Coromandel is not in the hands of the natives. In the weſtern part, indeed, there are Mahomedans known by the name of *Chalias*, who, at Naour, and Porto-Nuovo, ſend out ſhips to Acken, Merguy, Siam, and the Eaſtern coaſt. Beſides veſſels of conſiderable burthen employed in theſe voyages, they have ſmaller embarkations for the coaſting trade for Ceylon, and the pearl fiſhery. The Indians of

Maſſulipatan turn their attention another way. They import from Bengal white calicoes, which they dye or print, and ſell them again at the places from whence they had them, at 35 or 40 per cent. advantage. Excepting theſe tranſactions, which are of very little conſequence, the whole trade is veſted in the Europeans, who have no partners but a few Banians and Armenians ſettled in their colonies. The quantity of calicoes exported from Coromandel to the different ports of India, may be computed at 3500 bales. Of theſe the French carry 800 to Malabar, Mocha, and the Iſle of France; the Engliſh, 1200 to Bombay, Malabar, Sumatra, and the Philippine Iſlands; and the Dutch 1500 to their different ſettlements. Except 500 bales deſtined for Manila, each of the value of 100 guineas, the others are of ſuch an ordinary kind that they do not exceed 30 guineas at prime coſt; ſo that the whole number of bales do not amount to more than about 150,000l.

Coromandel furniſhes Europe with 9500 bales; 800 of which are bought by the Danes, 2500 by the French, 3000 by the Engliſh, and 3200 by the Dutch. A conſiderable part of theſe calicoes are dyed blue, or ſtriped blue and red for the African trade. The others are fine muſlins, printed callicoes, and handkerchiefs from Naſſulipatan, or Paliacate. It is proved by experience that each of theſe bales coſts only about 42l. ſterling; conſequently they ought to bring in to the manufactory where they are wrought, near 360,000l. The payments are not entirely made in ſpecie, either in Europe or Aſia; we give in exchange, cloths, iron, lead, copper, coral, and ſome other articles of leſs value. On the other hand, Aſia pays with ſpices, pepper, rice, ſugar, corn, and dates. All theſe articles taken together may amount to about 210,000l.; and from this calculation it follows, that Coromandel receives annually from Europe about 300,000l. in money. The Britiſh, who have acquired the ſame ſuperiority on this coaſt that they have elſewhere, have formed on it ſeveral ſettlements.

CORON, a ſea-port of Turkey in Europe, in the Morea. It is ſeated on a bay, 15 miles S.E. of Modon. Long. 21. 50. E. Lat. 36. 50. N.

CORPORATION (*Encycl.*). Having in that article noticed the ſeveral ſpecies of corporations, we here purpoſe to conſider, 1. How corporations in general may be created. 2. What are their powers, capacities, and incapacities. And, 3. How they may be diſſolved. We ſhall in this follow Judge Blackſtone.

I. Corporations, by the civil law, ſeem to have been created by the mere act, and voluntary aſſociation, of their members; provided ſuch convention was not contrary to law, for then it was *illicitum collegium*. It does not appear that the prince's conſent was neceſſary to be actually given to the foundation of them; but merely that the original founders of theſe voluntary and friendly ſocieties (for they were little more than ſuch) ſhould not eſtabliſh any meetings in oppoſition to the laws of the ſtate.

But in England the king's conſent is abſolutely neceſſary to the erection of any corporation, either implied or expreſsly given*. The king's implied conſent is to be found in corporations which exiſt by force of the common law, to which our former kings are ſuppoſed to have given their concurrence; common law being nothing elſe but cuſtom, ariſing from the univerſal agreement of the whole community. Of this ſort are the king himſelf, all biſhops, parſons, vicars, churchwardens, and ſome others; who, by common law, have ever been held (as far as our books can ſhew us) to have been corporations, *virtute officii*: and this incorporation is ſo inſeparably annexed to their offices, that we cannot frame a complete legal idea of any of theſe perſons, but we muſt alſo have an idea of a corporation, capable to tranſmit his rights to his ſucceſſors, at the ſame time. Another method of implication, whereby the king's conſent is preſumed, is as to all corporations by preſcription, ſuch as the city of London, and many others, which have exiſted as corporations, time whereof the memory of man runneth not to the contrary; and therefore are looked upon in law to be well created. For though the members thereof can ſhew no legal charter of incorporation, yet, in caſes of ſuch high antiquity the law preſumes there once was one; and that by the variety of accidents which a length of time may produce, the charter is loſt or deſtroyed. The methods by which the king's conſent is expreſsly given, are either by act of parliament or charter. By act of parliament, of which the royal aſſent is a neceſſary ingredient, corporations may undoubtedly be created: but it is obſervable, that moſt of thoſe ſtatutes which are uſually cited as having created corporations, do either confirm ſuch as have been before created by the king: as in the caſe of the college of phyſicians, erected by charter 10 Hen. VIII. which charter was afterwards confirmed in parliament; or, they permit the king to erect a corporation *in futuro* with ſuch and ſuch powers; as is the caſe of the bank of England, and the ſociety of the Britiſh fiſhery. So that the immediate creative act is uſually performed by the king alone, in virtue of his royal prerogative.

All the other methods therefore whereby corporations exiſt, by common law, by preſcription, and by act of parliament, are for the moſt part reducible to this of the king's letters patent, or charter of incorporation. The king's creation may be performed by the words "creamus, erigimus, fundamus, incorporamus," or the like. Nay it is held, that if the king grants to a ſet of men to have *gildam mercatoriam*, "a mercantile meeting or aſſembly," this is alone ſufficient to incorporate and eſtabliſh them for ever.

The king (it is ſaid) may grant to a ſubject the power of erecting corporations, though the contrary was formerly held: that is, he may permit the ſubject to name the perſons and powers of the corporation at his pleaſure; but it is really the king that erects, and the ſubject is but the inſtrument: for though none but the king can make a corporation, yet *qui facit per alium, facit per ſe*. In this manner the chancellor of the univerſity of Oxford has power by charter to erect corporations; and has actually often exerted it in the erection of ſeveral matriculated companies, now ſubſiſting, of tradeſmen ſubſervient to the ſtudents.

When a corporation is erected, a name muſt be given to it; and by that name alone it muſt ſue, and be ſued, and do all legal acts.

II. After a corporation is ſo formed and named, it acquires many powers and rights, which we are next to conſider. Some of theſe are neceſſarily and inſeparably incident to every corporation; which incidents, as ſoon as a corporation is duly erected, are tacitly annexed of courſe. As, 1. To have perpetual ſucceſſion. This is the very end of its incorporation: for there cannot be a ſucceſſion for ever without an incorporation; and therefore all aggregate corporations have a power neceſſarily implied of electing members in the room of ſuch as go off. 2. To ſue, or be ſued, implead, or be impleaded, grant or receive, by its corporate name, and do all other

* Cities and towns were firſt erected into corporate communities on the Continent, and endowed with many valuable privileges, about the 11th century (Robertſ. Cha. V. i. 30); to which the conſent of the feodal ſovereign was abſolutely neceſſary, as many of his prerogatives and revenues were thereby conſiderably diminiſhed.

acts as natural persons may. 3. To purchase lands, and hold them, for the benefit of themselves and their successors: which two are consequential to the former. 4. To have a common seal. For a corporation, being an invisible body, cannot manifest its intentions by any personal act or oral discourse: it therefore acts and speaks only by its common seal. For, though the particular members may express their private consents to any act, by words, or signing their names, yet this does not bind the corporation: it is the fixing of the seal, and that only, which unites the several assents of the individuals, who compose the community, and makes one joint assent of the whole. 5. To make by-laws or private statutes for the better government of the corporation; which are binding upon themselves, unless contrary to the laws of the land, and then they are void. But no trading company is with us allowed to make by-laws, which may affect the king's prerogative, or the common profit of the people, under penalty of 40l. unless they be approved by the chancellor, treasurer, and chief justices, or the judges of assize in their circuits: and, even though they be so approved, still, if contrary to law, they are void. These five powers are inseparably incident to every corporation, at least to every corporation *aggregate*: for two of them, though they may be practised, yet are very unnecessary to a corporation *sole*: *viz.* to have a corporate seal to testify his sole assent, and to make statutes for the regulation of his own conduct.

Corporations have a capacity to purchase lands for themselves and successors; but they are excepted out of the statute of wills; so that no devise of lands to a corporation by will is good; except for charitable uses, by statute 43 Eliz. c. 4. which exception is again greatly narrowed by the statute 9 Geo. II. c. 36. And also, by a great variety of statutes, their privilege even of purchasing from any living granter, is much abridged; so that now a corporation, either ecclesiastical or lay, must have a licence from the king to purchase, before they can exert that capacity which is vested in them by the common law: nor is even this in all cases sufficient. These statutes are generally called the statutes of *mortmain*. See MORTMAIN.

The general duties of all bodies politic, considered in their corporate capacity, may, like those of natural persons, be reduced to this single one;—that of acting up to the end or design, whatever it be, for which they were created by their founder.

III. How corporations may be dissolved. Any particular member may be disfranchised, or lose his place in the corporation, by acting contrary to the laws of the society, or the laws of the land: or he may resign it by his own voluntary act. But the body politic may also itself be dissolved in several ways: which dissolution is the civil death of the corporation: and in this case their lands and tenements shall revert to the person, or his heirs, who granted them to the corporation: for the law doth annex a condition to every such grant, that if the corporation be dissolved, the granter shall have the lands again, because the cause of the grant faileth. The grant is indeed only during the life of the corporation; which may endure for ever: but, when that life is determined by the dissolution of the body politic, the granter takes it back by reversion, as in the case of every other grant for life. The debts of a corporation, either to or from it, are totally extinguished by its dissolution; so that the members thereof cannot recover, or be charged with them, in their natural capacities: agreeably to that maxim of the civil law, "*si quid universitati debetur, singulis non debetur; nec, quod debet universitas, singuli debent.*"

A corporation may be dissolved, 1. By act of parliament, which is boundless in its operations. 2. By the natural death of all its members, in cases of an aggregate corporation. 3. By surrender of its franchises into the hands of the king, which is a kind of suicide. 4. By forfeiture of its charter, through negligence or abuse of its franchises; in which case the law judges that the body politic has broken the condition upon which it was incorporated, and thereupon the incorporation is void. And the regular course is to bring an information in nature of a writ of *quo warranto*, to enquire by what warrant the members now exercise their corporate power, having forfeited it by such and such proceedings. The exertion of this act of law, for the purposes of the state, in the reigns of King Charles and King James II. particularly by seizing the charter of the city of London, gave great and just offence; though, perhaps, in strictness of law, the proceedings in most of them were sufficiently regular: but the judgment against that of London was reversed by act of parliament after the revolution; and by the same statute it is enacted, that the franchises of the city of London shall never more be forfeited for any cause whatsoever. And, because by the common law corporations were dissolved, in case the mayor or head officer was not duly elected on the day appointed in the charter, or established by prescription, it is now provided, that for the future no corporation shall be dissolved upon that account; and ample directions are given for appointing a new officer, in case there be no election, or a void one, made upon the charter or prescriptive day.

CORRADINI *de Sezza* (Peter Marcelinus), a learned civilian and cardinal, born at Sezza in 1658, acquired the esteem and confidence of Clement XI. and died at Rome in 1743. He was the author of a learned and curious work entitled Verus Latium profanum & sacrum, 2 vols. folio; and a history of Sezza, in 4to.

CORRADO (Sebastian), an Italian grammarian of the 16th century, taught the Greek and Latin tongues at Reggio, where he formed an academy of polite literature; and at length removed to Bologna, in order to be professor of those languages. He wrote several works, the most esteemed of which are, Questura in qua Ciceronis Vita refertur, an excellent performance; and, De Linguâ Latinâ. He died in 1556.

CORREGIO, a town of Italy, capital of a territory of the same name, in the duchy of Modena, with a castle, 9 miles N.E. of Reggio. Long. 11. 12. E. Lat. 44. 46. N.

CORREZE, a department of France, containing the late province of Limosin. Tulles is the capital.

CORSHAM, or COSHAM, a town in Wilts. The Saxon king, Ethelred, had a palace here. Edmund earl of Cornwall, in the reign of Edward I. obtained a charter for a market; and the inhabitants still enjoy some privileges granted them by Richard, his predecessor. Their chief support is the woollen manufacture, here being some considerable clothiers. This place is four miles S.W. of Chippenham.

CORSICA, an island in the Mediterranean, 88 miles in length, and 40 in breadth. The air is unwholesome, and the land hilly, full of stones, and poorly cultivated; however, the valleys produce wheat, and the hills, olives, figs, grapes, almonds, and chesnuts. They have horses also, of a fiery nature. There are mines of iron, and a great deal of fish and coral on the coast. In the middle, is the mountain Gradaccio, where there are two lakes near each other, whence proceed the two principal rivers. A ridge of mountains divides the island into two parts, the N. and S. The capital is Bastia. It belonged to the Genoese; but the natives having been for many years in revolt against them, that

ſtate ſurrendered its right to France, of which Corſica is now a department. Long. 9. 0. E. Lat. 42. 0. N.

CORSOER, a town of Denmark, on the W. ſide of the Iſle of Zealand, on a ſmall peninſula, on the Great Belt, which ſeparates Zealand from Funen. It has a good harbour for light veſſels, and is defended by a citadel. Long. 11. 12. E. Lat 55. 12. N.

CORSTORPHIN, a village of Scotland, three miles W. of Edinburgh, ſituated on the declivity of a beautiful hill, and noted for its cream.

CORTE, a town of Corſica, with a ſtrong caſtle, 27 miles S.W. of Baſtia.

CORTIS, a town of Germany, in the biſhopric of Liege, 10 miles N.E. of Ramillies. Long. 4. 59. E. Lat. 50. 46. N.

CORVO, the ſmalleſt iſland of the Azores, having only about 600 inhabitants, who cultivate wheat and feed hogs. Long. 31. 5. W. Lat. 39. 42. N.

CORYATE (Thomas), a very extraordinary perſonage, who ſeems to have made himſelf famous by his whimſical extravagancies, was the ſon of a clergyman, and born at Oldcombe in Somerſetſhire in 1577. He acquired Greek and Latin at Oxford; and coming to London, was received into the houſehold of Henry prince of Wales. If Coryate was not over-witty himſelf, he got acquainted with the wits of that time, and ſerved to exerciſe their abilities, having more learning than judgment. He was a great peripatetic; for, in 1608, he took a long journey on foot; and after he returned, publiſhed his travels under the following ſtrange title, *Crudities haſtily gobbled up in five months Travels in France, Savoy, Italy, Rhetia, Helvetia, ſome parts of High Germany, and the Netherlands*, Lond. 1611, 4to. In 1612 he ſet out again, with a reſolution to ſpend ten years in travelling: he went firſt to Conſtantinople; and after travelling over a great part of the Eaſt, died of a flux at Surat in the Eaſt-Indies. Some of the accounts of his peregrinations are to be found in the accounts of Purchas's Pilgrimages.

CORYVREKAN, a dangerous whirlpool on the W. coaſt of Scotland, between the iſle of Scarba and the N. point of that of Jura. It is ſo named from a young Daniſh prince, who periſhed in this place. As the tide advances, this unfathomable gulf, of which the dreadful vortex extends above a mile in circuit, begins to boil up; and, at full ſea, its numerous eddies form watery pyramids, which riſe into the air, and burſting with the noiſe of thunder, whiten the ſubjacent waves with foam. Many ſmaller whirlpools and rapid currents are found in the neighbourhood; dangerous, however, to thoſe only who are ſtrangers to the coaſt.

COSLIN, a town of Germany, in Pruſſian Pomerania, 10 miles E. of Colberg.

COSNE, a town of France, in the department of Nievre, and late province of Nivernois. Anchors for ſhips are forged here; and its cutlery and gloves are much eſteemed. It is ſeated at the confluence of the Loire and Noain, 88 miles S. of Paris. Long. 3. 6. E. Lat. 47. 23. N.

COSSIMBAZAR, a ſmall city of Hindooſtan Proper, in Bengal. It has been at all times the reſidence of the different European factors; this being the centre of their trade. It is ſeated on an iſland in the weſtern arm of the Ganges, 110 miles N. of Calcutta. Long. 85. 22. E. Lat. 23. 40. N.

COSTAGNAZZAR, the higheſt mountain of Turkey in Europe, in Romania, anciently called Hæmus.

COSTUME (*Encycl.*). Thoſe antiquaries who have treated of the ancient Iriſh *coſtume*, ſhould have conſulted the old French ſatiriſt, the Sieur d'Auvray, in whoſe work, entitled the Banquet des Muſes, ou Recueil de toutes les Satyres, Yambes, Macarades, &c." (Rouen, duod. 1623), among many other curious paſſages, are the following alluſions to the *mantles* of the true or aboriginal Hibernians:

> " Il jugeoit à l'œil et au pas
> Les filles d'amoreux appas,
> Comme les Laquais aux mandilles,
> Aux mantes les vrays Irelandois,
> Aux chapeaux longs les Albanois,
> Et les Eſpagnols aux roupilles."—p. 324.
>
> " Un chapelet pour avoir bonne grace,
> Un peliſſon, un capot d' Ilandois," &c.—p. 336.

On the ſubject of our old Engliſh dreſſes, one of the moſt curious paſſages we recollect, is to be found in a work where few readers would expect it:—Fuller's Piſgah-Sight of Paleſtine: folio, 1662; book 4. ch. 6. Speaking of the various habits and ornaments of the Jews, he noticed the changes they underwent, and in a digreſſion, ſays, " For inſtance, it would poſe a good antiquary to deſcribe the exact faſhion of *harlots, gits, haketons, paltocks, tabards, court-pies, chevefailes*, and *gipſers*: barbarous names, which may ſeem to carry a ſpell or conjuration in the mention of them. Yet all theſe were kinds of garments commonly uſed in England, ſome four hundred years ago. Yea, pride, playing in all ages upon conceited opinions of decency, hath infinitely varied the faſhion of all apparel; cuſtome of our anceſtors appearing antick to us, as our faſhion (perchance) will ſeem incredible to poſterity. Who would believe that ever our Engliſh, ſome four hundred yeares ſince, wore ſhooes ſnouted and picked more than a finger long, crooking upwards (called crackowes), reſembling the devil's clawes, which were faſtened to the knees with chains of gold, and ſilver? Or, that about the reign of King Henry the Fifth, men grew ſo exceſſive in that kind, that it was fain to be ordered by proclamation, that none *ſhould wear* their ſhooes *broader at the toes than ſix inches?*"

COTE D'OR, a department of France, containing part of the late province of Burgundy. Dijon is the capital.

COTELERIUS (John-Baptiſt), fellow of the Sorbonne, and king's Greek profeſſor, was born at Niſmes in Languedoc in 1627. He made a collection of the fathers who lived in the apoſtolic age, which he publiſhed at Paris in two volumes folio in 1672; all reviewed and corrected from ſeveral MSS. with a Latin tranſlation and notes. He alſo publiſhed *Monumenta Eccleſiæ Græcæ*, in 3 vols. being a collection of Greek tracts out of the king's and M. Colbert's libraries, and which had never been publiſhed before: to theſe he added a Latin tranſlation and notes. He intended a further proſecution of this work; but his intenſe ſtudies broke his conſtitution, and deprived him of life in 1686. Beſides his great ſkill in languages and eccleſiaſtical antiquities, Cotelerius was remarkable for his probity and candour.

COTES (Roger), an excellent mathematician of the 18th century. He early diſcovered an inclination to the mathematics; and, at 17 years of age, was admitted a penſioner of Trinity College, Cambridge. In 1706 he was appointed profeſſor of aſtronomy in the profeſſorſhip founded by Dr. Plume, archdeacon of Rocheſter, being choſen the firſt in that chair for his great merit and learning. In the year 1713, at the requeſt of Dr. Richard Bentley, he publiſhed at Cambridge, in quarto, a ſecond edition of Sir Iſaac Newton's "Principia," with all the improvements which the author had annexed thereto; to which he prefixed an excellent *Preface*. He prepared ſeveral uſeful books for the public; and wrote *A Deſcription of the great Meteor* which appeared on the 6th of March, 1716, publiſhed

in the Philoſophical Tranſactions. He lived but a little while to carry on the diſcourſes for which he was eminently qualified: dying in the prime of his age in 1716, to the great regret of all the lovers of the ſciences.

COTES DU NORD, a department of France, ſo named from its northerly maritime poſition, and containing part of the late province of Bretagne. St. Brieux is the capital.

COTTAGER, the loweſt deſcription of peaſant in England; ſo called from his uſual reſidence being in a COT, or COTTAGE, ſituated on ſome waſte, or by the road ſide.

During the late ſcarcity, various efforts were made by the ſociety in London for bettering the condition of the poor (ſee SOCIETY, *Supp.*), to aſſiſt this uſeful claſs of agricultural labourers, many of whom were burthened with large families. From their REPORTS we extract the following account of a cottage and garden near Tadcaſter, by Thomas Barnard, eſq.

"Two miles from Tadcaſter," ſays he, "on the left-hand ſide of the road to York, ſtands a beautiful little cottage, with a garden, that has long attracted the eye of the traveller. The ſlip of land is exactly a rood, incloſed by a cut quick hedge; and containing the cottage, fifteen apple-trees, one green-gage, and three wineſour plum-trees, two apricot-trees, ſeveral gooſeberry and currant buſhes, abundance of common vegetables, and three hives of bees; being all the apparent wealth of the poſſeſſor. The ſingular neatneſs and good order that marked every part of this little domain, and ſome circumſtances reſpecting the owner, which had been mentioned to me by Dr. Burgh of York, made me anxious to obtain the hiſtory of the cottager and his family. In the end of May, 1797, I called there in my way from York; but found the houſe and the gate of the garden locked. In the road to Tadcaſter, however, I met his wife, laden with a baſket of proviſions from the market; and engaged her to find her huſband, who was at work about a mile off, and to ſend him to me at the inn at Tadcaſter. When he arrived he very willingly gave me his hiſtory, as follows—

"His name is Britton Abbot: his age ſixty-ſeven, and his wife's nearly the ſame. At nine years old he had gone to work with a farmer; and being a ſteady careful lad, and a good labourer, particularly in what is called taſk-work, he had managed ſo well, that before he was 22 years of age, he had accumulated near 40l. He then married, and took a little farm at 30l. a-year; but before the end of the ſecond year he found it prudent, or rather neceſſary, to quit it; having already exhauſted, in his attempt to thrive upon it, almoſt all the little property that he had heaped together. He then fixed in a cottage at Poppleton; where, with two acres of land, and his common right, he kept two cows. Here he had reſided very comfortably, as a labourer, for nine years, and had ſix children living, and his wife preparing to lie in of a ſeventh, when an incloſure of Poppleton took place; and the arrangements made in conſequence of it, obliged him to ſeek for a new habitation, and other means of ſubſiſtence for his family.

"He applied to Squire Fairfax, and told him that, if he would let him have a little bit of ground by the road-ſide, 'he would ſhew him the *faſhions* on it.' After enquiry into his character, he obtained of Mr. Fairfax the ground he now occupies; and with a little aſſiſtance from the neighbours, in the carriage of his materials, he built his preſent houſe; and planted the garden, and the hedge round it, which is a ſingle row of quick, thirty-five years old, and without a flaw or defect. He ſays he cut it down ſix times ſucceſſively when it was young. Mr. Fairfax was ſo much pleaſed with the progreſs of his work, and the extreme neatneſs of his place, that he told him he ſhould be rent free. His anſwer deſerves to be remembered: 'Now, ſir, you have a pleaſure in ſeeing my cottage and garden neat: and why ſhould not other ſquires have the ſame pleaſure, in ſeeing the cottages and gardens as nice about them? The poor would then be happy; and would love them, and the place where they lived: but now every little nook of land is to be let to the great farmers; and nothing left for the poor, but to go to the pariſh.'

"He has had ſeven children; ſix of whom attained to man's eſtate; and five are now living, and thriving in the world. His ſon has a little farm near Hemſley Moor: one of his daughters is the wife of a joiner at York; another, of the occupier of a little farm at Kelfield; a third, of a labouring man, who has a little land of his own, near Duffield: the fourth is the wife of a labourer, who has built a cottage for himſelf at Tadcaſter, and wants nothing (as the father obſerved) but a bit of ground for a garden. Britton Abbot ſays he now earns 12s. and ſometimes 15s. and 18s. a-week, by hoeing turnips by the piece; ſetting quick, and other taſk-work: 'but, to be ſure,' he added, '*I have a grand character in all this country.*' He gets from his garden, annually, about forty buſhels of potatoes, beſides other vegetables; and his fruit, in a good year, is worth from 3l. to 4l. a-year. His wife occaſionally goes out to work; ſhe alſo ſpins at home, and takes care of his houſe and garden. He ſays they have lived very happy together for forty-five years.—To the account that I have given, it may be needleſs to add, that neither he, nor any part of his family, has ever had occaſion to apply for parochial relief.

"Though my viſit was unexpected, and he at the latter end of his Saturday's work, his clothes were neat and ſufficiently clean: his countenance was healthy and open; he was a little lame in one leg, the conſequence of expoſure to wet and weather. He ſaid he had always worked hard and well; but he would not deny but that he had loved a mug of good ale when he could get it. When I told him my object in enquiring after him, that it was in order that other poor perſons might have cottages and gardens as neat as his, and that he muſt tell me *all his ſecret*—how it was to be done, he ſeemed extremely pleaſed, and very much affected; he ſaid, 'nothing would make poor folks more happy, than finding *that great folks thought of them*:' that he wiſhed every poor man had as comfortable a home as his own; not but that he believed there might be *a few thriftleſs fellows*, who would not do good in it.

"I aſked him whether he had not a cow. He ſaid he had had one, and ſhe had died; and having no other place but the lane to keep his cow, he had not attempted to get another.—'Could you get land, if you had a cow?'—He thought he could.—'Suppoſing then (I added) a cow could be bought for 12l. and you could rent it on the terms of paying down 3l. 10s. immediately; and then 3l. 10s. at the end of each year during three years; and that the cow was to be yours at the end of the three years, if ſhe lived, and you paid your rent regularly:—Do you think ſuch a bargain would anſwer for you?'—Yes, he ſaid, he was ſure it would very greatly; and there were few cottages to whom it would not be a very great advantage; eſpecially where they had a family of children. I told him to enquire whether he could get a little land; and I would have ſome more talk with him about it, when I came down in Auguſt.

"The hiſtory of Britton Abbot appears to me to merit attention. At the time of the incloſure of Poppleton, when he had ſix young children living, and his wife preparing to lie in of the ſeventh, his whole little ſyſtem of economy and arrangement was at once deſtroyed; his houſe, his garden, his little field, taken from him; and all his ſources of wealth dried up. With leſs ſucceſs in his application for the rood of land, the

ſpot in which his induſtry was to be exerted, and (in juſtice to him it muſt be added) with leſs energy than he poſſeſſes, he might have gone with his family into a workhouſe; and, from that hour, have become a burthen to the public, inſtead of being one of its moſt uſeful members. Obſerve for a moment the effects of his well-directed induſtry. Without any parochial aid, he has raiſed ſix of his ſeven children, to a ſtate of maturity; and has placed them out reſpectably and comfortably in the world. Five of them are now living, in the middle period of life; and he continues, at the age of ſixty-ſeven, a good working labourer; happy in his own induſtry and good management, and in the beauty and comfort of his cottage, and the extreme fertility of his garden,

"Britton Abbot poſſeſſes a degree of energy and ſpirit, that we muſt not expect to find in every cottager. If, however, the poor do not exert themſelves, and have not ſo much forethought and mangement as might be wiſhed, the fault is leſs in them, than in the ſyſtem of our poor laws, and in the *manner* in which they are executed. Were they properly and univerſally encouraged to induſtry and economy, we ſhould ſoon find thriving and happy cottagers in every part of the kingdom. Let only a tenth of the money, now ſpent in workhouſes, in what is uſually called '*the relief of the poor*,' be applied in aſſiſting and encouraging them to thrive and be happy in their cottages, the poor's rate will be leſſened, and, a national ſaving made both in labour and food *. The labourer is capable of more exertion, and is maintained for leſs than half the expence, in his cottage than in a workhouſe. In his cottage he has his family around him, he has ſomething he can call his own, he has objects to look forward to, and is the maſter of his own actions.—*Domeſtic connections, property, liberty, the hope of advancement*, thoſe maſter ſprings of human action, exiſt not in a workhouſe.

"It is the misfortune of this country, that the well-diſpoſed and induſtrious poor do not receive ſufficient aid or encouragement. They find no diſtinction made between them and the idle and profligate; except this—*that the idle and profligate are maintained in part at their expence.* As the law is too frequently executed, the cottager, *though poor himſelf*, is regularly aſſeſſed *for the relief of the poor*; but he receives no benefit from the fund, no aſſiſtance towards the ſupport of himſelf and his family, unleſs he is reduced to abſolute want, and preſents himſelf hopeleſs at the door of the workhouſe.

"The evil has been greatly increaſed by the ninth of George I. which authoriſes the farming of the poor, and refuſes relief to thoſe who will not ſubmit to reſide in the workhouſe. It is, in conſequence, the intereſt of the farmer of the workhouſe, to keep it in ſuch a condition, that (to uſe Mr. Parry's words) 'the honeſt and induſtrious labourer, who has brought up a large family with credit, and who from misfortune is poor, and from age paſt his labour, will ſubmit to be half ſtarved, rather than take up his abode amid ſuch wretchedneſs and profligacy.' By theſe means workhouſes become objects of terror to the honeſt and induſtrious, and at the ſame time the favourite reſort of the diſſolute and abandoned; the dirt, the waſte, the diſorder, the want of regulation, and the *undiſtinguiſhing treatment* of the worſt and beſt characters, being as gratifying to them, as they are irkſome and diſguſting to the well-diſpoſed poor.

"Let us conſider what muſt be the effect of this ſyſtem on the cottager.—Tenant to the farmer who has taken his cottage over his head, he is aware that his new landlord will require as much rent as he can contrive to pay. He has a young and increaſing family; and, when times are at the beſt, he often finds it as much as he can do to go on, from one day to another, in their ſupport. He can hardly expect that during the ſeverity of the winter, the high price of bread, or the viſitation of ſickneſs, his earnings will always, and at all ſeaſons, continue equal to the neceſſities of his family. If the hour of adverſity arrives, he knows the rule of his pariſh, that '*no aſſiſtance is to be given to the labourer, while he poſſeſſes any thing of his own*;' and that what, with much labour and ſelf-denial, he ſhall have ſaved, muſt all be exhauſted and ſpent, before his claim to parochial relief can be admitted. It may be well to conſider what incitement *he* has to thriſt and forethought. Can we confidently anſwer for ourſelves, that, ſo circumſtanced, we ſhould act even as well, and look as much to futurity, as he does; or that we ſhould not be made mere ſenſualiſts by deſpondency? It is perfectly clear, that we ſhould not ſpend every penny, that could be ſpared from the daily nouriſhment of our families, in ſelf-indulgence at an ale-houſe?

"Happy ſhould I be, if I could make uſe of the hiſtory of Britton Abbot, to obtain for the labourer encouragement to imitate the energy of his induſtry. Of the different modes of aiding and animating the poor, none would have more tendency to raiſe them above the want of parochial aid, than that of enabling them progreſſively to follow his example, in ſuch a manner, that the moſt deſerving might in their turn become the owners of comfortable cottages and productive gardens; a meaſure which ſeems to be peculiarly called for by the preſent condition of the dwellings of the poor. It is a melancholy fact that, in moſt parts of England, their habitations are not only comfortleſs and devoid of accommodation, but inſufficient in number; and that honeſt and induſtrious families are frequently driven into the workhouſe, merely for the want of cottages in their pariſh.

"If the cuſtom of ſetting apart ground for them to build upon were to obtain generally, and in a manner to induce and enable them to take the benefit of it, it would aſſiſt in gradually correcting this national and increaſing evil, and in ſupplying that uſeful claſs of men with proper habitations.—It would have other very important effects. It would diminiſh the calls for parochial relief; it would encourage and improve the good habits of the poor; it would attach them to their pariſhes, and give them an increaſed intereſt and ſhare in the property and proſperity of their country. The land required for each cottage and garden, need not be more than a rood; the value of which would bear no poſſible compariſon to that of the induſtry to be employed upon it. The quarter of an acre that Britton Abbot incloſed, was not worth a ſhilling a-year. It now contains a good houſe and a garden, abounding in fruit, vegetables, and almoſt every thing that conſtitutes the wealth of the cottager. In ſuch incloſures, the benefit to the country, and to the individuals of the pariſh, would far ſurpaſs any petty ſacrifice of land, to be required, *Five unſightly, unprofitable, acres of waſte ground would afford habitation and comfort to twenty ſuch families as Britton Abbot's.*

"In order to encourage the exertions of the labourer, I

* This experiment would be eaſily tried. Suppoſe the poor's rate of the pariſh ſo applied to be 600l. a-year; and that 60l. a-year of the rate were to be annually employed in aſſiſting the moſt induſtrious and deſerving labourers to become poſſeſſors of cottages and cows: I am confident that the poor's rate of that pariſh would be greatly diminiſhed in a few years; probably to half its preſent amount. The difference between a law that *encourages* the poor to exertion, and one that attempts to *compel* them to it, is, that in the firſt you have the co-operation of the millions of the people who are to be objects of the law; in the ſecond, all the labour is thrown on the *unfortunate and unſucceſsful persons*, who are to attempt to execute it.

ſhould hope that this would be conceded to me, that the rood of land, incloſed for his cottage and garden (on condition of a houſe being erected) be held in fee ſimple; and that, ſo long as a pariſhioner, labouring generally within his pariſh, continued owner and occupier, ſuch cottage and garden ſhould, by parliamentary authority, be exempt from rent, taxes, rates, tithes, and all burthens whatſoever. It would be an important object to keep theſe little freeholds in the hands of the labourers of the pariſh; ſo that they might be tranſmitted from father to ſon, like thoſe little eſtates, which we contemplate with ſo much pleaſure in Borrodale. If, therefore, the exemption from rent, taxes, &c. continued no longer than while the cottage was both the property and reſidence of a pariſhioner, generally working within his pariſh, it would not be of half as much value to any other perſon, as to him for whom it was originally intended; and if in ſome inſtances they got into other hands, they would ſoon return again into the poſſeſſion of the labouring pariſhioners.

"As the means of promoting induſtry and good conduct among the poor, I ſhould hope that a preference would be given to 'induſtrious pariſhioners, members of friendly ſocieties;' and that the character of the man, the number of his children, and other circumſtances, would induce the farmers to give him the carriage of his materials, and his other neighbours to help him with a pecuniary ſubſcription. The annual ſum of 10l. or 20l. ſo collected in a pariſh, and impartially and publicly given as a premium to the moſt deſerving labourer in that pariſh (either to aſſiſt him in erecting his cottage, or to enable him to purchaſe his cow), would produce a great effect on the good habits of the poor; and, while it rewarded merit, would ſtimulate others to follow the example.

"It would have other important effects.—It would greatly diminiſh pariſh rates *; for he who poſſeſſes a freehold cottage and garden, or a cow, has ſeldom, if ever, occaſion to apply for parochial relief. By attaching the cottager to his own pariſh, it would ſecure to the farmer a certain ſupply of labourers, and would equalize, and keep down, the price of labour, now much enhanced by the diſpoſition to wander about, in queſt of the higheſt wages and the eaſieſt work; a diſpoſition which has occaſioned a conſiderable waſte in the produce of national labour. But this would not be all. Freehold cottages and gardens do not only attach the owners to their country, but are alſo the ſureſt pledges and ſecurities for their conduct. The cottager, who has property, is habituated to ſet a higher value on himſelf and on his character, and ſeems to be of a ſuperior order of men. Beſides this, the addition, which theſe little freeholds might make to the induſtry, morals, and produce of a country, would be an object of conſideration in this reſpect; that the cottager, who had a garden and a little property of his own, has always before him *a pleaſurable object of induſtry* for his leiſure time; whereas, he who has none, is driven to the ale-houſe by the ſame *unhappy neceſſity*, that impels idle young men to the gaming table;—the want of occupation.

"In the mode which I ſuggeſted to Britton Abbot, of his renting the cow, he would acquire a gradually increaſing intereſt in her; ſo as to make him anxious for her preſervation, but not ſuch as to involve him deeply, in caſe of her death, or to give him a right to diſpoſe of her. In this way, the ſum of 15l. † would be ſufficient to conſtitute a *perpetual fund*, in any pariſh, for ſupplying the *annual premium* of a cow for ſome induſtrious and well-diſpoſed labourer, as long as the landlord will conſult his own intereſt, and afford the means of feeding her. Whether this object is to be attained by annexing ground to the cottages, or by letting to the cottager an adjuſtment for his cow, or by ſupplying him with paſture, and a certain quantity of hay ‡, at an annual rent; or by making it one of the conditions on which the farmer takes his farm, that he ſhall keep his cottager's cow at a limited price;—whatever mode is to be adopted, will depend much on the circumſtances of the country.—There is hardly any part of England, however, in which the cottager's cow may not be provided for, by one or other of theſe means; or by another mode, which I ſhould prefer, when practicable, as the right which it would give the poor man would be *unalienable*;—and that is, incloſing and improving from the waſte §, cow paſtures of ten or twelve acres each; the excluſive benefit whereof, the cottagers of the pariſh ſhould enjoy at a ſmall rent; which (after providing for fences, &c.) might go as a fund for ſupplying the poor of the pariſh with fuel. Such incloſures would be extremely gratifying and beneficial to that uſeful claſs of men, the labouring poor. The ſtock on them ſhould be limited; and a preference given to labourers working within the pariſh, in proportion to their families, their induſtry, and character.

"I have only to add, that my friend's hiſtory contains in it a ſtrong proof, that, the cottager is benefited by the ſupply of a garden and of land for his cow, while he continues a *labourer*; yet, if more land is added, juſt enough to conſtitute him a *little farmer*, with a very ſmall capital, and to make him forego his profit and advantage as a labourer, his means of life, inſtead of being improved by the acquiſition of land, are prejudiced. No perſons earn a harder or more precarious living, or do leſs good with their land, than very ſmall farmers. The condition of a labourer, who has a well-ſtocked garden, a couple of cows, a pig, and juſt ground enough to keep them, is affluence, compared with the lot of him, who attempts to live as a farmer, on a ſmall quantity of ground, not ſufficient to maintain him as a farmer, though abundantly adequate to its object, if divided among ſeveral labourers."

The following extract from an account of the advantages of cottagers keeping cows, alſo by Mr. Bernard, will ſtill further prove how poſſible it is to reſcue this induſtrious claſs of labourers from want and miſery.

"A late viſit into Rutlandſhire," ſays the author, "has

---

*. Landlords and farmers, who wiſh their own poor's rates reduced, would do well to enquire into the amount of the poor's rates in thoſe pariſhes, where labourers have gardens and cows. One annual rate of ſixpence in the pound has proved fully adequate to the relief of the poor in ſuch a pariſh. See the Earl of Winchelſea's letter, and ſome other reports, on the advantages of cottages renting land.

† Upon ſuppoſition that the price of the cow were 12l. the donor of ſuch a fund would have to advance 8l. 10s. the firſt year, 5l. the ſecond, and 1l. 10s. the third; after which the reſt of 3l. 10s. paid for three years, for each cow, would produce, in future, 10l. 10s. a-year; being (with 3l. 10s. originally paid by the cottager) 2l. more than would purchaſe a cottager's cow every year after. The additional 2l. a-year would, I preſume, be ſufficient to inſure, for the year, the landlord's intereſt in the cows.

‡ Mr. Burdon's cow paſtures are cloſes of ſixteen acres, for twelve cows each: he allows each cottager two loads of hay; making the hay in ſmall ſtacks of four loads each, ſo that one ſtack ſerves two cottagers. He finds the ſyſtem anſwer, both as to the improvement of ground, and the amount of rent. I can only ſay, that when I was at Caſtle Eden, I thought his cottagers' hay-ſtacks and cows the moſt pleaſing ornaments of a very beautiful place.

§ This plan has been adoped in the Iver incloſure bill now before parliament. *31ſt May*, 1800.

given me an opportunity of acquiring more minute and correct information, reſpecting the circumſtances and ſituation of the cottagers keeping cows, in the four pariſhes of Hambledon, Egleton, Greetham, and Burley-on-the-Hill. I give the reſult of my enquiries; and I give it with more preciſion and detail than I otherwiſe ſhould, as I am very deſirous of enabling land-owners to aſcertain whether, in their own peculiar inſtances, it will not anſwer for them to follow the example of what has been done in that neighbourhood. At the ſame time I beg leave to anticipate the obſervation, that in arable countries, where there is a ſcarcity of graſs land, and in thoſe diſtricts where, from vicinage or a peculiar market, graſs land bears a rent above its intrinſic value, it may not be practicable to ſupply cottagers with paſture for a cow, without ſome ſacrifice on the part of the landlord.

"Among the tenants of this part of the eſtate, there are 80 cottagers who keep cows. Of thoſe who poſſeſs cows, there are 22, each of whom has only one cow: 35 who have each 2 cows, 13 who have 3, 7 who have 4, and 3 who have 5 cows each; making in all 174 cows. Of theſe cottagers, about a third part have all their land in ſeveralty; the reſt of them have the uſe of a cow-paſture in common with others; moſt of them poſſeſſing a ſmall homeſtead, adjoining to their cottage; every one of them having a good garden, and keeping one pig at leaſt, if not more. Without any exception they pay for their land the ſame rent as a farmer would, and not more.

"The eſtate is tithe-free.—In Hambledon there is a cloſe of 114 acres, which is let in 108 cow-gates, at one guinea each; of theſe, 74 are let to cottagers, and the remaining 34 (not having been as yet applied for by cottagers) are for the preſent let to farmers. The tenants have the right of feeding, each four ſheep, inſtead of a cow, for each cow-gate; and the farmers generally ſo uſe their holdings, which is more for their own convenience, as well as for the general benefit of the paſture. Each of the cottagers has alſo an acre or more of homeſtead near his cottage, for which he pays a farmer's rent.

"At Egleton there is a cow-paſture of only 30 acres, which is let in 26 cow-gates, each at 30 ſhillings. Theſe are all occupied by cottagers, who have alſo ſmall homeſteads near their houſes, to ſupply them with hay.—In the pariſh of Burley, the mode of providing for ſome of the cottagers' cows is different: a cloſe of 11 acres and a half is divided into two equal parts, and the whole jointly occupied by four cottagers. One half is every alternate year held in four ſeveral parts by a marked boundary, each mowing his own part for hay; the other half is a cow-paſture for the four cottagers. They have each a right of putting in a cow and two ſheep in the paſture part, during the ſummer, and of feeding a cow and four ſheep upon the whole in the winter. The benefit of the ſheep feeding they can let to a farmer at a guinea and a half a-year. Beſides this, they have graſs and hay for one cow; for rent they pay 4l. 10s. a-year each, and in poor's rates and other levies, 5s. a-year, making in the whole 4l. 15s.; from which, after deducting 1l. 11s. 6d. (which their ſheep feeding is worth), there remains 3l. 3s. 6d. rent and taxes, for the ſupport of their cow.

"The accommodation that the cottager has for his cow in Greetham, is not ſo beneficial to him. A paſture-field of 35 acres of indifferent land, worth about 10s. an acre, is held as a joint paſture by 14 cottagers; each of whom has a right to paſture a cow in it. For their winter proviſion they have each of them an arable field of ſix acres, in which they grow ſome clover and ſainfoin. This is by no means ſo advantageous to them as graſs land: under theſe circumſtances, however, they are very glad to have the land, and always pay their rent with great regularity.

"I ſaid that the cottagers paid a farmer's rent for their land, and not more; but I ought to add, that the whole of the eſtate is let at moderate rents. The reader may find by calculation, that in Hambledon the land produces, per acre, nearly 20s.; in Egleton, about 23s.; and in Burley, 31s. per acre; the difference being occaſioned partly by the difference of time, when the cloſes were reſpectively let at their preſent rents, and partly by ſome difference in the quality of the land.

"The cottagers who keep cows are almoſt all of them labourers in huſbandry: there are, however, among them, ſome widows and daughters of deceaſed labourers, and ſome men who work as country carpenters, or in ſimilar trades. I can add, that of all the rents of the eſtate, none are more punctually paid, than thoſe for the cottagers' land. The ſteward informs me that there has never been an inſtance of an arrear, or of a delay in payment, even for a few days.

"When I ſtate that the land is let at, and not under, a fair, moderate rent, I do not mean to be underſtood to ſay, exactly the ſame of the cottages; which are comfortable and habitable buildings, in good repair, neatly kept, and regularly white-waſhed; and yet pay no more rent, than the ruinous and miſerable hovels in England uſually do.

"The reader may, perhaps, wiſh to know how the cottager is at firſt ſet up with a cow. As an example, I will give the hiſtory of one man, who had a wife and ſeveral children, and was laſt year likely to be burthenſome to the pariſh. It was agreed that the only remedy that promiſed relief to the pariſh in this caſe, was the cottager's cow. His landlord ſupplied him with land at a fair rent, and made his cottage and out-buildings comfortable. He aſked aſſiſtance of his neighbours: in the manſion-houſe he collected about two or three guineas; among the farmers, by gift or loan, he obtained ſome handſome additions; he purchaſed his cow, took poſſeſſion of his land, and is now doing very well.—About eight years ago another labourer with a large family was ſupplied with a cow, and land, in the ſame manner. He has ſince bred up his large family without any parochial aſſiſtance, and is now poſſeſſed of two cows, the ſecond purchaſed wholly from his ſavings. Two others were provided with cows and land in the like manner, about four years ago, and have gone on very well.

"The greater part of the cottagers have more than one cow. The fact is, that in every inſtance, as ſoon as the cottager has got a cow, all the efforts of his family are directed to the attainment of the means to purchaſe another, and another; ſo that ſome of them, who began very lately with only one, have now five cows. The only inconvenience to be apprehended from ſuch an increaſe in their property, is, that they may be induced to look to the produce of their cows and gardens, for the ſole ſupport of themſelves and family, and ceaſe to depend on their daily labour for their ſupport; being transformed into little ſtarving farmers, from opulent thriving labourers. But the fact is directly the reverſe.—Such are the beneficial effects of early and ſteady habits of induſtry, that theſe proprietors of cows are the moſt ſteady and truſty labourers. As a proof of the effects of this ſyſtem in promoting induſtry and frugality, I give the hiſtory of one of them, Chriſtopher Love, of Hambledon; who is now 75 years of age, and has for 53 years back kept three cows; and nevertheleſs has gone regularly every ſummer, for 50 years paſt, to harveſt-work in Cambridgeſhire: becauſe he is more in requeſt there, and receives better wages, than he would at home. He has bred up a family of nine children in great comfort, and is now well and in good health himſelf, and has been in Cambridgeſhire this

preceding harveſt; but thinks he ſhall go no more, as the family for whom he uſed to work are all dead, or removed.

"I ſaw one inſtance among them of a man who was bringing up and ſupporting nine children, all healthy, well fed, clean, and neatly dreſſed. A little child under four years of age was aſked if ſhe could ſpin? 'No, ſhe was too little, but ſhe could knit.' 'Her ſiſter (ſaid the mother, pointing to another girl, between five and ſix years of age) ſpins very well; ſhe got a prize for ſpinning this year, and brought home a premium of the value of ſix ſhillings in clothing.'

"The education of their children to huſbandry, to the management of cattle and of a dairy, and to every occupation that can fit them for the ſervice of a farmer, is a very important advantage of this ſyſtem: and if there were no other benefit to be derived from it, but that of adopting, and habitually preparing, the riſing generation for the moſt uſeful and neceſſary employment in the iſland, this alone would produce an abundant compenſation for any effort, or attention, that has been, or may be, directed to the ſubject. They are not only ſtout, healthy, clean, well clothed, and educated in regular and principled habits of life, but they are uſed to almoſt every part of their buſineſs from the earlieſt period of life; every inhabitant of the cottage being, from infancy, ſo intereſted in their cow, their pig, their ſheep, and their garden, as to imbibe, at a very early age, all the material information and habits requiſite in thoſe ſubjects.

"The cottagers in that country eat barley, or mixed, bread; and they prefer it, for a reaſon which one of them gave me; that not only they can afford to have more of it, but can alſo add a little bit of meat to dreſs with the vegetables from the garden. This makes in the aggregate a very important amelioration of the condition of the cottager:—bread, butter, cheeſe, plenty of milk, and vegetables, and ſome meat to mix with their other food, compoſe, altogether, a table of diet unknown to many Engliſh cottagers, and extremely conducive to health, ſtrength, and civilized habits of life. It is no inconſiderable convenience to the inhabitants of that neighbourhood, that theſe cottagers are enabled to ſupply them, at a very moderate price, with milk, cream, butter, poultry, pig-meat, and veal: articles which, in general, are not worth the farmer's attention, and which, therefore, are ſupplied by ſpeculators, who greatly enhance the price on the public."

Theſe facts are accompanied with the following pertinent obſervations.

"In preparing this detail," ſays Mr. Bernard, "I have endeavoured to give every circumſtance as coldly and correctly as I could; being aware that, in practical information, preciſion is of the utmoſt importance. I will not, however, preſume to ſay, that in what I have written, I have been entirely uninfluenced by the pleaſure of ſeeing the Engliſh cottager what, in a free, a proſperous, and enlightened country, he ought to be;—*thriving, induſtrious, and happy.*

"What has been ſtated will probably ſuggeſt to the reader, that the welfare of the cottager depends more on the improved reſources and habits of life, than on any increaſe or ſuperabundance of wages. In countries where the wages are the higheſt, without any improved ſyſtem of management and economy among the poor, the condition of the cottager is very inferior to that in many places, where the wages of labour are lower, but the means and habits of life ſuperior. Mechanics, who earn from a guinea to two guineas a-week, in London, in Manchester, and other places, and who depend upon the neighbouring ſhop for the neceſſaries of life, and (to uſe a common expreſſion) *live from hand to mouth*, do in general poſſeſs a leſs degree of domeſtic comfort, and enjoy a leſs proportion of the advantages of civilized life, than many cottagers. The explication is obvious. The mechanic, who with his family exiſts in a lodging, without any advantage or impulſe tending to domeſtic economy, and who earns, by a ſpecies of *ſlight of hand* in his trade, very high wages, applies what is barely neceſſary, in a weekly payment; to the baker and other tradeſmen, for the ſupport of the family; the reſt goes to the club, or the alehouſe, or is loſt in intervals between labour: while the labourer and his family, who have the power and inducement to thrift and management, direct every effort to the improvement of their circumſtances, and the increaſe of their comforts.

"It will, to the lateſt period of my life, be a ſource of enviable ſatisfaction to me, if what is ſaid in this and the other report of the ſociety, ſhall have the effect of awakening the attention of the land owner to an object ſo intereſting and eſſential to him, as the ſituation of his induſtrious labourers; whoſe comforts and means of life he may greatly increaſe, not only without any immediate loſs, but with a real and accumulating benefit to himſelf and his property; as he would ſoon find that by improving the condition of his dependents, and by exciting induſtry among them, he would proportionally increaſe the value of his eſtate. It would, indeed, be an act not only of benevolence and juſtice, but of wiſdom and prudence, whether he directed his views to his own inſulated property, or to the general welfare of the community.—Viewed in a political light, the labourer who has property, however ſmall,—a cow, a pig, or even the crop of his garden,—has an intereſt in the welfare and tranquillity of his country, and in the good order of ſociety. He who has no property, is always ready for novelty and experiment; and though gibbets and halters may for a time deter him from criminal and atrocious acts, yet no motive exiſts to fix him in virtuous habits, or to attach him to that national proſperity in which he has no part, and to that conſtituted order of property, which excludes him from all poſſeſſion.

"There is another conſideration, ſuggeſted by the preſent high price of wheat corn. Thoſe meaſures for the relief and ſubſiſtence of the poor, which are now eſſential to their exiſtence in many other parts of the kingdom, are unneceſſary in the neighbourhood of Burley. The cottager who is in the habit of uſing barley in bread, who keeps a pig, perhaps two, and has plenty of milk and vegetables, poſſeſſes within himſelf almoſt all the means of life; and feels very little inconvenience from that which, without the charitable aid and attention of the opulent, would oppreſs and overwhelm the labourer whoſe exiſtence depends on a mere pecuniary ſtipend. With ſuch means of life, he is leſs affected by the preſent high price of bread than almoſt any other individual: the dearneſs of proviſions produces not much variation in his circumſtances; except by delaying, for a very ſhort time, the deſired period of his purchaſing another cow; and by retarding his progreſſive thrift, and the improvement of his little property, for the benefit and *hereditary ſucceſſion* of his wife and children.

"In the facility of execution, and in the permanence of effect, a very material difference exiſts between meaſures taken for the improvement of the cottager's means of life *in his own cottage*, and for the increaſe of his reſources and incitements to thrift and induſtry, and thoſe for the ſupport and conduct of all *public charities and eſtabliſhments* for the relief of the poor. The latter require an unattainable continuance of exertion, and an unfailing ſucceſſion of diſintereſted care and attention: the former executes itſelf. The latter provide for the maintenance and relief of helpleſs and *hopeleſs* dependents: the former produces the *reſtoration* of health and ſtrength.—When the cottager has acquired, and feels the benefit of, his new means and habits of life, his own exertions, his own attentions, will provide for the continuance of the bleſſings of his family, as long as

his landlord will protect him in the enjoyment of his cottage and ground. He requires, in this inſtance, no ſubſequent labour or attention, on the part of his benefactor, to prevent the return of indigence and miſery whereas it demands the continuance of unwearied exertions in all public eſtabliſhments, to conduct them properly, for the ſolace and relief of exiſting wretchedneſs.

"In all that has been done by the Earl of Winchelſea for his cottagers, though there has been much attention paid, and much diſpoſition on his part to make a very conſiderable ſacrifice, if requiſite, for their benefit, yet in fact, and with the ſingle exception which I have ſtated as to his cottages, ſo far from any loſs or expence being incurred by him, a conſiderable and permanent improvement has been made upon his eſtate, without any reduction in the immediate profit.—While the land let to the cottager is ſet at the ſame rent, as that which the farmers occupy, the country is enriched and improved by an induſtrious and thriving tenantry, and the poor's rates reduced almoſt to nothing. The labourers' children are at the ſame time ſo bred up, and ſo accuſtomed to regular habits of employment, as to be very little burthen to their parents, and to be a great improving benefit to the eſtate.—The land-owner ſhould keep in mind, that if the labourer is reduced to indigence, his ſupport, which had been derived from his own exertions, muſt, in future, be drawn from the land. The farmer, indeed, *nominally* pays the poor's rate; but it is *really and ultimately defrayed by the landlord*; whoſe eſtate, by the increaſe and accumulation of poor's rate, is deteriorated in value, and diminiſhed in rental: while, on the contrary, by a different ſyſtem—by promoting the welfare, and encouraging the energy of the cottager—the land-owner might have leſſened the poor's rate and augmented the value and rental of the land.

"I do not mean to aſſert that the Engliſh cottager, narrowed as he now is in the means and habits of life, may be immediately capable of taking that active and uſeful ſtation in ſociety, that is filled by thoſe who are the ſubjects of this paper. To produce ſo great an improvement in character and circumſtances of life, will require time and attention. The cottager, however, of this part of the county of Rutland, is *not of a different ſpecies from other Engliſh cottagers*; and if he had not been protected and encouraged by the landlord, he would have been the ſame helpleſs and comfortleſs creature that we ſee in ſome other parts of England. The farmer (with the aſſiſtance of the ſteward) would have taken his land; the creditor, his cow and pig; and the workhouſe, his family.

"As I am diſpoſed to flatter myſelf, that ſome of my readers, who have landed property adapted to the experiment, *may* be induced to try this mode of *improving their eſtates*, I ſhall ſuggeſt what occurs to me as the method of proceeding; premiſing that in this, and every thing elſe which the landlord may think fit to do for the benefit of his cottagers, he ſhould be extremely careful not to make them the ſubjects of jealouſy, or diſlike, to either the farmer or ſhopkeeper; on whoſe goodwill to them, in ſpite of every attention of the landlord, much of their comfort and well-being will depend, particularly in winter, when the preſence of a friend and protector is moſt wanted. I ſhould therefore recommend him, at firſt, to follow the example of Mr. Burdon, and to begin with a cloſe or two of the ground in his own occupation. Let him then ſelect two or three of his moſt thriving and induſtrious labourers, and inform each of them, that he is diſpoſed to accommodate him with a little ground, at a moderate rent, if he can contrive to get a cow, and his wife can manage her: adding the offer of a ſmall loan or donation towards it. The introduction of ſo novel a ſyſtem may poſſibly require ſome aid and attention at firſt; and it may be proper that the poor's rate on their ground ſhould be kept down, as low as may fairly be; but as ſoon as two or three cottagers have ſucceeded, and it is known that upon land becoming vacant in future, the cottager will be conſidered as well as the farmer, though not to his injury or inconvenience; and that, upon the occupier of any little farm of 20 or 30 acres being obliged, as they frequently are, to abandon a loſing concern, the landlord would, in ſome inſtances. be diſpoſed to apply the ground for the accommodation of five or ſix of the moſt deſerving and thriving labourers; the farmers would ſoon be reconciled to a ſyſtem which muſt in its nature operate to lower the poor's rate, and to diminiſh the burthen of the poor;—the character of the cottager would be invigorated;—his ſpirit, his induſtry, his economy, would be all put in action; and a very eſſential improvement would take place in the ſtate and neighbourhood."

To place this ſubject in a ſtronger point of view, we add the following excellent obſervations on the means of enabling a cottager to keep a cow from the produce of a ſmall portion of arable land, by Sir John Sinclair, bart. M. P.

"In ſeveral parts of the kingdom, as in Lincolnſhire, Rutlandſhire, &c. which are calculated for grazing, it is not unuſual to give induſtrious cottagers as much land as will enable them to keep a cow, and ſometimes two, or more, beſides other ſtock; and it appears from the communications of Lord Winchelſea and others to the Board of Agriculture, from the publications of the Society for bettering the Condition of the Poor, and from a late intereſting work printed by Mr. Arthur Young, that ſuch a ſyſtem is productive of the happieſt conſequences. It is ſuppoſed, however, to be totally inapplicable to an arable diſtrict. I truſt that ſuch an opinion will not be admitted without full conſideration. Indeed, ſo far as I can judge, this advantageous ſyſtem is to the full as well adapted for the one diſtrict as for the other. It requires unqueſtionably more labour on the part of the cottager, and of his family; at the ſame time, the occupation of ſo great an extent of ground is not ſo neceſſary in arable as in grazing countries; a circumſtance, in various reſpects, extremely material.

"In arranging the following plan (which the reader will pleaſe to conſider merely as furniſhing an outline, to be perfected by further diſcuſſion and experiment), it is propoſed to keep in view the following principles:

"1. That the cottager ſhall raiſe, by his own labour, ſome of the moſt material articles of ſubſiſtence for himſelf and his family.

"2. That he ſhall be enabled to ſupply the adjoining markets with the ſmaller agricultural productions. And,

"3. That both he and his family ſhall have it in their power to aſſiſt the neighbouring farmers, at all ſeaſons of the year, almoſt equally as well as if they had no land in their occupation.

"It can hardly be queſtioned, that if it were practicable to have a number of cottagers of that deſcription in every pariſh, it would promote, in various reſpects, the intereſts of the public.

"*I. Extent of land neceſſary.*—Unleſs the experiment were fairly tried, it is impoſſible to ſtate exactly the extent of arable land requiſite to enable a cottager to raiſe the articles generally neceſſary for the ſubſiſtence of himſelf and family; and to keep a cow, ſome pigs, and poultry. Much muſt depend on the natural richneſs of the ſoil; (though, under the management about to be propoſed, almoſt any ſoil would, in time, become fertile); on the nature of the climate; on the ſize of the cow; on the induſtry of the cottager; on the age and number of his family, &c. But I ſhould imagine that three ſtatute acres and a quarter of good arable land, worth from 20s. to 30s. per acre, would be ſufficient. It is propoſed that the three acres ſhall be under a regular courſe of cropping. The quarter of an acre ought, if poſſible, to be converted into an orchard; where the cow might occaſionally paſture, and where a pond ought to be kept in good order, that it may have plenty of water at command. Were the land of a

quality fit for lucerne, perhaps two acres and a quarter might be ſufficient.

"*II. Stock and inſtruments of huſbandry.*—It is evident that ſo ſmall an extent of land as either two or three acres, under cultivation, excludes all idea of ploughing; and, indeed, unleſs the cottager ſhall manage the whole in the ſimpleſt and cheapeſt manner, there is an end to the whole ſyſtem. It would require, indeed, four or five acres to keep a ſingle horſe, and the expence of purchaſing horſes, or even oxen, ploughs, and other inſtruments of huſbandry, muſt be far beyond the abilities of a cottager; whereas with a ſpade, a hoe, a rake, a ſcythe, a ſickle, and a flail, which are all the inſtruments really neceſſary, he is perfectly competent to the management of his little farm.

"*III. Courſe of crops, &c.*—The three acres propoſed to be cultivated ſhould be divided into four portions, each conſiſting of three roods, under the following ſyſtem of management:

	Roods.
Under potatoes two roods, under turnips one	3
Under winter tares two roods, ſpring tares one	3
Under barley, wheat, or oats - - -	3
Under clover, with a mixture of rye graſs -	3
Total	12

"Other articles beſides theſe might be mentioned, but it ſeems to me of peculiar importance to reſtrict the attention of the cottager to as few objects of cultivation as poſſible.

"It is propoſed that the produce of the two roods of potatoes ſhall go to the maintenance of the cottager and his family; and that the rood of turnips ſhould be given to the cow in winter and during the ſpring, in addition to its other fare.

"The ſecond portion ſown with tares (the two roods of potatoes of the former year to be ſucceſſively ſown with winter tares, and the turnip rood with ſpring tares), might partly be cut green, for feeding the cow in ſummer and autumn; but, if the ſeaſon will permit, the whole ought to be made into hay for the winter and ſpring feed, and three roods of clover cut green for ſummer food.

"The third portion may be ſown either with barley, wheat, or oats, according to the ſoil or climate, and the general cuſtom of the country. The ſtraw of any of theſe crops would be of eſſential ſervice for littering the cow, but would be ſtill more uſeful, if cut into chaff, for feeding it.

"The fourth portion, appropriated to clover and rye graſs, to be cut green, which, with the aſſiſtance of the orchard, will produce, on three roods of land, as much food as will maintain a cow and her calf for five months, namely, from the end of May, or beginning of June, when it may be firſt cut, to the firſt of November, beſides ſome food for the pigs. It is ſuppoſed that an acre of clover and rye graſs, cut green, will produce 20,000lbs. weight of food for cattle. Three roods, therefore, ought to yield 15,000lbs. weight. A large cow requires 110lbs. weight of green food per day; a middling ſized cow, ſuch as a cottager is likely to purchaſe, not above 90lbs.; conſequently, in five months, allowing 1320lbs. weight for the calf and the pigs, there will remain 13,680lbs. for the cow. Were there, however, even a ſmall deficiency, it would be more than compenſated by the rood of land propoſed to be kept in perpetual paſture as an orchard.

"*IV. Mode in which the family may be maintained.*—It is calculated that three roods and eight perches of potatoes will maintain a family of ſix perſons for about nine months in the year; but, according to the preceding plan, it is propoſed to have but two roods under that article; for however valuable potatoes are juſtly accounted, yet ſome change of food would be acceptable, and the cottager will be enabled, from the produce of the cow, and by the income derived from his own labour, and from that of his family, to purchaſe other wholeſome articles of proviſion.

"*V. Manner in which the ſtock may be kept.*—It appears from the preceding ſyſtem of cropping, that ten roods of land, or two acres and a half, are appropriated to the raiſing of food for the cow in ſummer and winter, beſides the paſture of the orchard; and unleſs the ſeaſon ſhould be extremely unfavourable, the produce will be found not only adequate to that purpoſe, but alſo to maintain the calf for ſome time, till it can be ſold to advantage. It is indeed extremely material, under the propoſed ſyſtem, to make as much profit of the calves as poſſible, as the money thus raiſed will be a reſource, enabling the cottager to replace his cow when a new one muſt be purchaſed.

"For the winter proviſion of the cow, which is the moſt material, becauſe ſummer food can be more eaſily procured, there is the produce,

"1. Of about three roods of tares made into hay.

"2. Of three roods of ſtraw, deducting what may be neceſſary for litter; and if dry earth be put in the cow's hovel, and removed from time to time to the dunghill, little or no litter will be neceſſary.

"3. Of one rood of turnips.

"The whole will be ſufficient for ſeven months in the year, namely, from the 1ſt November to the 1ſt June; and during the remaining five months, the paſture of the orchard, ſome of the winter tares, and the produce of three roods of clover and rye graſs, will not only ſuffice, but will furniſh a ſurplus for the calf, if it is kept for any length of time, and ſome clover for the pigs.

"The inferior barley, potatoes, &c. will of courſe be given to the pigs and the poultry.

"*VI. Value of the produce.*—The land thus managed will certainly produce, by means of the extra induſtry of the family, and at a ſmall expence, a moſt important addition to the income which the cottager may derive from his ordinary labour. For inſtance:

	per Ann.
"1. The orchard (after the trees become fruitful) will probably yield - -	£. 1 10 0
2. Three roods of turnips and potatoes -	4 0 0
3. Eighteen buſhels of barley, at 4s. -	3 12 0
4. The cow and calf - -	7 0 0
5. Hogs - - - -	3 0 0
6. Poultry and eggs - -	2 0 0
Total	£. 21 2 0

"Where wheat can be raiſed inſtead of barley, the profit would be ſtill more conſiderable. Opinions will differ much regarding the value put on each article; but that is of little conſequence, as the total cannot be accounted too high.

"*VII. Time required for cultivating the land.*—The quantity of land intended to be cultivated, will not materially interfere with the uſual labour of the cottager. It will only require to be dug once, and is then fit to be cropped It is propoſed that only nine roods ſhall be annually cultivated (the remaining three roods being under clover and rye graſs), and nine roods may be dug in the ſpace of about 558 hours, or at the rate of 62 hours per rood. This might be done at by-hours (more eſpecially when the family of the cottager ſhall be ſomewhat advanced, and conſequently more able to furniſh aſſiſtance); but ſuppoſing that the digging, manuring, harveſting, &c. will require twenty entire days per annum in addition to the by-hours, and allowing ſixty days for Sundays and holidays, there will remain 285 days for the ordinary hand labour of the cottager, which, at 1s. 6d. per day, would

amount to 21*l.* 7*s.* 6*d.*; the earnings of the wife and children may, at an average, be worth at leaſt 4*l.* per annum more. This is certainly a low calculation, conſidering how much may be got during the hay and corn harveſts; but even at that moderate eſtimate, the total income of the family will be as follows:

1. Produce of the farm	£. 21	2	0
2. Labour of the cottager	21	7	6
3. Earnings of the family	4	0	0
Total	£. 46	9	6

"*VIII. Buildings.*—It is impoſſible to calculate the expence of building a cottage, as ſo much depends upon its ſize, the place where it is ſituated, the materials of which it is compoſed, the price of labour in the country, and a variety of other circumſtances. On this important ſubject, much uſeful information is contained in the firſt volume of the Communications publiſhed by the Board of Agriculture. But it is proper to obſerve that no expenſive additional buildings will be neceſſary in conſequence of the propoſed ſyſtem. A ſhed or hovel for the cow cannot occaſion any very heavy charge, and a ſmall barn, of the ſimpleſt and cheapeſt conſtruction, may be of uſe, not only for threſhing the crop, but alſo for ſecuring the hay, and making it to more advantage, in caſe the ſeaſon ſhould prove unfavourable: if the corn is put up in ſmall ſtacks, the barn may be made of very moderate dimenſions.

"*IX. Rent, and Balance of Income.*—The rents of cottages and of land vary ſo much in different parts of the kingdom, that it is difficult to aſcertain an average. But if the cottage ſhall be ſtated at 3*l.* per annum, the land at 25*s.* per acre, and the orchard at 10*s.* the whole will not exceed 7*l.* 15*s.* The cottager will alſo be liable to the payment of ſome taxes, ſay to the amount of 1*l.* 5*s.* more. Hence the total deductions would be about 9*l.* leaving a balance in favour of the cottager of 37*l.* 9*s.* 6*d.* Conſidering the cheap rate at which he is furniſhed with a quantity of potatoes, equal to ſeveral months' conſumption, and with milk for his children, ſurely, with that balance, he can find no difficulty not only in maintaining himſelf and family in a ſtyle of comfort, but alſo in placing out his children properly, and laying up a ſmall annual ſurplus, that will render any pariſh aſſiſtance, whether in ſickneſs or old age, unneceſſary; and thus he will be enabled to preſerve that manly and independent ſpirit which it ſo well becomes a Britiſh cottager to poſſeſs.

"*Advantages of the propoſed ſyſtem.*—I ſhall now endeavour briefly to explain ſome of the advantages which may be looked for with confidence from the propoſed ſyſtem.

"1. In the firſt place, the land poſſeſſed by the cottager would be completely cultivated, and rendered as productive as poſſible. The dung produced by the cow, the pigs, &c. would be amply ſufficient for the three roods under turnips and potatoes; which would afterwards produce, 1. Tares, 2. Barley, and 3. Clover; with a mixture of rye-graſs, in regular ſucceſſion, without any additional manure. The barley ſhould yield at leaſt eighteen buſhels, beſides three buſhels for ſeed; and if wheat or oats are cultivated, in the ſame proportion. The milk, deducting what may be neceſſary for the calf, and for the cottager's family, might be ſold in its original ſtate, if there ſhall be a market for it, or converted into butter, for the purpoſe of ſupplying the neighbouring towns or villages. Such cottagers, alſo, might certainly ſend to market both eggs and poultry.

"2. It is hardly poſſible to ſuggeſt a meaſure more likely to promote the benefit of a numerous and valuable body of people. The ſyſtem of keeping cows by cottagers, which has been found ſo advantageous in the grazing diſtricts, may thus be extended over the whole kingdom; and, indeed, if the above plan is found to anſwer, in place of four or five acres employed in feeding a ſingle cow, it would be much better, even in the grazing counties, to reſtrict the land to a ſmaller quantity, under a tillage mode of management; for thus not only the cow, but alſo the cottager himſelf, and his family, would, in a great meaſure, be maintained by a leſs ſurface of ſoil.

"3. It is of infinite conſequence to eſtabliſh the practicability of this ſyſtem, as the means of removing a moſt unfortunate obſtacle to the improvement of the country. It is well known to be the only popular objection to the incloſure of our waſtes and commons, that, while unincloſed, a number of cottagers are enabled to keep cows by the means of their common rights, and that their cows diſappear when the commons are incloſed. But if ſo ſmall a portion of land as $3\frac{1}{4}$ acres, when improved and properly cultivated, can enable a cottager to keep a cow even to more advantage than with a right of common; which can hardly be doubted, as he is enabled to provide winter as well as ſummer food; there is an end to that obſtacle to improvement. Indeed, if ſufficient attention be paid to the principles above detailed, the ſituation of the cottager, inſtead of being deteriorated, would be materially bettered by the incloſure; and his riſing family would be early accuſtomed to habits of induſtry, inſtead of idleneſs and vice.

"I ſhall conclude with aſking," ſays Sir John Sinclair, "if any one can figure to himſelf a more delightful ſpectacle than to ſee an induſtrious cottager, his buſy wife, and healthy family, living in a comfortable houſe, rented by himſelf, cultivating their little territory with their own hands, and enjoying the profits ariſing from their own labour and induſtry; or whether it is poſſible for a generous landholder to employ his property with more ſatisfaction, or in a manner more likely to promote, not only his own, but the public intereſt, than in endeavouring to increaſe the number of ſuch cottagers, and encouraging, by every means in his power, the exertions of ſo meritorious and ſo important a claſs of the community?"

Plan of the propoſed Cottage Farm, pointing out the Rotation of Crops in the different Lots.

Cottage.	The Orchard, or perpetual Paſture.	Pond.
Lot A. 3 Roods 1. Year { 2 Roods Potatoes 1 Rood Turnips	Lot B. 3 Roods. 1. Year { 2 Roods Winter Tares 1 Rood Spring Tares	
Lot C. 3 Roods. 1. Year—Barley, Wheat, or Oats	Lot D. 3 Roods. 1. Year—Clover and Rye-graſs.	

The Rotation of Crops for four Years.

Year	Lot A.	Lot B.	Lot C.	Lot D.
1	Potatoes and Turnips	Winter and Spring Tares	Barley, Wheat, or Oats	Clover and Rye-graſs
2	Winter and Spring Tares	Barley, Wheat, or Oats	Clover and Rye-graſs	Potatoes & Turnips
3	Barley, Wheat, or Oats	Clover and Rye-graſs	Potatoes and Turnips	Winter & Spring Tares
4	Clover and Rye-graſs	Potatoes and Turnips	Winter & Spring Tares	Barley, Wheat, or Oats

The rotation then begins as at firſt. Lot D might continue in natural graſs the firſt ſeaſon, to diminiſh the labour of that year.

The exact period when the different crops ſhall be dug for, or ſown, cannot be aſcertained, becauſe it varies ſo much in different counties, and depends upon the ſeaſons; but, according to the above rotation, the labour of digging for the various crops is diverſified as much as poſſible, ſo as not to interfere materially with the other occupations of the cottager. At no period would it be neceſſary for him to dig more than two roods in a month; and both he and his family will labour with much more ſatisfaction and diſpatch when they work for themſelves than for another. In caſe of neceſſity, the cottager might hire ſome of his neighbours to aſſiſt him in digging, which would be much better than hiring a plough. If a cottager under this ſyſtem could not work as a common daily labourer, he might, at leaſt, anſwer as a uſeful labourer by the piece.

COTTON (*Encycl.*). Is ſeparated from the ſeeds of other extraneous matter by a proceſs called *Batting*; for an account of a machine, or mill, lately invented for that purpoſe, ſee the article BATTING in this ſupplement. The following is a ſpecification of the patent granted to Mr. Greatrix, of Hulme, near Manchester, callico printer and dyer; for a new invented proceſs and method of dyeing and ſtaining colours upon cotton, linen, and mixed goods.

"To dye a black upon cotton, linen, and cotton and linen mixed," ſays the inventor, "I take tar, iron liquor of the very beſt quality, adding to each gallon thereof, three quarters of a pound of fine flour, and by boiling bring it to the conſiſtency of a thin paſte. I put the liquor or paſte above mentioned into the tub marked No. 3, belonging to the machine uſed in this proceſs, a ſection and horizontal plan of which, with reference to, and deſcription of, the ſeveral parts whereof, is hereunto annexed. (See Plate 20.) The goods intended to be dyed are wound upon the roller No. 14, and paſſed through the liquor or paſte above mentioned, betwixt the two rollers 7 and 12; thereby completely ſtaining or dyeing the whole maſs or body of the cloth. I paſs them into a very hot ſtove or drying-houſe till dry. I take cows-dung, put it into a large copper of water about ſcalding hot, and mix it well together, through which I paſs the piece of cloth until it be thoroughly ſoftened. Note: the quantity of dung, and the time neceſſary in this proceſs, depend upon the ſubſtance of the cloth, and the quantity of the paſte or liquor imbibed in it. I take and waſh the goods, ſo dunged, extremely well in water. I take a quantity of madder, or logwood, or ſumach, or any two of them, or all of them mixed together, as the ſtrength of the cloth and nature of the colour may require, and put them into a copper, or tub of hot water; then enter the goods before mentioned into this liquor, and keep rincing or moving them therein, until I have brought them up to the ſtrength of colour required. I have the goods again well waſhed and dryed. Note, for dyeing black, it will be proper to paſs the goods a ſecond time through the above operations; adding more or leſs of the dyeing-woods as before. Note alſo, that if, after the above operations and the ſhade of colour is too full, or too much upon the red hue, it will be neceſſary to give them a little ſumach, and then run them through a liquor made from iron and owler, or alder bark. Another method of dyeing black: I take common iron liquor, and add three quarters of a pound of fine flour, and by boiling bring it to the conſiſtency of a thin paſte; or, inſtead of flour, I add glue or linſeed, or gum, or any two, or all of them mixed together, till it is brought to a proper thickneſs. I then paſs the goods through the machine, and follow the before-mentioned operations. To dye olives, bottle greens, purples, browns, cinnamons, or ſnuffs, I take common iron liquor, or common iron liquor with alum diſſolved in it, or common iron liquor with alum and ſaccharum ſaturni diſſolved therein, in quantity of each according to the ſhade of colour wanted, made into a paſte or liquid, by adding flour, gum, glue, linſeed, or one or more of them as before. I then put the liquor or paſte above mentioned into the tub marked No. 3, belonging to the machine before deſcribed, and paſs the goods ſo intended to be dyed through the machine in the ſame manner I have deſcribed for dyeing black. I take them from the machine, and hang them up in a very cool room, where they remain till thoroughly dry. I take cows-dung, put it into a large copper of hot water, and mix it well together; through which I paſs the cloth or goods until thoroughly ſoftened, the quantity of dung and time requiſite, being proportioned as before. The goods after this proceſs being well waſhed, I take a quantity of liquor made from madder, logwood, fumach, fuſtic, brazil, woad, quercitron bark, peach wood, or other woods, to produce the colour wanted, or any two, or more of them; and, in caſe I ſee it neceſſary, I dilute this liquor with water, according to the ſhade or fulneſs of colour I want to dye. I then work the goods through this liquor very well; after which I paſs them through cold or warm water, according to the colour, the proper application of which is well known to dyers, adding a little alum, copperas, or Roman vitriol, or two or more of them, firſt diſſolved in water. I then waſh them off in warm water, and dry them. Note, if the colour is not ſufficiently full, I repeat the ſame operations till it is brought to the ſhade required. To dye crimſon, red, orange, or yellow, I take red liquor, ſuch as is generally made from alum, ſaccharum ſaturni, or ſuch-like ingredients, and dilute it with water, according to the ſtrength or ſhade of colour I want to dye, bringing it to the conſiſtency of a paſte or liquid, as before deſcribed. Then paſs the cloth through the machine; which being dryed in a cool room, paſs it through the operations of dunging and waſhing as before. I take a quantity of liquor, made from cochineal, madder, peach-wood, brazil, logwood, woad, fuſtic, ſumach, or any two or more of them proportioned in ſtrength to the ſhade or colour I want to dye, and work the goods through this liquor very well, till I have brought them to the ſhade of colour required; after which I waſh them in cold or warm water, and dry them."

Deſcription of the machine. No. 1, The frame. 2, The cloth or batting which conveys the paſte or liquor to the piece of cloth intended to be dyed. 3, The tub made to contain the paſte. 4, Another tub, which receives the ſuperfluous liquor or paſte from the piece, and conveys it into No. 3. 5, 6, and 7, are three rollers, round which the batting runs; paſſing through the tub of liquor, No. 3. 8, and 9, two ſcrews, for the purpoſe of tightening the batting. 10, and 11, two ſcrews which preſs the roller No. 7, againſt the roller No. 12, betwixt which the piece paſſes. 12, A roller on which the fly-wheel No. 13 is fixed, which puts the machine in motion. 13, The fly-wheel. 14, The roller on which the piece is wound. 15, The piece paſſing through the liquor, and betwixt the rollers 7, and 12. 16, Another roller, which draws the piece from the machine, by a ſtrap worked from a pulley, on the roller No. 12.

COTTON-*Mills* (*Encycl.*). It has been the practice of many pariſhes, particularly of the metropolis, to ſend the children of the poor to be employed in theſe manufactories, for the moſt part, very greatly to the injury of their health and morals. That this, however, is not uniformly the caſe, appears from the following extract from an account of Mr. Dale's cotton-mills at New Lanerk, in Scotland, publiſhed in the Reports of the Society in London for bettering the Condition of the Poor.

The cotton-mills at New Lanerk in the county of Lanerk in Scotland, are ſituate on a beautiful and romantic amphitheatre, near the high road between Carliſle and Glaſgow. The rapid ſtream of the Clyde ſupplies that abundance of water, which is the powerful operator of the machinery. For the purpoſe of conveying and directing its power, a ſubterraneous aqueduct is cut for many hundred yards through the ſolid rock. The firſt mill, in length 154 feet, was originally erected in 1785; and, having been burnt down, was rebuilt in 1789. The ſecond is exactly of the ſame dimenſions; the third is 130 feet, and the fourth 156 feet, in length.

The two firſt mills contain 12,000 ſpindles for ſpinning water twiſt; the other two are occupied by jennies, for ſpinning mule yarn.—The village of New Lanerk owes its exiſtence to the erection of theſe mills. It conſiſts of neat ſubſtantial houſes; forming two ſtreets about half a mile in length, and broad, regular, and clean. Near the centre of the village are the mills; and oppoſite to them, a neat manſion, the occaſional reſidence of Mr. Dale, the proprietor, and of his principal manager. The village, conſiſting chiefly of Highlanders from the counties of Argyle, Caithneſs, and Inverneſs, contains about 1,500 inhabitants; of whom all who are capable of work are employed in and about the mills. Of theſe, there are 500 children who are entirely fed, clothed, and educated by Mr. Dale. The others lodge with their parents in the village, and have a weekly allowance for their work.

The healthy and pleaſurable appearance of theſe children has frequently attracted the attention of the traveller. Peculiar regulations, adopted by Mr. Dale for the preſervation of the health and morals of thoſe under his protection, have made this ſtriking difference between his manufactory and many other ſimilar undertakings in this kingdom; ſo that while ſome other mills muſt be regarded as ſeminaries of vice, and ſources of diſeaſe, thoſe at Lanerk are ſo peculiarly exempt from theſe objections, that out of near 3,000 children employed in theſe mills during a period of twelve years, from 1785 to 1797, only fourteen have died; and not one has been the object of judicial puniſhment.

In order to ſupply that firſt neceſſary of life, pure and freſh air, the windows of the manufactory are frequently opened; and in ſummer there are air holes left under every other window.—Cleanlineſs is another great object of attention. The children waſh themſelves before they go to work, and alſo after it before they appear in the ſchools. The floors and the machinery are waſhed once a-week with hot water; and the ceilings and walls, twice a-year, with unſlaked lime.—The children who reſide in the houſe, and who have their maintenance in lieu of wages, are lodged in ſix large airy apartments. The boys and girls are kept *diſtinctly apart;* not only in the hours of reſt and refreſhment, but during the time of occupation.—They ſleep on caſt-iron bedſteads, the bed-tick filled with ſtraw, which is changed regularly every month. The bedrooms are ſwept, and the windows thrown open every morning, and kept open all the day. Many of the children have contrived to provide themſelves with boxes with locks; in which they keep their books and their little property. Their upper clothing in ſummer is cotton, which is waſhed once a-fortnight. In winter the boys are dreſſed in woollen; and, as well as the girls, have dreſs ſuits for Sundays.

For dinner they have ſeven ounces each of freſh beef with barley broth, or alternately five ounces of cheeſe; and a plentiful allowance of potatoes, or barley bread. This part of the table diet is ſeldom varied; except in winter by a dinner of freſh herrings, as a change. Their breakfaſt and ſupper conſiſt of oatmeal porridge, with the addition of milk in ſummer; and, during the winter, with a ſauce made of molaſſes and beer.

Seven o'clock is the hour of ſupper; ſoon after which (*for that pernicious practice, called night-work, is entirely excluded from theſe mills*) the ſchools commence, and continue till nine o'clock. Mr. Dale has engaged three regular maſters, who inſtruct the leſſer children during the day. In the evening they are aſſiſted by ſeven others, one of whom teaches writing. There is likewiſe a woman to teach the girls ſewing, and another perſon who occaſionally gives leſſons in church muſic. The maſters preſide over the boys' dinner table. On Sundays they conduct them to the place of divine worſhip; and, in the evening of Sunday, attend to aſſiſt and improve them, by religious and moral information.

In the year 1791, a veſſel carrying emigrants to America, from the iſle of Skye, was driven by ſtreſs of weather into Greenock, and about 200 perſons were put on ſhore in a very deſtitute ſituation. Mr. Dale offered them all immediate employment; which the greater part accepted. Soon after he notified to the people of the Highlands and the Hebrides, the degree of encouragement which he would give to families at the cotton mills; and undertook to provide houſes for 200 families. Theſe were finiſhed in 1793: in conſequence of which a conſiderable number of Highlanders have taken up their reſidence at New Lanerk. Several families alſo, who were laſt year driven from Ireland, have found immediate employment here.

"Amid the numerous variety of cotton mills," ſays Mr. Bernard, "that have been erected in this kingdom, I ſincerely wiſh it were in my power to ſhew many examples like thoſe of Mr. Dale's mills at Lanerk. Some *few* of theſe manufactories have been diſtinguiſhed for attention to health and cleanlineſs, and many of them for very curious mechaniſm, and ingenious inventions, by which the operations are produced and facilitated; but I have not had the good fortune to find in any (though I doubt not but it may exiſt in ſome inſtances) that proper degree of attention, which ought to be paid to the morals and inſtruction of the children. *Where boys and girls are indiſcriminately employed at all hours, not only of the day, but of the night*, and are mingled together without any advantage of education, without benefit of religious inſtruction or moral principle, and without any friend to adviſe or protect them, can we be aſtoniſhed at their plunging in a very early age, *and almoſt during childhood*, in every wretched and diſguſting ſpecies of debauchery? Can we be ſurpriſed that our numerous and crowded manufactories ſhould be the nurſeries of thieves and proſtitutes; ſent out at an early age to their own ruin, and to the annoyance of the kingdom, and of every individual of which it is compoſed?

"Such, however, is the preſent ſpirit and ſpeculation of this country, that wherever the demon of gain raiſes his banner, talents and exertion are ſure to follow it. Cotton mills are as yet but in their infancy. Whilſt great profits and immenſe fortunes are to be made by them, we know they muſt rapidly increaſe; and it is too obvious that, without public attention, they muſt be deſtructive of the moral and religious principles of the great maſs of the people. The effect of this ſpecies of abridgment of labour is ſo great, that 100 perſons in a cotton mill, will do more ſpinning, and that of ten times the fineneſs, and of a ſuperior quality, to what can be produced by 3000 of the very beſt ſpinners by hand. In conſequence of this, cotton mills have almoſt entirely deprived the cottager's wife and children of theſe means of domeſtic induſtry. The profit of ſpinning by hand is ſo reduced, that whole diſtricts of cottagers' families have been obliged to give it up, and apply for relief to the pariſh.

"Our national and individual increaſe of wealth, from the manufacture of cotton, has been attended with ſo much injury to the health and morals of the poor, and is ſo utterly

deſtructive of that which conſtitutes the eſſential and fundamental virtue of the female character, that if I am not permitted to ſuggeſt a doubt, whether it would not have been better for us *that cotton mills had never been erected in this iſland*, I may at leaſt expreſs an anxious wiſh, that ſuch regulations may be adopted and enforced, as ſhall diminiſh, if not entirely remove, the injurious and pernicious effects which muſt otherwiſe attend them.

"With this view I will lay before the reader an outline of ſome regulations, which, impelled by zeal, but very little preſuming on perſonal knowledge of the ſubject, I venture to ſubmit to the conſideration of the public: meaning to apply my obſervations, not merely to cotton mills, but to all other manufactories under ſimilar circumſtances; and particularly to thoſe, in which children are engaged as apprentices.

"In the *firſt* place, I conceive that ſome general and public attention ought to be paid to the moral and religious improvement of ſo numerous a claſs of our fellow-ſubjects: and that the moſt eſſential parts of their education ought not entirely to depend on the caprice, or diſpoſition, of their reſpective maſters; eſpecially as many of them have been apprenticed by lots from diſtant counties, and have been deſerted by thoſe, whoſe duty it was to have protected them. In addition to this, ſomething ſhould alſo be done for the benefit of theſe children, to inſtruct and prepare them to ſupport themſelves in life, without thievery and proſtitution, when the period of their apprenticeſhip expires at the age of ſixteen.

"It ſeems to me to be alſo expedient that the age and conditions of apprenticeſhip be regulated;—that the hours of work be limited, and *night-work* (ſo deſtructive to health and morals) entirely excluded;—that a total ſeparation take place between the boys and the girls;—that the works be liable to the periodical inſpection of the magiſtrates, who ſhould have power to order the regular white-waſhing and cleaning, and the warming and ventilating of the work-rooms; and who ſhould receive quarterly or monthly reports, from each manufactory, of the number, the health, and the reſpective ages, of all the apprentices and other perſons employed there.

"Such are the regulations, which, upon a curſory view of the ſubject, appear to be proper, and to have a tendency to meliorate the condition, and to preſerve the morals, of theſe unfortunate and neglected children. Other correctives and remedies may probably occur to thoſe who poſſeſs more practical knowledge of the ſubject. At preſent I have only to add that, as far as my enquiries have extended, I have reaſon to be ſatisfied, that almoſt all the owners of cotton mills will concur in thinking, that the preceding, or ſome ſimilar, regulations *ought to be enforced* by the legiſlature, for the protection of the children employed in thoſe mills. In order therefore that ſomething practicable and effectual may be done, without injury to the intereſt of the manufacturers, I would ſuggeſt that the outline of any regulations propoſed to be adopted, ſhould be firſt communicated to them, ſo that they might ſtate any objections, or amendments; and after a proper attention ſhall have been paid to their obſervations, I venture boldly to expreſs my confidence, that the meaſures will have the ſupport of every one, who deſires to promote the welfare and happineſs of his fellow-creatures, and the eſſential intereſts of virtue, morality, and religion, in this favoured country."

COUCY, a town of France, in the department of Aiſne, nine miles N. of Soiſſons. Long. 3. 13. E. Lat. 48. 30. N.

COVERDEN, a town of the United Provinces, in Overyſſel, with a fortreſs in the marſhes, ſtrong both by nature and art. It is thirty-five miles N.E. of Deventer. Long. 6. 35. E. Lat. 52. 46. N.

COULAN, or QUILON, a country of the peninſula of Hindooſtan, on the coaſt of Malabar. The inhabitants are generally Gentoos, with ſome Chriſtians of St. Thomas. The capital is of the ſame name, where the Dutch have a ſettlement. Long. 75. 30. E. Lat. 8. 30. N.

COUSERANS, a late province of France, lying along the river Satat, and forming, with Foix, the department of Arriege.

COUTRAS, a town of France in the department of Dordogne, and late province of Perigord; ſeated on the Dordogne, twenty miles N.E. of Bourdeaux. Long. 0. 3. W. Lat. 40. 4. N.

COW (*Encycl.*). For proofs of the advantage which the poor cottager may derive from keeping a cow. See the article COTTAGER in this ſupplement.

COWBRIDGE, a ſmall but neat town of Glamorganſhire, with a market on Tueſday. It is called by the Welch Pont-Van, from the ſtone bridge over the river, which ſoon after falls into the ſea. The ſtreets are broad and paved; it is governed by two bailiffs, twelve aldermen, and twelve common-council; and here the aſſizes for the county are held. It is twelve miles W. of Cardiff, and 176 W. of London. Long. 3. 33. W. Lat. 51. 28. N.

COWPER (William), a modern poet of diſtinguiſhed and original genius, was born in 1732, at Berkhamſtead in Hertfordſhire. His father, the rector of the pariſh, was John Cowper, D.D. nephew to Lord Chancellor Cowper. Mr. Cowper was educated at Weſtminſter ſchool, and at that ſeminary he acquired the claſſical knowledge and correctneſs of taſte for which it is celebrated, but without any portion of the confident and undaunted ſpirit which is ſuppoſed to be one of the moſt valuable acquiſitions derived from great ſchools to thoſe who are to puſh their way in the world. It appears, indeed, from his poem, entitled Tirocinium, that the impreſſions made on his mind from what he witneſſed, were of the moſt unfavourable kind, and gave him a permanent diſlike to the ſyſtem of public education. As through family intereſt the honourable and lucrative place of clerk to the Houſe of Lords had been provided for him, he was entered at the Temple for the ſtudy of the law, in order to qualify him for it. In this ſituation his manners were amiable and decent; and though it is probable that he did not refuſe to indulge in thoſe pleaſures which are uſual among young men ſimilarly ſituated, yet there ſeems no reaſon to ſuppoſe that he had any peculiar cauſes for ſelf-accuſation. His natural diſpoſition was timid and diffident; his ſpirits were conſtitutionally weak, even to the borders of abſolute unfitneſs for worldly concerns; ſo that when the time came for aſſuming that poſt to which he had been deſtined, he ſhrunk with ſuch terror from the idea of making his appearance before the moſt auguſt aſſembly in the nation, that, after a violent ſtruggle with himſelf, he actually reſigned the employment, and with it all his proſpects in life. It appears to have been under the agitation of mind which this circumſtance occaſioned, and which threw him into a ſerious illneſs, that he was led to a deep conſideration of his ſtate in a religious view; and from the ſyſtem he had adopted, this courſe of reflection excited in him the moſt alarming and diſtreſsful apprehenſions. In vain did his theological friends ſet before him thoſe encouraging views which the theory of Chriſtian juſtification is calculated to preſent, and which to many is the ſource of a confidence perhaps as exceſſive as their former fears; the natural diſpoſition of his mind fitted it to receive all the horrors, without the conſolations, of his faith. We are told, that "the terror of eternal judgment overpowered and wholly diſordered his faculties; and he remained ſeven months in a continual expectation of being inſtantly plunged into final miſery." In this ſhocking condition he became the ſubject of medical care,

and he was placed in the receptacle for lunatics kept by Dr. Cotton of St. Alban's, an amiable and worthy phyſician, and the author of ſome well-known poems. At length he recovered a degree of ſerenity; but his mind had acquired that indelible tinge of melancholy by which it was ever after characteriſed, and which rendered his whole life little more than a ſucceſſion of intervals of comfort between long paroxiſms of ſettled deſpondency. It is unneceſſary to follow him through all his ſcenes of retirement. Part of his time was ſpent at the houſe of his relation, Earl Cowper, at Cole-green; and part at Huntingdon, with his intimate friend the Reverend Mr. Unwin. After the death of the latter, he removed with his widow to Olney in Buckinghamſhire, which was thenceforth the principal place of his reſidence. The affectionate intimacy he enjoyed with this lady is ſtrongly expreſſed in the following lines, which have probably been underſtood by moſt readers as expreſſive of a conjugal union:

—Witneſs, dear companion of my walks,
Whoſe arm this twentieth winter I perceive
Faſt lock'd in mine, with pleaſure ſuch as love
Confirm'd by long experience of thy worth
And well-tried virtues could alone inſpire—
Witneſs a joy that thou haſt doubled long.
TASK, B. I.

At Olney he contracted a cloſe friendſhip with the Reverend Mr. Newton, then miniſter there, and ſince rector of St. Mary Woolnoth, London, whoſe religious opinions were in uniſon with his own. To a collection of hymns publiſhed by him, Mr. Cowper contributed a large number of his own compoſition. He firſt became known to the public in general as a poet by a volume printed in 1782. The pieces of which it conſiſted were of a ſingular caſt; and if they did not at once place the writer high in the ſcale of poetic excellence, they ſufficiently eſtabliſhed his claim to originality, and gave tokens of a genius rather kept down by his ſubject than deficient in native power. The principal topics are, Error, Truth, Expoſtulation, Hope, Charity, Retirement, Converſation, all treated upon religious principles, and not without a conſiderable tinge of that rigour and auſterity which belonged to his ſyſtem. To this it muſt be attributed, that though naturally a man of kind affections, and more inclined to compaſſion than ſeverity, yet, like the melancholy Jacques,

——moſt invectively he pierceth through
The body of the country, city, court.

Theſe pieces are written in rhymed heroics, which he commonly manages with little grace or attention to melody. The ſtyle is rather ſtrong and forcible than poetic; but though often proſaic, he is never flat or inſipid; and ſometimes the poet breaks through in a vein of lively deſcription or bold figure. Of his talent for painting, a better ſpecimen cannot be given than his draught of the melancholy man, probably ſketched from what too faithful remembrance ſuggeſted of himſelf:

Look where he comes—In this embower'd alcove
Stand cloſe concealed, and ſee a ſtatue move;
Lips buſy, and eyes fixt, foot falling ſlow,
Arms hanging idly down, hands claps'd below,
Interpret to the marking eye, diſtreſs,
Such as its ſymptoms only can expreſs.
That tongue is ſilent now;—that ſilent tongue
Could argue once, could jeſt or join the ſong,
Could give advice, could cenſure or commend,
Or charm the ſorrows of a drooping friend.
Renounc'd alike its office and its ſport,
Its briſker and its graver ſtrains fall ſhort;
Both fail beneath a fever's ſecret ſway,
And like a ſummer brook are paſt away.
RETIREMENT.

It does not appear that this volume excited much of the public notice; but his ſecond volume, publiſhed in 1785, introduced his name to all the lovers of poetry, and raiſed him at leaſt to an equality of reputation with any of his contemporaries. This chiefly conſiſts of a poem in ſix books, entitled The Taſk, which name it derived from the injunction of a lady upon him to write a piece in blank verſe, for the ſubject of which ſhe gave him *the Sofa*. It ſets out, indeed, with ſome ſportive diſcuſſion of this topic, but it ſoon falls into a ſerious ſtrain of rural deſcription, intermixed with moral ſentiments and portraitures, which, under different titles, is preſerved through the ſix books, with no perceptible method, but freely ranging from thought to thought, from the image to its improvement, as unſhackled fancy ſuggeſts. It is difficult to determine which is the moſt conſpicuous excellence of this charming production. In the deſcription of natural objects, it unites the moſt minute accuracy with ſtriking elegance and pictureſque beauty. Since Thompſon, Cowper is the poet who has added moſt to the ſtock of natural imagery; and his paintings are more exact than thoſe of that writer, though generally leſs grand and comprehenſive. His *manner*, indeed, has led ſome of his imitators into a kind of Dutch ſtyle of painting, which has waſted the powers of deſcription upon objects not worth the pains; but Cowper himſelf is generally preſerved by good taſte from this degradation of his art. The pious and moral reflections of the Taſk, touch the heart with irreſiſtible force; and its delineations of character are life itſelf. The perſonifications, and allegorical figures interſperſed, diſplay high powers of fancy; and the picture of Winter riding on his ſledgy car, may vie in ſublimity with any effort of poetical invention. The permanent colour of the diction is eaſe and force, ſometimes deviating into negligence, but more free than perhaps any other blank verſe from the ſtiffneſs and tumidity which ſo commonly diſfigure this mode of writing. Although the peculiar religious ſyſtem of the author is ſufficiently diſcernible in the Taſk, it however appears with leſs gloom and auſterity than in his former pieces. There is added to this volume Tirocinium, or a Review of Schools, a piece of great ſtrength, and replete with ſtriking obſervation, whatever he thought of the deciſive ſentence it pronounces againſt the public education of this country. The merry ſtory of John Gilpin ſeems to ſhew (as indeed do many paſſages in his other works), that a ſtrong perception of the ludicrous naturally balanced in his diſpoſition the gloomy propenſity which circumſtances rendered finally predominant.

For the purpoſe of loſing in employment thoſe diſtreſſing ideas, which were ever apt to recur, he undertook the real *taſk* of tranſlating into blank verſe the whole of Homer's Iliad and Odyſſey. This work poſſeſſes much merit of execution, and is certainly a much more exact repreſentation of the ancient bard than Pope's ornamental verſion; but though the epic dignity is well ſupported in thoſe paſſages which are intrinſically poetical, yet where the ſimplicity of the matter in the original is elevated into poetry ſolely by the force of ſonorous verſification, the poverty of Engliſh blank verſe has ſcarcely been able to prevent it from ſinking into mere proſe. On the whole, this tranſlation has probably been more praiſed than read; to the author, however, it was a moſt valuable ſource of innocent amuſement, and its completion is mentioned by him with the regret felt on parting with a beloved companion.

Nothing, however, was capable of durably relieving his mind from the horrible impreſſions it had undergone; and

abſolute deſpair was the ſtate in which it finally ſettled. He paſſed ſome of his latter years under the affectionate care of a relation at Eaſt Dereham in Norfolk, nor did he entirely drop his literary employments, and the occaſional compoſition of poems, till a ſhort time before his death. This event took place, after a gradual decline of ſtrength, on April 25th, 1800. —We are indebted to the popular biographical work of Dr. AIKIN for the foregoing particulars.

COW-POX, a diſeaſe to which cows are ſubject, and from which mankind are likely to derive moſt important benefits.
